Boston, MA 02114-2524

Dear Secretary Bowles:

I am writing with regard to your office's request for comments on the Massachusetts Department of Transportation's (MA DOT) joint Draft Environmental Report/Environmental Assessment for the Green Line Extension Project (GLX), EOEA No. 13886. I appreciate the opportunity to share my thoughts on the work MA DOT has done so far.

First, I want to re-affirm my strong support for the Green Line Extension. For years, residents and businesses in Somerville have had heavy rail passing through the city with only one stop, the Red Line's Davis Square station. They have lived with the noise, the construction and the loss of usable property. In addition to the numerous environmental justifications for this project – getting people out of cars and into trains, reduction in particulate matter, vehicle emissions, and etc. – finally providing the City of Somerville with transit stops is the right thing to do. I am pleased with MA DOT's commitment to this project and the effort that has so far been put in to planning it.

F-001-001

I understand and appreciate MA DOT's distinction between the Proposed Project and the Preferred Alternative. I am an unabashed supporter of extending the Green Line to Route 16/Mystic Valley Parkway as soon as possible. I have concern that MA DOT putting off the spur from Medford Hillside to Route 16 until later, the spur will forever live as a plan and not as reality. While I am heartened that highway funds have been 'flexed' already to finish the line out to Route 16 by 2020, there will be many, myself included, who will watch this carefully to be sure it happens. I urge the Executive Office of Environmental Affairs to reinforce MA DOT's commitment.

PRINTED ON RECYCLED PAPER

F-001-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

F-001-002 I commend MA DOT for its commitment to include service to Union Square in the Proposed Project. However, I do not think the Proposed Project goes far enough. The North Station, South Station, Porter Square and Back Bay stations have both subway and commuter rail stops. Union Square, which will have a Green Line station and already has the Fitchburg Line passing through it, should also.

In general, my thoughts and comments for the Proposed Project are entirely supportive. However, there are several issues for which I would like to underscore their importance. The first

F-001-003 is the Somerville Community Path. I appreciate that MA DOT is planning and will construct GLX with the Community Path taken into account. This must continue. Second, I understand

F-001-004 that in constructing GLX, there will be necessary work done on vehicular/pedestrian bridges spanning the right of way. The Commonwealth has an unfortunate history of closing Somerville's bridges and not reopening them for years. MA DOT must not drag its feet this time. Third, I urge that MA DOT be required to look closely at the bus routes in Somerville, with an

F-001-005 eye toward how to best bring bus riders to GLX stations. I believe none of the stations are more than a quarter mile from a bus route. MA DOT ought to consider bringing the buses directly to these rail stops.

F-001-006 As with many of my constituents, my greatest concern is about citing the maintenance and storage facility. I acknowledge the need for a maintenance and storage facility on the north side of the Green Line. I oppose the Preferred Maintenance Facility Site in Yard 8 and understand the problems associate with the alternative I most prefer, the Mirror H plan. That said, I find the Option L alternative to be the least objectionable and I conditionally support it. Option L, while moving the facility as far as possible from residences and as close as possible to the Boston Engine Terminal, must be built to best allow for continued development in the Inner Belt area. The MA DOT should move the Massachusetts Bay Transit Authority (MBTA) offices out of its Cobble Hill area property and into this new facility. The Cobble Hill property could then be sold at market rate to help pay for the storage facility's construction, and replace the taxable property that will be removed from Somerville's tax roll by the facility.

In closing, I would again like to re-state my support for the Green Line Extension. I believe that the Green Line Extension, when completed, will address unment public transit needs and spur economic growth in several Somerville neighborhoods. I appreciate the opportunity to offer my thoughts on how MA DOT should proceed with the Green Line Extension.

Sincerely,

Michael E. Capuano
Member of Congress

F-001-002

Opportunities for a shared station between the Green Line Extension (on the Medford Branch) and MBTA Commuter Rail were evaluated for the Project. This connection was ultimately dismissed, as described in DEIR/EA Section 3.3, and Appendix B. While the potential for a joint station at Union Square would need to be studied further, it is not currently part of the Proposed Project. A connection currently exists between the Green Line and Commuter Rail at North Station; this connection would remain. However, as the Project advances into preliminary engineering, opportunities for future additions and extensions of service will be considered.

F-001-003

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

F-001-004

Construction impacts of the Project are described in each environmental resource section in DEIR/EA Chapter 5, Environmental Consequences. Detailed construction plans will be developed in the next phase of the Project. Affected bridges are described in DEIR/EA Section 3.7.2. Detour routes and emergency access during construction will be developed during preliminary engineering as part of the Traffic Management Plan. At least one bridge will need to be closed during construction (Medford Street). A temporary bridge may be able to maintain a single lane of traffic at the Broadway Bridge. For all other bridges, at least one lane will be maintained during construction. Pedestrian and vehicular access to abutting properties will be maintained at all times. Project bridge designs and construction staging plans will be refined during preliminary

engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during design and construction.

F-001-005

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail. MassDOT will work with the MBTA to evaluate opportunities to improve connections between existing bus routes and proposed stations.

F-001-006

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

CERTIFICATE OF THE SECRETARY OF ENERGY AND ENVIRONMENTAL AFFAIRS
ON THE
DRAFT ENVIRONMENTAL IMPACT REPORT

PROJECT NAME	: Green Line Extension
PROJECT MUNICIPALITY	: Cambridge, Medford and Somerville
PROJECT WATERSHED	: Boston Harbor
EOEA NUMBER	: 13886
PROJECT PROPONENT	: Massachusetts Department of Transportation (MassDOT)
DATE NOTICED IN MONITOR	: October 26, 2009

As Secretary of Energy and Environmental Affairs, I hereby determine that the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act (G. L. c. 30, ss. 61-62I) and with its implementing regulations (301 CMR 11.00). However, I am declining to allow this DEIR to be considered the Final Environmental Impact Report (FEIR) (as permitted under 301 CMR 11.08(8)(b)(2)). The Proponent must prepare and submit for review a Final Environmental Impact Report (FEIR) in response to the Scope provided below.

At the outset, I would like to commend the proponent, the Massachusetts Department of Transportation (MassDOT), for its commitment to fund and build this critically important public transportation project. The project is the most significant remaining transit commitment arising out of the Central Artery/Tunnel Project (CA/T) in terms of reducing vehicle emissions and is emblematic of the type of public transportation investment needed to meet the Commonwealth's greenhouse gas reduction mandates. The Green Line Extension Project will finally provide light rail transit beyond Lechmere Station, serving the densely populated communities of Cambridge, Somerville and Medford that today are substantially under-served by public transit. The project is also a reflection of the Commonwealth's public transportation goals and commitment to the principles and practices of sustainable growth. The Commonwealth has committed to a significant

investment in urban mass transit in an effort to provide critical transportation, air quality and urban redevelopment benefits along the project corridor. The project is required by the State Implementation Plan (SIP) and fulfills a longstanding Commonwealth commitment to increase public transit in the greater Boston area. It will reduce regional emissions of nitrous oxides (NO_X) volatile organic compounds (VOCs), the chief precursors of smog, and of carbon dioxide (CO_2), the principal greenhouse gas responsible for global warming. The project also provides opportunity for new public and private investments to revitalize the social and environmental fabric of the corridor.

This project has received significant public input including hundreds of comment letters representing a range of views about numerous aspects of the project. I have received comment letters from elected officials and municipal representatives including U.S. Representative Capuano, Senator Jehlen, Representative Provost, Representative Sciortino, Representative Toomey, Medford Mayor McGlynn, Somerville Mayor Curtatone and the City of Cambridge. I have received comments from multiple city, State and regional agencies, from environmental, bicycle and pedestrian advocacy groups, from neighborhood groups, from groups that represent the disabled and environmental justice populations, and from businesses and residents.

The extension of any light rail service through an urban corridor such as Cambridge, Somerville and Medford is a challenging task and the range of views expressed in the comment letters reflect this challenge. I will note however, that despite the variety of comments received, comment letters generally expressed overall support in expanding light rail along the corridor. Expansion of light rail service is a unique opportunity for the region and I appreciate the time, effort, and thoughtfulness exhibited by residents of the Commonwealth through their ongoing attendance at public meetings and preparation of comment letters for consideration during the MEPA process. I anticipate that participation in these types of forums for the project will continue to be strong as the project proceeds to design and construction.

Comments on the DEIR reflect a unified desire to protect and enhance the character and vitality of this corridor and its neighborhoods and business centers. However, recommendations for how the project can achieve these goals most successfully vary widely among project constituents. The MEPA process has provided a valuable forum for the collection of all relevant points of view, but reconciling all of the identified (and sometimes competing) concerns is beyond the scope of the MEPA. The MEPA process occurs early in the design process to identify key environmental concerns and challenges associated with a project and therefore necessarily takes place in advance of final project design. It does not generally address issues commensurate with those often reviewed at the local site plan review or zoning board review levels within each municipality. Resolution of the final project planning details will therefore fall primarily to MassDOT, the affected communities, and to the various project stakeholders who I expect will continue to be actively engaged in this project going forward.

MEPA is also not a zoning process, and it does not proscribe to a Proponent what, where or how a project should be designed or built. MEPA review is limited by statute to those aspects of the project that may cause Damage to the Environment as defined in the MEPA regulations. I note that many of the environmental issues traditionally associated with expanded transit service are minimized in the current project by using an existing right-of-way (ROW); however, there are

many environmental impacts associated with the project that remain squarely within the scope of MEPA. For example, although the use of existing ROW dramatically decreases certain environmental impacts, this ROW will be altered both physically and operationally due to increased service and these impacts will need to be mitigated. Similarly, air quality and transportation impacts are at the heart of the proposed project, and are therefore a primary area of concern under MEPA. Thus, while many of the issues identified in comment letters are beyond the scope of review under MEPA, my decision today ensures that the environmental impacts of the proposed project have been thoroughly considered.

As set forth in greater detail herein, I acknowledge the continued concerns raised by many commenters regarding: the siting of the project's maintenance and vehicle storage facility (Maintenance Facility); the details of MassDOT's two-phased plan to provide service the Mystic Valley Parkway/Route 16 area; integration of stations into the neighborhood landscape; establishment of a robust public participation process during the final design and construction phase; and commitments to various environmental and construction period mitigation measures (notably noise and vibration mitigation). In order to address these concerns to the greatest extent possible and to ensure that the project adequately and properly complies with MEPA, I have provided a limited Scope for a FEIR below. The FEIR Scope requires MassDOT to further evaluate alternative locations for the Maintenance Facility in order to address the widespread opposition to the DEIR's preferred location at Yard 8. Specifically, MassDOT will be required to provide additional quantitative assessment of the environmental and operational impacts associated with the alternative Maintenance Facility locations under consideration (known as "Option L" and "Mirror H"). The Scope also requires MassDOT to provide further clarification concerning its air quality modeling assumptions, to clarify and confirm impacts associated with the College Avenue Station operating as a terminus station, and to explore ways to improve integration of the Lechmere Station into the surrounding neighborhood.

In order for this project to reach its maximum potential, MassDOT must continue to, and in some ways enhance or expand, project design and coordination efforts in a collaborative manner with State and city agencies, citizens, local businesses, and other stakeholders during all aspects of the project – planning, design and construction. The FEIR will therefore also need to present a Public Involvement Plan to facilitate robust community participation beyond the conclusion of the MEPA process. Once a comprehensive plan has been developed, I am confident that MassDOT can and will address those issues that are beyond the scope of MEPA responsibly and thoroughly. I note that as project design advances, the Massachusetts Bay Transportation Authority (MBTA) will become the lead agency on the project and will ultimately be responsible for the construction and operation of the service. MassDOT and the MBTA must forge a collaborative relationship and make a strong commitment to continuing civic engagement opportunities during the design process as well as a transparent public information and outreach process once construction commences.

Project Description

As described in the DEIR, the project consists of the extension of Green Line light rail service from a relocated Lechmere Station through Cambridge, Somerville, and Medford. The "proposed project" (Alternative 1) in the DEIR includes:

- The Medford Branch - Extending Green Line service to Medford within the existing MBTA Lowell Line commuter railroad ROW, from a newly relocated Lechmere Station terminating at Medford Hillside in the vicinity of College Avenue with intermediate stations at Brickbottom, Lowell Street, Gilman Square, and Ball Square;
- The Union Square Branch – Extending Green Line Service to Union Square in Somerville, within the existing MBTA Fitchburg Line commuter rail ROW, with a station at Union Square.

Given the fiscal constraints that have been introduced since the commencement of MEPA review, MassDOT has proposed constructing the Green Line Extension project in two phases. The DEIR therefore also included an analysis of an extension of the Medford Branch to Mystic Valley Parkway/Route 16, with no parking at Mystic Valley Parkway/Route 16 Station, and extension of the Union Square Branch to Union Square (using commuter rail ROW) (Alternative 2). The DEIR states that while this alternative also meets all of the stated project goals and provides additional regional benefits with regard to air quality and increased ridership, fiscal constraints prevent MassDOT from committing to this alternative within the 2014 timeframe mandated by the SIP. The DEIR indicated that 'flex funding' allocated by the Boston Area Metropolitan Planning Organization may be available sometime between 2016 and 2020 to assist in funding the construction of the Green Line Medford Hillside to Mystic Valley Parkway/Route 16 segment. MassDOT proposes to construct Alternative 1 as the first phase of the project and Alternative 2 as the second.

The majority of anticipated environmental impacts along the corridor for both phases are largely similar, with the exception of additional impacts introduced in Alternative 2 with the extension of the project beyond Medford Hillside to Mystic Valley Parkway/Route 16. As it is not anticipated that construction of the Medford Hillside to Mystic Valley Parkway/Route 16 segment will commence within the applicable MEPA or NEPA timeframes, reassessment of Alternative 2 will be required in the form of a Notice of Project Change (NPC). I expect that this NPC would present additional (and updated) information on the potential environmental impacts of this segment for review by interested parties, as the DEIR presented a 'worst case scenario' of possible environmental impacts based on currently available conceptual designs. This NPC will be required to address how this portion of the project avoids, minimizes, and mitigates Damage to the Environment as directed by the MEPA regulations and present additional station design alternatives and existing and proposed conditions data on potential environmental impacts along this section of the corridor. I encourage MassDOT to consider the thoughtful comments and design suggestions submitted in response to the DEIR when preparing the NPC.

The project corridor passes through a wide cross-section of land uses: industrial, commercial, institutional, and residential. The project will provide access to a dense population of potential and existing transit riders currently serviced primarily by bus service along 15

established routes. Several of the station locations provide unique opportunities for transit-oriented redevelopment, potentially spurring economic development within the corridor. The corridor lends itself well to increasing the multi-modal transportation experience, with connections to the existing street and neighborhood network, as well as the conceptually designed Community Path (described in further detail below).

The proposed project includes the construction of new tracks and stations, relocation of existing commuter rail tracks, potential relocation, removal and/or elimination of freight tracks, reconstruction of bridges, construction of a new Maintenance Facility, construction of retaining walls, and the construction of traffic, pedestrian and bicycle improvements along the project corridor. The DEIR stated that the project is expected to increase the MBTA's anticipated daily ridership at the project's seven stations (boardings and alightings) by approximately 52,000 by 2030, with approximately 90% of these trips to take place in the project's opening year of 2014. The DEIR estimates that Alternative 1 will generate new systemwide transit ridership of 7,900 boardings per day and a reduction of 25,018 vehicle miles traveled (VMT) per day (projected to the year 2030). The project cost for Alternative 1 is estimated at $804.8 million (in 2008 dollars) and includes the $76 million cost estimate for purchase of additional vehicles.

Procedural History

The Expanded Environmental Notification Form (EENF) was submitted for MEPA review and noticed in the Environmental Monitor on October 10, 2006. On December 1, 2006, Secretary Golledge issued a Certificate on the EENF outlining the scope for the DEIR.

As part of the EENF, MassDOT requested in accordance with 301 CMR 11.05(7) that it fulfill its EIR obligations under MEPA with a Single EIR, rather than the usual process of a Draft and Final EIR. The Secretary declined to grant this request for reasons discussed in the Certificate on the EENF. The DEIR received an extended comment period of 75 days, commencing on October 26, 2009 and concluding on January 8, 2010. On December 9, 2009, MassDOT issued supplemental information regarding the potential location of the Green Line vehicle storage and maintenance facility (Maintenance Facility), presenting a qualitative analysis of two additional Maintenance Facility sites (Mirror H and Option L) beyond the preferred alternative presented in the DEIR.

Within the DEIR, MassDOT requested that the DEIR be considered as the FEIR in accordance with 301 CMR 11.08(8)(b)(2). I have determined that while the DEIR is generally responsive to the requirements of 301 CMR 11.07 and the Scope, the ongoing evaluation of maintenance facility siting alternatives, the need for additional discussion of impacts at College Avenue and Lechmere Stations, and a requirement for clarification of the future mitigation and community participation commitments, preclude me from exercising my rights to declare that the DEIR will be considered an FEIR.

Project Permitting and Jurisdiction

The project is subject to review and mandatory preparation of an EIR pursuant to Sections 11.03 (1)(a)(1) and (6)(a)(5) of the MEPA regulations because it will require a State permit and will alter more than 50 acres of land and consists of a new rail or rapid transit line along a new, unused or abandoned right-of-way for transportation of passengers or freight. The project will require Access Permits from MassDOT. The project will require an 8(m) Permit from the Massachusetts Water Resources Authority (MWRA). It will require a Determination of Effect to Historic or Archaeological Resources (Section 106 of the National Historic Preservation Act) and a Section 4(f) Determination by the Federal Transit Administration (FTA). It will require review by the Massachusetts Historical Commission (MHC). Also, it will require a National Pollutant Discharge Elimination System (NPDES) industrial permit and a Multi-Sector General Permit for Stormwater Discharges Associated with an Industrial Activity (MSGP) from the United States Environmental Protection Agency (U.S. EPA).

Because the proponent is a State Agency and will use State funding, MEPA jurisdiction for this project is broad and extends to all aspects of the project that are likely, directly or indirectly, to cause Damage to the Environment as defined in the MEPA regulations.

It should be noted that the project will also review under the National Environmental Policy Act (NEPA) because MassDOT is seeking federal funding for the project. The DEIR also serves as the Environmental Assessment (EA) in accordance with NEPA. MassDOT has indicated in the DEIR that because the proposed project would be primarily located within the existing active commuter rail ROW and would be beneficial to communities, it anticipates that the FTA will issue a Finding of No Significant Impact (FONSI) at the conclusion of the NEPA process.

Review of the DEIR

General

The DEIR provided a response to the Secretary's Certificate on the EENF and included additional information as necessary to respond to the Scope and respond to comments received on the EENF.

Project Description and Permitting

The DEIR provided a detailed description of the proposed project and each alternative, indentifying an anticipated project schedule, project costs and funding sources. The DEIR contained a substantial number of existing and proposed conditions plans and graphics to support the report narrative. Conceptual station and maintenance facility plans were included in the DEIR to illustrate project context and identify general circulation plans for motor vehicles, buses, pedestrians, and cyclists to each station location.

The DEIR discussed proposed track modifications, station locations, bridge replacements, and proposed operating plans and requirements for each project alternative. The DEIR identified

the need for new or modified electrical systems or support structures, including extended catenary lines and new signals, for each alternative. As noted later in this document, the DEIR and supplemental review materials described the proposed location, operations, and components of the Maintenance Facility at Yard 8, as well as a qualitative review of the potential Mirror H and Option L locations. The DEIR contained a list of required permits and approvals, the status of each permit and/or approval, and a discussion of project consistency with federal, State and local planning.

Smart Growth/Land Use

An overall policy goal of the Commonwealth is to direct public infrastructure investments to spur revitalization of previously developed urban sites over undeveloped greenfield sites. This project provides an opportunity to achieve this goal and must be actively pursued through ongoing collaboration between MassDOT and the affected communities. The success of this project continues to be dependent not only on MassDOT's ability to plan effectively, but the ability of Cambridge, Medford and Somerville to respond with appropriate zoning changes and complementary regulations. MassDOT should work with these communities to coordinate land use planning activities and new transit operations.

If this project is designed with the proactive participation of communities and on a foundation of solid and innovative land-use planning, it has the opportunity to maximize economic development and long-term ridership potential. As discussed later in this Certificate, MassDOT must continue to engage interested parties in the form of a Citizens Advisory Group (CAG) which should include representatives of regional planning agencies, local government, business interests, community groups, representatives of environmental justice areas and the disabled community, abutters, and bicyclist and pedestrian groups.

The DEIR characterized existing land uses and provided population, housing density, and employment density data within a ½-mile radius of each proposed station site. The DEIR also described recent land use plans, studies, and design guidelines that may affect development near proposed station sites in each community. Proposed transportation projects that may have potential impacts on the Green Line Extension project were also discussed in the DEIR, noting their relationship to the expansion of light rail. The DEIR summarized direct land use impacts for each alternative, in the form of full or partial land takings.

The DEIR included data on current socioeconomic conditions in Cambridge, Somerville and Medford based upon available U.S. Census data, focusing on employment and income in each city. The DEIR characterized general socioeconomic conditions for each affected community along the project corridor. To evaluate direct socioeconomic impacts, the DEIR evaluated the local impacts of acquisition and demolition of existing homes and businesses for each alternative through loss of property taxes and estimated job displacement or relocations. I note that under Alternative 1, no homes and five businesses will be displaced and I commend the efforts put forth by MassDOT to propose a project that limits property takings to the maximum extent possible.

According to the DEIR, the project is expected to decrease low intensity commercial and light industrial uses in the project corridor and increase mixed-use, high-density transit-oriented

development, particularly in Union Square, and at Brickbottom and Lechmere Stations. The DEIR concluded that the project would provide socioeconomic benefits due to increased transit access, which increases both the potential for local commerce and the potential for area residents to commute to jobs elsewhere. The DEIR conceded that the precise economic benefit of increased transit access cannot be quantified based on existing data.

In accordance with federal and MEPA regulations, the DEIR included an assessment of short-term and long-term impacts and cumulative impacts of the project, any other projects, and other work or activity in the immediate surroundings and region (301 CMR 11.07). I acknowledge the difficulty in predicting future growth patterns and development pace, as future development will be greatly influenced by factors outside the control of MassDOT. This assessment described indirect effects as those effects resulting from possible redistribution of growth and changes in development densities. Federal guidance was used to evaluate the project's cumulative effects, specifically, CEQ's *Considering Cumulative Effects under the National Environmental Policy Act* (CEQ 1997). The assessment strived to analyze cumulative effects covering both known effects of the past, commencing in 1980, and predict those of the future, between present day and 2030.

The DEIR characterized and discussed corridor-wide indirect effects, noting that the various development alternatives will affect where growth occurs, the form of the growth, and the pace of development. The DEIR discussed potential for transit-oriented development (TOD) at proposed station sites, presented comparative data on impacts to property values, and characterized potential land use impacts within ½ mile radius of station sites. The cumulative impact analysis explored the potential influence of present and reasonably forseeable actions (i.e., background population growth and development projects). Finally, the DEIR included a qualitative discussion of the indirect and cumulative effects of the project, comparing the various project alternatives to a no-build alternative, for several review areas including: land use; traffic and transportation; property values; economy; neighborhoods; environmental justice; and historic, archaeological and cultural resources.

I note that MassDOT has committed to perform land use workshops with affected communities to further identify community needs and issues regarding land use and redevelopment. The data and analysis presented in the DEIR should be used as the foundation for these workshops, driving the discussion on key issues surrounding how to best integrate anticipated changes from the project into the existing community fabric. Information gathered at these workshops could be helpful for community leaders and elected officials in determining how to best revise zoning regulations, affordable housing policies and parking management measures to reflect the anticipated transit-oriented landscape. I urge the communities of Cambridge, Medford and Somerville to take direct action to build on the State's efforts and information in order to facilitate sustainable development and land use to the greatest extent possible.

Consistency and Coordination with Planning and Projects

The DEIR discussed preliminary project coordination, identified key project features and described the Green Line Extension's relationship to proposed regional projects such as: the Urban Ring; reconstruction of Route 28/McGrath Highway; the North Point development and relocation

of Lechmere Station; the Community Path; and the Minuteman to Mystic Valley Parkway Path. I have received several comments requesting MassDOT to redesign and reconstruct the elevated portion of Route 28/McGrath Highway into a boulevard layout. Although this is beyond the scope of the proposed project, it is important that as project design advances, MassDOT accommodate identified future projects into project layout and design, or at a minimum, not preclude their construction. I encourage MassDOT to design the project to facilitate future transit projects such as light rail expansion or connections to existing infrastructure such as Porter Square and the Red Line, the Urban Ring, other commuter rail service expansion, or roadway, bicycle and pedestrian path networks as much as possible.

The Community Path

The intent of the Somerville Community Path (the Community Path) is to extend the Minuteman Bikeway/Linear Park multi-use path from its current terminus at Cedar Street in Somerville to the Charles River Path network in Cambridge and Boston, a distance of approximately 2.5 miles. The proposed route follows the edge of the MBTA Lowell Line ROW, generally located at street level while existing commuter rail trains and proposed light rail trains will run below grade, in a cut section. The DEIR presented ten-percent design plans for the Community Path to demonstrate the feasibility to construct the Community Path alongside the project. The DEIR identified where the Community Path could be accommodated within the ROW, identified potential pinch points and obstacles to including it within the ROW, and recommended solutions in instances where the Community Path could not be accommodated in the ROW (i.e. cantilevering the trail or narrowing the path). The DEIR also evaluated the viability of extending the Community Path to Route 16 to create a connection with the Mystic River Parkway based upon the feasibility of sufficient ROW widths or alternative on-street routes. The results of this study concluded that extending the path to Route 16 is not feasible at this time.

I have received many thoughtful comments received from bicycle and pedestrian advocates, and commenters in general, regarding the unique multi-modal transit opportunities afforded by effectively integrating the Community Path with proposed Green Line stations and overall neighborhood character. The Community Path could provide an additional avenue to access public transit, and thereby enhance and increase ridership potential. MassDOT has committed to the 100-percent design of the Community Path as part of the final design of the Green Line Extension. As station designs are refined, an emphasis should be placed on bicycle access to stations, as well as the provision of adequate bicycle parking. Based upon additional review of the location of the Maintenance Facility, the route of the Community Path through the Inner Belt and Brickbottom areas from Washington Street to Lechmere may become more feasible and should be re-evaluated for integration into project design. Lastly, I strongly encourage MassDOT and the City of Somerville to work together to seek State and federal funding opportunities to facilitate construction of the Community Path concurrently with the project.

Environmental Justice

Cambridge, Somerville, and Medford all have substantial State-defined environmental justice (EJ) areas, classified as areas with substantial foreign-born, minority, or low-income populations. As part of the Certificate on the EENF, I required MassDOT to identify EJ areas and

other sensitive populations, provide relevant socio-economic data, describe how the project is designed to provide fair access to stations and economic development opportunities and avoid any disproportionate share of impacts. The DEIR was generally responsive to this directive, identifying EJ populations along the corridor, describing changes in transit access to EJ and disability populations, tabulating the number of buildings to be acquired within EJ census blocks, estimating project-related job losses, and identifying the number of sensitive receptors affected by noise in EJ areas for each project alternative. The DEIR concluded that according to transit modeling for the project, the Build Alternatives would substantially increase transit access for EJ and disability populations and would thereby provide increased access to jobs, housing, and public services.

In response to the requirement to take affirmative measures to ensure full public participation in the MEPA process by all affected communities, particularly those with a high percentage of minority, low-income, non-English-speakers and the disabled, the DEIR included a summary of the ongoing public involvement and agency coordination process, with a specific discussion of outreach efforts to EJ populations. MassDOT has established a public involvement process that included a Project Advisory Group, open public meetings, and coordination with the staff and elected officials of Cambridge, Somerville, and Medford, as well as other stakeholders along the corridor. MassDOT identified key issues such as ridership modeling, maintenance facility location and operations, station siting, tunnel alignment alternatives, and construction impacts that were discussed during the course of the public involvement process. MassDOT established a Project Advisory Group consisting of municipal officials, community representatives, and other interested individuals to help guide the public process, build consensus, and advise MassDOT on issues of concern. MassDOT also conducted tutorial sessions for Advisory Group members, held general project public meetings, and station workshops. MassDOT created a project website that acts as a portal to access project documents, studies, and meeting minutes.

Alternatives Analysis

The DEIR included a discussion of a total of eight (8) project alternatives. The alternatives analysis evaluated the following scenarios:

- No Build – existing transportation facilities and services and all future committed transportation improvements projects without the extension of the Green Line;
- Baseline – No-Build conditions plus enhanced MBTA Route 80 bus service between Lechmere Station and Mystic Valley Parkway/Route 16 and shuttle service between Lechmere Station and Union Square;
- Alternative 1 – Green Line Extension to Medford Hillside and Union Square (via commuter rail ROWs);
- Alternative 2 – Green Line Extension to Mystic Valley Parkway/Route 16 and Union Square (via commuter rail ROWs);
- Alternative 3 – Green Line Extension to Medford Hillside (via commuter rail ROW) and Union Square (in-street running);
- Alternative 4 – Green Line Extension to Mystic Valley Parkway/Route 16 (via commuter rail ROW) and Union Square (in-street running);

- Alternative 5 – Green Line Extension to Mystic Valley Parkway/Route 16 (via commuter rail ROW); and
- Alternative 6 – Green Line Extension to Union Square (via commuter rail ROW).

The alternatives presented in the DEIR were a result of years of study, creation of planning documents, work with State Agencies and advisory groups, and operational and design criteria requirements. The selection of Alternative 1, and Alternative 2 at a later date, were based on consideration of ridership, project costs, and community impacts. For each alternative, the DEIR described proposed operations, station locations, vehicle equipment requirements, anticipated new transit boardings and VMT reductions, estimated travel times, headways, fares, capital improvement requirements, and conceptual capital and operating and maintenance costs. The DEIR also provided data on noise, vibration, air quality, traffic, land acquisition, stormwater, historic and archaeological assets, hazardous materials and EJ population impacts for each project alternative for comparative purposes.

As directed in the Certificate on the EENF, the DEIR evaluated extending the project to Mystic Valley Parkway/Route 16. As I noted earlier, this project element, although part of MassDOT's "Preferred Alternative" (Alternative 2), is not being pursued at this time due to budgeting constraints and will be required to be reevaluated as part of an NPC review with the MEPA office.

Additionally, the DEIR evaluated design alternatives (Alternatives 3 and 4) that would bring light rail service closer to Union Square by diverting from the Fitchburg commuter rail ROW to an in-street running single-loop corridor. Alternatives 3 and 4 would result in increased construction costs due to roadway and bridge reconstruction and reconfiguration and would present challenges to extending service beyond Union Square in the future. Therefore the DEIR concluded that Alternative 1 provided a better balance of cost, ridership and environmental impacts than an option that included an in-street running of the Union Square branch.

Finally, the Certificate on the EENF requested that the DEIR explore alternatives that could provide a connection between light rail and commuter rail service including a new commuter rail stop at Tufts University or Gilman Square. Studies and conceptual design plans prepared in coordination with the DEIR concluded that to meet accessibility design requirements and maintain commuter rail, light rail and freight service along this portion of the ROW an additional track for freight service would be necessary, thereby increasing environmental impacts at either the College Avenue or Gilman Square Stations. MassDOT has therefore dismissed introduction of a commuter rail link along the Green Line Extension as a viable option at this time. The existing connection between the Green Line and the Lowell Commuter Rail Line will remain at North Station in Boston. Although not evaluated in the DEIR because it was not part of the Scope for that document, I note Congressman Capuano's recent comments regarding the possibility of providing commuter rail service at Union Square and ask that MassDOT consider whether such a measure would be possible in the future. While there may be similar challenges to integrating the commuter rail, freight and light rail networks in this area, MassDOT should consider possibilities for expansion of commuter rail service in the area during its ongoing transit planning efforts.

Maintenance Facility

The DEIR indicated that the capacity of the MBTA's Green Line system is constrained by the need for layover and maintenance facilities. Under existing conditions, there are no maintenance facilities located on the north side of the transit system in proximity to the proposed Green Line Extension. The preferred location for the Maintenance Facility presented in the DEIR is at a location known as Yard 8 with Adjacent Parcel (or simply, Yard 8), located in the Innerbelt/Brickbottom area of Somerville. The DEIR provided a general discussion of purpose and need for the facility, siting and program criteria, previous evaluations of potential facility locations, and a discussion of use of the MBTA Boston Engine Terminal (BET) Commuter Rail Maintenance Facility site in lieu of Yard 8.

During the public comment period on the DEIR, MassDOT issued a supplemental technical memorandum entitled, *Green Line Extension Project – Additional Maintenance Facility Alternatives Analysis*, dated December 9, 2009. This memorandum contained a preliminary analysis of two additional Maintenance Facility locations, the so-called "Mirror H" and "Option L" sites, and qualitatively compared them to Yard 8. The Mirror H site, proposed by the City of Somerville, straddles the InnerBelt area of Somerville and the North Point area of Cambridge. Option L, conceived by MassDOT, is located immediately adjacent to the MBTA's Commuter Rail Maintenance Facility at BET. The technical memorandum outlined the Maintenance Facility program and requirements (developed in consultation with MBTA operations and vehicle maintenance staff), provided a brief discussion of system operational impacts associated with each location, and qualitatively evaluated each location with regard to a set of evaluation criteria. Evaluation criteria included: ability to meet MBTA program requirements; cost; property impacts; operation impacts to the Green Line Extension and railroads; compatibility with other transportation proposals in the project area; compatibility with existing land use planning; future economic development opportunities; ability to meet project schedule; natural, physical, and social/cultural impacts to neighborhoods; and future vision transportation access.

Both MassDOT and I acknowledge the broad-sweeping opposition from elected representatives, municipal officials, and abutting residences and businesses to locating the Maintenance Facility at Yard 8. Concerns range from noise, vibration and air quality impacts, to potential reduction of economic development potential in the area, and the equitable distribution of transit system impacts. Therefore, as part of the FEIR, MassDOT will be required to provide an expanded analysis of potential Maintenance Facility locations as further outlined later in this Certificate.

Impacts to Land/Stormwater

The DEIR indicated that impacts to land were minimized through the placement of the project primarily within the existing MBTA Lowell Line and Fitchburg Line ROWs, avoiding larger acquisitions of buildings or open space. The DEIR identified anticipated land acquisition parcels (and therefore areas of land alteration) along the corridor, the cause of impact to each parcel, the acquisition area, and whether the parcels would be acquired partially or in full. Alternative 1 is estimated to require the acquisition of 10.1 acres of land along the Medford Branch and 1.4 acres of land along the Union Square Branch. The DEIR also calculated the

anticipated increase in impervious surfaces along the project corridor for each alternative. Alternative 1 will result in a total of 6.8 acres of new impervious area associated with the Medford Branch, Union Square Branch and Maintenance Facility.

The existing ROW ranges from 55 to 110 feet in width. The project will not alter any wetlands although the ROW will be modified significantly and vegetated banks will be replaced with retaining walls in some locations. Proposed retaining walls will include a "green" design component, which means that efforts will be made to use recycled or recyclable materials and to incorporate vegetation as part of the wall system. Landscape treatments will also be proposed on the slopes above the walls and to the greatest extent practicable at each station. Estimated amounts of earthwork could not be determined at this time based upon the level of design. Temporary land takings to facilitate the construction process may also be required and should be determined as planning and design advance. The MassDOT has committed that as the project progresses through preliminary engineering and final design to refine project designs to further minimize temporary and permanent property acquisitions (via reductions in earthwork, land alteration, etc.) to have the least possible impact on local neighborhood and property owners.

The DEIR included an overall conceptual drainage plan, identifying the major connection points to the existing stormwater system and anticipated stormwater management measures. The DEIR indicated that a Stormwater Pollution Prevention Plan (SWPPP) will be prepared prior to construction. MassDOT has committed to preparing a detailed long-term operations and maintenance plan for the stormwater management system. MassDEP has made several recommendations regarding station area and maintenance facility stormwater drainage design, which I encourage MassDOT to consider as design plans advance. I remind MassDOT that the project will contribute flows to existing stormwater discharges to Category 5 impaired waterbodies (Mystic and Charles Rivers) and stormwater management systems should be designed to address any applicable Total Maximum Daily Load (TMDL) requirements. MassDOT has committed to designing the drainage system to meet the MassDEP Stormwater Standards to the extent practical. The project will be required to achieve requisite NPDES permit obligations, including MS4 requirements to implement construction site runoff controls, post-construction runoff controls, and pollution prevention/good housekeeping measures.

Station Design and Locations

The DEIR proposed specific station locations selected based upon siting criteria consisting of, but not limited to, station access (including to identified EJ populations), transit operations and ridership goals, land use compatibility, and costs. Station locations and general design were also based upon input from the public at station workshops, and from public officials and federal and State code requirements on accessibility, level of service (LOS), passenger circulation, and safety requirements. None of the new station locations in Alternative 1 have park-and-ride facilities and therefore the ridership market or these stations are almost wholly defined as persons capable of accessing the station by non-vehicular means. Walk-access transit catchment areas of a one-mile radius were evaluated based on FTA's requirements.

The DEIR included a discussion of the feasibility and advisability of location stations a Winthrop Street in Medford, and a location between Winthrop Street and College Avenue.

MassDOT evaluated both the physical environmental impacts stations at these locations may impose, but also the ridership market potential given the project and the Preferred Alternative. MassDOT concluded that based on their understanding of the ridership market, the Winthrop Street area could best be served by the proposed College Avenue Station and the future Mystic Valley Parkway/Route 16 station, while minimizing the impacts on area residents.

I acknowledge the MBTA comment letter which indicates that efforts will be made to properly size stations to limit overall environmental impacts. The MBTA has indicated that all stations will meet Americans with Disabilities Act (ADA), Massachusetts Architectural Access Board (MAAB) standards and the MBTA's settlement agreement with the Boston Center for Independent Living (BCIL); meet the applicable National Fire Protection Association (NFPA) standards; and be designed and built to be the most efficient and sustainable stations possible that function well and are integrated into the community.

The DEIR provided conceptual layout design plans and cross-section renderings of the stations that generally identified platform locations, access points, circulation patterns, bicycle storage areas, proximity to bus stops and crosswalks, and payment turnstiles. According to the DEIR, each station is envisioned to provide: a headhouse as a shelter for paid and unpaid lobbies with automated fare lines; vending machines; an information booth; and restrooms. Stations will also include: landscaping; bike racks; MBTA direction and spider maps; uniformly lit station platforms; tactile/Braille Station identification signs; and trash receptacles. Due to steep grade changes along the project route, many station platforms will be located at a different elevation than station access points. Entry to and exit from the platforms will be provided by elevators, escalators, and stairs. Finally, MassDOT has proposed a variety of "green" design elements to be incorporated into station design including high performance lighting, recycling stations, recycled content site and building materials as practicable, water efficiency measures, and where possible, maximization of building energy performance and implementation of an indoor air quality management plan.

As MassDOT refines project design plans, I encourage it to consider the many thoughtful comments I have received regarding station design, neighborhood integration, and station access. I note comments related to facilitating bus route/light rail station connections with bus pull-out areas, the potential advantages (or disadvantages) of kiss and ride drop offs, and bus route modifications to better integrate light rail stations with bus stops. As part of the Advisory Group process, station design issues germane to specific station locations, neighborhoods, and ridership needs should be collaboratively explored.

Air Quality

The DEIR included a mesoscale analysis to estimate area-wide emissions of VOCs, NOx, CO_2, carbon monoxide (CO), and particulate matter (PM_{10}). The mesoscale analysis evaluated the changes in emissions levels based upon changes in the average daily traffic volumes, roadway lengths, and vehicle emissions rates. An evaluation of air toxics was also conducted. The DEIR also included a microscale analysis of CO, PM_{10} and $PM_{2.5}$ emissions. The microscale analysis estimated project related emission based on traffic and emissions data including, traffic volumes, VMT, signal cycle timing, physical roadway improvements, years of analysis and roadway speeds.

MassDOT consulted with MassDEP prior to conducting the analysis to develop appropriate modeling protocols. The air quality analysis compared the 2007 No-Build conditions with 2030 Build conditions, analyzing area-wide VMT reductions based upon new ridership projections for each alternative. The DEIR concluded that by 2030, ridership for Alternative 1 will generate 7,900 new transit trips per day, resulting in an area-wide reduction in daily VMT of 25,018.

In support of the air quality analysis, the DEIR included a discussion of the study methodology, National Ambient Air Quality Standards (NAAQS), and summary data for both the microscale and mesoscale studies for each alternative. The DEIR concluded that the 1-hour and 8-hour CO concentrations are below the CO NAAQS, the 24-hour PM_{10} concentrations are below the PM_{10} NAAQS, and the 24-hour $PM_{2.5}$ concentrations are below the $PM_{2.5}$ NAAQS. The DEIR also evaluated the potential $PM_{2.5}$ air quality impacts associated with the relocation of the existing commuter rail tracks. While $PM_{2.5}$ emissions will increase at both the nearest property line and residential building, the annual and 24-hour $PM_{2.5}$ concentrations will remain below the NAAQS standards. The DEIR mesoscale analysis results indicate that Alternative 1 will result in an area wide emissions decrease of 17,115 kilograms per day (kg/day) for CO_2, 7.6 kg/day for VOCs, 4.4 kg/day for NOx, and 0.8 kg/day for PM_{10} when compared to the 2030 No Build condition.

The DEIR described the air quality benefits associated with this project and described its consistency with the State Implementation Plan (SIP) and MassDEP's Transit Regulations. The construction of the Green Line Extension from Lechmere Station to Medford Hillside and the construction of the Union Square spur of the Green Line before December 31, 2014 are codified in MassDEP's Transit System Improvement Regulations (310 CMR 7.36). These regulations do not include a specific geographic terminus of the Green Line within the Medford Hillside neighborhood. MassDOT has presented air quality data in the DEIR that, as confirmed by the comments submitted by MassDEP, are consistent with and meet the emission reduction requirements required under 310 CMR 7.36(8), *Determination of Air Quality Emission Reductions."* These requirements are also part SIP, which was approved in 2008 by the U.S. EPA.

I note comments received from the Conservation Law Foundation (CLF) indicating its belief that MassDOT has not demonstrated consistency with the SIP due to perceived errors in the air quality modeling methodology. After consulting with MassDEP and MassDOT, I respectfully disagree with this assertion. Transportation modeling is inherently fluid and dynamic; data inputs and modeling refinements are constantly integrated into updated modeling runs with an end goal of providing the most accurate and up to date predictions of actual transportation impacts possible. In acknowledgement of the anticipated evolution of modeling techniques and data inputs, the SIP provides a provision (310 CMR 7.36(9)) whereby upon substantial completion of a project, MassDOT shall complete an analysis of the total air quality benefits of such projects and such analysis shall be performed in accordance with U.S. EPA requirements in effect at the time of the analysis. Thus, the predictive modeling provided at this stage of project development is back-stopped by the use of actual data upon substantial completion of the project. This provides further support for the understanding that air quality data evolves over time through the use of updated modeling assumptions. However, I acknowledge that the air quality modeling methodology can be difficult for the average project reviewer to understand without the benefit of direct access to modeling experts. Therefore, as noted later in this Certificate, I have required MassDOT to

provide a narrative clarifying the relationships of air quality modeling data to MassDEP and EPA requirements for SIP consistency as part of the FEIR.

Transit Ridership

The DEIR estimated ridership methodologies, associated reductions in VMT (based on both new and diverted trips), operating parameters, vehicle requirements, headways, and travel times for each alternative. The model developed to calculate ridership provides projections for a forecast year of 2030 and assumes that a number of proposed transportation projects, including segments of the Urban Ring project Phase II and Silver Line Phase III projects and other area highway transportation projects consistent with the Regional Transportation Plan, will be implemented by this time. Operating plans were developed as an extension of the existing Green Line D and E Branch services, so as to minimize impact to the Central Subway system operations. Analyses conducted by the Central Transportation Planning Staff (CTPS) have concluded that all segments of the Green Line branches are capable of accommodating the peak transit loads in both the AM and PM peak hours and will not exceed the MBTA's maximum load service policy. The project does not propose to reduce bus service or bus operations within the service area. As requested by commenters, I encourage MassDOT to evaluate how existing bus service within the service area may be modified to provide improved or direct access to proposed light-rail stations in an effort to maximize ridership. This topic should be explored further in the context of the Advisory Group process. Construction activities should be structured to avoid or minimize any delays in service along the Lowell or Fitchburg commuter rail lines.

Traffic and Transportation

The DEIR analyzed existing and proposed conditions at a series of project area intersections selected subsequent to input from MassDOT, CTPS, MEPA, the City of Cambridge, the City of Somerville, and the City of Medford. The proposed 2030 traffic volume networks were developed by CTPS using its regional travel demand model and the model was run for each alternative at each selected project area intersection.

The DEIR analyzed traffic for existing, build and no-build conditions to evaluate the implications of the project for intersection LOS, pedestrian and bicycle circulation, intersection safety, and parking. The traffic analysis included the following areas:

- Mystic Valley Parkway/Route 16 and its intersections with Alewife Brook Parkway, Auburn Street and Winthrop Street;
- Boston Avenue and its intersections with High Street, Mystic Valley Parkway/Route 16, North Street, Winthrop Street, College Avenue, and Harvard Street;
- Broadway and its intersections with Boston Avenue and Winchester Street/Albion Street;
- College Avenue at its intersections with Powderhouse Boulevard/Broadway/Warner Street and George Street;
- Main Street at its intersections with High Street/Salem Street/Forest Avenue/Riverside Avenue, South Street and Mystic Valley Parkway/Route 16

eastbound ramps, Mystic Valley Parkway/Route 16 westbound ramps, Mystic Avenue, Harvard Street, and George Street;
- Medford Street and its intersections with Broadway, Lowell Street, Central Street, School Street, Pearl Street, Walnut Street, Highland Avenue, and Somerville Avenue;
- Highland Avenue and its intersections with Lowell Street, Central Street, School Street, and McGrath Highway;
- Washington Street and its intersections with Innerbelt Road, McGrath Highway/Route 28, Somerville Avenue/Webster Street and Beacon Street;
- Prospect Street and its intersections with Somerville Avenue, Webster Avenue, Cambridge Street and Hampshire Street;
- O'Brien Highway and its intersections with Third Street, Water Street, North First Street, Mid-Block Pedestrian Crossing, Land Boulevard/Gilmore Bridge; and Museum Way; and
- Cambridge Street at First Street.

According to the DEIR, future build model runs for Alternatives 1 through 6 were prepared by including the extended Green Line as a mode choice and quantifying the number of vehicle trips expected to change mode from passenger car to transit service. Using additional model runs, peak hour turning movements, estimates of pick-up/drop-off and park-and-ride trips were generated, and peak hour volumes were determined and incorporated into LOS analyses. These LOS analyses and model data were then used to identify potential mitigation measures into the roadway network and evaluate their effectiveness. The DEIR proposed mitigation measures for intersections where LOS E/F conditions resulted because of the Build Alternative and where LOS E/F conditions under the No-Build Alternative were notably worsened (generally an increase in control delay of more than ten seconds). Pedestrian LOS is not expected to change and in many cases will be improved. Currently-designated and future bicycle facilities will not be negatively impacted under Alternative 1.

Proposed vehicular, bicycle and pedestrian mitigation includes: traffic signal timing and phasing modifications; new traffic signal equipment; geometric modifications at intersections; new pavement markings; addition of 270 bicycle parking spaces; and pedestrian signal improvements at 29 locations. Traffic mitigation is proposed at six intersections:

- Boston Avenue at Winthrop Street;
- Boston Avenue at College Avenue;
- Washington Avenue at McGrath Highway;
- Prospect Street at Somerville Avenue;
- Washington Street at Somerville Avenue/Webster Street; and
- Medford Street at Pearl Street.

Design of these intersection mitigation measures, as well as the establishment of construction management and detour plans, should be reviewed and designed collaboratively with MassDOT, the City of Cambridge, City of Somerville, City of Medford, and respective Police and Fire Departments to ensure conformance with applicable standards and regulations.

The DEIR also discussed the project's relationship to O'Brien Highway reconstruction plans from Third Street to Museum Way associated with the Full-Build North Point development. While the traffic analysis assumes that all mitigation associated with North Point will be in place by 2030, delays in project development require that certain mitigation measures be implemented by MassDOT to mitigate impacts of the Green Line Extension. These intersection improvements have been incorporated into the list of traffic-related mitigation measures proposed by MassDOT in the DEIR.

As part of the project's mitigation package, MassDOT has pledged to work with cities to develop station-area parking enforcement plans. While parking enforcement is ultimately the responsibility of each municipality, I encourage an open dialogue between MassDOT and each city to establish parking management and enforcement plans that effectively mitigate illegal parking within one-half mile of the stations. Additionally, as station designs are advanced, I encourage MassDOT to revisit opportunities to reduce vehicular traffic associated with the introduction of new stations through strong emphasis on bus route, pedestrian, and bicycle connections.

Freight Service

As indicated in the DEIR, the project will operate adjacent to operating rail lines, including the MBTA Lowell Line, the MBTA Fitchburg Line, and Pan Am Railway's (PAR) Yard 8. Freight rail operations in the project area are provided by two railroads: CSX and PAR's Springfield Terminal Railway. The DEIR described existing rail operations and routes along the project corridor. With the exception of impacts within Yard 8, the expansion of Green Line service along the Lowell Line ROW is not anticipated to negatively impact freight rail service along the corridor. Freight rail service will be maintained throughout the construction period.

According to the DEIR, the main impact to freight operations will be the use of Yard 8 for the Maintenance Facility. All PAR movements arriving or departing via the MBTA Lowell Line pass through Yard 8. As currently proposed, the project would include the reconstruction of the adjacent Yard 10 lead track, to allow PAR to continue through operations or temporarily store freight cars. I note comments received from PAR on the DEIR and concerns raised regarding the potential impact of MassDOT's use of Yard 8 on PAR operations. These comments should be addressed as part of the Maintenance Facility portion of the FEIR scope outlined later in this Certificate.

Noise/Vibration

The DEIR presented an analysis of existing and proposed noise and vibration conditions along the project corridor, prepared based upon methodology defined in the FTA guidance manual *Transit Noise and Vibration Impact Assessment* (Report FTA-VA-90-1003-06, May 2006). The DEIR included a description of background information on the subject matter, a description of FTA sensitive land-use categories, identified sensitive locations along the corridor, and contained measurement results of the existing noise conditions for both noise and vibration impacts.

The DEIR states that the project corridor's existing noise environment is generally dominated by trains on the MBTA commuter rail lines. Existing noise measurements included nine long-term (24-hour) and seven short-term (1-hour) locations and calculated: Existing Day-Night Average Sound Levels (Ldn); Existing Peak-Transit Hour Sound Level (Leq); Commuter Train Noise Level (Lmax); and Distance to Nearest Track. These measurements were taken to characterize the existing noise environment along various segments of the project route. The DEIR measured reference vibration levels of the commuter and Amtrak trains at Tufts University Alumni Field and performed measurements of the vibration propagation characteristics of the soil at three locations along the proposed corridor (200 Innerbelt Road, 20 Vernon Street, and Tufts University Alumni Field). Measurements were conducted of train passbys at several distances from the track centerline (50 to 250 feet).

Proposed noise and vibration impacts were analyzed for the various Build Alternatives and the type and location of mitigation measures required to mitigate potential significant noise and vibration impacts were presented in the DEIR. The DEIR acknowledges that the project will add a new noise and vibration source to the environment along the project corridor. While there is an existing noise and vibration source along the ROW, relocating the commuter rail lines and adding new light rail lines have the potential to increase future noise at some noise-sensitive and vibration-sensitive receptors. The DEIR summarized noise level projections for sensitive receptors without mitigation and identified their location, distance from the tracks, existing noise levels, moderate and severe noise impact criteria, future predicted noise levels, increases in noise levels over existing conditions, and the number of "moderate" and "severe" impacted buildings. Alternative 1, without mitigation, would result in moderate noise impact to 120 residential buildings and three institutional buildings, and severe noise impact to 41 residential buildings and one institutional building. The DEIR stated that vibration impact from the commuter trains generally occurs within 60 feet of the future commuter rail near track centerline and within 40 feet of the proposed Green Line near track centerline. The DEIR summarized vibration level projections for sensitive receptors without and mitigation and indentified their location, distance from the near track, maximum vibration velocities, the total number of impacted buildings, and which rail line was the cause of impact. For Alternative 1, without mitigation, vibration impact is projected at 90 residential buildings and three institutional buildings.

The DEIR stated that based upon the FTA guidance document, the project would mitigate both moderate and severe noise impacts wherever practical and wherever existing noise levels are above 65 dBA. The DEIR concluded that noise mitigation including noise barriers, sound insulation treatments, and rail lubrication would be feasible, reasonable, and effective in mitigating all potential noise impacts due to the project for all alternatives. The DEIR presented a goal for mitigating potential vibration impact below the impact criteria of 72 VdB for Green Line trains and 75 VdB for commuter trains. The DEIR concluded the vibration mitigation, including up to 19,700 track-feet of vibration mitigation such as ballast masts or resilient fasteners on the Green Line and relocated commuter rail tracks and the relocation or use of specially-engineered trackwork (flange-bearing or moveable-point frogs) for 12 crossovers and turnouts, would be effective in keeping future vibration levels at or below existing levels for commuter trains and below impact criterion for Green Line trains.

I received several comments questioning the validity of noise and vibration assessments at certain locations given that individual properties were not physically inspected. The level of noise and vibration assessment included with the DEIR is commensurate with the level of detail anticipated given the 10% design status of the project and effectively serves the MEPA process in identifying areas where mitigation will be necessary. The amount, type and specifics of noise and vibration mitigation appropriate for individual properties and structures will be refined during the ongoing design process in accordance with FTA guidance and standards. I have required MassDOT, as part of the scope for the FEIR, to provide a conceptual plan for evaluating, monitoring and compensating affected parties along the corridor with respect to noise and vibration.

Open Space and Historic Resources

As required, the DEIR included a discussion of the potential impact of the project on cultural resources including open spaces, historic properties and archaeological resources. This information was also prepared to fulfill the FTA's obligations under Section 106 of the National Historic Preservation Act and the Section 4(f) provisions of the U. S. Department of Transportation Act of 1966.

The DEIR identified and described public parks, recreation areas and conservation lands within an area of potential effect (APE) that extends approximately 100 feet on either side of the proposed rail corridors, station locations and maintenance and/or interim train storage facilities. It noted that none of the five areas identified within the APE will be directly affected by the project. It indicated that there would be an indirect effect on one site (Trum Playground) associated with an increase in noise levels. The DEIR indicated that expansion of the existing 5-foot noise barrier within the right-of-way to 10 feet would effectively mitigate associated impacts.

The DEIR summarized the historic and archaeological reconnaissance survey conducted within the APE; defined as an area extending 125 feet or one assessor's lot on either side of the proposed routes, station locations and maintenance and/or interim train storage facilities. It indicated that a total of 423 individual properties, two railroad corridor landscapes and 15 areas/districts were identified within the APE. Of these properties, four are individually listed in the National Register, 16 are recommended eligible for listing and 52 were previously recorded in the Inventory of Historic and Archaeological Resources of the Commonwealth. The DEIR noted direct impacts associated with removal of the existing Lechmere Station and re-construction of the station on the opposite side of O'Brien Highway. Indirect impacts associated with noise, vibration and changes to the visual setting may affect several properties identified in the DEIR.

The DEIR identified five areas where potentially significant archaeological resources may be located. It noted that previous activity within the corridor, including extensive earth moving and substantial filling, limit the possibility of finding intact archaeological deposits within the majority of the APE.

The DEIR indicated that mitigation will be provided for historic resources that are listed or eligible for listing in the National Register and that will be adversely affected by the Project. Mitigation for Lechmere Station will include archival documentation, consideration of salvage of

architectural elements of the Station and, potentially, interpretive signage. Other mitigation will include construction of noise walls and sound insulation. The DEIR indicates that design of the rail bed, ballast and track will incorporate measures to avoid impacts associated with vibration. To the extent that archaeologically sensitive areas are not avoided through project design, then the proponent will consult with MHC and FTA regarding the necessity of an intensive (locational) archaeological survey. MHC, in its role as the State Historic Preservation Officer (SHPO) will continue consultations with MassDOT and FTA regarding the development and refinement of project mitigation through the Section 106 process.

Hazardous Waste/Contaminated Soils

The Green Line Extension will traverse areas with a long-standing industrial and commercial history. As such, the project corridor contains numerous locations where impacted soil may be present and will require soil and/or groundwater remediation prior to or as part of project design or construction. Remediation will likely include removing contaminated soils and pumping contaminated groundwater in accordance with the provisions of the Massachusetts Contingency Plan (MCP), M.G.L. c.21E and c.21C, and the Resource Conservation and Recovery Act (RCRA).

The DEIR indicated that a Phase I Environmental Site Assessment (ESA) has been conducted for all the properties that are part of the land acquisitions for the project. As part of the Phase I ESA process, sites with Recognized Environmental Conditions (RECs) are evaluated. The DEIR included a description of each REC and its relative impact on proposed station sites and the Maintenance Facility site for each project alternative, along with respective Release Tracking Numbers (RTNs). The DEIR presented a general discussion of how the project will manage contaminated media and comply with applicable hazardous materials regulations for both soil and groundwater oil and hazardous materials (OHM).

The project will be required to comply with the MCP. The DEIR has indicated that at the completion of response actions for which an RTN has been obtained, but a closure report consisting of a Response Action Outcome (RAO) has not yet been submitted, a condition of No Significant Risk must exist as defined by the MCP. The MassDOT has indicated that a preferred outcome is a Class 1-A RAO in which contamination is reduced to background levels. In situations where a Class 1-A RAO cannot be supported, MassDOT should evaluate alternatives to a Class 1-A RAO designation. Proposed mitigation measures during construction may include special handling, dust control, and management and disposal of contaminated soil and groundwater.

MassDEP has indicated that if there is no pre-characterization of soils along the ROW, sampling of every 200 cubic yards of soils is recommended, including both the excavation piles and in-situ sampling. MassDEP notes that issues related to soil sampling, as further discussed in its comment letter, should be addressed prior to the 50-percent design stage of the project. MassDOT should consult with the MassDEP as project design proceeds and construction commences to ensure that planning and implementation of demolition and management of contaminated soils is performed consistent with applicable regulations and the recommendations made in the MassDEP comment letter.

Construction Period Impacts

MassDOT has acknowledged the challenges associated with the construction period impacts of such a complex project including: narrow roadways; traffic volumes; continuous access requirements to a variety of land uses; limited staging areas; and maintaining existing rail operations along the project corridor. Construction period mitigation measures must seek to minimize impacts to vehicular traffic, pedestrian and bicycle traffic, on-street parking, public access, and emergency access to local businesses and residences.

The DEIR included a conceptual construction sequencing and staging plan. Existing commuter rail and freight rail service will be maintained throughout the construction period. Alternative 1 will require the replacement of seven highway bridges and four railroad bridges, as well as the reconstruction of the Lechmere viaduct and the construction of two new viaducts at Red Bridge Junction to serve the Union Square Branch. The DEIR states that bridge reconstruction will be staged whenever possible to maintain traffic over respective bridges during construction; however, two bridges, Medford Street and Broadway Street in Somerville, will need to be closed during construction and detours established.

The project will also include numerous intersection upgrades to accommodate new transit stations, new traffic patterns and volumes, pedestrians, and bicycles. The DEIR outlined general criteria to be required for traffic management and construction staging along roadways and rail corridors. Blasting is not anticipated for construction of the project. Construction procedures will comply with MassDEP's Solid Waste and Air Quality Control regulations, rodent control policies will be implemented, and construction policies will require that all diesel construction equipment used on-site will be fitted with after-engine emission controls such as diesel oxidation catalysts (DOCs) or diesel particulate filters (DPFs). The project will comply with MassDEP's idling regulations (310 CMR 7.11) and MassDOT has committed to posting idling restriction signs on project construction sites. MassDOT should work with contractors to establish protocols to alleviate dust, noise, odor and nuisance conditions which may occur during construction.

Final identification of effective construction period mitigation measures requires advancement of project design. MassDOT must prepare a detailed plan to address myriad construction period impacts through coordination with the City of Cambridge, City of Somerville and City of Medford, and their respective Police and Fire Departments. I encourage MassDOT to also engage the broader community in the development of these plans as part of the mandated community outreach as project design is refined and prior to construction. As noted above, such a plan should seek to avoid, minimize and mitigate potential impacts to vehicular traffic, pedestrian and bicycle traffic, on-street parking, public access, emergency access to local businesses and residences, dust, noise, odor, rodents and construction-related nuisance conditions.

SCOPE

As discussed above, I am providing the following Scope for the preparation of a FEIR, limited to the topics outlined below. Although I recognize that this Scope will not address every issue raised by project commenters, I am confident that resolution of these remaining details will allow MassDOT to demonstrate that the project has fully complied with the requirements of MEPA. Additional topics will be addressed through the state and local permitting process and through MassDOT's ongoing community involvement processes.

The FEIR should follow Section 11.07 of the MEPA regulations for outline and content, as modified by this Certificate. The FEIR should identify, describe and assess environmental impacts of any changes in the project that have occurred between the preparation of the DEIR and FEIR.

Maintenance Facility

S-001-001

Comment letters on the DEIR express a widespread lack of support for location of the Maintenance Facility at Yard 8 in Somerville. As part of the FEIR, MassDOT must expand upon the December 9, 2009 technical memorandum and provide a quantitative environmental analysis of both the Mirror H and Option L locations and include for comparative purposes the existing analysis of Yard 8. I note that comments submitted on the DEIR express preferences for both Mirror H and Option L, but based on the information and comments submitted to date, it appears that Option L may be the most feasible alternative location and the one with the fewest potential conflicts and impacts.

The analysis should expand upon the evaluation criteria presented in the technical memorandum (summarized on Page 4-1 of the report). The FEIR should provide a comprehensive analysis of Maintenance Facility siting and operations for not only these previously explored criteria but also on: land uses (including EJ populations), impervious area, parking, stormwater, hazardous materials, traffic, land acquisition, noise, vibration, air quality, open space, historic and archaeological resources, the Community Path, and construction period impacts.

The FEIR should provide a detailed assessment of Maintenance Facility sizing, and in exploring alternatives seek to minimize the project footprint and potentially reduce land acquisitions through innovative design (e.g., consolidating employee parking areas, shifting MBTA offices out of the Cobble Hill area property as suggested by Congressman Capuano, splitting storage and maintenance operations, etc.). The FEIR should evaluate impacts to freight operations for each design alternative, noting operational or deed restrictions that may hinder flexibility in Maintenance Facility siting or operations.

S-001-001

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. Design for the maintenance facility will be developed during the Project's preliminary engineering stage.The FEIR provides an assessment of the maintenance facility sizing and footprint; preliminary engineering will address innovative design issues to the extent practical. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering.

Air Quality

S-001-002 The FEIR should include a narrative discussion clarifying the air quality modeling assumptions, challenges associated with the inherent evolution of modeling programs and input data, and how the air quality modeling results were conducted in a manner that sufficiently demonstrated consistency with the SIP.

College Avenue Station

S-001-003 The DEIR presented a two phased approach to the Green Line Extension, with the initial phase terminating at College Avenue in Medford. In prior MEPA reviews and public meetings, the environmental impacts associated with College Avenue were reviewed within the context of functioning as an intermediate station along the project route. I have received numerous comments concerned about how the College Avenue Station will function for an undefined period as a terminus and the associated environmental impacts.

While MassDOT evaluated the College Avenue Station in the DEIR, it is unclear how modeling assumptions (pick-ups/drop offs, pedestrian trips, etc.) considered the unique attributes of a station acting as the terminus of a light rail line. The FEIR should revisit the DEIR models, revise as necessary to accurately assess the predicted function of the station, and describe differences in operations and mitigation measures between the DEIR and the FEIR, if any. The FEIR should clarify how College Avenue Station, functioning as a terminus, will impact traffic, parking, pedestrian, and bicycle operations within the study area and outline sufficient mitigation measures to offset identified negative impacts. The FEIR should describe Green Line operations at the proposed terminus (i.e. train reversals, temporary train storage, movement of personnel, etc.) and how the facility has been designed to accommodate terminal station ridership demand. The FEIR should clarify how train operations in Alternative 1 at this location may impact sensitive noise and vibration receptors, and present appropriate mitigation measures.

Lechmere Station

S-001-004 The project requires the relocation of the existing Lechmere Station in Cambridge. Lechmere Station presently functions as a northern terminus for Green Line operations, but will be transformed into an intermediate station for both the Medford and Union Square branches of the Green Line Extension. Lechmere Station is a hub for both Green Line light rail and MBTA bus routes and is currently integrated into the urban fabric, located between Cambridge Street and O'Brien Highway. The project will require the relocation of the station to the north side of O'Brien Highway, adjacent to a new street grid proposed as part of the North Point development project.

The FEIR should explore ways to reduce the proposed parking program (in light of the station no longer functioning as a terminus) and consider other design refinements to reduce impacts of the relocated Lechmere Station on abutting land uses (notably the Glass Factory Condominiums). I acknowledge the concerns regarding noise and vibration impacts and the potential for MBTA operational conflicts with residences closest to the station. Furthermore, I note concerns regarding pedestrian and bicycle safety in and around the new station location and

S-001-002

Chapter 3 of the FEIR clarifies the air quality modeling assumptions, challenges associated with the evolution of modeling programs and input data, and how the air quality modeling results were conducted to demonstrate consistency with the SIP.

S-001-003

FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

Section 4.4 of the FEIR, Access and Circulation, describes pedestrian and traffic access for the proposed College Avenue Station. Bicycle, pedestrian, bus and automobile access at stations will be refined during preliminary engineering.

Section 4.3 of the FEIR describes how College Avenue Station would operate as a terminus. Ridership projections and the methodology used in their development are described in DEIR/EA Section 3.4, Ridership Methodology and specific details for College Avenue Station are provided in FEIR Section 4.4.

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors.

S-001-004

Parking at the new Lechmere Station was reduced in the revised conceptual design, included in FEIR Chapter 5, Lechmere Station. The revised conceptual plans will be refined in the preliminary engineering

S-001-004

bus circulation routes. The FEIR should clarify modeling assumptions, and proposed station layout and mitigation measures that will be implemented to effectively and safely convey bus passengers, pedestrians and cyclists from the neighborhood to the relocated Lechmere Station. I do not expect MassDOT to present final station design and architectural drawings in the FEIR, as this is a level of detail that goes beyond the current design phase. Final station design should be explored further, as I have requested with other stations, during the public involvement process. However, the level of information presented in the FEIR should be of sufficient conceptual design to reflect anticipated station layout and operations, relationships to the broader transportation network, existing and permitted buildings, and where mitigation measures would be implemented.

Public Involvement Plan

S-001-005

As noted previously, a key to the overall success of the Green Line Extension project is the effective integration of light rail service into the existing urban landscape. To facilitate collaborative land use planning, review of advanced project design elements (notably station design), and implementation of mitigation measures, I am directing MassDOT to develop a Public Involvement Plan (PIP) for the project. The FEIR should present a PIP that clearly outlines how a broad range of participants (i.e., representatives of regional planning agencies, local government, business interests, community groups, representatives of EJ areas and the disabled community, abutters, and bicyclist and pedestrian groups) will continue to provide meaningful community involvement throughout the duration of the entire project, including detailed design, engineering, construction phases. This PIP should build on the lessons learned from the previous Advisory Groups convened in association with the project, consider ideas presented as part of the Community Corridor Planning Project, reflect comments received on the DEIR, and represent a serious commitment by both MassDOT and the MBTA to actively engage the public upon completion of MEPA review. I also expect that the PIP presented in the FEIR will provide not only a plan for procedural engagement of the various participants, but that it will also outline the primary substantive topics that are anticipated to be addressed through the PIP process.

Mitigation/Section 61 Findings

S-001-006

The FEIR should include a separate chapter on mitigation measures. This chapter on mitigation should include distinct draft Section 61 findings for each State Agency action. The draft Section 61 Findings should contain a clear commitment to mitigation, a schedule for implementation, an estimate of the individual costs of the proposed mitigation and the identification of the parties responsible for implementing the mitigation.

In response to the extensive comments received regarding future mitigation commitments on behalf of MassDOT and the MBTA, the FEIR should include a conceptual plan for evaluating, monitoring, and compensating affected parties along the corridor with a specific emphasis on, but not limited to, noise, vibration, and land acquisition impacts. This conceptual plan should address not only mitigation associated with the future ongoing operations of the Green Line Extension, but impacts uniquely limited to the construction period. I encourage MassDOT to integrate the components of this plan into the broader framework of the PIP to provide a forum for information sharing between future MassDOT studies and data and interested and affected parties.

stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

FEIR Chapter 5 describes the revised conceptual plans for Lechmere Station, including station design, track alignment, and other amenities. Changes to the track alignment depicted in the DEIR/EA were evaluated, but could result in additional impacts on area abutters. Proposed mitigation measures for area abutters are also described in FEIR Chapter 5.

The revised conceptual plans for Lechmere Station also include bus facilities and bus waiting areas. Mitigation measures for station impacts are described in FEIR Chapters 5 (Lechmere specific) and 8.

S-001-005

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

S-001-006

Chapter 8 of the FEIR addresses Draft Section 61 Findings and Mitigation Commitments. As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. The stakeholder coordination process for project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

EEA# 13886 DEIR Certificate January 15, 2010

Comments/Circulation

S-001-007 The FEIR should contain a copy of this Certificate and a copy of each comment letter received. The FEIR should respond fully to each substantive comment received to the extent that it is within MEPA jurisdiction. This directive is not intended to and shall not be construed to enlarge the Scope of the FEIR beyond what has been expressly identified in this Certificate.

S-001-008 In accordance with Section 11.16 of the MEPA Regulations and as modified by this Certificate, the MassDOT should circulate a hard copy of the FEIR to each State and city agency from which MassDOT will seek permits or approvals and to each of the City agencies that submitted comments. The MassDOT should also circulate a copy of the FEIR to those submitting individual written comments. To save paper and other resources, MassDOT may circulate the FEIR in CD-ROM format, although MassDOT should make available a reasonable number of hard copies, to accommodate those without convenient access to a computer to be distributed upon request on a first come, first served basis. MassDOT should send a notice of availability of the FEIR (including relevant comment deadlines and appropriate addresses) to those who signed the petition and for which addresses are available. In addition, a copy of the FEIR should be made available for public review at the Cambridge, Medford and Somerville public libraries.

Boston, MA 02114

Dear Secretary Bowles,

S-002-001 I am writing to offer my comments on the Green Line Extension DEIR. I would first like to acknowledge DOT for all of their hard work on this project. I believe that the Green Line Extension is the most important transportation project that we have undertaken in many years. Completing this project in a timely manner and meeting our legal obligations is critical.

S-002-002 I fully support the Mystic Valley Parkway terminus and would like to see a commitment to extending the Green Line to Rte 16 put into writing. The Phase I terminus at College Ave does not meet the requirements of providing service to the "Medford Hillside" neighborhood. Therefore, a firm commitment to complete the extension to Rte 16 is imperative.

S-002-003 I do have particular concerns about the location of the maintenance facility. There are currently 3 proposed alternatives for the location of a maintenance facility in Somerville. The location that has been the preferred alternative for DOT has been Yard 8. This alternative would create severe hardships for residents of the Brick Bottom community and would cut off development opportunities for the city. Either the Mirror H location so called or option L would be preferable to the location at Yard 8.

S-002-004 One of the issues that has gotten a great deal of attention has been DOT's request that the DEIR be considered as a final EIR. I believe that this would be a mistake. While I can appreciate DOT's desire to have the entire EIR process out of the way, I am concerned that the current DEIR does not specify a final location for the maintenance facility nor does it accurately reflect a final design for the Rte. 16

S-002-001

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

S-002-002

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. The Proposed Project, with a terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010).

Since the release of the DEIR/EA, a few stakeholders raised concerns that the proposed College Avenue Station, serving as a terminal station for the Proposed Project, would not adequately serve the Medford Hillside neighborhood. Serving this neighborhood was identified as part of the SIP description. To address and resolve these concerns, CTPS prepared a memorandum demonstrating that the College Avenue Station location does adequately serve the walk market area for the Medford Hillside neighborhood. This memorandum is provided in Appendix C of the FEIR.

S-002-003

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further

S-002-004

terminus station. In fact, the current DEIR contains references to substantial land takings at Rte. 16 that even DOT believes will be unnecessary. The Medford Neighborhood Green Line Association has an alternate drawing that would require no land takings at all.

The Green Line Extension Project is one of the most important public transportation projects we have undertaken in many years or are likely to undertake in the near future. I am fully supportive of this project but I am also cognizant of the need to get this important project right the first time.

Thank you for taking the time to consider these comments to the DEIR. If you have any questions, please do not hesitate to contact me.

Sincerely,

Patricia D. Jehlen

Patricia D. Jehlen
State Senator

consideration and Option L is identified as the preferred maintenance facility site.

S-002-004

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA. As described in the FEIR, MassDOT has selected the Option L site as the preferred maintenance facility location.

Because the subject of the FEIR addresses the Proposed Project, which does not extend to Mystic Valley Parkway/Route 16, design for a station there has not been advanced. Consideration of the Medford Neighborhood Green Line Association design will be given when that segment is studied. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

Secretary Ian Bowles, Executive Office of Energy & Environmental Affairs
MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA number # 13886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles,

I am writing to offer a few additional comments to my earlier comment letter. In particular I have several questions relative to the financing of the Green Line Extension and the decision to divide the project into two phases with the extension to Rte. 16 from College Ave being relegated to Phase 2.

S-003-001 I understand that there is a need for the project to be properly financially constrained; however, I question whether the maintenance facility and the relocated Lechmere station need
S-003-002 to be fully built in phase one. I also question whether the $160 million figure that the state has agreed to pay for the Lechmere relocation is completely justified. Original estimates for the relocation were closer to $70 million and construction costs have actually come down somewhat due to the economic downturn. Given the enormous cost of this relocation I question why the much more environmentally critical extension to Rte 16 is the portion being postponed. Completion to route 16 is crucial, and financing plans should ensure that it is done in the most timely manner possible. Perhaps, if it can't be included safely in the New Starts application, there could be a parallel track of planning and preparation.

S-003-003 I would also like to see in more detail what the Commonwealth's plan to pay for this project is. There is $600 million authorized for this project in the Transportation Bond Bill. However, there is also language that requires the bond authorization to be reduced by the amount of any federal contribution. This would seem to cap the total cost of the project at $600 million which

S-003-001

Both the relocated Lechmere Station and a new Green Line storage and maintenance facility are critical components of the Proposed Project, and need to be fully constructed during the first phase of this Project. Cost estimates developed for the DEIR/EA will be further refined as the Project advances through preliminary engineering.

S-003-002

Project cost estimates are based on the current, conceptual level of design, and will be further refined as the Project progresses through preliminary engineering. Extension to Mystic Valley Parkway/Route 16 is planned, but cannot be completed by 2014 with the available funding. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

S-003-003

In order to fund any state share of the costs of constructing the Green Line Extension project, MassDOT will need to make use of capital funds raised through Commonwealth bonding. Should the existing bond authorization for the State Implementation Plan projects (of which the Green Line Extension project is one) not be sufficient, MassDOT will need to work with the Legislature and the Executive Office of Administration & Finance to provide additional bond authorization to cover those costs of the Green Line Extension Project for which the Commonwealth is responsible.

S-003-003 | is insufficient. I assume that DOT has the ability to use other capital bond money for this purpose but more information on what funds can and will be used would be helpful.

This is a very important project and I believe that we need to be as clear as possible as to what our options are to ensure that it is fully funded and extends to Rte 16 in the shortest possible timeframe.

Thank you for considering these additional comments. If you have any questions, or if I can be of any further assistance, please do not hesitate to contact me.

Sincerely,

Patricia D. Jehlen
State Senator

January 8, 2010

Dear Secretary Bowles,

I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project. I commend MassDOT on their efforts in the release of the DEIR, which represents a significant milestone in the public evaluation process of the project. My comments will be organized by topic.

1) Community Participation

S-004-001 It is imperative that MassDOT ensure that an interactive community participation process continue. Specifically, the Massachusetts Environmental Protection Agency (MEPA) should require collaborative planning, with community involvement in the design and engineering of the route, stations, and connections. Senior project staff should commence working out of a centrally located field office to maximize access.

S-004-002 In instances when project mitigation proves insufficient to meet pre-agreed impact standards for noise, vibration, pollution and other environmental burdens, it is essential that the community be consulted in devising solutions.

2) Station Design and Siting

S-004-003 New stations must connect as fluidly as possible, with all other clean modes of transportation, including current and re-routed buses. Each station should accommodate bus drop-off and pick-up (i.e. curb extensions and other roadside adjustments), with maximum integration of transit modes and minimal street disruption. Enhanced bus routes connecting new Green Line stations with proximate Red Line and Orange Line stations should be implemented simultaneously, as was the case with the Red Line northwest extension. Neighborhood shuttle and loop buses should also be added as necessary.

S-004-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

S-004-002

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

S-004-003

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

S-004-004 Station entrances and exits should be sited to encourage an even distribution of riders along the length of the platform which, as a result, would enhance rider safety.

S-004-005 Stations should be located and configured to maximize pedestrian, bicycle, and wheelchair access to and from adjacent neighborhoods. The Federal Transit Administration (FTA) has proposed a policy change relating to bicycle/pedestrian access to public transportation, which we should adopt as a planning principle for this project. The proposed policy states:

> For purposes of determining whether a pedestrian or bicycle improvement as a physical or functional relationship to public transportation, regardless of whether it is funded as a capital project or public transportation enhancement, all pedestrian improvements located within one-half mile and all bicycle improvements located within three miles of a public transportation stop or station shall have a de facto physical and functional relationship to public transportation. According to a test of activity and use, pedestrian and bicycle improvement is within the distance most people can be expected to safely and conveniently walk or bicycle to use that particular transit service. Federal Registrar: November 13, 2009 (Volume 74, Number 218) http://edocket.access.gpo.gov/2009/E9-27240.htm

S-004-006 Furthermore, both branches of the tracks should be constructed to allow for future extension, should it be warranted – between Lechmere and Washington Street/Union Square, between College Avenue and Route 16, and along a future Green Line extension to Porter Avenue that could serve both Somerville and Cambridge neighborhoods. The specific issue of integrating the Community Path into this project is addressed later on in these comments.

3) Green Line Maintenance Facility Relocation

S-004-007 The siting of the proposed maintenance facility and storage yards should not increase existing transportation infrastructure and environmental burdens in Somerville or interfere with local economic development. MassDOT should abandon its proposal to place the facility in "Yard 8," and devote no more time and resources to studying this location. It is shocking that DOT should even consider placing such a facility where abutting residents would be subjected to the air pollution it will generate during construction, and beyond.

The Yard 8 proposal is equally outrageous when judged by its economic development and land use impacts on the City of Somerville. With other city officials, I have expressed to DOT on many occassions opposition to the Yard 8 siting, which would preclude the re-development of one of the few areas in Somerville suitable for expanding the City's commercial tax base. While it is hard to fully evaluate "Option L" from the scanty analysis it receives in the draft EIR, its elimination of commercially taxable land, already yielding annual revenue of close to a quarter of a million dollars, would seem to represent more negative impact that could in any way be overcome.

To put the question of maintenance facility siting in context, it is important to note that the MBTA is the largest property owner in Somerville, owning 2,803,380 square feet of land out of the city's modest total of 116,252,928 square feet. The Boston Engine Terminal alone, taxed at Somerville's Fiscal Year 2010 commercial tax rate ($10.44/K), would yield $706,567 in gross revenue this year, in a city under serious fiscal constraint. The inadequacy of the DEIR's land use planning and economic development analysis may be gauged by its insensitivity to scale of fiscal impact, in a city the size of Somerville, posed by locating a maintenance facility in "Yard 8," or even "Option L" location. Additionally, the "Yard 8" facility design includes a 100-car employee parking lot – clearly an unfair economic imposition, and land use detriment to Somerville.

S-004-004

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. These stations are designed to be consistent with MBTA standards and compliant with ADA. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

S-004-005

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

S-004-006

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and

The environmental and economic detriment to Somerville from being overburdened with transportation infrastructure vastly outweighs the meager public transportation resources it enjoys. Even completion of the Green Line Extension, that long overdue amenity, will not compensate for the existing burden on Somerville's land, let alone the construction of additional regional transportation infrastructure. Between tracks and the Boston Engine Terminal (BET), Somerville – one of the smallest municipalities in the Commonwealth – has long borne the brunt of providing commuter rail service not just to much of Eastern Massachusetts, but to Rhode Island as well.

Putting the maintenance facility on the other side of the BET from the "Option L" site, at the "Mirror H" location, would help to alleviate the historic injustices described above, as well as others resulting from a series of siting and design decisions by the state and other public agencies. Approximately 4 ½ acres of Somerville land at North Point are cut off from the rest of Somerville, and from vehicular access to it. This physical isolation of what would otherwise be valuable, developable land, is the result of cumulative land use decisions: the alignment of the McGrath/O'Brien Highway and of elevated I-93 and the location of the BET and related rail infrastructure.

Locating a maintenance facility on Somerville's North Point acreage probably represents the most minimal deprivation of our developable land. The negative impact of "Mirror H" identified in the EIR – "renegotiation of MBTA – North Point agreement" – would seem to be fairly spurious. The original signatories to that Agreement, locked in litigation for years, are no longer pursuing the North Point development, and have been unable to find a buyer for it. The "agreement" to relocate the Lechmere MBTA station, inter alia, is so dead that the state has assumed, in its recent amendment to the Regional Transportation Plan (RTP), that the Commonwealth must take on the cost of the state relocation, accounting for approximately $150,000,000 in additional project costs.

S-004-008 While it has been assumed, in the DEIR, that it is necessary to locate a regional maintenance facility and car storage areas in Somerville, I am convinced this would be a misuse of precious urban land. I would urge a scale back of such facilities to a size that truly reflects local need. Land use planning and economic development considerations need to be factored into this analysis in a more robust and thorough manner.

4) Integration of the Community Path

S-004-009 I have seen many opportunities lost, and time and public treasure squandered, by the failure to integrate the design and execution of interconnected public works projects. The stubborn refusal of project engineers on the Lowell Street Bridge reconstruction project to consider community testimony and institutional knowledge about plans for the Green Line and Community Path extensions is one example of such waste, which must now be remedied. It is important to recognize the design phase of the Green Line extension as an opportunity to integrate and complete the Community Path with is, as a single, elegant, multi-modal transportation corridor.

I recommend to your attention the detailed, helpful comments of Somerville resident Alan Moore on this subject.

5) Conclusion

S-004-010 I enthusiastically support the Green Line extension project. I am grateful for the commitment to the project displayed by EOT, and its successor agency, MassDOT, as well as by EOEEA, its MEPA unit and DEP in its SIP oversight capacity. I applaud the thoughtful comments made by the City of Somerville, and

infrastructure design with conceptual future Green Line additions and extensions.

S-004-007

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

S-004-008

The Green Line Extension storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the Project. Chapter 2 of the FEIR fully describes the environmental impacts of the proposed storage and maintenance facility. In order to maximize operating efficiencies, the facility must be constructed within the same timeframe as the Green Line Extension Project, in the vicinity of the Green Line Extension right-of-way, and north of downtown Boston.

S-004-010 by Somerville STEP. I respectfully request that you require MassDOT to issue a Final EIR which is reasonably complete, describes all alternatives, and complies with all the criteria in your certificate.

The recapitulate my understanding of your requirements, I would look for:

- The employment of "Smart Growth" criteria in land use planning;
- Direct public infrastructure investment to spur revitalization of previously developed urban sites;
- A plan from MassDOT which is consistent with local and regional growth management plans;
- Consistency and coordination with existing land use plans, such as integration of the Community Path, with its full funding addressed;
- Employment of principles of environmental justice; ensuring that no segment of the population bears a disproportionate burden of environmental impacts.

S-004-011 Finally, I would ask that, in the FEIR, MassDOT be required to describe the air quality benefits associated with the project as a whole, and with each phase of its construction.

Thank you for considering these comments.

Very Truly Yours,

Denise Provost

The storage and maintenance facility alternatives include storage for Green Line Extension vehicles and replacement of the existing Lechmere Station vehicle storage. Storage capacity is also provided for vehicles currently stored in trackways between Lechmere Station and Government Center; this storage will be lost due to the Green Line Extension.

S-004-009

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

S-004-010

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

S-004-011

The Green Line Extension will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality. As required by the Secretary's Certificate on the DEIR/EA, the FEIR includes a narrative clarifying the relationships of air quality modeling data to MassDEP and EPA requirements for State Implementation Plan (SIP) consistency.

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I am writing in regards to the proposed MBTA Green Line Extension to Medford and Somerville. As you may know, much of the proposed project runs through both communities in my legislative district. As such, I have had the opportunity to attend nearly every public meeting on this project over the past five years, and appreciate the opportunity to share my comments with you on the Draft Environmental Impact Report.

S-005-001 It is my firm belief that the green line extension will be a major benefit for my communities, and for the environmental health of the region. There is no transportation project currently in the pipeline in the Commonwealth that comes anywhere near the environmental benefits that the green line extension will facilitate. I look forward to completion of the entire project, from Lechmere all the way to both Union Square and Route 16 by December 31, 2014, and share my comments below in light of that goal.

DEIR Not Final

S-005-002 I am strongly urging you as Secretary to require the entire scope of work be completed that was outlined in your original Certificate on the EENF in December 2006. That Certificate called for a number of items to be studied that have not been adequately addressed by this DEIR. Specifically, the DEIR identified the Route 16 extension as the preferred alternative, but study of this alternative is not complete.

The EENF Certificate made it clear what would be required to allow the DEIR to be the final document: "If the DEIR provides a reasonably complete and stand-alone description and analysis of the project, project alternatives and environmental impacts, and adequately addresses mitigation, the regulations allow the DEIR to be reviewed as a FEIR." Many significant questions remain, and I do not believe the threshold for accepting the DEIR as the FEIR has been met.

S-005-001

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

S-005-002

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

S-005-003 I know there has been a suggestion made to complete the DEIR through College Avenue, and do a separate review for Route 16 at a later date. I disagree with this proposal, as I believe the separation into two phases will ultimately lead to the failure of the project to be completed in its entirety to Route 16, the stated preferred alternative. To not complete the analysis of the Route 16 terminus at this time would be a violation of the commitment made by this administration to our communities, and would violate the requirements laid out by your EENF Certificate.

Moving forward, I urge you to reject the current draft as final, and to require a supplement to DEIR. This supplement should address all of the elements laid out in the EENF Certificate, including a full analysis of the preferred alternative, including the Route 16 segment, as well as other issues raised below. I urge you to not allow the current DEIR to serve as the final document, to not allow the separation of the project into two phases in violation of the EENF Certificate's scope of work and project deadline, and to seek an end product that meets the legal requirements of this project.

Route 16 Terminus

S-005-004 The preferred alternative, extending the green line all the way to Route 16, would result in the biggest reduction in vehicle miles traveled and the best improvement in air quality. I fully support making the extension to Route 16 a reality in the timetable required by the SIP Commitments the Commonwealth has made to Medford and Somerville.

The Dept. of Transportation has suggested that this project could be split into two phases, phase I to College Ave by Dec. 31, 2014, and Phase II to Route 16 at a later date. This is being proposed not because there is value in splitting the project, but purely for reasons of fiscal constraints. There are several problems with this approach.

S-005-005 First, the DEIR does not address how the College Ave station can adequately serve as a temporary terminus station for an indefinite length of time. There are additional considerations for a terminus station which have not been incorporated into the design of the College Avenue Station.

S-005-006 Second, the DEIR fails to acknowledge public concern, which I share, that stopping the project at College Avenue does not meet the legal requirements of this project to extend the green line to the Medford Hillside neighborhood. The revised SIP Regulations (310 CMR 7.0) call for the completion of the entire project, "opened to full public use," from Lechmere to Medford Hillside. Others are submitting further details on the subject, including detailed maps and analysis, but in short the Medford Hillside neighborhood is located beyond half a mile at a minimum from the College Avenue Station, and outside of that station's walkable encatchment area. In looking at the history of this project, the Beyond Lechmere Northwest Corridor Study showed the Winthrop Street Station encatchment area indicating the "Medford Hillside" neighborhood, with College Avenue as a separate station (see https://www.commentmgr.com/Projects/1228/docs/MIS8-05-AppendixB.pdf, Figures B6 and B7).

S-005-007 And third, splitting off the Route 16 extension to an unspecified later date disregards the reality that the Route 16 Station has the best air quality benefit, which is the primary purpose of the legal commitments. The Route 16 station has connectivity to bike and pedestrian paths along the Alewife Brook Parkway and Mystic River, and is situated in the middle of a dense neighborhood with potential for ridership numbers that I believe would be much higher than even the very promising projections in the DEIR. In the EENF

S-005-003

Since the release of the DEIR/EA, a few stakeholders raised concerns that the proposed College Avenue Station, serving as a terminal station for the Proposed Project, would not adequately serve the Medford Hillside neighborhood. Serving this neighborhood was identified as part of the SIP description. To address and resolve these concerns, CTPS prepared a memorandum demonstrating that the College Avenue Station location does adequately serve the walk market area for the Medford Hillside neighborhood. This memorandum is provided in Appendix C of the FEIR.

S-005-004

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. The Proposed Project, with a terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Additionally, FEIR Chapter 4 includes a detailed description of College Avenue Station functioning as a terminal station.

S-005-005

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch.

S-005-007 Certificate, the following was indicated regarding the terminus: "I note that the regulations do not specify the terminus of the line within Medford Hillside and final project designs will be dependent upon the attainment of specific emissions reductions." Stopping at College Ave, without inclusion of Route 16 by the Dec. 2014 deadline, does not attain the strongest reduction in emissions.

S-005-008 Additionally, the current station design at Route 16 is flawed. Throughout this process, we have sought to minimize land takings and impacts on abutters. Representatives from DOT have indicated the plan presented in the DEIR is a "worst case scenario" and indicated they have considered alternatives that do not have the dramatic impacts on businesses at the terminus location as is shown in the current design. The Secretary should require DOT to meet the requirements of the EENF Certificate, and produce design alternatives that minimize disruption to existing businesses, minimize land takings, and enhance economic development potential at Route 16.

Winthrop Street Station Omission

S-005-009 The Secretary's EENF Certificate called for the study of potential stations at College Avenue and Winthrop Street, in addition to Route 16, at the end of the line. As an alternative, requested by community members, the Certificate called for a study of the possibility of combining the College Ave and Winthrop Street stops into a single combined stop.

Having attended every advisory group meeting and neighborhood station meeting, as well as having reviewed all of the public comments submitted as a part of that process, I have serious concerns about the DEIR's recommendation in this area.

The combined College Ave/Winthrop St station concept, when presented at neighborhood meetings, raised many questions and concerns of abutters. It was desirable by most that spoke and commented to not move forward with the combined approach. However, rather than continuing to study the separate College Ave and Winthrop St stations as separate stations, the project team has taken the opinion that simply doing a single College Ave station was the desired option. That is not the predominant opinion that was expressed through this process. There are unique challenges in the entire corridor between College Ave and Route 16, but those appeared to be surmountable, and worthwhile.

The complete loss of an additional station without adequate or credible explanation cannot be allowed, and is not in compliance with the EENF Certificate. I believe the design and analysis of the Winthrop Street station also needs to be completed. As stated above, the current DEIR should not stand as the FEIR, and the Winthrop St. Station analysis also needs to be included in the FEIR.

Maintenance Facility

S-005-010 Unlike the Route 16 Station, which has received little attention, the planners in DOT have given a great deal of time and attention to the Maintenance Facility location and design. It is critically important to the economic development potential of Somerville, as well as the quality of life of abutters in the Brick Bottom community, to make sure this is brought to a positive resolution. Unfortunately, we are not there yet with an adequate alterative, and this further adds to why I believe the DEIR cannot serve as the FEIR.

Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

S-005-006

Since the release of the DEIR/EA, a few stakeholders raised concerns that the proposed College Avenue Station, serving as a terminal station for the Proposed Project, would not adequately serve the Medford Hillside neighborhood. Serving this neighborhood was identified as part of the SIP description. To address and resolve these concerns, CTPS prepared a memorandum demonstrating that the College Avenue Station location does adequately serve the walk market area for the Medford Hillside neighborhood. This memorandum is provided in Appendix C of the FEIR.

S-005-007

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

S-005-008

All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may

Lechmere Relocation

The Commonwealth has an obligation to complete the green line extension, and in order to do this, the existing Lechmere Station must be moved over McGrath O'Brien Highway. The original cost of this relocation was meant to be covered by private developers at North Point, which over the course of the environmental review has fallen apart. This leaves the Commonwealth with a financial challenge for this project, and current plans call for the cost of the Lechmere relocation to be included in the green line extension project costs.

This additional $111 million expense is nearly the same as the projected cost in current dollars of the College Ave to Route 16 segment of the project. The Lechmere relocation is not just a benefit to enabling the green line extension, but also helps ensure the economic potential of the North Point development, and the burden of the relocation should not be bourn solely through the loss of Route 16.

S-005-011 It is my belief that we need to find creative solutions to paying for the Lechmere relocation, and redirect this portion of the budget to complete the Route 16 segment on time. I would urge the Secretary to continue to work with the Secretary of Housing and Economic Development and Secretary of Transportation. The North Point development, if revived at some point in the future when economic circumstances are more favorable, stands to benefit immensely from the relocated Lechmere Station. The original commitment should not be overlooked as mitigation in future developments.

Air Quality

S-005-012 In determining whether this project meets the requirements of the revised SIP Regulations, we need to understand whether the air quality reduction of the green line extension, in combination with the other SIP Commitments, is adequate to meet the required 110% air quality benefit compared to the original SIP commitment package.

I will defer to others who have conducted an analysis of this question, specifically testimony being submitted by the Conservation Law Foundation, which suggests uncertainty on this point. Until we can bring resolution to this question, which is at the heart of the project's purpose, I would contend that the EENF Certificate's requirements have not been met, and further demonstrate the need to reject this DEIR as the FEIR, and move ahead with requiring supplemental analysis and submissions to complete this work.

Conclusion

S-005-013 As a Representative of the project's study area, I have seen community understanding and support for this project evolve rapidly in the past two years. Many steps have been taken to reach out to stakeholder groups, neighborhoods, abutters, and community members, such that by the conclusion of this environmental review I believe there is a much fuller understanding of the project than previously existed. I applaud efforts that have occurred in the past two years to increase outreach and awareness, and to be responsive to neighborhood concerns.

With that said, I believe the scope of work required by the EENF Certificate has not yet been met. More work needs to be done to particularly around the station design of the terminus at Route 16 before many in our community can commit their support to the preferred alternative. Nonetheless, I believe the

achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

S-005-009

As described in DEIR/EA Appendix B, Section 4.5, MassDOT's analysis and understanding of the ridership market potential concluded that the Winthrop Street area would be best served by a single station in the vicinity of College Avenue and Winthrop Street. As explained in DEIR/EA Section 3.7, the preferred station location is at College Avenue.

S-005-010

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. However, the relocation of Lechmere

benefits of the full extension of the green line to Route 16 are well worth the extra work required in the short term, and I urge you to work with Secretary Mullen and the Department of Transportation to expedite the work needed to satisfy the requirements for a final environmental impact report.

Sincerely,

Carl Sciortino
State Representative

Station is a vital component of the Green Line Extension Project and is necessary in order to comply with the SIP commitment.

S-005-011

Project cost estimates are based on the current, conceptual level of design, and will be further refined as the Project progresses through preliminary engineering. It is anticipated that Green Line Extension construction would be financed with a combination of funds from federal and state sources. Efforts to engage a developer for the North Point development will continue as this Project moves into the next phases of design.

S-005-012

The Green Line Extension will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality. As required by the Secretary's Certificate on the DEIR/EA, the FEIR includes a narrative clarifying the relationships of air quality modeling data to MassDEP and EPA requirements for State Implementation Plan (SIP) consistency.

S-005-013

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

As the State Representative representing East Cambridge and East Somerville, including the Northpoint parcel in Cambridge and the Inner Belt and Brickbottom areas of Somerville, I am writing to offer my comments on the Green Line Extension Project's Draft Environmental Impact Report/Environmental Assessment (DEIR/EA) and its impact on my constituents.

The Green Line Extension holds the promise to be a major boon to Cambridge, Somerville, Medford and the entire Commonwealth; however, it is essential that the project not be carried out in a way that will negatively impact the safety of commuters, the quality of life of neighbors, or the economic development of the surrounding communities.

In this light I am strongly supporting Alternative "Option L" for the maintenance facility, increased pedestrian safety measures and access for the new Lechmere station and the Brickbottom station, and increased mitigation for the residents of Brickbottom Artists Association and Glass Factory Condos.

Over the past eighteen months, I have repeatedly stressed to the Governor, the Executive Office of Housing & Economic Development, and the Executive Office of Transportation (EOT – now the Massachusetts Department of Transpotation or MassDOT) that the Inner Belt and Washington Street area is ripe for economic development and residential growth

opportunities. My experience as a state and local elected official has provided me extensive experience working on zoning and land use issues. Simply stated, the Inner Belt and Washington Street have the potential to become a focal point of economic vibrancy and community development for the region, and I cannot support any project that would significantly undermine this potential.

For these reasons, Mayor Curtatone along with my colleagues in the Somerville legislative delegation and I have vehemently voiced our objections to locating a Green Line maintenance facility at Yard 8 to Governor Patrick and EOT/MassDOT. Locating a maintenance facility at Yard 8 would inhibit the growth potential of this area and runs counter to the purpose and vision for Green Line expansion. My goal has been, and continues to be, bringing transportation officials together with economic development leaders to ensure that the siting of the maintenance facility does not have a detrimental impact on future mixed use development.

S-006-001

Placing the maintenance facility at the site of so-called "Option L," further away from the Brickbottom community, is more compatible with preserving the development potential of East Somerville while still allowing for system connectivity. Option L also mitigates the disruptive impact that the maintenance facility would have on the densely populated residential community at Brickbottom. While I still have reservations about Somerville bearing the burden of another MBTA industrial use, Option L should receive serious consideration as the maintenance facility site.

It is my firm belief that the long-term economic development benefits to Somerville and the Commonwealth as a whole will significantly outweigh any additional costs associated with Option L. While locating the maintenance facility at Yard 8 would have substantial negative consequences for both the abutters and the City of Somerville, siting the facility adjacent to the existing Boston Engine Terminal would be compatible with Somerville's vision for revitalization of the Inner Belt area.

S-006-002

The "Mirror H" site on the Cambridge-Somerville line is also being considered for the maintenance facility site. I have concerns, however, that placing the maintenance facility at this location is not an adequate solution to mitigating the environmental and financial impacts of the facility. Rather than addressing the negative impacts of the facility, it seems to shift the potential noise pollution, detrimental effects on economic development and growth, and other harmful byproducts of the facility to another community.

S-006-003

I also want to urge you to consider the necessity of providing safe and convenient pedestrian access to both the new Lechmere Station and the Brickbottom Station.

The relocation of Lechmere station across the McGrath/O'Brien Highway to the Northpoint parcel means that thousands of commuters from East Cambridge will now be required to cross a major, multi-lane highway to access the Green Line. It is imperative that the protection of these commuters is a top priority for the Commonwealth, and that we ensure that pedestrian access from the south of McGrath is consistently and reliably safe.

S-006-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. The evaluation considers land use and connectivity impacts and opportunities associated with each maintenance facility site alternative.

S-006-002

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Mirror H location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

S-006-003

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. These plans, including the pedestrian crossings of O'Brien Highway and associated street, crosswalk, and sidewalk designs are consistent with the approved NorthPoint development plans, and will be further refined in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

S-006-003 I am not satisfied that a simple signaled crossing meets these standards, and I have strongly urged EOT/MassDOT to put more robust measures in place to protect riders coming from Cambridge.

S-006-004 While I understand that the current Lechmere Station is barely at 10% design, there seem to be significant differences compared with other new stations on the extension. Access points into the station have continually been a concern, and the design should be consistent with other stations being developed. At this point in the process, it appears the Lechmere Station is being short-changed when it comes to Charlie Card access and sufficient protection of commuters from the elements.

S-006-005 Additional planning and mitigation also needs to be considered for the residents of the Glass Factory Condos, where the elevated track will run within feet of their windows.

In short, the new Lechmere Station should be a structure the neighborhood can be proud of after many decades dealing with the flaws and inefficiencies of the current station.

S-006-006 Additionally, it is important to me and to the residents of the East Somerville that the accessibility of the planned Brickbottom Station is maximized by providing access from each side of Washington Street. Pedestrian access should similarly be maximized to facilitate and encourage rail use in the surrounding neighborhood.

Thank you for the opportunity to provide comments on the DEIR/EA. I look forward to continuing to work with you and the neighborhoods I represent to realize a successful Green Line Extension and its integration into our communities.

Sincerely,

Representative Timothy J. Toomey Jr.
26th Middlesex District

cc: Governor Deval Patrick
Secretary Jeffrey Mullan, MassDOT
Secretary Gregory Bialecki, EOHED

S-006-004

Revised conceptual plans for Lechmere Station, including modifications to the station headhouse and entrances, enclosed automatic fare collection, and other amenities are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

S-006-005

As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds. As reported in FEIR Section 5.4, the existing outdoor-to-indoor noise reduction of the Glass Factory Condominiums has been measured and the resulting interior noise level projections have been assessed against appropriate interior noise criteria. Recommended mitigation measures are specified in Chapters 5 and 8 of the FEIR. The stakeholder coordination process for project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

S-006-006

The conceptual plan for the Brickbottom Station will be refined during the preliminary engineering stage, taking into consideration municipal, neighbor, and other stakeholder concerns to the extent practical. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

Re: Green Line Extension Project
Draft Environmental Impact Report
EEA #13886

Dear Ms. Johnson:

The MBTA appreciates the opportunity to comment on the Green Line Extension Project. The extension of the Green Line is a major undertaking that is currently being led by the Massachusetts Department of Transportation (MassDOT), and the Authority is actively engaged with MassDOT on this project.

S-007-001

The project is a commitment of the Commonwealth under the State Implementation Plan (SIP) and as a result, the MBTA is fully committed to working to see the project advance into service as quickly as possible. More importantly, however, the project will provide significant transportation benefits to the MBTA's customers in the Somerville and East Cambridge areas. These neighborhoods are highly transit dependent communities and rely heavily on the MBTA bus system. By providing Green Line service, these customers can have direct access to the central subway system and realize a much more efficient transit path. Additionally, by diverting customers from the bus system, we improve capacity and operations of the bus network for the many people who will continue to use that service. The Green Line Extension project provides significant improvements to a large network of customers, and the MBTA strongly supports this project.

S-007-002

MassDOT has been working to advance this project as quickly as possible. As the design advances, the MBTA will become the lead agency on the project and will ultimately be responsible for the construction and obviously the operation of the service. While the MBTA will be the lead for these phases, MassDOT will remain closely involved. Both the MBTA and MassDOT are fully committed to working with the same level of commitment to complete the project.

Maintenance Facility:

S-007-003

A significant portion of both the Draft EIR and the public discussion about the project focuses on the siting of a needed Green Line vehicle maintenance and storage facility. MassDOT has reviewed several possible locations for the maintenance facility. In December, MassDOT released additional information on potential maintenance and storage facilities. The MBTA understands that the siting decision for such a facility is a controversial one and that many factors must be weighed in deciding

Moving Massachusetts Forward. massDOT Rail & Transit

Massachusetts Bay Transportation Authority, Ten Park Plaza, Boston, MA 02116-3974

S-007-001

The Project's Purpose and Need is described in DEIR/EA Chapter 2, Purpose and Need. The Project is needed to comply with the State Implementation Plan (SIP), which includes requirements for this Project as well as other transit projects to meet the air quality and transit commitments established as a result of the Central Artery/Tunnel project.

S-007-002

MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses. This will help ensure compliance with legal requirements and, to the extent feasible, consistency with planning and other projects.

S-007-003

The Green Line Extension storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the Project. Chapter 2 of the FEIR fully describes the environmental impacts of the proposed storage and maintenance facility. In order to maximize operating efficiencies, the facility must be constructed within the same timeframe as the Green Line Extension Project, in the vicinity of the Green Line Extension right-of-way, and north of downtown Boston.

The storage and maintenance facility alternatives include storage for Green Line Extension vehicles and replacement of the existing Lechmere Station vehicle storage. Storage capacity is also provided for vehicles currently stored in trackways between Lechmere Station and Government Center; this storage will be lost due to the Green Line Extension.

S-007-003 where to site the facility. The MBTA adamantly believes that a new maintenance facility must be sited in the Somerville area to support this extension. The MBTA cannot operate this service without a maintenance facility. We appreciate that any abutter to such a facility may experience some type of impacts. The MBTA will work with MassDOT and the abutters to the selected area to avoid or to minimize those impacts to the greatest degree possible.

In its analysis of additional maintenance facility locations, MassDOT provided further assessment of three possible locations for the maintenance facility: Yard 8, the so-called *"Mirror H"* location as well as the so-called *"Option L"* location. In that assessment, MassDOT, after consulting with the MBTA Green Line operations staff, assessed these three locations for a variety of factors, such as their ability to meet the MBTA's maintenance needs, impacts to overall Green Line operations, costs,

S-007-004 property and community impacts, and several other factors. Upon review of this assessment, the MBTA has concluded that both the Yard 8 site as well as the Option L site are well suited, in terms of size and possible layout, to support the MBTA operations. Both provide adequate space and allow for a well configured maintenance and storage facility. The Option L site also allows for better train movements in and out of the maintenance facility and on to the Green Line tracks. The configuration of Yard 8 would require a reverse move of Green Line trains on to the active track whereas the Option L location would not. It would be preferable to the MBTA to avoid this reverse move but the MBTA can operate under either scenario. The MBTA understands that a variety of factors will influence the final decision on where the maintenance and storage facility should be located and the MBTA will work with MassDOT and the City of Somerville as these decisions are being made.

Stations:

MassDOT has identified seven locations for new stations along the line (including a newly relocated Lechmere Station). The station locations are well located to optimize the MBTA's anticipated ridership demand. The stations have so far been designed to only the most conceptual levels. MassDOT and the MBTA will be advancing the design of the stations and to make sure they are properly sized. For the MBTA, three factors drive the size and design of a potential station:

S-007-005 1. All stations must be designed and built to fully meet not only the Americans with Disabilities Act (ADA) requirements as well as the Massachusetts Architectural Access Board (MAAB) standards but must also meet the standards of the MBTA's settlement agreement with the Boston Center for Independent Living (BCIL). The BCIL standards provide guidance elements that affect the size and footprint of the stations such as elevator location, elevator size, *etc.* In many cases, the BCIL standards are more stringent and more robust than either the ADA or the MABB requirements. Any station design must take the BCIL agreement into account.

S-007-006 2. All stations must meet the applicable National Fire Protection Association (NFPA) standards. These standards can affect the sizing and possible location of stations in regards to emergency access/egress. Emergency standards for both the width of the egress as well as second means of egress are often dictated by code and the MBTA does not have the flexibility to change those standards. Any design concept that does not meet the NFPA cannot be advanced, even if that concept reduces impacts on the surrounding neighborhoods.

S-007-004

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

S-007-005

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. Designs for each station will be further developed during the Project's preliminary engineering stage. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. Specific design details and station elements will be further developed during preliminary engineering. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access. The process

S-007-007

3. The MBTA seeks to design and build the most efficient and sustainable stations possible. The MBTA's design goal will be to build stations that function well and are integrated into the surrounding community, while at the same time reducing energy consumption and maintenance needs. Smaller stations require less electricity and energy to power and to light, and also result in lower long term maintenance costs. While larger stations may make a stronger civic statement in a neighborhood, they tend to be more resource intensive when it comes to the long term maintenance and energy consumption.

To a certain degree, these three driving principles conflict with each other. (Fire safety rules often call for a larger station, with more functions, while the sustainable design approach leans towards smaller stations.) MassDOT and the MBTA will work to balance these three principles to result in stations that are fully functional and safe for all passengers, yet reduce resource consumption as much as possible.

Right of Way Issues:

During the public involvement process, a number of comments and ideas have been raised by abutters and community representatives which they believe will help to better integrate the project into their neighborhoods and to reduce impacts. Several of these ideas, however, are in conflict with the MBTA's safety plans or operating needs, and the MBTA feels strongly that they should not be advanced. Most notably, these concerns include:

S-007-008

- The Green Line right of way must be built as a two track system. Abutters have requested that some segments of the right of way be built as a single track system so as to move the trains as far away from the neighborhood as possible and shrink the overall footprint of the system. While we understand the abutters' desire to have as much space as possible between their homes and the tracks, a rapid transit system operating on four- or six-minute headways cannot operate on a single track. Two tracks are a requirement for this type of operation.

S-007-009

- The MBTA feels strongly that there should be no at-grade crossings of the tracks. Community representatives have asked that an at-grade crossing be added near Lowell Street to accommodate the community bike path. The MBTA believes that in the interest of public safety, no at-grade crossings should be included in the project. The MBTA recognizes that several grade crossings currently exist on the western branches of the Green Line (*e.g.*, the B, C and E lines) and some have argued that a different standard is being imposed on the Somerville branches. There are notable differences, however. First, the grade crossings on these existing branches are well integrated into the existing streetscape and have been for nearly a century. Travel patterns and travel habits are well established here; creating new crossings in areas without that extended history and without the abutting streetscape layout is very different, particularly given the relatively high speeds at which trains on the Green Line Extension will be traveling.

  Furthermore, these existing crossings on the western branches are the source of many delays to the Green Line operations. Automobile traffic delays across the intersections or auto accidents at the crossings cause significant delays to the Green Line. Pedestrians crossing in front of the Green Line create a safety hazard that operators must deal with on a regular basis. Since any grade crossing on the Somerville branches would be a crossing not only of the Green Line but

for stakeholder coordination during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

S-007-006

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. These stations are designed to be consistent with MBTA standards and compliant with ADA. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

S-007-007

MassDOT concurs with the stated MBTA priorities. As described in DEIR/EA Section 3.7, the Project will emphasize low-energy, low-impact, and low-maintenance "green" design.

S-007-008

The conceptual Green Line Extension designs show a two-track configuration at minimum throughout the revenue service alignment.

S-007-009

As presented in both the DEIR/EA and FEIR, it is in accordance with MBTA policy that conceptual designs for the Proposed Project include no at-grade crossings of the Green Line or Commuter Rail tracks.

also the commuter rail line (since the corridor is a shared use corridor) these safety hazards would be magnified. Introducing new crossings creates new safety and operational challenges that the MBTA believes should be avoided.

By way of comparison, the D Line Branch of the Green Line (service to Riverside) is far more comparable to the Somerville extension. Similar to Somerville, that branch was a commuter rail corridor that was converted to light rail in the late 1950's. That corridor has no grade crossings and as such, can reach much higher speeds than the other three surface level branches. These higher speeds are critical to maintaining the headways and throughput that is used on that line. The D Line is also far less prone to service delays since there are no interruptions due to automobiles, pedestrians, etc. Managing the service is much easier on this line, and as a result, service delivery is much better. The MBTA views the Somerville extension as the same type of service. It can be better provided however if there are no grade crossings. .

S-007-010

The MBTA understands that MassDOT will be requesting that the DEIR also serve as the Final EIR. The MBTA strongly supports this request and urges MEPA to require no additional environmental review. The project has been the subject of an extensive public involvement process and that process will continue through the life of the project. The Draft EIR includes a full and complete assessment of the alternatives, including alternatives for the maintenance facility, and a full analysis of the environmental impacts of those alternatives. No additional environmental review issues appear to be left unanswered. The remaining issues, while critical community issues, are not those that are typically addressed in a MEPA process. By allowing the DEIR to serve as the Final EIR, the MBTA and MassDOT can shorten the planning process and move more quickly into advancing the design process. There remain many long lead design issues that the MBTA needs to advance as quickly as possible so as to meet the December 2014 deadline established in the SIP regulation. These long lead items (*e.g.*, signal system design, track design, vehicle procurement, *etc.*) do not result in any new or different environmental impacts, but the MBTA would typically not advance the design until the environmental review process is completed. Reducing the length of time the project is in MEPA will assist the MBTA in meeting the SIP regulation date.

The MBTA appreciates the opportunity to review and comment on this project. Our continued involvement is obviously critical to keep the project on schedule and the MBTA is committed to providing that assistance. If you have any additional questions, please do not hesitate to contact me.

Sincerely,

Andrew D. Brennan
Director of Environmental Affairs

S-007-010

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

Re: EOEEA #13886, Green Line Extension Project

Dear Secretary Bowles:

The Department of Conservation and Recreation ("DCR" or "Department") is pleased to submit the following comments in response to the Draft Environmental Impact Report ("DEIR") submitted by the Massachusetts Department of Transportation ("MassDOT") for the Green Line Extension Project (the "Project"). The filing concurrently serves as the Project's Draft Environmental Impact Statement ("EIS") and Section 4(f) statement under the National Environmental Protection Act ("NEPA").

The Project envisions extending Green Line service using light-rail vehicles from the relocated Lechmere Station through Cambridge and Somerville, ultimately terminating at Mystic Valley Parkway/Route 16 (the "Preferred Alternative"). Phase One of the Project (the "Proposed Project") would construct the Green Line extension to Medford Hillside, while Phase Two is proposed to extend to Mystic Valley Parkway/Route 16. The Project would include construction of new tracks and stations; re-location of existing commuter rail tracks; relocation, removal and/or elimination of freight track rights; reconstruction of bridges; and construction of a maintenance storage facility.

Changes Since EENF

The Certificate for the Expanded Environmental Notification Form ("EENF") was issued in December 2006. Initially, DCR's interest in the Project centered on potential impacts to McGrath Highway and Monsignor O'Brien Highway (previously under DCR's care and control), as well as the proposed terminal station adjacent to DCR's Mystic Valley Parkway/Route 16. However, two notable changes have occurred since the EENF review that will greatly reduce DCR's role in the immediate future of the Project.

S-008-001

First, under transportation reform legislation passed in 2009 (Chapter 25 of the Acts of 2009), and a Memorandum of Understanding executed by DCR and the newly created MassDOT, care and control of various parkways, including McGrath Highway and Monsignor O'Brien Highway, was transferred from DCR to MassDOT. As a result, DCR expects to have minimal involvement in these areas and will not be involved in coordinating activities with the Proponent in these locations.

Second, due to funding constraints, and in order to ultimately implement its Preferred Alternative, the Proponent has divided the Project into two distinct phases. Under Phase One of the Project ("Phase One"), the Green Line would be extended to Medford Hillside near College Avenue, in the vicinity of Tufts University. Phase Two of the Project ("Phase Two") would focus solely on extending the Green Line from College Avenue to Route 16/Mystic Valley Parkway.

Richard K. Sullivan, Jr., Commissioner, Department of Conservation & Recreation

S-008-001

MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses. This will help ensure compliance with legal requirements and, to the extent feasible, consistency with planning and other projects.

EOEEA #13886
Page 2 of 2

Phase Two

S-008-002

DCR requests the Proponent coordinate planning activities for Phase Two of the Project with the Department as significant planning efforts have been undertaken to improve public access and amenities, particularly involving bicycle and pedestrian paths along the Mystic River. In addition to the Mystic Valley Parkway, DCR owns parkland along the Mystic River in the vicinity of the proposed Mystic Valley Parkway station (the "Station"). DCR is constructing a bike path along Alewife Brook adjacent to Route 16 that will link the Minuteman Bike Path and adjacent neighborhoods to the Mystic River. In addition, DCR has developed a Mystic River Reservation Master Plan that makes specific recommendations for improvements from Route 99/Alford Street Bridge to the Mystic Lakes in Winchester, Arlington, and Medford. DCR is pleased the Proponent makes specific reference to these activities in the DEIR and notes the importance of integrating the pathway with the design of the Phase Two station to encourage safe and multi-modal access. DCR recommends the Proponent continue its coordination with the Department when planning Phase Two of the Project, particularly with regard to designing the station to encourage multi-modal transportation.

Prior consultations between DCR and the Proponent assumed the construction of a 300-space parking garage at Mystic Valley Parkway/Route 16. It is DCR's understanding that the Preferred Alternative does not include construction of this garage. Because of such a structure's potential impacts to DCR parkland and parkways, DCR requests that the Proponent consult with the Department regarding the parking garage if the Preferred Alternative is modified to include the 300-space garage.

S-008-003

DCR notes that by separating the Project into two phases, there is a possibility that Phase Two will not separately meet federal cost/benefit criteria for funding. Accordingly, if Phase Two is not funded, and the Phase One interim condition becomes permanent there may be impacts associated with increased vehicular traffic on DCR Parkways if transit users who would have been within walking distance of the Mystic Valley Parkway/Route 16 station now become drop-off users at College Avenue. DCR requests that the FEIR identify any long-term impacts to DCR parkways associated with Phase One in isolation, when compared to implementing Phase Two.

Thank you for this opportunity to comment. If you have questions or need further information regarding traffic impacts to Mystic Valley Parkway, please contact Ken Kirwin at 617-626-1498 or ken.kirwin@state.ma.us. If you have questions or need further information regarding the Mystic River Master Plan or DCR's planned infrastructure improvements along the Alewife Brook and Mystic River corridors, please contact Dan Driscoll at 617-626-1438 or dan.driscoll@state.ma.us.

Sincerely,

Richard K. Sullivan, Jr.
Commissioner

S-008-002

At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues. MassDOT will continue to coordinate with state and local agencies as this phase of the project progresses.

S-008-003

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments. No impacts to DCR Parkways are anticipated from using College Avenue Station as a terminus.

RE: The Green Line Extension Project DEIR/EA EEA#13886

Dear Secretary Bowles:

The Massachusetts Department of Environmental Protection (MassDEP), Bureau of Waste Prevention staff in Boston has reviewed the DEIR/EA submitted by EOT (now MassDOT) regarding the proposed Green Line Extension Project and offers the following comments.

Air Quality Requirements

The proponent identifies the proposed project as Alternative 1. As presented and evaluated in the DEIR/EA, Alternative 1 includes: 1) the Green Line Extension to a College Avenue, Medford terminus using the Fitchburg and Lowell commuter rail right of way; 2) a spur to Union Square in Somerville; and 3) seven new "neighborhood' stations, designed for local bicycle and pedestrian access without commuter parking. The proposed Green Line Extension from Lechmere Station to Medford Hillside and the Green Line Union Square spur of the Green Line are required transit projects pursuant to MassDEP's Transit System Improvements regulation, 310 CMR 7.36, subsection (2) (j) 1. and 2., respectively. Consistent with 310 CMR 7.36, the completion date for the project is December 31, 2014.

Alternative 1 and the analysis contained in the DEIR/EA are consistent with and meet the emission reduction requirements that are required under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the Massachusetts State Implementation Plan (SIP).

This information is available in alternate format. Call Donald M. Gomes, ADA Coordinator at 617-556-1057. TDD# 1-866-539-7622 or 1-617-574-6868.
MassDEP on the World Wide Web: http://www.mass.gov/dep
Printed on Recycled Paper

The DEIR/EA also identifies a second preferred alternative, subject to future funding. The "Future Full Build Alternative 2"contains all the elements of Alternative 1 and includes an extension of the Green Line beyond College Avenue to Mystic Valley Parkway/Route 16. The proponent indicates the preferred alternative was fully evaluated in the DEIR/EA, but is not presently programmed or funded for completion by 2014.

S-009-001 While not required by 310 CMR 7.36, MassDEP strongly supports the proponent's continuing efforts to extend the Green Line beyond College Avenue to Mystic Valley Parkway/Route 16 as soon as funding is secured. MassDEP concurs with the proponent that the Future Full Build Alternative 2 would provide additional regional air quality benefits.

Project Mobile Source Air Quality Analysis

The DEIR/EA included a mesoscale analysis to estimate area-wide emissions of volatile organic compounds (VOC), oxides of nitrogen (NOx), carbon dioxide (CO2), carbon monoxide (CO), and particulate matter (PM10). The DEIR/EA also included a microscale analysis of CO, PM10, and PM2.5 emissions. The air quality analysis compared 2007 No Build conditions with 2030 Build conditions for six project alternatives. The project proponent consulted with MassDEP in the development of the project modeling protocols. The analyses compared area-wide vehicle miles travelled (VMT) reductions based on new ridership projections for each alternative. The 2030 ridership estimate for Alternative 1 project is a result of a shift of existing transit riders from other transit modes and an increase of new transit ridership systemwide. By 2030, ridership for Alternative 1 is estimated at 52,000 daily boardings and alightings at the seven proposed stations, of which 7,900 are new transit trips. This reflects an area-wide reduction in VMT of 25,018.

DEIR/EA Sections 5.6.4 and 5.6.5 describe the model inputs and results for the mesocale analysis for each project alternative compared with the No Build condition. Changes in emissions are based on average daily traffic volumes, roadway lengths, and vehicle emission rates. The mesoscale analysis estimates the proposed Alternative 1 Build condition compared to the No Build condition in 2030 would result in an area wide emissions decrease of 17,115 kg/day for CO2, 7.6 kg/day for VOCs, 4.4 kg/day for NOx, and 0.8 kg/day for PM10.

The results of the microscale analysis for the proposed Alternative 1 Build condition compared with the No Build condition in 2030 were below the applicable National Ambient Air Quality Standards (NAAQS) for CO, PM10, and PM2.5.

Layover/Maintenance Facility

MassDEP recognizes the necessity for a layover and maintenance facility to support the proposed project. The DEIR/EA has identified the Yard 8 site as the preferred layover and maintenance facility. However, the project proponent is aware of Somerville's concerns for this
S-009-002 particular site and is exploring alternate sites nearby. MassDEP recommends that the proponent and the City continue working together to achieve an acceptable solution and to keep the project on schedule.

S-009-001

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

S-009-002

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

Community Paths

S-009-003 As required by the MEPA Certificate, the DEIR/EA contained conceptual designs for the Somerville Community Path and a feasibility study for the Medford Community Path. The Community Paths would provide important bicycle and pedestrian linkages to the project that would likely increase transit ridership resulting in greater air quality benefits. Therefore, MassDEP recommends that the proponent and the Cities of Somerville and Medford continue working together to coordinate Path design and construction where feasible.

Construction Air Quality

S-009-004 The proponent has committed to require all project contractors to install after-engine emission controls such as diesel oxidation catalysts (DOCs) or diesel particulate filters (DPFs). MassDEP commends the project proponent for committing to install these devices to reduce diesel engine emissions. MassDEP's guidance document, "Diesel Engine Retrofits in the Construction Industry – A How to Guide", is available on MassDEP's website at http://www.mass.gov/dep/air/diesel/conretro.doc.

The proponent has committed all project contractors to use low sulfur diesel (LSD) fuel while 15-ppm fuel is referred to as ultra-low sulfur diesel (ULSD) fuel as required in 2010.

Compliance with the Massachusetts Idling Regulation

S-009-005 The proponent is committed to posting idling restriction signs on project construction sites to remind all drivers, construction workers, and delivery personnel of MassDEP's idling regulation, 310 CMR 7.11. This regulation prohibits motor vehicles from unnecessarily idling their engines more than five minutes. MassDEP recommends the proponent provide MBTA employee training and MBTA Police enforcement of the regulation on all MBTA property. Questions regarding this regulation should be directed to Julie Ross of MassDEP at 617-292-5958.

The MassDEP appreciates the opportunity to comment on this proposed project. Please call or contact Jerome.Grafe@state.ma.us, 617-292-5708 if you have any questions.

Sincerely,

Christine Kirby
Acting Division Director,
Division of Consumer and Transportation Programs

S-009-003

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

S-009-004

Construction impacts of the Project are described in each environmental resource section in DEIR/EA Chapter 5, Environmental Consequences. Construction contractors will be required to comply with relevant federal, state, and local laws, regulations, and codes to eliminate or minimize adverse effects (such as noise and vibration levels, and traffic flow) to environmental and social resources. As stated, all project construction contractors will be required to use low sulfur diesel fuel.

S-009-005

Please see response to Comment S-009-004.

RE: Somerville, Medford,
Cambridge
Green Line Extension
EEA # 13886

Attn: MEPA Unit

Dear Secretary Bowles:

The Department of Environmental Protection has reviewed the Draft Environmental Impact Report submitted by the Massachusetts Department of Transportation (MassDOT) to extend the Green Line mass transit service from the relocated Lechmere Station in Cambridge to the Medford Hillside section of Medford (EEA# 13886). The rail corridor, which would serve the region's most densely populated communities, is proposed along 4.4 miles of railroad right-of-way, following the Lowell commuter rail line to Medford, and the Fitchburg commuter rail line to Union Square in Somerville. The project requires the construction of about four miles of light rail track; new signal, communications, and electrical systems; relocation of existing commuter rail lines; four multi-span viaducts; station platforms; a maintenance/storage facility; traction power substations; an overhead catenary system, and reconstruction of 11 bridges. A relocated Lechmere Station and layover/maintenance facility also are proposed. The Department provides the following comments.

The DEIR also is a federal Environmental Assessment and 4(f) Statement that evaluates six alternatives, including the proposed project, (Alternative 1), from a relocated Lechmere Station to Medford Hillside and Union Square, via the MBTA Fitchburg Line right-of-way, and MassDOT's preferred alternative, (Alternative 2), from a relocated Lechmere Station to Mystic Valley Parkway/Route 16 and Union Square (using commuter rail rights-of-way). Because of funding limitations, the project will be constructed in two phases, Alternative 1 by 2014 and the remaining rail line from College Avenue Station to Mystic Valley Parkway/Route 16 would be constructed at a future date. The project includes seven rail stations; five new stations are proposed at Brickbottom, Gilman Square, Lowell Street, Ball Square, and College Avenue.

Massachusetts Contingency Plan (MCP)/M.G.L. Chapter 21E

S-010-001

Due to the fact that soils along the proposed right-of-way have not been pre-characterized, the proposed frequency of sampling, i.e., every 500 cubic yards, would be

This information is available in alternate format. Call Donald M. Gomes, ADA Coordinator at 617-556-1057. TDD# 866-539-7622 or 617-574-6868.
http://www.mass.gov/dep • Fax (978) 694-3499
Printed on Recycled Paper

S-010-001

An analysis of hazardous materials potentially present within the Green Line Extension Study Area is provided in DEIR/EA Section 5.14, Hazardous Materials. Additional investigation may be conducted during the next phases of the Project to determine the nature and extent of any contamination and remediate any sites as appropriate. This work would be conducted in accordance with the Commonwealth's Massachusetts Contingency Plan requirements.

S-010-001 inadequate. From the DEIR, it appears that only the stockpiles generated during excavation would be sampled. There is no mention of sampling prior to excavation, or confirmatory samples of contaminants that may remain on site in the excavation pit. Without up front sampling, it will be difficult, if not impossible, to determine whether there would be the potential for public or worker exposure to harmful contaminants during excavation. Pre-characterization of the soils also is done to identify the suite of contaminants to be sampled. According to the DEIR, asbestos is not listed as a contaminant to be sampled, even though the rail line traverses an old residential neighborhood. It should be.

S-010-002 If no pre-characterization of the soils is planned along the Green Line extension corridor, MassDEP recommends sampling of every 200 cubic yards of soil, including both the piles and in-situ sampling. In addition, confirmatory samples need to be taken. Issues related to the soil sampling need to be addressed prior to the 50 percent design stage of the project, and MassDEP recommends that MassDOT contact MassDEP for consultation on this and other issues raised in this comment, if the FEIR will be submitted at a later stage of design.

S-010-003 MassDEP was unable to find information on soils disposal offsite in the hazardous materials sections of the DEIR. Specific locations for disposal need to be identified and arrangements for disposal must be completed prior to excavation. There also is no explanation of how the soils will be identified and categorized for offsite disposal or re-use on site. Work relating to disposal of the soils is included in the MCP process that must be completed, and related information needs to be submitted to MassDEP, prior to 50 percent design.

S-010-004 The DEIR is silent on how MassDOT plans on notifying MassDEP of reportable concentrations under the MCP. Is this going to be handled as a special project, rather than on a site-by-site basis? MassDEP recommends that the proponent consult with the Department on development of a plan for the notification and close-out issues relating to this project.

S-010-005 In addition, MassDOT needs to develop a plan for groundwater dewatering, irrespective of whether it is contaminated or not. The DEIR statement that a 21,000 gallon holding tank would be used for dewatering is insufficient.

Lastly, the FEIR should clarify the soil clean up that will be achieved. As written in the DEIR, it is not clear what volumes and percentages of the soils will be removed or reused, and the language used suggests that the clean up of contaminated soils would be complete.

Stormwater

According to the DEIR, stormwater from the Green Line track system runs off into ditches and underdrains which convey flow to storm sewers with outfalls into the Mystic and Charles Rivers. These rivers are classified as a Category 5 impaired waterbody on the Massachusetts 2008 303(d) List of Impaired Waterbodies.[1] Both rivers have multiple impairments in the reaches near the project site. Among the pollutants causing impairment are pathogens, low dissolved oxygen, oil and grease, nutrients, total phosphorus, and others in the Charles River; and pesticides, priority organics, inorganics, metals, nutrients, and pathogens,

[1] The Massachusetts 2008 303(d) List of Impaired Waterbodies is available at the following website: http://www.mass.gov/dep/water/resources/08list2.pdf.

S-010-002

MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses. This will help ensure compliance with legal requirements and, to the extent feasible, consistency with planning and other projects.

S-010-003

Please see response to Comment S-010-001.

S-010-004

Please see response to Comment S-010-002.

S-010-005

The need for groundwater dewatering will be determined during preliminary engineering, and an appropriate plan made at that time if necessary. An analysis of hazardous materials potentially present within the Green Line Extension Study Area is provided in DEIR/EA Section 5.14, Hazardous Materials. Additional investigation may be conducted during the next phases of the Project to determine the nature and extent of any contamination, and remediate any sites as appropriate. This work would be conducted in accordance with the Commonwealth's Massachusetts Contingency Plan requirements.

unionized ammonia, low dissolved oxygen, pathogens, oil and grease, and other pollutants in the Mystic River. Currently, total Maximum Daily Loads (TMDL) have been prepared for the Charles River to address some of the pollutants from point and nonpoint sources, which are causing water quality impairments.

S-010-006

A general approach to stormwater management for the Green Line project is described in the DEIR, which is at a conceptual stage of design. It is requested that the FEIR expand upon the conceptual plans and analysis of stormwater controls to the extent feasible to demonstrate that the drainage system would satisfy the Massachusetts Stormwater Standards, which MassDOT is committed to do, and also achieve requisite USEPA NPDES permit obligations, including MS4 requirements to implement construction site runoff controls, post-construction runoff controls, and pollution prevention/good housekeeping measures, in addition to addressing any applicable Total Maximum Daily Load (TMDL) requirements, which have been established for the Charles River Basin.

The DEIR indicates that a Stormwater Pollution Prevention Plan (SWPPP) will be prepared prior to construction and that it will include an update to the operations and maintenance plan. The FEIR should assess requirements for coverage under the EPA's NPDES General Permit for Stormwater Discharges from Construction Activities, (Construction General Permit or (CGP)), which controls discharges of pollutants from the site, in order to ensure consistency with the assumptions and requirements of the EPA TMDLs for the Charles River. The SWPPP will need to document the measures being taken to ensure consistency with the TMDLs. The TMDLs for the Charles River Basin are available on the MassDEP website: http://www.mass.gov/dep/water/resources/tmdls.htm.

S-010-007

The DEIR indicates that new train station roof drains would be connected to trunk lines, (page 5-143). However to avoid contributing drainage from some of the new stations, including Brickbottom, Lowell Street, and Gilman Square into combined sewer overflows, MassDEP recommends that station drainage be infiltrated or controlled onsite with low impact development techniques, (e.g., green roofs and/or bioretention basins/rain gardens), where siting is feasible considering soil conditions and contamination levels.

To control drainage in the vicinity of most of the station areas and the maintenance facility, the DEIR indicates that infiltration and/or detention systems would be used. The FEIR should evaluate the feasibility of using unlined infiltration or detention systems, taking into consideration soil and groundwater conditions and contamination levels. The use of an under drain system within the rail ballast also should be evaluated in greater detail to explain how water quality will be controlled, particularly in areas of soil and groundwater contamination.

The MassDEP appreciates the opportunity to comment on this proposed project. Please contact Iris.Davis@state.ma.us, at (978) 694-3399 for additional information on waste site cleanup issues and Jerome.Grafe@state.ma.us, at (617) 292-5708 for air quality issues. If you have any general questions regarding these comments, please contact Nancy.Baker@state.ma.us, MEPA Review Coordinator at (978) 694-3338.

S-010-006

As described in DEIR/EA Section 5.9, the Project would be required to comply with federal and state stormwater discharge permit requirements during both the construction and operational phases. Compliance with these standards would include using Best Management Practices to prevent contamination of stormwater and control erosion and accretion (sedimentation) from stormwater runoff from the railroad alignment, stations, and maintenance facility.

S-010-007

The DEIR/EA and FEIR include only conceptual Project designs. Designs for each station, the storage/maintenance facility, and the entire project alignment will be refined during the Project's preliminary engineering stage. Drainage from each site will be considered at that time.

Sincerely,

John D. Viola

RE: Green Line Extension, Cambridge, Somerville, Medford, MA. MHC # RC.40762. EEA# 13886.

Dear Mr. Doyle:

Staff of the Massachusetts Historical Commission (MHC) have reviewed the Draft Environmental Assessment/Environmental Impact Report (DEIR/EA) And Draft Section 4(f) Evaluation, received October 16, 2009, for the project referenced above and have the following comments.

MHC understands that the preferred project alternative by FTA, Alternative 1, is the Green Line extension to Medford Hillside and Union Square using the existing Massachusetts Bay Transportation Authority (MBTA) Fitchburg right-of-way. However, the Massachusetts Executive Office of Transportation (EOT) has proposed Alternative 2, the Future Full-Build Alternative, Green Line extension to Mystic Valley Parkway/Route 16 and Union Square, as its preferred alternative, to be constructed in two phases.

S-011-001 The DEIR/EA considers identified historic and archaeological resources for the full-build Alternative 2. MHC requests that FTA, in consultation with EOT and this office, complete identification, evaluation and consultation to avoid, minimize or mitigate adverse effects to significant historic and archaeological resources under 36 CFR 800 for the complete undertaking. A programmatic Memorandum of Agreement (MOA) (36 CFR 800.4(b)(2)) to guide future review of potential effects to historic and archaeological resources within EOT's preferred full-build alternative may be considered.

MHC notes that the FTA has developed a draft MOA (Appendix J) for mitigation of adverse effects to the existing Green Line Lechmere Station and Viaduct, listed in the National Register of Historic Places, for which demolition is proposed. MHC has previously reviewed the Lechmere Viaduct rehabilitation (MHC # RC.9602), relocation of the Lechmere Station (MHC # RC.3250) and the North Point development project (MHC # RC.29928, EEA#12650) in 2006 through 2008, for which archaeological survey has been conducted. In MHC's opinion, the development of an MOA prior to the FTA's findings of effect pursuant to Section 106 of the National Historic Preservation Act (36 CFR 800) is premature. The MHC requests that the FTA make a finding of effect and summarize alternatives considered as part of on-going state level environmental review.

www.sec.state.ma.us/mhc

S-011-001

Section 5.13.2.3 of the DEIR/EA describes the impacts to historic and archaeological resources that would result from extending the Green Line from College Avenue Station to Mystic Valley Parkway/Route 16 Station. However, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. Accordingly, the Proposed Project will not impact historic or archaeological resources in that segment. MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses. MassDOT will continue to work with FTA and MHC to ensure compliance with NHPA requirements. As noted in the Massachusetts Historical Commission letter of August 5, 2009, a copy of the MBTA Green Line Extension Project Historic and Archaeological Resources Reconnaissance Survey, Cambridge, Medford, and Somerville, Massachusetts was received from FTA on July 10, 2009.

S-011-002 The MHC met with the Cambridge Historical Commission and MBTA representatives in May of 2008 to discuss effects to the Viaduct. Please see MHC's correspondence of 5/22/2008 (see enclosed) for MHC's specific recommendations concerning the Viaduct. Any MOA language should incorporate this recommendation.

S-011-003 Archaeological resources within archaeologically sensitive areas of the full-build project area of potential effect have not yet been identified or evaluated according to the Criteria of Eligibility (36 CFR 60). MHC requests that an intensive (locational) archaeological survey (950 CMR 70) be conducted for those archaeologically sensitive portions of the full-build Alternative 2, including the 24/30 Joy Street, Yard 8 and Middlesex Canal areas, as identified in DEIR/EA Section 5.13.3.2, page 5-155, and the 2009 PAL technical reconnaissance report.

These comments are offered to assist in compliance with Section 106 of the National Historic Preservation Act of 1966, as amended (36 CFR 800), Massachusetts General Laws, Chapter 9, Sections 26-27C (950 CMR 70-71) and ~~MEPA (301 CMR 11). If you have questions or require additional~~ information please contact Jonathan K. Patton at this office.

Sincerely,

RE: Lechmere Viaduct Rehabilitation, Phase II, Cambridge; MHC# 9602

Dear Ms. Palmgren:

Thank you for meeting with staff at the Massachusetts Historical Commission and the Cambridge Historical Commission on May 20, 2008 for a preliminary discussion of design alternatives for rehabilitation of the steel spans of the Lechmere Viaduct.

Project managers for the rehabilitation presented materials pertaining to reinforcement of the viaduct using an option of all steel and an option of concrete encasement. It was agreed that the MBTA should further refine the concrete encasement option because the steel reinforcement option presented a major visual intrusion and may be difficult and costly to execute from an engineering standpoint.

MHC looks forward to receiving further information as it develops. As we agreed at the meeting, project engineers will pay close attention to resolving the termination of the concrete encasement so that it does not obscure the arches. The MBTA will also do further investigation to determine the viaduct's original paint color for use in selecting a new scheme when the viaduct is repainted.

These comments are offered to assist in compliance with M.G.L. Chapter 9, Section 26-27C, as amended by Chapter 254 of the Acts of 1988 (950 CMR 71.00) and Section 106 of the National Historic Preservation Act of 1966, as amended (36 CFR 800). Please contact Ann Lattinville of my staff if you have additional questions.

Sincerely,

Brona Simon

Subject: Draft Environmental Impact Report #13886
Green Line Extension Project, Cambridge, Somerville and Medford

LATE COMMENT

Dear Secretary Bowles:

The Massachusetts Water Resources Authority (MWRA) appreciates the opportunity to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension Project. The Massachusetts Department of Transportation (Mass DOT) is planning to extend the Green Line to improve transit service, mobility and regional access for residents and visitors of Cambridge, Somerville, and Medford.

MWRA's comments focus on issues related to 8 (m) permitting, Non MWRA Wastewater Flows and Discharge Permitting through the Toxic Reduction and Control (TRAC) Group.

8 (m) Permitting

Section 8 (m) of Chapter 372 of the Acts of 1984, MWRA's Enabling Legislation, enables the MWRA to issue permits to build, construct, excavate, or cross within or near an easement or other property interest held by the MWRA, with the goal of protecting Authority-owned infrastructure. MWRA staff has determined that the impacts of the proposed plan (preferred route, stations and maintenance facility alternatives) should have minor or no impact to above ground MWRA wastewater facilities. All three alternative sites for the maintenance facility are remote from MWRA facilities (water or sewer), although one end of the very long and narrow project area for the "Mirror H" alternative comes close to major MWRA underground conduits immediately upstream of the Prison Point CSO Facility. There are no above ground MWRA wastewater facilities near any of the proposed stations along the entire Green Line Extension and Union Square Spur.

S-012-001

However, there is only one location where the proposed Green Line Extension will cross over an MWRA sewer (the Cambridge Branch Sewer at the intersection of Poplar Street and Joy/Chestnut Street in the Brickbottom section of Somerville) and one location where the proposed Union Square Spur will cross over a MWRA sewer (Cambridge Branch Sewer at Medford Street near the Somerville/Cambridge line). An MWRA 8 (m) permit will be needed for these areas if these locations are part of the final plan. The list of required permits on page ES-49 of the DEIR Executive Summary should include MWRA 8(m) permit/s, which will be required for any at grade water and sewer crossings.

S-012-001

MassDOT will coordinate with utilities providers to minimize impacts to existing utility lines. Utilities on bridges identified for reconstruction would be rebuilt with the bridges. An MWRA 8(m) permit will be secured if required.

S-012-002 We encourage the Project Proponent and their consultants to meet with MWRA staff to review design and engineering plans as early as reasonably possible. Staff at DOT should contact Mr. Kevin McKenna within MWRA's Wastewater Permitting Group at (617) 305-5956 for permitting assistance and coordination.

Non-MWRA Wastewater Flows

S-012-003 The component of the project deserving most attention relative to MWRA's wastewater system is the maintenance facility at any of the alternative sites near North Point. While we don't have wastewater infrastructure in the immediate area, careful attention needs to be paid to non-MWRA sewers and storm drains and flows to our facilities. The area suffers from chronic flooding, and we believe the extensive drainage systems cutting through the North Point area to Millers River are in poor shape, at best. Sewer and stormwater plans for the alternative that is finally selected need to be reviewed by MWRA carefully when they become available, in part for any impacts to the dry weather and wet weather flows to the Prison Point CSO Facility.

Discharge Permitting

S-012-004 MWRA prohibits the discharge of groundwater or stormwater to the sanitary sewer system pursuant to 360 CMR 10.023(1) except in a combined sewer area when permitted by MWRA and the municipality. Any plans to discharge construction related groundwater or stormwater to the MWRA sewer system or MWRA CSO system, i.e. Prison Point, will require that the Proponent obtain a discharge permit from MWRA or an NPDES permit from the Environmental Protection Agency. For assistance on this issue, the Proponent and/or Contractor should contact Thomas Coffey, Industrial Coordinator within MWRA's TRAC Group at (617) 305-5624.

S-012-005 If the Proponent intends to install gas/oil separators in its garage structure, they must also comply with 360 C.M.R. 10.016 and with the regulations of the Board of State Examiners of Plumbers and Gas Fitters, 248 C.M.R. 2.00 (State Plumbing Code), and all other applicable laws. The installation of the proposed gas/oil separators will require MWRA approval and may not be back filled until inspected and approved by the MWRA and the Local Plumbing Inspector. Peter Yarossi, MWRA, Regional Manager within the TRAC Group can assist in this permit and can be reached at (617) 305-5671.

Should you have any questions or need additional information on these comments please feel to contact me at (617) 788-1165.

Sincerely,

Marianne Connolly

S-012-002

MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses. This will help ensure compliance with legal requirements and, to the extent feasible, consistency with planning and other projects.

S-012-003

As described in DEIR/EA Section 5.9, the Project would be required to comply with federal and state stormwater discharge permit requirements during both the construction and operational phases. Compliance with these standards would include using Best Management Practices to prevent contamination of stormwater and control erosion and accretion (sedimentation) from stormwater runoff from the railroad alignment, stations, and maintenance facility. During preliminary engineering, MassDOT will coordinate with MWRA on sewer and stormwater plans for the storage and maintenance facility.

S-012-004

MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses. This will help ensure compliance with legal requirements and, to the extent feasible, consistency with planning and other projects.

S-012-005

Please see response to Comment S-012-004.

RE: Green Line Extension Project DEIR/EA, MEPA #13886

Dear Secretary Bowles:

The Metropolitan Area Planning Council (MAPC) regularly reviews proposals deemed to have regional impacts. The Council reviews projects for consistency with *MetroFuture*, the regional policy plan for the Boston metropolitan area, MAPC's Smart Growth Principles, and the Commonwealth's Sustainable Development Principles, as well as for their impacts upon the environment. MAPC has reviewed the Draft Environmental Impact Statement (DEIR) and offers the following comments.

L-001-001

MAPC strongly supports expansion of public transit services in the project area and the timely completion of this State Implementation Plan (SIP) commitment. The Green Line project, as proposed, will improve mobility for residents and businesses in the corridor and reduce auto trips and emissions. The project can be even further improved by providing good access for walkers, bicyclists, and transit riders by using the stations to knit the communities together. It can also promote transit-oriented development while preserving affordability. And it can ensure significant benefits accrue to the current Environmental Justice (EJ) communities in this corridor. The DEIR provides a good starting point to address some of these issues, and we commend MassDOT staff and their consultants for their hard work in its preparation.

L-001-002

We do not believe that a final EIR is necessary because of complete analysis and significant agreement on many issues. However, since some additional planning remains to resolve outstanding issues, many of which could affect overall project cost, we believe either a Supplemental DEIR (SDEIR) is necessary to provide the additional information or a new legally binding agreement between the Secretaries of DOT and EEA be established. This agreement should either address, or lay out a process to address all the issues raised in this letter, many of which are likely to be raised in other comment letters to this DEIR. The development of such a SDEIR or agreement should run concurrently with other efforts to move the project forward, and should not delay either an application for federal New Starts funds, or the eventual completion of the project by the 2014 deadline.

Jay Ash, *President* Michelle Ciccolo, *Vice President* Grace S. Shepard, *Treasurer* Marilyn Contreas, *Secretary*
Marc D. Draisen, *Executive Director*

L-001-001

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

L-001-002

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

L-001-003 We believe there needs to be a final decision on the maintenance facility location as part of the SDEIR or agreement. MassDOT has proposed the Yard 8 site as its preferred location for the maintenance facility, but community opposition to that location has been very strong, based on quality of life and economic development concerns. In response, MassDOT in December analyzed two additional maintenance facilities, known as Mirror H and Option L. Based on that analysis, plus subsequent public comment, we believe Option L should be designated the preferred alternative. Future MEPA documents should include additional analysis of Option L as proposed—with variations on that design, as well as the adjacent Boston Engine Terminal site—to identify the location and design with the minimum impact on the community and the minimum total cost.

L-001-004 MassDOT has called the Green Line Extension to Route 16/Mystic Valley Parkway terminus (Alternative 2) their preferred alternative, but the proposed project identified in this DEIR (Alternative 1), and the one that will be proposed for the federal New Starts application, will end at College Avenue. The DEIR analysis clearly shows the benefits of extending to Route 16, including 1,700 additional new transit riders per day (4,000 additional total riders at the station, without parking), with their concurrent reductions in greenhouse gases and other pollutants. A Route 16 terminus will also provide much better access for residents of West Medford, Arlington, Winchester, and beyond who will wish to ride the Green Line.

L-001-005 We believe the project benefits have also been understated by the failure of MassDOT to include the Community Path Extension as part of the project, and by their refusal to consider changes to the existing bus network until after the project is open. As shown at Davis Square, the Community Path is one of the primary connections to the surrounding neighborhoods and will likely lead to significant ridership increases. Similarly, since the

L-001-006 project will not encourage auto access, access to the stations from surrounding communities and distant parts of the project communities will have to come via other transit services. Designing the stations with efficient feeder bus service and bus stops at the stations should also significantly increase ridership.

L-001-007 We do not believe, as asserted in the DEIR, that "no substantial neighborhood effects are expected under the proposed alternatives (S-008-012)". Change around new transit stations is well documented and inevitable, but this change need not reduce affordable housing nor have a negative impact on the existing neighborhoods, many of which are located in Environmental Justice communities. We therefore recommend a corridor planning analysis, to identify and plan for these changes.

The Secretary's Certificate required EOT to "develop a more detailed corridor study to examine zoning, development opportunities (including the potential for air rights development to create open space or playing fields or affordable housing), the relationship

L-001-003

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

L-001-004

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

of EJ communities to the project and potential and existing transit connections". This corridor study was not part of the DEIR.

MassDOT should pursue these corridor plans jointly with the communities to anticipate these changes and to identify strategies that promote positive outcomes. Community fears of change should be dealt with proactively with a plan of action. This corridor planning effort should be part of the SDEIR or agreement.

L-001-008

Fortunately, Somerville has already done much of the necessary planning in Union Square, and is in the process of developing a Comprehensive Plan for the entire community. The East Cambridge Planning Team has completed similar work for the new Lechmere station area. To avoid duplicative efforts, the results of these community-led processes, plus needed future work in Medford as part of the SDEIR or agreement, should be incorporated into all future station location and design work. MAPC has participated in similar work for the South Coast Rail project and in the Route 128 and I-495 corridors and stands ready to provide assistance to MassDOT and the communities.

There are also a number of details missing from the DEIR that should be included in the SDEIR or agreement.

L-001-009

1. Very little detail on the costs of alternatives was provided in the DEIR, just total costs. A full accounting of the costs of different project components, including necessary mitigation, will allow a true comparison of costs versus benefits for each option considered. For the maintenance facility options, mitigation of noise and vibration impacts may make Option L the least costly option, while alternative designs for Option L or the use of the Boston Engine Terminal site could reduce Right of Way costs. The Option L alternative may also allow the MBTA to sell some of the existing property it owns on the Yard 8 and Mirror H sites. The costs for additional sound barriers and traffic mitigation should weigh against the ridership and environmental benefits of extending the Green Line to Route 16. Alternative station designs that have been proposed could also have significant impacts on costs.

L-001-010

2. None of the stations will have new parking, and all of the stations are intended to have good walk, bike, and bus access. Yet none of the station designs include bus pullout areas and all allow for auto drop off and pick up. We believe these priorities are reversed. All stations, with the possible exception of Lowell Street, should have areas where bus passengers can be dropped off and picked up (including waiting areas), and none should have accommodations to encourage people to drive to the stations. All stations accessible from the Community Path should have easy connections built right into their design, and all stations should have at-grade walk

L-001-005

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

L-001-006

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

L-001-007

Direct and indirect impacts to land use are described in DEIR/EA Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for sustainable land use, which could further reduce automobile traffic congestion and improve air quality. As described in the FEIR, Section 6.2 of the Public Involvement Plan, MassDOT will hold land use workshops to discuss related issues with the community.

L-001-010

connections to the surrounding neighborhoods from multiple locations. And the proposed Brickbottom Station is more appropriately located directly off Washington Street, with direct pedestrian connections to both the Inner Belt and Brickbottom areas of Somerville. These improved station connections should all be proposed and evaluated in the SDEIR or agreement.

L-001-011

3. Perhaps the best way to develop these better station designs would be through station subcommittees, with MassDOT working collaboratively with city and neighborhood representatives to look at multiple options that improve access and reduce costs. These subcommittees would also be where local land use plans, developed in the community-led corridor process described above, are tied directly to appropriate station access plans. The collaborative subcommittee model should also be employed for the maintenance facility, for the Community Path design, and for any other issues where consensus building and technical evaluations are required. Station subcommittees are now being used successfully around the country on other transit extension projects, and what is proposed here is similar to what is currently being done for the South Coast Rail project. The Advisory Committee that met during the DEIR development was helpful for evaluating corridor-wide alternatives, but for the public participation process of the SDEIR or agreement we believe the Secretary should require the more focused subcommittee approach. This approach, however, should not be allowed to delay the overall project scheduled, and, properly done, may actually save time in producing final station designs.

L-001-012

4. Replacement parking (234 spaces) is proposed at Lechmere station. The justification for these spaces in the Green Line Extension project is not included in the DEIR; their necessity is simply assumed. While parking may have been necessary when Lechmere was the northernmost terminus on the Green Line, it is no longer clear what market will be served by this parking. Eliminating this parking will reduce the overall project costs and provide additional surplus land for the MBTA to sell in a prime development area, in addition to reducing auto trips and greenhouse gases. An examination of how many spaces, if any, will be used at Lechmere by Green Line riders should be part of the SDEIR or agreement.

L-001-013

5. Traffic mitigation is proposed at six intersections, but these seem to be a mix between changes required to improve pedestrian access to stations and "mitigation" for traffic increases caused by the project. Intersection improvements needed for good access should be part of the project costs. Station designs that do not encourage drop off and pick up should not result in additional traffic, reducing the need for mitigation. It is particularly unclear why mitigation is proposed at Boston Avenue and Winthrop Street in Medford, a

MassDOT and the MBTA conducted a series of public workshops to gather input on land use and facility design issues from the communities. The workshops were organized around facility locations or groups of locations. All were well-advertised, open to the public and in accessible venues.

L-001-008

MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses. This will help ensure compliance with legal requirements and, to the extent feasible, consistency with planning and other projects.

MassDOT has reviewed the suggestions submitted by the East Cambridge Planning Team. Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. These plans, including the pedestrian crossings of O'Brien Highway and associated street, crosswalk, and sidewalk designs will be further refined in the preliminary engineering stage of the Project. MassDOT intends to demolish the existing station and prepare the site for future reuse. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement throughout the Project design process.

L-001-009

Project cost estimates are based on the current, conceptual level of design, and will be further refined as the Project progresses through preliminary engineering. FEIR Chapter 2, Maintenance Facility Alternatives Analysis, provides order-of-magnitude cost estimates for constructing a maintenance facility at the three alternative sites.

L-001-013 location not particularly close to any proposed station where the design (widening by removing 12 parking spaces) is likely to be controversial.

L-001-014 6. No mitigation is proposed near two stations, Route 16/Alewife Brook Parkway and Lechmere, with the worst traffic conditions in the corridor. The Lechmere omission is based on the North Point project taking care of the mitigation. Since the North Point project is currently stalled, and its future mitigation commitments unclear, and since the existing East Cambridge community cannot safely access the relocated Lechmere station without significant upgrades to pedestrian accommodations across and along O'Brien Highway, these upgrades and their costs need to be identified in the SDEIR or agreement and included in the project. If, as recommended, the Route 16 station is the terminus of the project analyzed in the SDEIR or agreement, then safe pedestrian crossing of Route 16 and traffic accommodations to allow efficient feeder bus access to the station should also be included in the document and the project cost.

L-001-015 7. During the development of the DEIR, EOT made a commitment to complete 100% design of the Community Path, without a commitment to pay for construction. There is no mention of this commitment in the Section 61 Findings or anywhere else in the DEIR documents. As mentioned above, we believe that the Community Path should be part of the Green Line Extension project, and costs included in the federal New Starts application. The FTA has recently proposed a policy that "pedestrian improvements located within one-half mile and all bicycle improvements located within three miles of a public transportation stop … may be eligible for FTA funding".[1] The Purple Line project in Washington DC and the Expo Line is Los Angeles both have bike paths as part of their rail projects. The commitment to design should be incorporated into the Section 61 Findings, and the design work should continue concurrent with the SDEIR or agreement. If New Starts funding for the path is not received, then MassDOT should immediately apply to the Boston Region MPO for Enhancements or CMAQ funding to insure that funds are in place to build the Path and the rest of the Green Line Extension simultaneously.

L-001-016 8. As part of a more detailed corridor study, MassDOT should coordinate with other planned transportation projects in the corridor, including the Urban Ring and the reconstruction of Route 28/McGrath Highway, which was another requirement for the DEIR. Analysis in the DEIR focused on whether the Green Line project plans would preclude these other projects. We believe the SDEIR or agreement should take the Secretary's "planned in conjunction" phrasing to heart. The Urban Ring, Phase II or Phase III, will share the same general North Point/Brickbottom area,

[1] Federal Register: November 13, 2009 (Volume 74, Number 218), Page 58678-58681.

L-001-010

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

L-001-011

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project. As stated in Section 6.4, MassDOT and the MBTA will convene a Green Line Extension Design Working Group. This group will advise the agencies on design workshops, participate in the workshops and serve as a corridor advisory group during design.

L-001-012

Although Lechmere Station will no longer function as a terminal station, there is still a demonstrated demand for existing parking. Nonetheless, parking at the relocated Lechmere Station was reduced in the revised conceptual design. These revised plans are included in FEIR Chapter 5, Lechmere Station.

L-001-013

Traffic signal timings for pedestrians would require updating to reflect the latest ADA guidance regardless of whether the proposed project were in

and there should be an examination in the SDEIR or agreement of the potential for cost saving/sharing of track, stations, and other project elements. The location and design and cost of the maintenance facility may also be impacted by Urban Ring considerations.

Current Green Line project designs assume the Route 28/McGrath Highway viaduct will remain as is. While there is not yet a project under design, there is widespread support in Somerville for replacing the viaduct with an "urban boulevard". There is also a need for new roadway access to the Inner Belt area. These roadway projects will require several crossings of the Green Line tracks, and design alternatives that make sure these roadway projects are not precluded, and the cost implications of these alternatives, should also be evaluated in the SDEIR or agreement.

9. Finally, the public health implications of ultra-fine particulates (UFPs) have become much better understood since the time of the original EENF filing. There are health risks from emissions from diesel trains, especially for children, older adults, and those with underlying respiratory and cardiovascular problems. A growing body of epidemiologic literature has linked UFPs to asthma and adverse cardiovascular outcomes. Distance from the emission source is directly related to severity of impact. Solutions to these public health problems will require state and federal action, from regulatory relief to electrification of diesel trains. The Green Line itself will not emit significant UFPs, but the project will require some sections of the commuter rail tracks to be moved closer to some residences and perhaps some other at-risk populations. Those that have been moved closer should be identified in the SDEIR or agreement, and appropriate mitigation should be added to the project costs.

L-001-017

We understand that expanding the project definition as we suggested to include a new maintenance facility location, a Route 16 endpoint, and the Community Path Extension will increase the total project cost. But we believe that the benefits in increased ridership, improved air quality and public health will make this expanded project much more likely to win federal New Starts funding, which will save the Commonwealth hundreds of millions of dollars in the long run. In addition, we have heard many public comments on how different station designs could reduce project costs, including designs that would reduce the need for most property takings at the Route 16 station and the Option L site. We believe that a careful examination of the best of these comments may also allow cost reductions, which will further increase the chances of New Starts funding.

We believe that this new project definition, and the enhanced public collaboration process that would go with it, are consistent with Secretary Mullan's new paradigm for an efficient, entrepreneurial MassDOT. The communities of Medford, Somerville, and

place. MassDOT is committed to ensuring timing updates occur prior to service implementation to provide the best possible access to stations by alternate transportation means.

The proposed improvements at Boston Avenue and Winthrop Street are recommended to offset a direct impact of the Project. The existing geometry and projected left-turn traffic at the intersection cause level of service to degrade between the No-Build and Build condition.Through the preliminary engineering process, MassDOT will work closely with the City and local stakeholders to progress design plans at this intersection to reduce parking impacts to the extent possible.

L-001-014

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project.Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. The chapter presents a traffic analysis, a detailed description of pedestrian crossings of O'Brien Highway, and proposed roadway, crosswalk, and sidewalk improvements that are consistent with the NorthPoint development plans. These station and street plans will be further refined in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

L-001-015

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

L-001-018

Cambridge contain a wealth of ideas and expertise, much of it now focused on getting the best Green Line project possible. We suggest MassDOT collaborate with these communities, testing ideas, revising plans, and refining costs, in a spirit of finding the best solutions. The outcome should be a better project and perhaps even a reduced cost, without delaying the project opening beyond its required completion of December 31, 2014.

Thanks you for the opportunity to comment on this important project.

Sincerely,

Marc D. Draisen
Executive Director

L-001-016

DEIR/EA Section 3.9 describes the compatibility of the Green Line Extension with other regional projects, such as the conceptual reconstruction of McGrath Highway and the Urban Ring transit corridor initiative. MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses to ensure, to the extent feasible, consistency with planning and other projects.

L-001-017

Mitigation measures for construction period air quality impacts are described in DEIR/EA Sections 5.6, Air Quality, and 6.4, Construction Period Impacts. Air quality is expected to improve during operations, and mitigation measures are not required.

L-001-018

MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses. This will help ensure compliance with legal requirements and, to the extent feasible, consistency with planning and other projects. In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

ARLINGTON TRANSPORTATION ADVISORY COMMITTEE
7 Twin Circle Drive, Arlington, MA 02474

January 7, 2010

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office, Attn: Holly Johnson, MEPA Analyst, EEA #13886
100 Cambridge Street, Suite 900, Boston, MA 02114

RE: Draft Environmental Impact Report, Green Line Extension

Dear Secretary Bowles,

The Arlington Transportation Advisory Committee (TAC) is writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension that is currently under review. We believe the Green Line Extension project can have a significant positive environmental impact on the region that includes Arlington, Medford and Somerville when the terminus is brought to Route 16.

Bringing the Green Line to Route 16 would serve an additional 10,000 residents living within one-half mile of that station. Getting more of these motorists out of their cars to use public transportation will improve our environment in many ways – reduced greenhouse and pollutant emissions, reduced congestion, and better quality of life. Four points are discussed below that would help local residents to choose the Green Line instead of their cars.

L-002-001

1) New pedestrian and cyclist paths are being developed by DCR that could easily connect to a terminus of the Green Line at Route 16. These projects include bike paths being developed in the Alewife and Mystic River reservations. It appears that these investments by DCR have not been factored into the DEIR. To take advantage of these investments and get more people out of their cars, it is necessary to allow easy pedestrian and bicycle access to the station from across Route 16 and Boston Avenue. For potential pedestrians and cyclists living on the other side of Route 16, easy and non-threatening access across Route 16 is essential to gain ridership. The ability to cross the Route 16 intersections Boston Ave and Auburn need to be upgraded, as does the ability to walk/cycle safely under the railroad bridge.

In designing access to the station, care needs to be taken to minimize conflicts between pedestrians, motor vehicles and bicycles in all forms of conflicts. For example, with its current configuration of 4 narrow lanes, few cyclists would choose to use Route 16. Fortunately, DCR is working on improving this with bicycle paths. Also, the station layout itself must be more pedestrian and bicycle friendly than represented on the station layout in the report (fig 3.7-27).

L-002-002

2) The pedestrian and bicycle boardings during the peak hour for Alternate 2b are estimated in the DEIR as 720 pedestrians and 40 bicyclists, extrapolated to 2030 from 2000 census data. This does NOT take into account the added pedestrian and cycling network being constructed by DCR that could make it easier for the some of the thousands of local residents to walk or cycle to the station. We believe the estimates of cyclist and pedestrian boardings at a Route 16 terminus in 2030 may therefore be significantly understated by the DEIR.

L-002-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues. At such a time, connections from anticipated bike paths can be reevaluated.

L-002-002

Ridership projections presented in DEIR/EA Section 3.7 were developed by CTPS and include estimates for various access modes, including walking, biking, bus and car. A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project.

L-002-003

3) The DEIR indicates the taking of office buildings at 200 and 222 Boston Avenue, which house successful businesses contributing to the economy and to the tax base of Medford. This might be avoided by adjusting the Commuter Rail and Green Line tracks slightly to the east. We know there is hesitancy to take residences, but the general layout and traffic circulation at the proposed Route 16 Station does not provide comfortable pedestrian or bicycle access. Adjusting the land taking could enhance the usability of the station, reduce the land taking costs, and retain the property value base for Medford.

L-002-004

4) The pros and cons of allowing rider connections between the Commuter Rail and the MBTA at the Route 16 station were not discussed in the DEIR. The ability to connect to the Commuter Rail at Route 16 would allow Commuter Rail riders better access to the local community including Tufts and commercial locations, increasing potential ridership and rider convenience. This would need easy pedestrian access from the Commuter Rail to the Route 16 station, probably under the existing bridge at Route 16. Its potential benefits should be analyzed. It should be examined.

L-002-005

There are many advantages to performing the project in one phase rather than two. If in two phases, the significant environmental and other benefits of the Route 16 terminus will not be realized for 8 to 10 years, if at all. Separating the phases will add roughly $50 million in 2008 dollars to the cost, and future inflation will increase this value. This estimate may not include the effort to go through the DEIR and other processes a second time. Very importantly, performing the project in one phase will most likely provide the best possible ridership-cost benefit ratios, which are critical in the competition for needed federal funding for the whole project. Finally, with two phases, the local residents will experience a second round of major construction disruptions. ***If at all possible, we urge that the full project be done in a single phase.***

For the above reasons, the TAC suggests that 1) further exploration of the pedestrian and bicycle access to a Route 16 terminus with the impact of the DCR investments and pedestrian and cyclist friendly improvements, 2) a redesigned station layout considering the land taking needed and improved pedestrian accommodation, and 3) the option of rider connections to the Commuter Rail be conducted. This should be done in an expedited but thorough manner before acceptance of the DEIR. We suggest that the focus of this effort should be on the many regional, air quality and financial advantages that can be gained by including the Route 16 Station in the initial phase of the project.

Thank you for the opportunity to comment.

Sincerely

Ed Starr

Edward Starr - Chair
Arlington Transportation Advisory Committee

cc: Representative Sean Garballey
cc: Senator Ken Donnelly
cc: Steve Woelfel, EOT Green Line Extension Project Engineer
cc: Kate Fichter

L-002-003

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. DEIR/EA Section 5.3 describes the Project's potential acquisitions. MassDOT will continue to evaluate opportunities to minimize these property impacts when the segment from College Avenue Station to Mystic Valley Parkway/Route 16 is advanced.

All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

L-002-004

As required by the Secretary's Certificate on the EENF, opportunities for a shared station between the Green Line Extension (Medford Branch) and MBTA Commuter Rail were evaluated for the Project. Several candidate locations were evaluated; MVP/16 Station was not one of these. This connection was ultimately dismissed, as described in DEIR/EA Section 3.3, and Appendix B, Section 5. Pedestrian connections to the existing West Medford Commuter Rail Station to a future MVP/16 Green Line Station may be considered in a later phase of

the Project. A connection currently exists between the Green Line and Commuter Rail at North Station; this connection would remain.

L-002-005

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

CITY OF CAMBRIDGE • EXECUTIVE DEPARTMENT

Robert W. Healy, City Manager *Richard C. Rossi, Deputy City Manager*

RECEIVED JAN 11 2010

January 8, 2010

Secretary Ian Bowles
EOEEA, Attn: MEPA Office Holly Johnson
EEA No. 13886
100 Cambridge Street
Boston, MA 02114

Re: Comments on the Draft Environmental Impact Report/Environmental Assessment (DEIR/EA) for the Green Line Extension Project
EEA No. 13886 Massachusetts Department of Transportation

Dear Secretary Bowles:

The City of Cambridge submits the following comments on the DEIR/EA for the Green Line Extension Project.

The City of Cambridge strongly supports improvements to transit facilities in Cambridge and the entire region to increase transportation options for residents, improve livability and reduce the overall environmental impact of transportation. In order to realize the full benefits of the Green Line Extension project for its residents, the City of Cambridge has submitted two detailed comment letters on the DEIR dated May 13, 2009 and December 16, 2009 which I have attached and should be considered part of the City's full comments on the document.

In considering the full range of the City's comments in the attached letters, I would like to highlight some of the major comment areas which require further design and analysis, and which the City of Cambridge would like to work closely with MassDOT to complete:

L-003-001 **New Lechmere Station Design** – the proposed relocated Lechmere Station is inadequate in terms of station function, comfort, design, and future development potential as envisioned in the North Point special permit. The station and associated infrastructure should be re-designed based on our detailed comments and should be a positive addition to the neighborhood in terms of aesthetics. The station should also function at the highest level in terms of passenger access, comfort and safety.

L-003-002 **Crossing O'Brien Highway** – the moving of Lechmere Station across O'Brien Highway will result in thousands of new pedestrian crossings of the highway each day. Therefore, a detailed design process must take place with the state, city and community to insure that the highway is

L-003-001

Revised conceptual plans for Lechmere Station, including modifications to the station headhouse and entrances, enclosed automatic fare collection, and other amenities are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

L-003-002

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. The chapter presents a traffic analysis, a detailed description of pedestrian crossings of O'Brien Highway, and proposed roadway, crosswalk, and sidewalk improvements that are consistent with the NorthPoint development plans. These station and street plans will be further refined in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

L-003-002

as narrow and easy to cross as possible and that the many new crossings are convenient, safe and provide a high level of service for pedestrians.

L-003-003

Maintenance Facility - the proposed Mirror H site has significant impacts on the development project permitted at North Point, including affecting approximately three acres of land and 1,557,000 square feet of development. In addition to adversely affecting this regionally important transit oriented development project, this would impact the City's ability to expand the local property tax base and create jobs. As also pointed out by East Cambridge residents at the public meeting held on December 16, 2009, a maintenance facility in this location would only add to the noise experienced by existing and future residents from the Boston Engine Terminal.

L-003-004

Old Lechmere Station - the redevelopment of the old Lechmere station site is of significant interest to the City and East Cambridge neighbors. There is a great deal of interest in exploring the possible redevelopment of the site to include a year-round public market. We urge MassDOT to begin discussion of future uses of this site early on with the City and neighbors.

The City appreciates this opportunity to comment on this important project. The proposed Green Line Extension will have significant regional travel benefits and could be a positive addition to East Cambridge provided careful attention is paid to the details of the project in this neighborhood. If there are any questions on these comments, please contact Susanne Rasmussen, Director of Environmental and Transportation Planning, at 617-349-4607 or srasmussen@cambridgema.gov.

Very truly yours,

Robert W. Healy
City Manager

cc: Kate Fichter, MassDOT Project Manager

L-003-003

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Mirror H location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

L-003-004

As part of the Green Line Extension, MassDOT intends to demolish the existing Lechmere Station and prepare the site for potential future redevelopment.

Johnson, Holly (EEA)

Subject: Cambridge City Councilor Craig Kelley's Comments on the Green Line Extension DEIR EEA #13886

Dear Ms. Johnson:

Please forward my comments on the Green Line Extension DEIR to the appropriate party. Many thanks.

Craig Kelley
Cambridge City Council

As a City Councilor in Cambridge, I, like most people I know, support the Green Line extension. However, there are some shortcomings in the current documentation that should be addressed before the planning is considered final. Addressing these shortcomings includes:

L-004-001 *Stations, including Lechmere, need to be focused on integrating the surrounding community and facilitate bike, bus and pedestrian access, not access or parking for cars.

L-004-002 *Protecting existing housing communities by eliminating the Yard 8 Option for the Maintenance Facility and requiring a full analysis of Scheme L and the alternate Scheme L designs.

L-004-003 * Committing to a collaborative public process for the next phase that would provide oversight and station area participation and develop a process for addressing mitigation concerns.

L-004-004 * Integrating the Community Path into the design, planning and funding of the Green Line extension.

L-004-005 * Coordinating the Green Line extension with calming of the McGrath/O'Brien Highway in Cambridge & Somerville.

L-004-006 * Designing and constructing the Mystic Valley Parkway / Route 16 terminus at the same time as the rest of the project.

As I said at the public testimony several weeks ago, and as Somerville Mayor Curatone stated more eloquently than I, we have one opportunity to extend the Green Line. Mistakes made in this planning process will come back to haunt us during construction and operations in future years, so it is imperative that we get it right at this time.

Please feel free to contact me should you have any questions or concerns about my comments.

Sincerely,

Craig A. Kelley
Cambridge City Council

L-004-001

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

L-004-002

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

L-004-003

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

As stated in Section 6.4, MassDOT and the MBTA will convene a Green Line Extension Design Working Group. This group will advise the agencies on design workshops, participate in the workshops and serve as a corridor advisory group during design.

L-004-004

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

L-004-005

DEIR/EA Section 3.9 describes the compatibility of the Green Line Extension with other regional projects, such as the conceptual reconstruction of McGrath Highway and the Urban Ring transit corridor initiative. MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses to ensure, to the extent feasible, consistency with planning and other projects.

L-004-006

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input

on station design and layout, neighborhood impacts, economic development, and other area planning issues.

SUSAN M. GLAZER
Deputy Director for Community Development

Cambridge Comment Letter

Green Line Maintenance Facility/December 16, 2009

Thank you for this opportunity to comment on the Draft EIR for the Green Line Extension project. The City of Cambridge is very supportive of the MBTA's plans to extend Green Line service into Somerville and Medford, expanding the system's reach into these important population centers. A new station in the North Point area of Cambridge will also support the planned development of a mixed-use community in this emerging area, as well as the over 750 units of housing that have been built in North Point in the last several years.

We have a number of questions and comments about information contained in the DEIR and I will touch on these issues briefly:

L-005-001

1. **Station Design** – at this point the design of the new Lechmere Station is strictly functional and bare bones. We urge the MBTA to devote additional time and energy to refining that design so that the resulting station makes a positive aesthetic contribution to the East Cambridge and North Point neighborhoods and functions at the highest levels in terms of passenger access, comfort and safety.

L-005-002

2. **Crossing of O'Brien** – we urge the MBTA to continue to pay close attention to the details surrounding the pedestrian crossing of O'Brien Highway. The moving of the station across the highway will result in significant increases in the number of pedestrians crossing this busy thoroughfare; it is of the greatest importance that those crossings be well-planned and timed to maximize safety and pedestrian ease of use.

L-005-003

3. **Maintenance Facility**. As you point out in the Maintenance Facility Alternatives Analysis, one of the locations under consideration for the Green Line Maintenance Facility, Mirror H, would have significant impacts on the 5 million square foot mixed-use project permitted for North Point. Six parcels of that project--A, B, C, D, E and F--would be significantly affected by location of the maintenance facility and associated rail lines at Mirror H. Approximately one-half to one-third of the area of these parcels would be taken up by the facility and tracks, depriving the owner of use of that land. These parcels comprise approximately 3 acres of land area and 1,557,000 square feet of potential development. It is not clear where the figure of $8 million to acquire the privately-owned parcels comes from, but in our view that number could go much higher.

344 Broadway
Cambridge, MA 02139
Voice: 617 349-4600
Fax: 617 349-4669
TTY: 617 349-4621

L-005-001

Revised conceptual plans for Lechmere Station, including modifications to the station headhouse and entrances, enclosed automatic fare collection, and other amenities are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

L-005-002

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. The chapter presents a traffic analysis, a detailed description of pedestrian crossings of O'Brien Highway, and proposed roadway, crosswalk, and sidewalk improvements that are consistent with the NorthPoint development plans. These station and street plans will be further refined in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

L-005-003

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Mirror H location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

L-005-004

4. **Noise Impacts**. In the public discussions surrounding the permitting of the North Point project in 2003, above-ground parking structures were planned for the parcels to the north of the site; these structures were intended to act as a noise and vibration buffer from the activity in the existing rail yards. The introduction of a Green Line maintenance facility would remove that buffer and add an additional source of noise and vibration to the development site and the East Cambridge neighborhood. The DEIR should include a detailed assessment of the noise impacts of the maintenance facility on existing residents of North Point and the adjacent East Cambridge neighborhood.

L-005-005

5. **Mix of Uses.** The Cambridge Zoning Ordinance for North Point (Section 13.73) requires that there be a balance of commercial and residential uses, with commercial uses comprising no more than 35% of uses. By reducing the amount of residential development by up to one-half, the amount of commercial development would also need to be reduced in order to maintain the 65/35 mix of residential/commercial.

L-005-006

6. **Jobs and Taxes**. The City of Cambridge and the Commonwealth of Massachusetts have long regarded the North Point project as a key transit-oriented development opportunity in Eastern Massachusetts. The fully permitted project is an important aspect of the City's ability to expand the local property tax base and create jobs. This potential would be severely compromised by locating the maintenance facility at Mirror H.

L-005-007

7. **Old Lechmere Station.** Finally, we urge MassDOT to work closely with the City of Cambridge and the East Cambridge neighbors on planning for use of the old Lechmere Station site, which will be vacant once the new station has been built. There is a great deal of interest in exploring whether a year-round public market could be located in this area. We find these ideas intriguing and applaud the neighbors' enthusiasm and initiative. We urge discussion of future uses of this site to begin early.

Thank you for this opportunity to comment on this important regional transportation initiative.

Very truly yours,

Beth Rubenstein

Beth Rubenstein

Assistant City Manager for Community Development

L-005-004

Pursuant to FTA-established guidelines, noise and vibration impacts have been identified and evaluated for moderate and severe impacts to sensitive receptors. Details on noise and vibration measurements for the Option L maintenance facility site and mitigation measures are described in FEIR Chapter 2, Maintenance Facility Alternatives Analysis, and Chapter 8, Draft Section 61 Findings and Mitigation Commitments, respectively.

L-005-005

MassDOT has and will continue to coordinate with municipalities such as the City of Cambridge at appropriate milestones as the Project progresses. These will help ensure compliance with legal requirements, including zoning ordinances. The Proposed Project has been designed to retain the ability to construct NorthPoint as permitted.

L-005-006

An expanded technical and environmental analysis, including socioeconomic impacts, of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Mirror H location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

L-005-007

As part of the Green Line Extension, MassDOT intends to demolish the existing Lechmere Station and prepare the site for potential future redevelopment.

Re: Green Line Extension - Lechmere Station Design

Dear Mr. Woefel:

Thank you for the opportunity to comment on conceptual designs for the relocated Lechmere Station, which the City of Cambridge has received as part of the Green Line Extension project design development. The City concurs with EOT's decision to include the relocation of the station in the project and strongly supports the inclusion of O'Brien Highway roadway crossings and changes to improve access to the station. We look forward to on-going discussions with EOT as design proceeds.

It is important that the new station and surrounding roadways, sidewalks and parking be designed to not only contribute to the future vibrancy of the Lechmere/North Point area, but also to maximize the potential value to the state of MBTA parcels for future development, including air rights. As such, we recommend that roadways and bus operations areas be reduced, and to the greatest extent possible, follow the curb lines of the roadways as previously agreed to by the MBTA (as delineated in the North Point special permit), so that future development will be able to efficiently realize this plan. Also, the special permit envisioned that North First Street would serve as a multi-modal node; readjusting station entrances to face the streets would make it easier to access the station for pedestrians and cyclists.

In particular, we suggest that the following specific changes be considered:

L-005-008

- Include the mid-block crossing of O'Brien Highway, east of Cambridge Street, which is critica to retaining a strong connection between the new station and those accessing the Galleria/First Street, and residents in that vicinity.

L-005-009

- Move primary station entrances to face North First Street and Water Streets, along with a card only access point near East Street.
- Move fare collection to the inside of the building so patrons may enter from multiple points and wait inside the building.
- Adjust the station building footprint to reduce un-used space on the west side of the station and enclose viaduct supports within the structure.
- Consider shortening the platform and replacing steel and glass walls over North First Street with glass only, to reduce its visual impact on this important entryway to the North Point area.

344 Broadway
Cambridge, MA 02139
Voice: 617 349-4600
Fax: 617 349-4669

L-005-008

The planned midblock pedestrian crossing of O'Brien Highway between East Street and Land Boulevard/Charlestown Avenue is not being proposed as mitigation for the Green Line Extension project. The installation of this crossing is dependent upon the location's ability to demonstrate need by meeting pedestrian signal traffic warrants as established by the Manual on Uniform Traffic Control Devices (MUTCD). Pedestrian projections for the area indicate that both the relocation of Lechmere Station and the full-build development of NorthPoint must occur before a pedestrian traffic signal would be warranted. Since the completion of NorthPoint is unknown at this time, pedestrian traffic related to the development could not be included in the warrant analysis and the warrant would not be met. Traffic signal conduit will extend to the end of the project limits for the reconstruction of O'Brien Highway, to be tied into by the NorthPoint proponent when they fulfill the remaining mitigation measures associated with O'Brien Highway. This will make the process of installing the midblock crossing simpler and less costly for the proponent in the future.

L-005-009

Revised conceptual plans for Lechmere Station, including modifications to the station headhouse and entrances, enclosed automatic fare collection, and other amenities are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

L-005-009

- The station design should allow light into the building and create a positive and elegant fac to the entrance to North Point, as well as to future buildings on adjacent parcels. Clear glazing should be utilized particularly on platforms and passenger waiting areas to improve safety, visibility, passenger orientation, and to animate the street.
- Lighting should be designed to create safe spaces and passageways without creating light spillover that would disturb neighbors.
- Merge the eastern half of the bus-way with the two-way extension of North Point Bouleva (11 max. travel lanes) to simplify movements to N. First Street and make it easier to construct future roadway connections to match the special permit plan. With station entrances facing N. First and Water streets, a separate bus-way alongside the building is n needed.
- Maintain curblines as approved in the special permit as closely as possible on the north sic of N. First Street and create a tighter corner radius where N. Point Boulevard enters it. A pull-off area, similar to the original design, should be included so vehicles that pull over to the curb at the station do not block bicycle lanes.
- Provide a bicycle connection from the Community Path to the new station and to a covere secure bicycle parking facility, similar to those at Alewife Station.

L-005-010

- The parking lots should have additional landscaping, trees, shrubs so that rows of parking have no more than fifteen contiguous parking spaces without a densely planted landscape buffer. Keep pedestrian crossings of streets as short and direct as possible from parking lo and existing development to the station.
- In addition to existing development, the station directly impacts three proposed adjacent developments: the 5 million sq. ft. North Point PUD, 22 Water Street, and the Archstone housing project. In order to understand the impact of the new Lechmere Station design c its abutters and the broader area, it is important that the architect build a three dimensio model – perhaps one that could be built to fit into one of the North Point Development models developed by Guilford/JLL.

L-005-011

- Continue a public process with residents and the City regarding the station design and changes to O'Brien Highway as further plans are developed.

Thank you for the opportunity to comment on this important project. We look forward to closely working with EOT as the design moves forward to produce a station design and roadway system t meet the needs of current and future Cambridge residents, add to the urban fabric of North Poin maximize potential value of MBTA land, and function effectively as an intermodal transportation hub.

Sincerely,

Beth Rubenstein

Beth Rubenstein

Assistant City Manager for Community Development

Cc: Kate Fichter, EOT

L-005-010

Although Lechmere Station will no longer function as a terminal station, there is still a demonstrated demand for existing parking. Nonetheless, parking at the relocated Lechmere Station was reduced in the revised conceptual design. These revised plans are included in FEIR Chapter 5, Lechmere Station.

L-005-011

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

100 Cambridge Street, Suite 900
Boston, MA 02114

Subject: Green Line Extension Project
Cambridge/Somerville/Medford
Draft Environmental Impact Report (DEIR)

Dear Secretary Bowles:

Please accept this comment letter on the DEIR prepared for the Green Line Extension Project. The City of Medford has led by example in its support of public transportation and transit oriented development as evidenced by the redevelopment of both the Station's Landing and River's Edge projects adjacent to the Wellington Station Orange line. However, due to the lack of detailed technical analyses, the inability of the State's Project Director to deliver promises made during this planning process and the insufficiency of mitigation to ameliorate anticipated negative impacts on both residential and commercial properties and therefore the citizens of the City itself, I am prevented from fully embracing the project as proposed at this time.

Be assured that as Mayor I support the expansion of public transit service in Medford with the goal of improving air quality and creating transit oriented development. The Green Line Extension originally proposed to the Medford Hillside has the potential of providing benefits in addition to improvement in air quality.

When the Romney Administration proposed substituting other projects for the Green Line, I argued for the project to move ahead and proposed that the project terminus be studied in a DEIR to Mystic Valley Parkway. Not only would this location provide for additional riders, I believe the extension beyond College Avenue could provide additional air quality benefits while providing potential for transit oriented development. My only condition for the final support of this terminus was that the State provide adequate technical information to review the proposal while minimizing property takings and impacts. Unfortunately, despite the information contained in the DEIR, the State has failed to provide the necessary information to make an informed decision on whether it is best to extend the project beyond College Avenue and in what manner. A decision of this magnitude cannot be made by conjecture. Therefore, I urge the State to meet its responsibility to provide the necessary information and to work in partnership with the City so we may resolve these issues and move forward together.

L-006-001

The Mass/DOT's (Proponent's) approach to build the project in two phases with College Avenue functioning as a terminus but not being designed as one, presents difficulties. The uncertainty over how long the proposed College Avenue station will function as an end of the line Green Line station is a major concern for the City of Medford. The lack of information on station design in general is not sufficient. The FEIR should provide alternative designs for the College Avenue station including one that moves the station platform to the south of the bridge. Pedestrian access could still be provided from the north with mechanical and pathways incorporated into the bridge design. Reduction of platform length in addition to a shift in the southerly direction should provide some measure of relief to residents of Burget, Hume and Sunset Avenues as compared to the proposed location.

L-006-002

While I am not in support of the creation of all day parking for people from the greater Boston region, I am concerned about the ability of the stations to accommodate drop off and pick up, and to provide safe and efficient access by pedestrians and people with mobility or other physical limitations, bicyclists and people arriving by bus. If assumptions regarding how people arrive at stations are inaccurate, the functioning of the already constricted Boston and College Avenue intersection could prove debilitating in terms of traffic operations, safety and parking impact on adjacent neighborhoods. The FEIR must justify the DEIR's assumptions regarding drop off and pick up rates.

L-006-003

L-006-004

L-006-001

MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses. These will help ensure compliance with legal requirements and, to the extent feasible, consistency with planning and other projects.

L-006-002

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

L-006-003

The only Green Line Extension station that will provide parking is Lechmere Station. Drop-off and pick-up areas will be provided at at several stations. These will accommodate expected kiss-and-ride activity. DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and new Lechmere Station, respectively. In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations will be refined during preliminary engineering.

L-006-004

The Project is intended, in part, to relieve traffic congestion, as described in DEIR/EA Chapter 2, Purpose and Need. Some station access points for parking or passenger drop-off/pick-up are likely to impact local traffic flow, as outlined in DEIR/EA Section 5.5, Traffic. As described in DEIR/EA Chapter 6, these impacts will be minimized to the extent

L-006-005 Pedestrian as well as vehicular mitigation improvements must be considered. The study identifies unregulated parking opportunities near the proposed stations. Use of spaces may be abused by transit riders adversely affecting neighborhoods. A parking management plan should be prepared by Mass/ DOT in cooperation with the City and submitted as part of the FEIR to ensure neighborhoods are not impacted as a result of demand for parking.

L-006-006 It is unclear as to how much construction will occur at night. The FEIR needs to state clearly what the Proponent's intended schedule of construction is providing a breakdown of am versus pm hours. Specifics on when, where, and for how long nighttime and/or weekend construction will occur should be presented. Based on that presentation, mitigation must be proposed. Also regarding construction, a noise analysis during construction based on typical equipment to be utilized should be presented in the FEIR. The DEIR does not sufficiently analyze impacts and mitigation within Medford.

L-006-007 In regard to stormwater, an operation and maintenance program using best management practices must be established. Additionally, proper
L-006-008 infrastructure must be required to avert flooding. More information is required on utilities and proposed mitigation.

L-006-009 The FEIR must examine the extension from College Avenue to Mystic Valley Parkway to the same degree as is required in the Secretary's Certificate for all portions of the project. The DEIR quite simply does not. This fact, along with the disconnect between what the Proponent's representatives say publicly versus what has been presented and committed to in this report has created the fundamental dilemma of how to provide unwavering support for this project while ensuring that the best interest of the citizens is served.

In general, the DEIR does not adequately address all impact issues for the extension beyond College Avenue. The Proponent has presented this extension as both its preferred alternative and its "worst case scenario". The City's primary issue with the extension beyond College Avenue has been with the Proponent presenting a plan that minimizes noise, vibration, air quality, parking and the taking of private property including successful commercial properties that generate tax revenues and employment. The Proponent's representatives have stated that such a plan exists but have not shown it.

practical. Section 4.4 of the FEIR describes access and circulation at College Avenue Station in more detail.

L-006-005

DEIR/EA Chapter 6 and FEIR Chapter 8 list the traffic and parking measures to which MassDOT has committed to mitigate impacts. These mitigation measures address pedestrian and roadway traffic signal improvement needs, impacts during construction, and parking enforcement coordination. These measures will be further advanced during preliminary engineering.

L-006-006

Construction impacts of the Project are described in each environmental resource section in DEIR/EA Chapter 5, Environmental Consequences. Construction contractors will be required to comply with relevant federal, state, and local laws, regulations, and codes to eliminate or minimize adverse effects (such as noise and vibration levels, and traffic flow) to environmental and social resources.

L-006-007

As described in DEIR/EA Section 5.9, the Project would be required to comply with federal and state stormwater discharge permit requirements during both the construction and operational phases. Compliance with these standards would include using Best Management Practices to prevent contamination of stormwater and control erosion and accretion (sedimentation) from stormwater runoff from the railroad alignment, stations, and maintenance facility.

L-006-008

MassDOT will coordinate with utilities providers to minimize impacts to existing utility lines. Utilities on bridges identified for reconstruction would be rebuilt with the bridges. The existing MBTA drainage system will be

They stated they would complete the necessary field survey to identify actual land acquisitions that can be shown publicly in a format that is understandable by all. That survey has not been done resulting in schematics that look good on paper but have little usefulness in reality and do not allow the public to determine if and how much of their property will be affected. The Proponent has also failed to complete its required land use study as it has promised and as is required in the Secretary's Certificate. This study along with the identification of station locations will provide the basis from which the City will conduct more detailed land use planning. This information has been requested by the City repeatedly but it has not been forthcoming.

L-006-010

Key department heads within the City shall submit comments under separate cover. Additionally, the City's consultant has provided comments on the topics of air quality, noise and vibration, constructability, wastewater, transportation, stormwater and visual impacts. This technical review is attached.

L-006-011

It has been the vision of this administration to support the preservation of residential neighborhoods in the Hillside while identifying opportunities for the expansion of our commercial tax base and the creation of jobs. The Walkling Court housing development could benefit from a public/private partnership to improve living conditions for our seniors while providing a mix of uses. Similarly, the redevelopment of the Whole Foods' property should be evaluated to explore mixed use transit oriented opportunities.

If the Proponent would fulfill both its commitment to work with us, and its obligation to provide adequate and transparent information, the construction of this project from Lechmere Station to Mystic Valley Parkway could be achieved in a way that not only improves public transit but improves the quality of life in our neighborhoods.

While the extension of the Green Line through Medford may well bring with it many benefits, the DEIR does not provide me with sufficient information on issues critical to the quality of life of Medford resident to support the project without reservation at this time. I appreciate your consideration of these comments and look forward to the FEIR addressing the issues raised.

4

reconstructed with proposed connections to the existing municipal drainage system.

L-006-009

All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

L-006-010

Direct and indirect impacts to land use are described in DEIR/EA Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for sustainable land use, which could further reduce automobile traffic congestion and improve air quality. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes how a series of workshops will be scheduled to gather public input on land use and facility design issues.

MassDOT's responses to the City's Consultant FST's general comments

Very truly yours,

Michael J. McGlynn
Mayor

and issue-specific comments are provided as responses L-006-012 through L-006-019. Responses to detailed comments on air quality, noise and vibration are provided in Responses L-010-020 through L-010-029. The Consultant's detailed comments on traffic, stormwater, wastewater, bridges, constructability and visual impacts will be addressed through the preliminary engineering process. MassDOT looks forward to continuing to work with the Cities of Medford, Somerville, and Cambridge through the subsequent design and construction phases of the Green Line Extension Project.

L-006-011

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA. Analysis of the segment from College Avenue to Mystic Valley Parkway/Route 16 will be conducted when that phase is advanced and subject to separate review under MEPA. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

MEMORANDUM

TO: Mayor Michael J. McGlynn
City of Medford

FROM: Ed Hollingshead, AICP

DATE: December 11, 2009

SUBJECT: Peer Review Green Line Extension Project
EA/DEIR and 4 (f) Statement EEA # 13886

This memorandum was prepared to summarize the findings of our peer review of the Medford section of the referenced EA/DEIR (Document). Attached to this memorandum are individual memoranda containing our completed reviews for the air quality, noise/vibration, visual, traffic, stormwater, and constructability sections of the Document. Outlined below is an overview of the project and our main comments.

Overview

The project's Preferred Alternative involves the extension of the Green Line from Lechmere Square in Cambridge to Route 16 in Somerville. Three stations are proposed in or immediately adjacent to Medford: Ball Square, College Avenue Station, and Route 16.

Due to funding constraints discussed in the Document, the Preferred Alternative is divided into two parts. The first part termed the Proposed Project (Alternative 1) proposes to extend the Green Line from Lechmere to the proposed College Avenue Station at College Avenue in Medford by 2014. The project's second part termed the "Future Full-Build Alternative or the Preferred Project" (Alternative 2), which completes the extension beyond College Station to Route 16 at Medford Hillside, is anticipated to receive funding between 2016 and 2020. Consequently, while the intent is to follow the Proposed Project with the final extension to Route 16 with a minimum of lag time the Future Full-Build Alternative, which can be thought of as beyond College Station, is a later and, realistically, less-certain phase.

In general, the Document is well done and complies to an acceptable degree with the December 1, 2006 Certificate of the Secretary of Environmental Affairs on the October 10, 2006 Expanded Environmental Notification Form.

Having said that, while the directions in the Certificate are followed and required topics are covered, our review as identified issues that need to be responded to in the Final Environmental Impact Report (FEIR).

Our review focuses on the following main topic areas:

FAY, SPOFFORD & THORNDIKE

- Transportation
- Stormwater
- Wastewater
- Bridges
- Constructability
- Air Quality
- Noise and Vibration
- Visual Impacts

Issues related to our overall findings follow.

General Comments

L-006-012

1. The language used in the Project Description on Pages ES-11 and ES-12 of the Executive Summary is misleading for the Medford segment of the project. This portion of the project is rarely in a full cut section. Therefore, impacts to adjacent properties along the existing Lowell Commuter Rail corridor need to be mitigated in a different manner other than using "green" retaining walls. The only portion in a full cut section is located in the vicinity of the Winthrop Street Bridge. This is the only bridge in Medford where the rail profile is lowered to achieve the necessary vertical clearance. All other segments of the Green Line Extension through the City of Medford are located in a partial cut, at grade, or on retained fill. Widening the rail footprint in these areas will have greater impact to adjacent properties and require other means of mitigation besides the use of "green" retaining walls. What other types of mitigation are being proposed in the City of Medford?

L-006-013

2. In regard to construction staging, the Construction section on Page ES-14 states "Most of the right-of-way is located below the surrounding land surface, reducing potential land acquisitions as well as environmental impacts such as noise and visual changes." This statement is not entirely correct for the Green Line Extension through the City of Medford. Only a limited segment of the project in the vicinity of the Winthrop Street Bridge exhibits an existing cross section as shown in Figure ES-3 (i.e., cut slopes on both sides of the rail corridor). In fact, no portion of the Proposed Project has an existing cross section similar to Figure ES-3. This cross section only applies to the "Future Full Build" Alternative that extends to the Mystic Valley Parkway (Route 16) Station. The Proponent should, in sketch form, similar to Figure ES-3, provide the range of existing cross sections throughout the various segments of the Proposed Project within the City of Medford and include the mitigation treatments for each section.

Based on the construction staging discussion on Page ES-14, it is unclear how only two bridges will require traffic detours during construction. In the preceding sections it states that all four bridges in the City of Medford (Harvard Street, College Avenue, Winthrop Street, and North Street) need to be reconstructed. The Proponent should provide additional details to support the statement that most bridges will not require detours. For all bridges that do require traffic detours, these routes within the City of Medford and detour routes into Medford from replacement of the Broadway Street Bridge in Somerville should be shown.

L-006-014

3. Proponent should provide an emergency response plan showing access and egress locations to the railroad right-of-way to assist emergency personnel when responding to an incident/emergency on a Green Line or Commuter Rail vehicle. This is of particular concern in sections bordered by noise barriers. Who will be the primary respondent to such an incident--City of Medford responders or others?

L-006-015

4. Table 6-2 on page 6-3 states that the project will avoid nighttime construction in residential neighborhoods. As much of the Commuter Rail alignment abuts residential neighborhoods, the proponent

L-006-012

As stated in DEIR/EA Chapter 6, Draft Section 61 Findings and Mitigation Measures, soundwalls are proposed for some locations where the Green Line Extension corridor is level with surrounding properties. The mitigation measures required by the Secretary's Certificate on the DEIR are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

L-006-013

Detailed construction staging and traffic management plans will be developed in more detail during the preliminary engineering phase of the Project. These plans will be developed in close coordination with MassDOT, the MBTA, the City of Medford, the City of Somerville, and the City of Cambridge.

L-006-014

During preliminary engineering, MassDOT will coordinate with emergency response providers to plan for appropriate site, vehicle, and community access while the Project is constructed and operating. A detailed SSMP will be developed during preliminary engineering in coordination with the city to identify temporary and permanent emergency access and egress routes.

L-006-015

MassDOT is confident that construction of the Green Line Extension can be accomplished with a minimum of disruption to the commuter rail service, and will direct contractors to minimize construction activities during night time. MassDOT has met with the MBTA on several occasions to discuss construction staging within this rail corridor. The MBTA and MBCR will be performing this work as they did for the Orange Line in the Northeast corridor. Proposed track construction and track

L-006-015

should specify how and where specifically construction activity could occur during revenue hours. All locations of nighttime or weekend construction should be identified and hours of construction identified. Page ES-14 in the document states, "The preliminary analysis of construction staging and sequencing shows that it is feasible to construct the Project while maintaining railroad operations, access to abutters, and traffic and pedestrian paths." Based on the conceptual level of analysis that has been performed up to this point, we believe this statement is misleading. It seems to imply that the current "quality of life" within the City of Medford will go on unaffected by the construction of this project. We do not understand how Commuter Rail operations will be maintained at current levels of service throughout construction. The preliminary staging plans in the EA/DEIR show only one phase of construction occurring during non-revenue hours of operation. Given the proximity of the construction to the existing Commuter Rail tracks, we find it impractical to maintain Commuter Rail service without employing the use of full time flag persons, nighttime construction, or weekend construction activities to minimize disruption to Commuter Rail schedules. All of these methods will affect daily schedules, commuter routes, and pedestrian travel. The Proponent should identify, in more detail, what methods will be used to maintain current service levels.

L-006-016

5. On page ES-38 considerable discussion is devoted to the anticipated noise impacts of the project and the range of potential mitigation measures such as noise walls, noise treatments, and rail lubrication. Please identify specific locations in the City of Medford that qualify for noise treatments and noise walls. The FEIR should indicate areas where mitigation for noise and vibration is needed based on the impact assessment and identify the specific mitigation that will be proposed (e.g., use of ballast along the tracks, sound insulation, sound barriers, maintenance plans).

The EA/DEIR provides the first step in detailing impacts and mitigation. The FEIR should identify specific locations within the City of Medford that require noise or vibration mitigation and provide the specific mitigation being proposed for each location. As feasible, mitigation for noise impacts (particularly window replacements which are unrelated to physical construction in the corridor that might influence construction of some barriers) should be provided prior to the start of construction rather than at the completion of construction as stated in Table 6-1 on page 6-2.

L-006-017

6. On Page 5-116 regarding specific noise mitigation treatment it states, "For many locations along the MBTA Fitchburg and Lowell lines, noise barriers are a feasible and effective means of noise mitigation because the existing right-of-way is lower than sensitive receptors for substantial portions of the Project." While this may be true for segments of the project outside the City of Medford, this is certainly not the case for the Green Line Extension project within the city limits. As identified and stated earlier, much of the corridor within the City of Medford is either in partial cut (i.e., west side in cut/east side at grade), entirely at grade, or entirely on retained fill sections. As a result, the use of sound/noise walls as an effective mitigation measure becomes questionable and, in some cases, impractical. Second-story bedroom windows of residential receptors, for instance, would seem to be extremely difficult to mitigate. Table 5.7-4 on Page 5-117 and Figure 5.7-5 indicate the maximum height noise barrier being proposed in the vicinity of Piggott Road, Lyman Avenue/Charnwood Street is 10 feet. Adjacent to Burget Avenue the proposed noise wall height is only 6 feet. Sensitive receptors in this vicinity are at approximately the same elevation as the rail corridor. Thus, the second stories of these receptors are higher than the noise walls being proposed. Please provide your proposed noise mitigation treatments for this type of situation as it relates to the sensitive receptors along Boston Avenue, Winchester Street, Colby Street, Burget Avenue, Charnwood Road, Orchard Street, Lyman Street, Walkling Court, and Piggott Road.

L-006-018

7. On Page 5-127, Table 5.8-4 Potential Vibration Impacts at Sensitive Receptors Without Mitigation appears not to include many sensitive receptors in its vibration analysis. In the EA/DEIR there is no mention of vibration studies being conducted or vibration monitoring sites being established north of College Avenue Station. In fact, based on Figure 4.8-3 Noise and Vibration Measurement Sites, only two

shifts will be done on weekends using a work train while maintaining bidirectional commuter rail service on track 2.

L-006-016

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

L-006-017

The location, length and height of noise barriers proposed for the project are specified in Section 5.7.3 of the DEIR/EA. Mitigation recommendations for noise impacts will be further refined during Project design. FTA guidelines specify that potential noise impact is assessed and mitigation is provided, when necessary, feasible and reasonable, for outdoor locations of frequent human use.

L-006-018

DEIR/EA Sections 5.7, Noise, and 5.8, Vibration, describe the noise and vibration impacts, respectively, expected from the Project. Pursuant to FTA-established guidelines, these impacts have been identified and evaluated for moderate and severe impacts to sensitive receptors. FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments, describes the mitigation measures that would be implemented to eliminate, minimize, or offset impacts above regulatory thresholds.

L-006-018

vibration monitoring sites were established at sensitive receptors along Boston Avenue between College Avenue and Harvard Street near Tufts University buildings. To accommodate the new Green Line tracks, the existing Commuter Rail tracks are being moved as much as 18 feet further east within the existing right-of-way. Consequently, there is the potential for increased vibration to sensitive receptors located along that side of the right-of-way. While Table 5.8-4 does identify potential vibration impacts at sensitive receptors along Winchester Street, Colby Street, Brookings Street, and Piggott Road, it fails to mention any potential vibration impacts to residential sensitive receptors along Burget Avenue, Charnwood Road, Orchard Street/Lyman Avenue, or Walkling Court. Please confirm that these sensitive receptors were included in your vibration analysis, identify the existing vibration levels at these above locations, and, as required by the Secretary's Certificate, please identify specific mitigation measures for each sensitive receptor that requires mitigation.

8. A total of 19 bridges exist along the entire Green Line Extension Corridor. However, only four bridges in the City of Medford are affected by the project - Harvard Street, College Avenue, Winthrop Street, and North Street in Medford.

L-006-019

The Winthrop Street Bridge has inadequate horizontal clearance to accommodate a 4-track (2 Commuter Rail and 2 light rail) system and, thus, would need full replacement to lengthen the main span. The College Avenue Bridge has adequate clearance to accommodate a 4-track system but may need replacement due to its proximity to the proposed College Avenue Station and the subsequent need for a wider cross section to accommodate a new Green Line center platform. The North Street Bridge has adequate horizontal clearance but should be evaluated to confirm its structural integrity. Although the abutments are sufficiently spaced apart, the rail bridge superstructure over Harvard Street needs to be widened to accommodate two additional Green Line tracks. It appears that this widening will impact the vertical clearance beneath the rail bridge, as Harvard Street is concave beneath the bridge. Consequently, it may be that the profile of Harvard Street would need to be lowered to maintain an acceptable clearance. Currently, the section of Harvard Street under the bridge floods in high rain events. Should the profile of Harvard Street need to be altered to maintain vertical clearance due to widening of the bridge the MBTA should address this flooding issue as part of that roadway project.

The FEIR should provide detailed construction staging plans for the reconstruction of each of these bridges and explain how both vehicular and pedestrian traffic is to be maintained throughout the reconstruction activities. These staging plans are essential to determine the impact to emergency response personnel, abutters, and the traveling public. If needed, identify specific detour routes for vehicles as well as pedestrians.

Issue Specific Comments

Air Quality

The document appears to be reasonably thorough and, for the most part, uses methodologies that are consistent with current EPA/DEP guidance. However, as discussed below, a number of issues with the analysis limit the verification of the accuracy of the results. Missing data and methodology details would need to be provided by the author to check the accuracy. However, the errors and inaccuracies described are not likely significant enough to change the overall conclusions presented in the Report, which states that the build alternatives would provide air quality benefits when compared to the No-Build Alternative.

L-006-020

Compliance With the Secretary's Certificate on the Expanded Environmental Notification Form

- The Certificate requires reporting of emission inventory results for CO and PM2.5, these results are not presented in the Report; and

L-006-019

As stated in DEIR/EA Section 3.7.2, the College Avenue and Harvard Street Bridges are identified for replacement as part of the Green Line Extension Project. Vertical clearance at these bridges will be given further consideration during preliminary engineering. Drainage under the Harvard Street Bridge will be evaluated during the preliminary engineering phase of the Project. In the Future Full-Build Alternative, both the Winthrop Street and North Street Bridges would require reconstruction.

Detour routes and emergency access during construction will be developed during preliminary engineering as part of the Traffic Management Plan. At least one bridge will need to be closed during construction (Medford Street), therefore a detour will be proposed. A temporary bridge may be able to maintain traffic for thereconstruction of Broadway Bridge. For all other bridges, at least one lane of traffic will be maintained during construction. Pedestrian and vehicular access to abutting properties will be maintained at all times. Project bridge designs and construction staging plans will be refined during preliminary engineering.

L-006-020

The Green Line Extension will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality. As required by the Secretary's Certificate on the DEIR/EA, the FEIR includes a narrative clarifying the relationships of air quality modeling data to MassDEP and EPA requirements for State Implementation Plan (SIP) consistency.

L-006-020

- Quantitative PM10 and PM2.5 hotspot assessments that were not required in the Certificate were included in the analysis using methodology that is not currently endorsed by EPA or FHWA, and therefore the reported results may be misleading to the public.

Affected Environment – Section 4.7

- Report does not provide description of modeling methodology for the Microscale Commuter Rail Evaluation; and

Environmental Consequences – Section 5.6

- The 1-hour CO background concentration is suspect and the 8-hour CO background concentration is not presented;
- No description of the development of PM10/PM2.5 background concentrations is provided;
- The project-opening year, or construction completion year, is not included in the analysis; and
- As required in the Certificate, an attempt to provide a greenhouse gas emission inventory comparison between the alternatives is provided. However, it is incomplete. Although greenhouse gas emissions are calculated for on-road motor vehicles, there is no accounting of greenhouse gas emissions for electricity generation to power the extended Green Line.

Noise and Vibration

The Noise and Vibration Sections of the subject document contain a complete noise and vibration assessment report and methodology, similar to that which would be developed for an Environmental Impact Statement (EIS). The document appears to be reasonably thorough and utilizes methodologies that are consistent with current general practice, as defined in the Federal Transit Administration (FTA) guidance manual *Transit Noise and Vibration Impact Assessment* (Report FTA-VA-90-1003-06, May 2006). The document also complies with the Secretary's Certificate for Noise and Vibration.

L-006-021

However, we would like to point out several portions of the assessment which may be lacking in detail, or which may provide a less than adequate and balanced perspective to the possible noise and vibration exposure to residents that live close to the proposed project. The following presents a summary of our concerns.

Existing Environment – Noise (4.8)

- The background discussion for noise may under emphasize the meaning of the measurement scale (dB) as it relates to human annoyance. For the reader who is not familiar with noise measurements, the quantitative results of the assessment may render the predicted noise level increases as less of an annoyance than will actually be experienced.
- The assessment relies on estimations of 24-hour Ldn from a one-hour noise measurement. This technique could lead to inaccurate characterization of the existing noise level that, in turn, can lead to inaccurate predictions. The report should have included more 24-hour measurements at more locations, especially in parts of Medford other than where Tufts University is located.

Environmental Consequences – Noise (Section 5.7)

- The summary statements imply that there will be no noise impacts with mitigation; however, several mitigation options may not work for practical reasons resulting in higher levels of impact than the report indicates. The FEIR should address these conditions and the consequential reduction in impact mitigation.

L-006-021

As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds. FEIR Chapter 8 describes specific proposed mitigation measures, plans for monitoring after construction, and next steps pertaining to mitigation. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies. Construction measures to mitigate construction noise and vibration impacts will be further defined during preliminary engineering.

L-006-021

- Construction noise impacts are not adequately analyzed, such as effects from required nighttime construction and other operations that are likely to be very disruptive. The FEIR should analyze in detail the types of equipment to be used and the time and frequency of operation and the likely impact from construction operations.
- The report lacks detail to determine impact levels and likely forms of mitigation at individual buildings, and how well the mitigation is expected to perform. The report should include a list of all impacted buildings, the type of mitigation, and whether the mitigation in practice is capable of reducing noise levels sufficiently.
- Noise source reference details for MBTA trains, equipment, and maintenance yard activities are not complete and therefore it is not clear if the assessment is adequate. The report should include an appendix that lists all noise sources including the expected variation in the assumed noise levels.
- The methodology used to determine receptor locations and allocation of measurement data to establish impact criteria is not provided. It is possible that more measurements should have been conducted in areas of Medford other than near Tufts University buildings.

Existing Environment - Vibration (4.9)

- Train vibration measurements were only performed at one location near the Tufts University sports fields and appear to have neglected the residential portions of Medford to the north and south of this area. Additionally, the vibration data shown in the report does not indicate the variation between different MBTA trains, which can be 15 VdB or more. This could lead to inaccurate predictions, or predicted levels that are less than the levels that may actually occur. This issue should be explained in the FEIR.
- The assessment does not include any mention of vibration sensitive businesses in Medford, such as a possible research and development facility that may be sensitive to vibration. As such operations do exist in Medford in and around the Tufts campus, the FEIR should document these uses and either document that increased vibrations will not impact operations or propose sufficient mitigation to manage documented impacts.
- The EA/DEIR does not and the FEIR should include a technical appendix listing equipment used, certifications, etc.
- The discussion and assessment only pertains to effects felt by people. The background discussion should have included some discussion for assessment of possible house damage caused by large displacement oscillations of the rail track.

Environmental Consequences – Vibration (5.8)

- The performance of the proposed vibration mitigation options (ballast mats and resilient fasteners) is not sufficiently referenced and the stated performance levels (10 to 15 VdB for ballast mats) may be greater than what can be practically achieved. This may result in higher vibration levels to nearby residents than proposed. The report should either be more realistic about mitigation, or provide references of actual post installation tests, not conducted by manufacturers, to substantiate claims.
- The number of vibration impacts and vibration levels in the section between Medford Hillside and Mystic Valley Parkway seems proportionally less than other sections of the project. Also, no ground propagation tests were performed in areas to the north and south of the Tufts University ground propagation measurement site. Either more tests and analysis should be performed, or at least an explanation for the inconsistent data should be provided.

L-006-021

- The listing of vibration impacts does not include detailed information for each receptor making it difficult to determine the level of vibration to be expected at each building location. The document should include a list of all affected buildings, including predicted levels and mitigation details.

Constructability

L-006-022

Typical MBTA requirements for Maintenance and Protection of Railroad Traffic state "***under no circumstances shall any equipment or materials be placed or stored within fifteen (15) feet from the centerline of the outside track***." Although in the EA/DEIR it was noted to maintain minimum horizontal and vertical offsets from live track centerlines to work zones and structures, how prevalent is the condition where the referenced 15-foot offset cannot be achieved? In such circumstances it is understood this restriction may require additional off-peak hour work construction. The FEIR should identify all areas requiring that construction occur at night and/or weekends and for any such locations the duration/type of construction activities together with proposed mitigation should be described.

L-006-023

While land acquisitions were discussed for the project, temporary and permanent easements are not addressed in the EA/DEIR. The Certificate required that temporary and permanent construction easements be identified. Consequently, the FEIR should provide a detailed study and investigation of the existing topographic conditions, construction staging, contractor work zone and laydown requirements, contractor construction equipment anticipated to be utilized, potential contractor access/egress locations and major construction tasks to be performed. The information obtained will enable the preliminary temporary and permanent easements to be determined.

L-006-024

The EA/DEIR notes the railroad bridge that carries the MBTA Lowell Line over Harvard Street will have to be reconstructed to add two spans to accommodate four tracks. The bridge inspection report indicated the existing substructure and superstructure require rehabilitation for reuse to satisfy the proposed Green Line projects design life. We recommend documentation regarding these required improvements be provided by the project proponent. As mentioned previously, FST questions if the Harvard Street bridge has adequate vertical clearance based on existing conditions and the need for potential improvements to the Harvard Street alignment under future build conditions. These roadway improvements may also impact the existing utilities such as drainage, wastewater, and water located within the roadway. We recommend the vertical clearance under existing and future build condition be documented as per MassHighway Bridge Manual and that the need for roadway improvements, if applicable, including impacts to the existing utilities, be addressed by the project proponent.

Wastewater and Water

The EA/DEIR does not address or comment upon potential impacts to specific existing wastewater facilities at any of the proposed three station locations, at any of the five bridges, or along the existing train corridor in the City of Medford. The online existing conditions drawings show some manholes, but do not show the pipelines associated with these manholes. The drawings do not indicate whether there are any utilities on the five bridges. Concerning the generation of wastewater at the proposed stations, the EA/DEIR makes one general comment regarding the use of low-flow and waterless fixtures to minimize water consumption and wastewater generation. There are no quantities given for the generation of

L-006-025

wastewater at the stations or any discussion on how the stations will be sewered. The FEIR should indicate projected wastewater volumes and confirm with the City of Medford that capacity exists to accommodate the projected volumes. The presence/absence of utilities on bridges impacted by the

L-006-022

Construction impacts of the Project are described in each environmental resource section in DEIR/EA Chapter 5, Environmental Consequences. Pedestrian and vehicular access to abutting properties will be maintained at all times. Construction contractors will be required to comply with relevant federal, state, and local laws, regulations, and codes to eliminate or minimize adverse effects (such as noise and vibration levels, and traffic flow) to environmental and social resources. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the next phases of the Project: design and construction.

L-006-023

As indicated in DEIR/EA Section 3.7.1, a more comprehensive review of easement requirements will occur once more detailed final design plans are prepared. The final design will minimize both land acquisitions and any construction easements to the extent practical.

The MBTA has existing access rights to egress locations along the existing commuter rail right-of-way. These existing access locations such as 20 Vernon Street will be utilized during construction. Property rights for the Project will be secure before an NTP is issued to the contractor. This will allow the contractor to immediately clear station sites such as 350 Medford Street for laydown areas.

L-006-024

MassDOT will gladly coordinate with the City of Medford on its findings related to bridge replacement needs. Designs for bridges, including clearances, associated roadway areas, and impacted utilities will be advanced during preliminary engineering. MassDOT has and will continue to coordinate with the City of Medford at appropriate milestones as the Project progresses. This will help ensure compliance with legal

L-006-025 project should be noted and, as appropriate, their accommodation during construction staging of the appropriate bridges noted.

L-006-026 Regarding water service, there is no discussion on this topic in the EA/DEIR. While water usage is anticipated to be low, the FEIR should document coordination with the City of Medford regarding capacity available to service Station demands.

Transportation

In general, based on EA/DEIR assumptions related to how far new riders will travel to each station and the low percentage of those riders arriving in cars, the traffic analysis is (with limited comments) adequate and does not depict meaningful impacts to the City of Medford.

However, the EA/DEIR's projections of station-by-station ridership demands are based in part on an assumption that the catchment area for each station is one mile. Based on this assumption, ridership is divided between walking, bicycle, buses, and drop-off/pick-up. Regarding drop-off/pick-up, the EA/DEIR assumes that only five percent of riders will arrive in this manner uniformly for each station. Because the proposed design for the Ball Square Station proposes no area for drop-off/pick-up while College Avenue Station only provides 7 spaces and the Route 16 station only provides 14 spaces, it is critical to traffic operations that both the size of each station's catchment area and the percentage of drop-off/pick-up arrivals be correct. These assumptions are also critical for both traffic operations and parking demand. The EA/DEIR states these values but does not provide documentation to support these assumptions. The FEIR should document that the assumed five percent rate is reasonable based on recorded activity at other urban end-of-the-line stations. For instance, Oak Grove and Forest Hills are end-of-the-line stations on the Orange Line. What is the experience at these locations with the adequacy of short-term parking and what happens when Orange line service is delayed and drivers start to stack up waiting for delayed riders? Where will an ever-increasing number of vehicles wait at Ball Square without impacting traffic flow on busy streets adjacent to this station?

L-006-027

Additionally, the FEIR should document why a one-mile catchment area is reasonable. Particularly for potential riders north of Route 16 with little alternatives to, say, College Avenue Station in less then two miles, it seems unlikely that drop-off will not be an attractive option. If the catchment area was extended such that due to distance, say two miles, very few new riders would access the station on foot, then what happens with the demand for drop-off and long term parking near these end-of-the-line stations? Without a detailed explanation supporting the catchment area and related pick-up/drop-off and even parking demand at these end-of-the-line stations, a final conclusion on traffic impacts is not possible.

The FEIR should also discuss how the MBTA will monitor both drop-off/pick-up activity along with commuter parking on residential streets for the demand cases ultimately documented in the FEIR.

Stormwater

L-006-028 While not expressly subject to the state's Stormwater Standards, the Proponent has committed to comply with these requirements. This is a major environmentally positive commitment on the part of the project. We suggest, however, that while much has been done, the FEIR needs to enhance this effort to document full compliance with these standards. The attached memorandum on stormwater discusses additional steps that should be documented in the FEIR.

Visual

The most significant change would be the loss of forested areas along the right-of-way, reducing the green space visible from local residential areas. In a city like Medford, the tree-lined buffer

requirements and, to the extent feasible, consistency with planning and other projects.

L-006-025

As described in DEIR/EA Section 5.9, the Project would be required to comply with federal and state stormwater discharge permit requirements during both the construction and operational phases. Compliance with these standards would include using Best Management Practices to prevent contamination of stormwater and control erosion and accretion (sedimentation) from stormwater runoff from the railroad alignment, stations, and maintenance facility.

L-006-026

During preliminary engineering, MassDOT will coordinate with utilities providers to minimize impacts to existing utilities, including water sources.

L-006-027

The ridership demands are based on the assumption that the catchment area for pedestrians is one mile from each station. The catchment area for all modes of transportation (including driving as appropriate by alternative) includes the entire 164 community area in the CTPS regional travel demand model.

The pick-up/drop-off percentages are based on a 2007 CTPS survey undertaken to understand the use by station and mode of drop-offs at transit stations across eastern Massachusetts. The survey showed that within the urban core surface rail stops generally have between three and seven percent drop-off activity. More detailed information is provided in the transportation section of the Draft EIR.

between the existing rail lines and the houses and businesses means a lot to the community character of the neighborhoods and to Tufts University.

The wide stand of trees along Boston Avenue across from the Tufts campus buffers the rail corridor. The University's Tisch Library, at the top of the hill, overlooks this stand of trees. The partial loss of this buffer will greatly impact the ambiance of the College.

L-006-029

We recommend that the entire Medford stretch of the Green Line Extension be reviewed again for the FEIR, from a visual point of view, with an eye to the elevation of the abutters in relation to the elevation of the rail corridor.

We recommend also that the existing tree buffer be inventoried before it is removed. The City of Medford has a policy that if trees are removed, the same number of caliper inches need to replaced with new trees in the project. If the trees needed to replace the tree buffer do not fit in the project area, new trees could be planted on the streets of the City of Medford in the neighborhoods adjacent to the project area.

L-006-028

As described in DEIR/EA Section 5.9, the Project would be required to comply with federal and state stormwater discharge permit requirements during both the construction and operational phases. Compliance with these standards would include using Best Management Practices to prevent contamination of stormwater and control erosion and accretion (sedimentation) from stormwater runoff from the railroad alignment, stations, and maintenance facility.

L-006-029

MassDOT has and will continue to coordinate with municipalities such as the City of Medford at appropriate milestones as the Project progresses. This will help ensure compliance with local requirements such as tree replacement and, to the extent feasible, consistency with planning and other projects.

Fay, Spofford & Thorndike

Memorandum

To: Ed Hollingshead, AICP

Date: December 11, 2009

Re: Peer review Transportation– Green Line Extension Project Draft Environmental Impact Report, Environmental Assessment, and Section 4(f) Statement (referred to as 'the EA/DEIR') - EOEA # 13886

Traffic Impacts Overview

This peer review focuses on the probable traffic impacts of the Green Line Extension Project in Medford as they pertain to vehicular, pedestrian, and bicycle traffic for the Proposed Project (short term) with a College Avenue Station terminus and the Preferred Alternative (long term) with a Mystic Avenue/Route 16 terminus. The referenced EA/DEIR concludes that the traffic impacts of the Green Line Extension Project are expected to be minimal following construction.

A review of the EA/DEIR indicates that City of Medford traffic-related issues are addressed in several parts of that document including:

- Chapter 4 – Affected Environment, Sub-section 4.6
- Chapter 5 – Environmental Consequences, Sub-section 5.5
- Chapter 6 – Draft Section 61 Findings and Mitigation Commitments
- Appendix A: Responses to Comments on the EENF
- Appendix F: Traffic Analysis

The Green Line Extension Project includes three potential stations within or adjacent to the City of Medford. The Proposed Project includes Ball Square and College Avenue Stations located entirely within the City of Medford. In the long term, the Preferred Alternative extends Green Line service northwestward to a proposed Mystic Avenue/Route 16 Station located in the City of Somerville just northwest of the Medford line. Implementation of the Route 16 Station involves the purchase of two properties within the City of Medford. The Preferred Alternative assumes none of the proposed Green Line Extension stations in Medford will include park and ride facilities. A total of 7 drop-off/pick-up spaces will be provided at

the College Avenue Station, and approximately 14 drop-off/pick-up spaces will be provided at the eventual Mystic Valley Parkway/Route 16 Station. None are proposed for the Ball Square Station.

The EA/DEIR indicates that traffic impacts in Medford will be minimal or beneficial. Detailed traffic analysis sheets in the EA/DEIR traffic technical appendix (Appendix F) indicate that there will be only small differences between the Build and No-Build traffic conditions. However, AM and PM peak hour diagrams showing the projected differences in traffic volumes between alternatives were not provided in EA/DEIR or its appendices for direct comparisons.

There are two key assumptions made in the EA/DEIR that led to the presented ridership forecasts and to the resulting conclusions that traffic impacts associated with the Green Line Extension Project will be minimal.

Specifically, the ridership analysis methodology described in Appendix F of the EA/DEIR indicates that it is assumed that the "catchment area" of a transit station is defined as being within one mile of the station's location, regardless of access mode. This assumption, therefore, includes buses, drop-off/pick-up, bicycles, and walking.

The assumed size of the catchment area sets a limit on the population served by each station and, thus, the potential ridership levels that the service might attract. One of the key consequences of this limited-size catchment area is that future ridership estimates assume *that commuters living to the north and west of the new Medford Green Line stations at distances greater than one mile will not drive to the station areas and park their vehicles in nearby neighborhoods or nearby unrestricted parking spaces and walk to the Stations.* This key assumption will require intensive enforcement if it is to be achieved.

The second key assumption made in the EA/DEIR is that drop-off/pick-up riders will comprise only five percent of the ridership at each station.

Due to the critical importance of these two assumptions, it is highly recommended that the FEIR focus on documenting the validity of them with supporting data, based if possible on actual experiences at other MBTA stations already operational. Of particular interest would be their validity at end-of-the line stations such as what the College Avenue Station in Medford will be with the Proposed Project and what the Mystic Avenue/Route 16 Station will be with the Preferred Alternative. If the actual station catchment areas should prove to be larger than the assumed one mile, resulting in higher-than-anticipated station use and accordingly an increase in the number of people using each of the various access modes, traffic impacts in Medford would be expected to be different, in a negative way, from what has been anticipated in the EA/DEIR. Also, either by itself or in conjunction with a larger catchment area, an actual rate of drop-off/pick-up mode greater than the assumed five percent would potentially result in greater traffic impacts to the street system and neighborhoods surrounding the stations than was estimated in the EA/DEIR.

Detailed Comments

Chapter 4 – Affected Environment Sub-section 4.6

The existing 2008 traffic analyses were generally conducted in accordance with accepted industry procedures and included intersections cited in the December 1,2006 Certificate on the EENF and in accordance with MEPA Traffic Analysis Guidelines. Chapter 4 identifies the following signalized study area intersections within the City of Medford (from Mystic Valley Parkway southerly):

- Mystic Valley Parkway at Auburn Street east and west
- Mystic Valley Parkway at Winthrop Street
- North Street at Boston Avenue
- Winthrop Street at Boston Avenue
- Boston Avenue at College Avenue
- Boston Avenue at Harvard and Warner Streets
- Broadway at Boston Avenue (Ball Square)
- Main Street at Harvard Avenue
- Medford Square – Main Street at High, Salem, and Forest Streets, and Riverside Avenue

Additionally, the following unsignalized study area intersections located within the City of Medford were evaluated in Chapter 4 of the EA/DEIR:

- Boston Avenue at High Street/Sagamore Avenue
- College Avenue at George Street
- Main Street at George Street
- Main Street at Mystic Avenue
- Main Street at South Street/Mystic Valley Parkway EB Ramps (potential future signal location)
- Main Street at Mystic Valley Parkway WB Ramps (potential future signal location)

The EA/DEIR provided information requested in the MEPA Certificate on pedestrian activity and pedestrian mitigation measures in the vicinity of Medford stations. Figures providing AM and PM peak hour pedestrian flow volumes at Medford intersections illustrating existing and projected pedestrian crossing movements at intersections analyzed are included in the EA/DEIR. Figures presenting No-Build and Build traffic volumes are not included in the EA/DEIR.

The list of intersections selected and evaluated within the City of Medford is generally adequate, though Boston Avenue at North Street should be analyzed in the FEIR as an intersection likely to be affected during construction when the North Street Bridge is reconstructed.

An analysis for recent crash data in Medford is also included in the EA/DEIR.

Chapter 5 –Environmental Consequences Sub-section 5.5 – Traffic

The future Build and No-Build traffic analyses were generally conducted in accordance with accepted industry procedures and included intersections cited in the December 1, 2006 Certificate on the EENF. The Build year is 2030, a twenty-two-year horizon from the year 2008 existing conditions for the study. Our review of the intersections indicates that the analyses were performed in accordance with accepted procedures identified in the current Highway Capacity Manual, the industry standard. Also, the traffic impact analyses specifically were prepared to respond to the City of Medford's comment letter dated October 17, 2006.

From a 'big picture' perspective, the two following conditions have the potential to significantly affect traffic conditions in Medford.

1. Traffic conditions during construction of Proposed and Preferred Project

    - During construction of the proposed project to College Avenue Station, reconstruction of three bridges will result in traffic impacts in the City of Medford. College Avenue and Harvard Street bridges in Medford are required to be reconstructed, along with retaining walls adjacent to neighborhoods and commercial abutters. The EA/DEIR indicates that reconstruction of these Medford bridges will not require traffic diversions, while the reconstruction of the Broadway Bridge in Somerville is expected to produce traffic diversions, conceivably both in nearby Medford neighborhoods and in Somerville. We recommend that specific construction phasing plans be developed for all bridges proposed for reconstruction. This will confirm the notion that only the Broadway bridge in Somerville (next to Medford) requires traffic, pedestrian, and/or bike circulation detour plans. For all bridges for which detour plans are

necessary, these plans should be included in the FEIR. The EA/DEIR does not provide a detour plan for the Broadway bridge the one bridge that is slated for closure during reconstruction.

Reconstruction of the Winthrop and North Streets bridges and the retaining walls adjacent to residential and commercial abutters will also produce traffic impacts on the City of Medford during construction of Green Line service to Route 16. Again, detour plans, as appropriate, should be included in the FEIR for each of these bridge locations.

2. Traffic conditions with the proposed Green Line service in operation to both College Avenue Station and Route 16.

   - The potential for traffic operational issues coincident with the opening of Green Line stations primarily relates to the appropriateness of the ridership catchment areas and rate of drop-off assumed in the EA/DEIR. If the EA/DEIR's assumptions on these two issues are correct, then with the comments discussed below, traffic, pedestrian, bicycle and parking issues associated with the project are limited. However, until these assumptions are fully supported in the FEIR, transportation impacts associated with the proposed action remain unclear. These two key assumptions are discussed below.

Assumed Catchment Area and Rate of Drop-off/Pick-up

The EA/DEIR projections of traffic in 2030 are based on the premise that all drop-off/pick-up activity will originate ***within one mile of the new Green Line stations***. The validity of this assumption is particularly questionable for end-of-the-line stations. When the College Avenue and finally the Route 16 Stations represent the end of the line it seems unlikely that drop-off/pick-up activities will not be generated from distances in excess of one mile.

In fact, we note that the FTA on November 13, 2009 published a new policy request in the Federal Register Volume 74, No. 218 that states:

> "All pedestrian improvements located within one-half mile and all bicycle improvements within three miles of a public transportation stop have a *de facto* physical and functional relationship to public transportation. According to a test of activity and use, *pedestrian and bicycle improvements beyond these threshold distances may be eligible for FTA funding if the improvement is within the distance most people can be expected to safely and*

conveniently walk or bicycle to use that particular transit service."

If FTA anticipates riders bicycling up to three miles, it seems reasonable to anticipate drop-off/pick -up activities occurring within this same distance. Certainly, it seems reasonable that these activities will involve populations located beyond one mile from stations.

Even based on the catchment area and arrival modes assumed in the EA/DEIR, questions exist related to the impact of drop-off/pick-up activities on area traffic operations. The following table based on EA/DEIR data presents ridership and drop-off/pick-up at the relevant stations

As indicated in the following table, 30 drop-off/pick-up actions are projected during peak hours at the Ball Square Station **although no location for these actions to occur is proposed.** Consequently, even assuming that the projected number of actions is correct, this represents, on average, a vehicle stopping every two minutes. In the busy afternoon peak hour with on-street parking limited and vehicles arriving as other vehicles continue to await the arrival of passengers, it is reasonable to anticipate a number of vehicles parked or double parked. The FEIR should acknowledge that the EA/DEIR has not addressed this issue and identify locations where drop-off/pick-up activity can safely occur at Ball Square. Without this identification, traffic operations in Ball Square are likely to be impacted by double-parked vehicles.

Future Station	Peak Hour Drop-off/Pick-up demands*	Total Daily Drop-off/Pick-up demands*	Total Daily Riders at Station*
Ball Square Station	30/30	90/90	1,800/1,800
College Avenue	40/35	115/100	2,300/2,000
Mystic Valley Parkway/Route 16	NA/42	NA/120	NA/2,400

Data Source: EA/DEIR Chapter 5 and Appendix F
*Proposed to College Station/Preferred to Route 16
NA – Not Applicable

The preceding table also suggests that the EA/DEIR projects a uniform five percent of the total riders for the Medford Green Line Extension stations is expected to come from drop-off/pick-up activity; the rest will either be arriving by walking, biking, or bus. The EA/DEIR indicates this is typical for such stations. Given the dense urban locations these stations are proposed for, the surrounding high traffic volumes, and the total lack of Station parking at Ball Square and the very limited parking at the College Avenue and Route 16 stations, this assumption of five percent is an important assumption. Again, the FEIR should document that this is a reasonable assumption based on actual behavior at other MBTA end-of-the-line

stations. Simply doubling the drop-off/pick-up rate to 10 percent could have meaningful peak hour implications for each of the proposed stations.

Additionally, it is recommended that the potential drop-off/pick-up 'catchment' area be extended to locations within a 5- to 10-minute *drive* of the College Avenue and Ball Square Stations; e.g., up to two plus miles upstream from each station. Because the MBTA does not propose park and ride facilities at either of the two Medford Stations, we would anticipate higher-than-projected demands for drop-off/pick-up activity from locations more than one mile distant. For instance, the EA/DEIR indicates that an evaluation of demand for parking at the Route 16 Station supported a demand for 300 parking spaces. Although not proposed, this suggests that there is a demand to reach the extended Green Line that exceeds the EA/DEIR's assumed one-mile catchment area. This in turn suggests that drop-off/pick-up activity may be higher than assumed.

Parking

Observations and parking inventory findings presented in the EA/DEIR confirm there are opportunities for parking within 500 feet of the new Medford Stations.

Any available spaces may be subject to use, particularly by motorists picking up passengers in the afternoon and evening or for longer-term parking. Because some Medford neighborhoods have neighborhood parking permit programs, it may be less likely that motorists will attempt to park and ride in neighborhoods. However, with an increased likelihood of more riders driving to stations, the potential for more vehicles on Medford streets exists pending resolution on the catchment and drop-off/pick up assumptions in the FEIR.

Chapter 6 –Section 61 Findings and Mitigation Commitments

Review of Traffic Mitigation measures in the EA/DEIR indicates traffic impact mitigation is proposed at only two intersections in the City of Medford—Boston Avenue at College Avenue (with the Proposed Project) and Boston Avenue at Winthrop Street (with the Preferred Alternative).

The latter intersection requires removal of 12 on-street parking spaces on Boston Avenue for an intersection upgrade that involves re-striping and signal modifications only. According to the data contained in the EA/DEIR, the Project increases intersection traffic by approximately 3 percent during the PM peak hour or approximately 60 trips per hour out of nearly 2,000 trips per hour projected to enter the intersection. The projected level of service with the change modifies the operation from LOS F in both the No-Build and the unmitigated Build to LOS D. AM analysis for this intersection with the Proposed Project was not available for review. While removing on-street parking does improve PM peak hour operations from LOS F to LOS D, it could adversely affect local businesses on Boston Avenue that may rely on an available supply of on-street parking. The FEIR should address this potential impact.

Similarly, the addition of an exclusive-right-turn lane on Boston Avenue at College Avenue, according to the EA/DEIR analysis sheets, improves the overall LOS from an LOS F with both the No-Build and unmitigated Build to LOS D with the mitigated Build. There are drawbacks with the exclusive-right-turn lane. It is located at a busy pedestrian crossing and will conceivably make the crossing more difficult. Provision of an exclusive right-turn lane next to the station within a few feet of the station's proposed drop-off/pick-up location could be problematic from a safety perspective if drop-off/pick-up vehicles queue back into the travel lane on Boston Avenue. Since a portion of the drop-off demands may come from the north, U-turning on Boston Avenue may also become a safety issue, as the proposed alignment for the drop-off/pick-up area is for vehicles to enter facing northbound.

As noted above, the addition of an exclusive-right-turn lane at this location is not pedestrian-friendly, as it creates a longer crossing of College Avenue at the station and encourages higher-speed right turns from College Avenue to Boston Avenue near the proposed drop-off/pick-up lane at the future station. Analysis of the projected volumes indicates that accommodation of the slight increase in traffic at the College Avenue intersection should be balanced by the need to enhance pedestrian flow to and from the station and to monitor (enforce) potential overflow of drop-off/pick-up activity at the seven spaces that may be well used throughout the day. If, as expected, drop-off/pick-up demands are higher than projected, motorists may be double-parked or encroach on parking areas in nearby neighborhoods. We suggest that FEIR revisit this issue.

As listed below, a total of 12 intersections is proposed for pedestrian enhancements in Medford. Of these, four involve pedestrian signal enhancements, two involve wheel chair ramp enhancements, and six involve signs or crosswalk markings only. One of the two wheelchair ramp enhancement locations has already been implemented by the City of Medford. Because the City routinely maintains crosswalk markings, it is assumed that the new markings would need to be reviewed with the City for applicability.

- Mystic Valley Parkway at Auburn Street: - Signalize side street crossings and increase pedestrian walk/flashing don't walk time
- Mystic Valley Parkway at Winthrop Street - Increase pedestrian walk/flashing don't walk time
- Boston Avenue at North Street - Upgrade pedestrian signal heads and increase pedestrian walk/flashing don't walk time
- Boston Avenue at Winthrop Street - Re-stripe crosswalk markings

- Boston Avenue between Winthrop Street and College Avenue - Install warning signage for mid-block crossing
- Boston Avenue at Harvard Street - Re-stripe crosswalk markings
- College Avenue between Boston Avenue and Frederick Street - Signal warrant analysis for possible mid-block pedestrian signal; install if warrants are met
- College Avenue at George Street - Install wheelchair ramps and re-stripe crosswalk markings
- Main Street at George Street - Install wheelchair ramps and add crosswalk markings
- Main Street at Mystic Valley Parkway ramps - Re-stripe crosswalk markings
- Main Street at Harvard Street – Re-stripe crosswalk markings
- Main Street at Mystic Avenue – Re-stripe crosswalk markings

Of the above mitigation measures, the intersection of Boston Avenue with North Street requires additional wheel chair ramps to become ADA compliant and the intersection of Main Street at George Street has recently been upgraded to include new wheel chair ramps and a crosswalk.

As mentioned previously, the FTA on November 13, 2009 published a new policy request in the Federal Register Volume 74, No. 218 that states impacts that could be eligible for FTA funding. We recommend that the Green Line Extension project conform to these distances, should the FTA policy be adopted.

The EA/DEIR indicates that during the peak hours 700-800 pedestrians an hour will access the Ball Square and College Avenue Stations in Medford. At a minimum, if these demands are to occur, sidewalks within ½ mile of the Medford Stations should be addressed from an ADA enhancements perspective. Sidewalks with narrow passageways or rare missing sidewalks, or accessible pedestrian routes that are not compliant with current ADA requirements, should be improved under this Project.

Additional Mitigation Measures

The EA/DEIR in Tables 6-1 and 6-2 commits to working with the Cities (including the City of Medford) to develop station-area parking enforcement plans. It would be appropriate to cite specific examples of what types of actions the Proponent would commit to in working with the City in the FEIR. For instance, monitoring of pick-up/drop-off activity at both stations and before/after surveys of parking demands in residential neighborhoods generated by Green Line riders would be useful. Should these prove to be issues, the Proponent should suggest what next steps would be committed to.

Additionally, should projected drop-off/pick-up estimates be meaningfully understated based on future monitoring, and nearby intersections become an issue with unforeseen double parking and/or congestion, we would recommend the Proponent establish a contingency fund to assist the City in dealing with potential traffic and parking problems.

Substantial bicycle activity was observed on streets in the vicinity of the proposed two Medford Green Line Extension stations at Ball Square and College Avenue during early December. It is recommended that the City also request the Proponent for funds, potentially eligible under the proposed FTA regulation cited above, to address enhancement of bicycle circulation facilities in the vicinity of the stations to improve bicycle access to the Stations. We note that bike lanes were recently added on Broadway in Somerville in the vicinity of the proposed station at Ball Square, but there are none on streets in the vicinity of the proposed Ball Square or College Avenue stations in Medford. We suggest that the MBTA commit to a comprehensive study to identify a system of bike routes in Medford between abutting residential neighborhoods and the proposed stations.

Stormwater

MEMORANDUM

TO: Ed Hollingshead, AICP

FROM: David Glenn, P.E.

DATE: December 4, 2009

PROJECT: DEIR/EA EEA Number 13886
Green Line Extension
Medford, MA.

SUBJECT: Stormwater Review

As requested, Fay, Spofford & Thorndike, LLC. (FST) has performed a review of the Stormwater Management Plan associated with the above referenced Environmental Assessment/Draft Environmental Impact Report (EA/DEIR) for the Green Line Extension Project. Materials received to date include DEIR/EA Volume 1, dated October 15, 2009 as prepared by Vanasse Hangen Brustlin, Inc (VHB).

In regards to stormwater, the Secretary's Certificate on the Expanded Environmental Notification Form (EENF) required the DEIR to include an overall drainage plan and demonstrate the stormwater management system will comply with the DEP Stormwater Management Standards, including water quality and quantity during construction and post development. The DEIR should include an operations and management plan of the stormwater management system and identify stormwater discharge points and describe any drainage impacts associated with required off-site improvements.

The EA/DEIR, Chapter 5.9 Stormwater provides a general discussion on the above referenced items. FST offers the following comments on the proposed stormwater management system, specifically for compliance with the DEP Stormwater Management Standards.

A) Standard No.1 requires no untreated stormwater discharges or erosion to wetland resource areas.

The DEIR/EA notes a new underdrain system will be constructed along the MBTA commuter rail corridor that will connect to the existing drainage trunk lines beyond the railroad corridor that discharge to the Mystic River. Stormwater runoff from the Ball Square Station will discharge into the existing Harvard Street Drainage. Runoff from the College Avenue Station and Mystic Valley Parkway/Route 16 Station will be directed to the Mystic Valley Parkway/Route 16 Station drainage system, which

discharges to the Mystic River. **FST recommends additional documentation be provided to demonstrate discharge velocities from the existing and proposed outfalls will not cause erosion or scouring at the point of discharge or downstream.**

B) *Standard No.2 requires peak flow attenuation (i.e. no increase in peak stormwater discharge rates).*

A summary table of the net impervious surface changes by station identifies an increase in impervious area for each of the three stations located in Medford. The increase in impervious area consisting of new pavement and rooftops varies from 0.4 to 0.6 acres. Stormwater runoff from each station will discharge into an existing municipal drainage system. **FST recommends a hydraulic analysis for the 2-, 10- and 100-year storms be provided that assesses the potential impacts of the increase of peak flow and volumes to the existing municipal drainage systems.**

C) *Standard No. 3 requires the loss of annual recharge to groundwater be minimized through the use of infiltration measures and annual recharge from post-development shall approximate the annual recharge from pre-development conditions.*

The EA/DEIR provided a general discussion on infiltration systems to be utilized as a component of the stormwater management system based on existing soil conditions. As previously noted, the proposed three stations in Medford will result in the increase in impervious, thereby resulting in a loss of annual recharge to groundwater. **We recommend additional documentation be provided to demonstrate the annual recharge from post-development shall approximate the annual recharge from pre-development conditions and the use of Low Impact Development (LID) measures to be considered.**

D) *Standard No. 4 requires the stormwater management system include a series of Best Managements Practices (BMPs) to demonstrate a total suspended solids (TSS) removal rate of at least 80 percent. Where there is more than one outfall, each outfall shall achieve 80% TSS removal prior to discharge.*

The DEIR/EA states where need, TSS removal would be accomplished by way of a proprietary water quality device. **FST recommends the proposed Stormwater BMP's and TSS Removal Calculation Worksheet be provided for each station to demonstrate compliance.**

E) *Standard No. 5 requires the use of specific stormwater management BMP's from Land Uses With Higher Potential Pollutant Loads (LUHPPLs).* **Does not apply.**

F) *Standard No. 6 Critical Areas.* **Does not apply.**

G) *Standard No. 7 Redevelopment Project.* **Does not apply.**

H) *Standard No. 8 requires an erosion and sedimentation control plan be implemented to prevent impacts during construction and land disturbance activities.*

The erosion and sedimentation control narrative provides a general discussion on controls to be utilized during construction phases of the project. We recommend a more detailed discussion be provided identifying items such as sequence of construction, limits of phasing and placement/type of erosion control measures

I) *Standard No. 9 requires all stormwater management systems have an operation and maintenance plan to ensure the systems function as designed.*

The stormwater operations and maintenance program needs to address the frequency of inspection/cleaning of the proposed Stormwater BMP's. The program should also identify the stormwater management system owner and parties responsible for operation and maintenance of the stormwater facilities.

J) *Standard No. 10 Prohibition of Illicit Discharges.*

The standard has not been addressed in the EA/DEIR.

Wastewater

Fay, Spofford & Thorndike

Memo

To: Richard A. Azzalina

From: Robert H. Letourneau, P.E.

Date: November 20, 2009

Re: Peer Review of Greenline Extension DEIR/EA
Regarding Wastewater Facilities in Medford

Draft Environmental Impact Report/Environmental Assessment and Draft Section 4(f)
Evaluation for Greenline Extension Project into the City of Medford

---

I have reviewed on-line the above mentioned document as it pertains to the proposed Greenline Extension project into the City of Medford. The subject report does not address or comment upon potential impacts to specific existing wastewater facilities at any of the proposed three station locations, at any of the five bridges, or along the existing train corridor in the City of Medford. The online existing conditions drawings show some manholes, but do not show the pipelines associated with these manholes. The drawings do not indicate whether there are any utilities on the five bridges. Concerning the generation of wastewater at the proposed stations, the report makes one general comment regarding the use of low-flow and waterless fixtures to minimize water consumption and wastewater generation. There are no quantities given for the generation of wastewater at the stations or any discussion on how the stations will be sewered.

Bridges

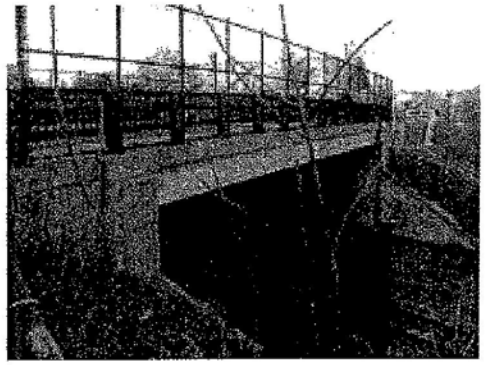
SUBJECT: Bridge Review Peer Review Green Line Extension Project
EA/DEIR and 4 (f) Statement EEA # 13886

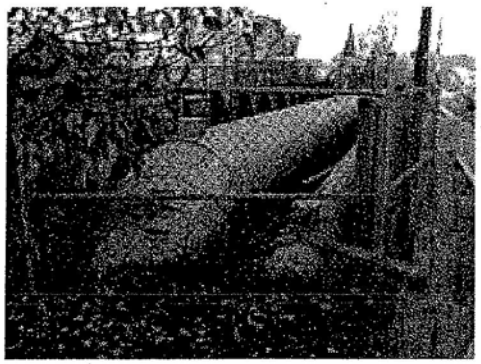
College Avenue Over MBTA Commuter Rail, Medford (M-12-012)

The bridge is a single-span, prestressed concrete slab bridge supported by wall abutments. The bridge was constructed in 1997.

The bridge was last inspected on July 17, 2009. The Routine Inspection Report indicates that:
Item 58, Deck, is rated 8 – Very Good.
Item 59, Superstructure, is rated 8 – Very Good.
Item 60, Substructure, is rated 8 – Very Good.

Immediately to the north of the existing bridge is a separate utility bridge that supports two large pipes.





The Green Line project DEIR documentation suggests that this bridge requires replacement, due to horizontal constraints for fitting two new tracks below the structure.

Discussion:

- There may be lateral clearance for two additional tracks. Because the existing structure is in very good condition, and because of the difficulties of construction at this site (discussed below), the Green Line Project should carefully review options to fit new tracks in the existing right-of-way without replacing the bridge. The DEIR suggests that the existing commuter rail tracks should be moved 13 feet in the alignment to the east. New Green Line tracks would be placed to the west.

- A new Green Line College Avenue Station is proposed on the alignment north of the College Avenue Bridge. Placement of a new station requires additional track right-of-way width, from 61 feet without the station to a maximum of 81 feet at the station. Ideally, the new proposed College Avenue Station location should be coordinated to minimize track width requirements so that the existing bridge could be reused. To do so requires a study of station siting and track widths as the station location is placed at some distance to the north of the bridge crossing.

If it is determined that the bridge requires replacement due to track width requirements, the following is a discussion of impacts and issues:

- Construction at this site for a new bridge is very constrained. The existing intersection of College Avenue and Boston Avenue is immediately to the west of the west abutment of the bridge. The intersection appears to be congested for many parts of the day. In addition to vehicular traffic, the intersection has very heavy pedestrian traffic from Tufts University.

- Construction of a temporary bridge at this site will be difficult. Immediately to the south is the existing post office/Tufts lounge building. To the north is an existing utility bridge, with further site constraints posed by Boston Avenue and a Tufts administrative building and parking lot.

- For a new, longer span, it may be possible to construct the replacement bridge one half at a time:
  - Build a section of the new bridge wide enough for one lane of traffic to the north of existing with new connections for utilities. To minimize right-of-way and alignment impacts, demolish part of northern face of existing bridge (as much as possible while still providing service for two lanes of traffic).
  - Relocate College Avenue WB onto new section. Demolish additional section of new bridge, providing service still for one lane.
  - Construct more of new bridge, providing service for College Avenue EB.
  - Demolish remaining existing bridge, complete new bridge. The new bridge would be wider than existing, thus providing a right-turn-only lane from College Avenue WB to Boston Avenue NB.

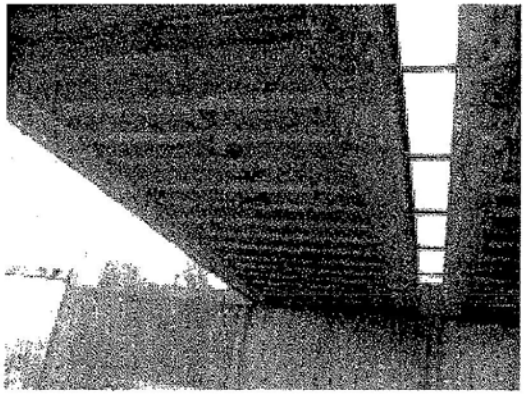
- The existing bridge is the only connection between the main part of the Tufts University campus and athletic facilities and support buildings on the east side of the tracks. Furthermore, the bridge provides access to one of the main Tufts University parking lots on the east side of campus adjacent to Cousins Field. As a result, the bridge supports a very heavy demand for pedestrian traffic. Any construction scheme will need to maintain unfettered pedestrian access at all times during the academic year. This requirement potentially may be lessened during the summer months when school is not in session.

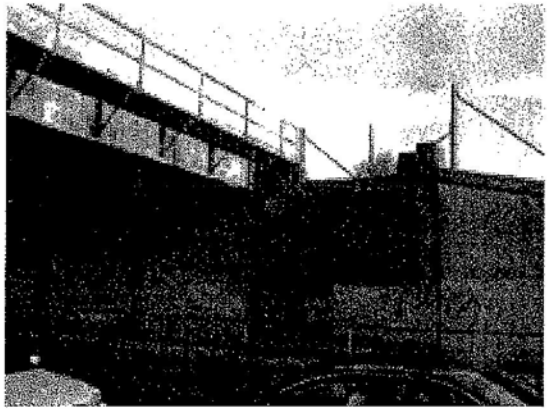
- College Avenue rises in a steep grade from the east approach to cross the tracks. Should the span be lengthened, the vertical control point for this crossing will likely need to be moved further to the east down College Avenue. A careful study will be needed to confirm roadway grade elevations for access along the right-of-way, in particular for Tufts University Halligan Hall to the north, and the Cousins Parking Lot to the south.

- The Green Line Project Full Build will require replacement of Winthrop Street over MBTA Commuter Rail (see also separate discussion). Winthrop Street, along with Harvard Avenue, provides the potential for detours around College Avenue. Should the work proceed with the Full Build option, it will probably be necessary to avoid limiting service to both the College Avenue and Winthrop Street crossings at the same time.

MBTA Commuter Rail over Harvard Street – (M-12-011)

The bridge is a single-span, steel girder floor beam bridge supported by wall abutments. The bridge consists of two separately framed spans supported by the continuous wall abutments





The Green Line project DEIR documentation suggests that this bridge can be widened to support two new tracks crossing Harvard Street.

Discussion:

- The existing crossing of Harvard Street originally had four tracks. Two of the tracks and the superstructure were removed. The wall abutments remain. Assuming the abutments are sound, it should be possible to build new spans in the available slots.
- The Commuter Rail tracks crossing the existing spans are placed at the center of the crossing. Two new spans would be constructed to the east and west of the existing spans. The Commuter Rail tracks would be shifted to the east, using part of the existing

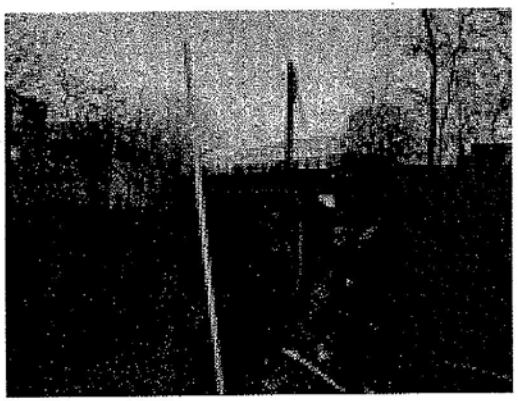
span and one new span. Likewise, the Green Line tracks would be placed on the existing span and one new span to the east.

- The inspection report suggests that the existing substructure and superstructure require some rehabilitation for reuse to satisfy the proposed Green Line project's design life.
- The schedule for new construction and rehabilitation work at Harvard Street should be carefully coordinated with other needed bridge construction/reconstruction for the Green Line project, in particular work at College Avenue.

Broadway Over MBTA Commuter Rail - (S-17-013)

The bridge is a single-span, steel stringer bridge supported by wall abutments. The bridge was constructed in 1973.

The bridge was last inspected on October 24, 2008. The Routine Inspection Report indicates that:
Item 58, Deck, is rated 7 –Good.
Item 59, Superstructure, is rated 6 – Satisfactory.
Item 60, Substructure, is rated 6 – Satisfactory.



The Green Line project DEIR documentation suggests that this bridge requires replacement, due to horizontal constraints for fitting two new tracks below the structure.

Discussion:

- The existing span appears to be not long enough to provide space for two new tracks below in the right-of-way.
- The crossing site at Ball Square is heavily congested. Construction staging for a new crossing will require careful coordination with abutters and traffic on Broadway.

- Due to right-of-way limitations, it appears that construction of a temporary bridge may be difficult. It may be possible to reconstruct the bridge half at a time, providing a minimum of two lanes of service on Broadway.

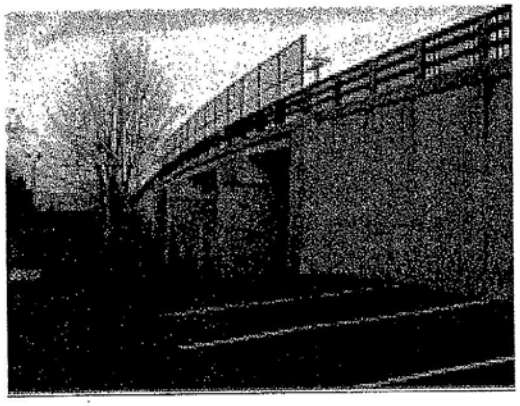
- Broadway rises in a sharp grade to cross the tracks. For a new, longer span, the vertical control points for this crossing will likely need to be shifted to the east and west. A careful study will be needed to confirm roadway grade elevations for access along the right-of-way for abutters.

Bridges potentially impacted by the Green Line Full Build Option to Mystic Valley Parkway:

North Street Over MBTA Commuter Rail (M-12-014)

The bridge is a three-span, prestressed concrete slab bridge supported by wall abutments and piers. The bridge was constructed in 1997.

The bridge was last inspected on July 17, 2009. The Routine Inspection Report indicates that:
Item 58, Deck, is rated 8 – Very Good.
Item 59, Superstructure, is rated 8 – Very Good.
Item 60, Substructure, is rated 8 – Very Good.



The Green Line project DEIR documentation suggests that this bridge may be reused as part of the Full Build option. Sufficient room is present to fit two new tracks below the structure.

Discussion:

- The inspection report and field visit suggest that the bridge is in good condition and suitable for reuse as part of the Green Line Full Build option. Minor rehabilitation of pavement, joints, and concrete walls may be needed.

- The span layout of the existing bridge is such that new tracks would be placed under each of the approach spans. The Commuter Rail NB track would be shifted to beneath the east approach span, and the SB track would remain under the main span but shifted to the east. New Green Line tracks would be placed under the main span and west approach span. The tracks for both facilities would need to take into account the existing wall piers separating the main span from approach spans.

- Existing traffic patterns in the residential areas to the east of the bridge limit access for through traffic to the south. Unless the pattern of one-way streets is temporarily changed during construction of the other bridges (at Winthrop Street and College Avenue), the North Street crossing would not be useful as a detour route.

- The current approach of North Street to the east of the bridge rises in a very sharp grade that appears to be substandard.

Winthrop Street Over MBTA Commuter Rail (M-12-013)

The bridge is a single-span, steel stringer bridge supported by wall abutments. The bridge was constructed in 1984.

The bridge was last inspected on January 16, 2008. The Routine Inspection Report indicates that:
Item 58, Deck, is rated 7 –Good.
Item 59, Superstructure, is rated 7 –Good.
Item 60, Substructure, is rated 7 –Good.

The Green Line project DEIR documentation suggests that this bridge requires replacement, due to horizontal constraints for fitting two new tracks below the structure. Discussion:

- The existing span appears to be not long enough to provide space for two new tracks below in the right-of-way.

- The crossing site is adjacent to the intersection of Winthrop Street and Boston Avenue. It is in a heavily congested commercial area. Construction staging for a new crossing will require careful coordination with abutters and residential owners on Winthrop Street and Boston Avenue. In particular, one abutter has a driveway access to Winthrop Street immediately to the northeast of the existing bridge.

- Due to right-of-way limitations, it appears that construction of a temporary bridge may be difficult. It may be possible to reconstruct the bridge half at a time, providing a minimum of two lanes of service on Winthrop Street.

Regarding Constructability Issues in Medford

Subject Draft Environmental Impact Report/Environmental Assessment and Draft Section 4(f) Evaluation for Green Line Extension Project into the City of Medford

---

Comments contained herein are with regard to the **"Draft Environmental Impact Report/Environmental Assessment and Section 4(f) Statement Volume 1"** dated October 2009.

The Certificate of the Secretary of Environmental Affairs on the Expanded Environmental Notification Form for the Green Line Extension, dated December 1, 2006, states the following on pages 13 and 14:

"***Construction Period Impacts***

The EIR should include a discussion of construction phasing, evaluate potential impacts associated with construction activities and propose feasible measures to avoid or eliminate these impacts. It should note whether any blasting will be required. The EIR should identify temporary and permanent construction easements. The proponent must comply with DEP's Solid Waste and Air Quality Control Regulations during construction. The proponent should implement measures to alleviate dust, noise, and odor nuisance conditions (including rodent control), which may occur during construction."

With reference to Chapter 3 Section 3.7.6 **Construction Sequencing and Staging**, FST has reviewed the Report and has the following review comments:

1) Construction Zones and Lay Down Areas

A statement is made that there is limited space for construction zones and lay down areas within or near the rail corridor. There is no general discussion of the various contractor work zone size and lay down area requirements that would be anticipated to complete the tasks associated with the work. Typical Construction Staging Figures 3.7-37 and 3.7-38 are not representative of the various site conditions that will be encountered within the railroad corridor. Further studies need to be completed to develop additional Typical Construction Staging sketches that will enable a further detailed discussion of the \

potential constraints and conditions to be encountered. The discussion should also address contractor work zone requirements for the equipment and work to be performed. Also addressed should be whether or not there are any potential contractor lay down areas available off-site. If it is determined that potential sites do exist, their locations should be identified.

2) MBTA Lowell Line Commuter Rail

The existing MBTA commuter rail service must be maintained throughout construction. With train service on the Lowell Line being provided on weekdays and weekends, work directly impacting the train service will be limited to off-peak daytime and nighttime work. This issue should be discussed for the major construction work tasks that will be performed to properly evaluate and address when the daytime and nighttime impacts will be occurring.

3) MBTA Lowell Line Commuter Rail

As noted in Section 4.5.2.1 **MBTA Lowell Line**, there are 21 inbound and 21 outbound weekday commuter train runs. Weekend and holiday service consists of eight inbound and eight outbound train runs. The times of these train runs should be documented for the current schedule, particularly noting the times of the first trains in the morning and the last trains at night. For work activities occurring adjacent to and in close proximity to the easterly side of the commuter rail tracks, the MBTA will place restrictions on how close to the tracks and what type of work can be performed with regard to Green Line construction. It is anticipated that for much of the work in this area that is directly adjacent to the railroad tracks there will be a requirement for off-peak-hour nighttime work. This requirement should be addressed and discussed for the major construction work tasks that will be performed to properly evaluate and address the potential nighttime impacts to the residential neighborhoods.

4) Maintenance and Protection of Railroad Traffic

Typical MBTA requirements state "***under no circumstances shall any equipment or materials be placed or stored within fifteen (15) feet from the centerline of the outside track***". Although in the report it was noted the necessity to maintain minimum horizontal and vertical offsets from live track centerlines to work zones and structures, it must be determined how prevalent is this condition. It is understood this restriction may require additional off-peak-hour work construction. Whether most of the work will be done in the day or night should be documented.

5) Existing Freight Rail Service

Freight rail service must also be maintained throughout construction, and maintaining this service has implications for construction staging. There is no mention of hours of freight rail operation on weekdays and weekends. As with the commuter rail line, work directly impacting the freight service will be limited to off-peak-hour work. The noise, vibrations, dust, and air quality will negatively affect the residential and commercial neighborhoods as well. This situation should be addressed and discussed for the major construction work tasks that will be performed to properly evaluate and address the daytime and nighttime impacts to the neighborhoods.

6) Land Acquisition

While land acquisitions were discussed in the EA/DEIR for the project, temporary and permanent easements were not addressed. The Certificate required that temporary and permanent construction easements be identified. As noted above, a more-detailed study and investigation of the existing topographic conditions, construction staging, contractor work zone and lay down requirements, contractor construction equipment anticipated to be utilized, potential contractor access/egress locations, and major construction tasks to be performed are needed. The information obtained will enable the preliminary temporary and permanent easements to be determined.

7) Construction Staging and Sequencing

Activity for the new Green Line extension will be dictated by the number and type of bridges to be reconstructed, traffic detours, alternate construction by-pass routes, pedestrian access, commuter rail service, freight rail service, access to commercial and residential areas, contractor work zone requirements, contractor lay down requirements, contractor access/egress requirements, temporary easement requirements, and Life Safety vehicular access. These are items, issues, and concerns that need to be properly addressed during the initial planning and permitting stages. A more detailed study and investigation is warranted to further evaluate, understand, potentially address, and make additional recommendations at this stage to fulfill the EIR requirements.

8) Reconstruction of Harvard Street bridge

Harvard Street's profile as it passes under the rail bridge is concave. In heavy rain events, water ponds in this depression directly under the rail bridge. Given its concave shape, as the rail bridge is widened its eastern and western edges will extend toward the sections of Harvard Street that are at an angle. At these points it is possible that the clearance between Harvard Street and the expanded edges of the rail bridge will be reduced such that they could impact trucks. The Build case clearance at this location should be established in the FEIR. If the existing clearance is reduced such that an impact to vehicular traffic occurs, the proponent may need to adjust the grade of Harvard Street. In such an event, the proponent should address the flooding issue at this location as part of a redesign of Harvard Street.

Air Quality

KM Chng Environmental Inc.

MEMORANDUM

To: Ed Hollingshead (FST)

From: Tim Lavelle (KM Chng)

Subject: EOT Green Line Extension – EIR/EA
- Air Quality Review

Date: 4 December 2009

As requested, we have reviewed the document *Draft Environmental Impact Report/ Environmental Assessment and Section 4(f) Statement* for the Green Line Extension Project (EEA #13886). Our objective was to review the completeness, methodology, and data assumptions for the air quality analysis conducted for the Project.

SUMMARY

The document appears to be reasonably thorough and, for the most part, uses methodologies that are consistent with current EPA/DEP guidance. However, as discussed below, a number of issues with the analysis limit the verification of the accuracy of the results. Missing data and methodology details would need to be provided by the author to check the accuracy. However, the errors and inaccuracies described are not likely significant enough to change the overall conclusions presented in the Report, which states that the build alternatives would provide air quality benefits when compared to the No-Build Alternative.

The following brief summary points identify issues with the document's compliance with the Secretary's Certificate and also problems with missing or incomplete methodology details and data within the air quality sections of the Report. For more explanation of the summary points, this Summary section is followed by a section of Detailed Comments addressing each of the bulleted summary points.

Compliance With the Secretary's Certificate on the Expanded Environmental Notification Form

- The Certificate requires reporting of emission inventory results for CO and PM2.5, these results are not presented in the Report; and
- Quantitative PM10 and PM2.5 hotspot assessments that were not required in the Certificate were included in the analysis using methodology that is not currently endorsed by EPA or FHWA, and therefore the reported results may be misleading to the public.

Affected Environment – Section 4.7

- No description of PM10/PM2.5 persistence factors used to estimate 24-hour and annual results from the 1-hour modeled results is provided;
- Report does not provide description of modeling methodology for the Microscale Commuter Rail Evaluation; and
- The emissions inventory does not present results for CO or PM2.5.

Environmental Consequences – Section 5.6

- The 1-hour CO background concentration is suspect and the 8-hour CO background concentration is not presented;
- No description of the development of PM10/PM2.5 background concentrations is provided;
- The project-opening year, or construction completion year, is not included in the analysis; and
- As required in the Certificate, an attempt to provide a greenhouse gas emission inventory comparison between the alternatives is provided, however it is incomplete. Although greenhouse gas emissions are calculated for on-road motor vehicles, there is no accounting of greenhouse gas emissions for electricity generation to power the extended Green Line.

Air Quality Appendix

- The air quality study protocol is not provided in the Report Appendix for public review;
- It appears that the 8-hour CO concentration results were calculated incorrectly;
- It appears that there are multiple issues with the MOBILE motor vehicle emission factor modeling;
- There are issues with the background concentrations used in the CAL3QHC hotspot modeling for CO, PM10, and PM2.5; and
- There are data input issues with the emission factors used in the CAL3QHC hotspot modeling.

DETAILED COMMENTS

Compliance With the Secretary's Certificate on the Expanded Environmental Notification Form

- The air quality scope in the Secretary's Certificate requires that "the analyses should analyze the following emissions: VOC, NOx, greenhouse gases, carbon

monoxide, particulate matter (PM) and air toxics." Although it appears that CO and PM2.5 emissions were estimated for each alternative as data files in the Air Quality Appendix indicate, the results for these two pollutants are not presented in the EIR.

- The scope requires that the microscale analysis examine localized hotspots for CO concentrations only. Because the study area is located in an attainment area for PM10 and PM2.5 (meaning that EPA recognizes this area as meeting the regulated ambient air quality standards for these pollutants), there are no requirements for including PM10/PM2.5 hotspots in the analysis, and even more so for not including a *quantitative* analysis. Even if PM10/PM2.5 hotspots were required, current Transportation Conformity guidance endorsed by FHWA and EPA calls for *qualitative* assessments only. The agencies are currently in the process of finalizing *quantitative* methodology for PM10 and PM2.5 hotspots in conjunction with the completion and distribution of the MOVES emission factor model, which is scheduled to be released by the end of 2009. Therefore, PM10/PM2.5 modeled concentrations may not be accurate. The results presented are potentially misleading, and should not be included in this Report. This comment also applies to the PM2.5 hotspot analysis conducted for the Microscale Commuter Rail Evaluation, which has further questionable issues described under the Affected Environment section below.

Affected Environment – Section 4.7

- The section describes persistence factors used and how they were developed for modeling 8-hour CO concentrations, however no explanation of persistence factors is provided for the 24-hour PM10 and PM2.5 concentrations or annual PM2.5 concentrations. The persistence factor is used to estimate pollutant concentrations for longer averaging time periods than the 1-hour concentrations predicted by the modeling.
- The Report provides no description of the modeling methodology or the model used in the analysis for the Microscale Commuter Rail Evaluation.
- As discussed previously, meeting compliance with the Secretary's Certificate requires that the existing conditions mesoscale analysis include estimates of PM2.5 and CO emissions, which are not presented in the Report.

Environmental Consequences – Section 5.6

- As in the Affected Environment section, no persistence factors are provided for the PM10/PM2.5 hotspot modeling, no description of methodology for the Commuter Rail Evaluation is provided, and the mesoscale analysis does not present CO or PM2.5 emission results.
- The NAAQS for lead was revised to 0.15 ug/m^3 in October 2008. Table 5.6-1, *National Ambient Air Quality Standards*, should be updated to reflect this revision. This edit has no effect on the analysis or results.
- EPA recommends using the maximum applicable concentration from the last 3 years of monitoring data as the background concentration for microscale modeling. It appears that background concentrations used in the analysis were

extracted from a report published in 2006. No 8-hour CO background concentration is presented in the Report.

- Although PM10 and PM2.5 background concentrations used in the hotspot analyses are presented, no description of how the concentrations were developed is provided. Also, it is unusual to see a 24-hour PM10 background concentration (23 ug/m^3) that is less than the 24-hour PM2.5 background concentration (29.7 ug/m^3), which, again, leaves the PM10/PM2.5 modeling suspect.
- Because of Federal and State-mandated emission controls, which reduce motor vehicle emission rates in future years, the project-opening year (or construction completion year) can often show higher emissions and concentrations than the project-design year. Therefore, the project-opening year is usually included in the air quality analysis for transit projects. The project-opening year for the Green Line Extension was not included in the analysis.
- Greenhouse gases are not a local or regional issue, but a global issue. Although greenhouse gas emissions were estimated for study-area on-road motor vehicle traffic, there is no accounting of emissions from power plants providing the electricity to power the Green Line Extension.

Air Quality Appendix

- The Certificate requires that a study protocol be developed for the Project. Although the Report text alludes to DEP consultation regarding development of the study protocol, the accepted protocol should be included in the Air Quality Appendix for public review.
- It appears that the 8-hour CO concentrations were calculated incorrectly. The analysis uses the 1-hour modeled concentration plus the background concentration multiplied by the persistence factor to calculate the 8-hour values, instead of applying the persistence factor to the 1-hour modeled concentrations and then adding in the 8-hour background concentration. Since no 8-hour CO background concentration is presented in the Report, the 8-hour CO concentration results could not be verified. Since PM10 and PM2.5 persistence factors are also not presented, the modeled microscale results for PM10 and PM2.5 could not be verified.
- Based on the review of the MOBILE emission factor model inputs, there appear to be multiple issues with the emission factor modeling for the 2007 and 2030 calendar years including: vehicle registration data, I/M program data, anti-tampering program data, diesel rebuild effects, diesel sales fractions, ambient temperatures, RVP values and diesel sulfur content. This means that emission factors developed for the project are not completely accurate according to the latest guidance from DEP.
- CAL3QHC CO files show a background ambient concentration of 5 ppm, not 3 ppm as presented in the Report.
- CAL3QHC PM10/PM2.5 files show all free flow links having 0.0 g/mi emission factors. This under-estimates the concentrations estimated for the PM10/PM2.5 microscale analyses. However, as noted previously, quantification of

PM10/PM2.5 hotspot concentrations is not endorsed by FHWA/EPA and this error just leads to further misinterpretation of the results presented in the Report.

- CAL3QHC PM10/PM2.5 files show a background ambient concentration of 5 ug/m^3, which does not match any of the background concentrations presented in the Report. Therefore, based on issues already discussed, and errors of this magnitude, all air quality modeling for this project is considered suspect.

Although there are obvious errors in parts of the analysis, the overall conclusions presented in the Report would not likely change if the errors were corrected.

Noise and Vibration

KM Chng Environmental Inc.

MEMORANDUM

To: Ed Hollingshead (FST)

From: Martin Brien (KM Chng)

Subject: EOT Green Line Extension - EA
- Noise and Vibration Preliminary Review

Date: 25 November 2009

As requested, we have reviewed the document *Draft Environmental Impact Report/ Environmental Assessment and Section 4(f) Statement* for the Green Line Extension Project (EEA #13886). Our objective was to review the completeness and methodology of those documents with regard to possible noise and vibration exposure to neighbors of the project, with particular concern for the portions of the project within Medford city limits.

SUMMARY

The Noise and Vibration Sections of the subject Environmental Assessment (EA) document contain a complete noise and vibration assessment report and methodology, similar to that which would be developed for an Environmental Impact Statement (EIS). The document appears to be reasonably thorough and utilizes methodologies that are consistent with current general practice, as defined in the Federal Transit Administration (FTA) guidance manual *Transit Noise and Vibration Impact Assessment* (Report FTA-VA-90-1003-06, May 2006). The document also complies with the Secretary's Certificate for Noise and Vibration, as stated in the EA.

However, we would like to point out several portions of the assessment which may be lacking in detail, or which may provide a less than adequate and balanced perspective to the possible noise and vibration exposure to residents that live close to the proposed project. The following presents a summary of our concerns. The summary is followed by a detailed account with references to the EA document providing specific reasons for the concerns.

Environmental Consequences – Noise (Section 5.7)

- The summary statements imply that there will be no noise impacts with mitigation; however, several mitigation options may not work for practical reasons resulting in higher levels of impact than the report indicates. The report should address these conditions and the consequential reduction in impact mitigation.
- Construction noise impacts are not adequately analyzed such as effects from required nighttime construction and other operations that are likely to be very disruptive. The report should analyze in detail the types of equipment to be used and the time and frequency of operation and the likely impact from construction operations.
- The report lacks detail to determine impact levels and likely forms of mitigation at individual buildings, and how well the mitigation is expected to perform. The report should include a list of all impacted buildings, the type of mitigation, and whether the mitigation in practice is capable of reducing noise levels sufficiently.
- Noise source reference details for MBTA trains, equipment and maintenance yard activities is not complete and therefore it is not clear if the assessment is adequate. The report should include an appendix that lists all noise sources including the expected variation in the assumed noise levels.
- The methodology used to determine receptor locations and allocation of measurement data to establish impact criteria is not provided. It is possible that more measurements should have been conducted in areas of Medford other than near Tufts University buildings.

Environmental Consequences – Vibration (5.8)

- The performance of the proposed vibration mitigation options (ballast mats and resilient fasteners) is not sufficiently referenced and the stated performance levels (10 to 15 VdB for ballast mats) may be greater than what can be practically achieved. This may result in higher vibration levels to nearby residents than proposed. The report should either be more realistic about mitigation, or provide references of actual post installation tests, not conducted by manufacturers, to substantiate claims.
- The number of vibration impacts and vibration levels in the section between Medford Hillside and Mystic Valley Parkway seems proportionally less than other sections of the project. Also, no ground propagation tests were performed in areas to the north and south of the Tufts University ground propagation measurement site. Either more tests and analysis should be performed, or at least an explanation for the inconsistent data should be provided.
- The listing of vibration impacts does not include detailed information for each receptor making it difficult to determine the level of vibration to be expected at each building location. The document should include a list of all affected buildings, including predicted levels and mitigation details

Existing Environment – Noise (4.8)

- The background discussion for noise may under emphasize the meaning of the measurement scale (dB) as it relates to human annoyance. For the reader who is not familiar with noise measurements, the quantitative results of the assessment may render the predicted noise level increases as less of an annoyance than will actually be experienced.
- The assessment relies on estimations of 24-hour Ldn from a one-hour noise measurement. This technique could lead to inaccurate characterization of the existing noise level that, in turn, can lead to inaccurate predictions. The report should have included more 24-hour measurements at more location, especially in parts of Medford other than where Tufts University is located.

Existing Environment - Vibration (4.9)

- Train vibration measurements were only performed at one location near the Tufts University sports fields and appear to have neglected the residential portions of Medford to the north and south of this area. Additionally, the vibration data shown in the report does not indicate the variation between different MBTA trains, which can be 15 VdB or more. This could lead to inaccurate predictions, or predicted levels that are less than the levels that may actually occur.
- The assessment does not include any mention of vibration sensitive businesses in Medford, such as a possible research and development facility which may be sensitive to vibration.
- The assessment should have included a technical appendix listing equipment used, certifications, etc.
- The discussion and assessment only pertains to effects felt by people. The background discussion should have included some discussion for assessment of possible house damage caused by large displacement oscillations of the rail track.

KM Chng Environmental - DETAILED COMMENTS

Affected Environment – Noise (4.8)

1. 4.8.1 Introduction, page 4-63, the first paragraph may under emphasize the meaning of a sound pressure decibel by stating that a 3 dB change is a "barely noticeable change outside the laboratory", whereas a "10 dB change would typically be perceived as a doubling (or halving) in loudness". The reference for this statement is not given. Earlier research (e.g. Stevens, 1956), suggests this phenomenon; however, other research indicates that there is a range of 1-3 dB that is noticeable to many people and that a 6-10 dB difference is generally perceived as a doubling in loudness (e.g. Warren 1970). This is particularly true of louder sounds (above approximately 70 dBA). It should be noted that all physics reference texts define a doubling of sound pressure level as 6 dB. The term "loudness" is a psycho-acoustic term which can be confusing to the general public. Also, the discussion does not mention possible practical effects of project noise increases, such as levels which would limit normal speech, require extreme level adjustments in telephones and television sets, levels which might cause elevated stress, or learning disabilities, etc.
2. Table 4.8-1 Exiting Noise Measurement Results, page 4-67, the use of long term and short term measurements in the same column is confusing. For the short-term measurements, apparently Ldn was estimated, and shows a significantly larger variability (58-80 dBA) compared to the long-term measurements. This result casts some doubt on the use of these types of data and their consequent veracity in describing the existing environment. The data indicate that it would be perhaps less speculative to omit the short term Ldn "measurements" from the assessment, or else measurements should have been obtained using a measurement system that had been recording data for a complete 24 hours period.
3. 4.8.3.2 Noise-Sensitive Land Use, page 4-68 to 4-70, the discussions for each section of the project corridor do not explain the specific reasons for the variations in measured sound level. The short-term levels vary from 59 to 80 dBA, which is a large range for a generally homogeneous urban area. Although the introduction states that, in general, the measured noise levels were dominated by the heavy rail activity (commuter and Amtrak trains), the assessment does not describe adequately the noise contributions from other sources. Since the Ldn near train corridors will mostly reflect the level and duration for train events, the reader would not know whether the area is otherwise relatively quiet or noisy. For example, why is the Ldn at LT-1 64 dBA at 60 feet from the nearest track, whereas the Ldn at LT-9 is 71 dBA, which is also 60 feet from the track? Also, if there is significant variation in noise levels between different MBTA trains, the assessment does not account for this.

4. For the record, it would have been useful to have a technical appendix that lists the type and model of microphone, sound level meters, and other equipment or software used to measure the existing environment. The text mentions that audio recordings were made; however, there is no mention of anything learned from the audio recordings, assuming that observation personnel were not deployed for the full 24-hour measurement periods.

Affected Environment – Vibration (4.9)

1. 4.9.1 Introduction, page 4-71, the discussion briefly explains the common use of velocity amplitude to measure vibration levels for transportation projects. However, the text does not mention the relationship of ground displacement to certain types of structural damage. In some cases, a relatively large displacement of the rail, which can be caused by poorly maintained wheels and wheel truck suspensions, can cause cracks in surface building materials such as wallboard joints, and occasionally hairline cracks in concrete blocks and other similar rigid building materials.
2. 4.9.2 Methodology, page 4-72, the assessment only utilized one location to measure commuter train levels at Tufts University Alumni Field, and two other locations in Somerville to measure vibration propagation characteristics of the soil. In the interest of Medford residents living in dwellings north of the Tufts University athletic fields, the assessment should have included both existing train vibration measurements and soil/ground propagation measurements in this area between the proposed College Avenue station and the Mystic Valley station.
3. 4.9.4 Existing Vibration Conditions, page 4-73, the discussion and Figure 4.9-2 do not indicate how many trains were measured or what variation in levels were recorded. The range of levels can be significant since MBTA equipment on other lines has shown large variations, and receptors can be exposed to levels 10 dB or more greater than the average (KM Chng Greenbush Study).
4. 4.9.5 Vibration-Sensitive Land Use, pages 4-74 to 4-76, although the general discussion states that vibration is "generally dominated by trains" on the MBTA commuter rail lines, the individual discussion for each section do not identify any other source of vibration. It seems unlikely that there would not be any other vibration sources, such as heavy trucks on uneven pavement. If other sources exist, it might be helpful to know what and where they are, and what the typical levels are, to compare them to commuter rail levels.
5. 4.9.5 Vibration-Sensitive Land Use, page 4-76, the assessment only mentions Tufts University buildings as sensitive land use. According to Medford city officials, there may be corporate R&D facilities in this section, which employ hundreds of Medford residents that may also be sensitive to project induced vibration effects.

6. As stated for the noise section, it is useful to include a technical appendix, which would at least contain a list of the measurement equipment, software, and any techniques that would be required to obtain results similar to those shown in the assessment.

Environmental Consequences – Noise (5.7)

1. 5.7.1.3 Noise Reference Levels, page 5-107, the data presented for noise reference levels does not contain details to explain the appropriateness of using the Green Line D Branch data. There is no technical appendix to show this data so that others can assess it. For example, can it be assumed that the rail and track system that will be used for the Green Line Extension will be the same as the D Branch? What is the variance for the measured D Branch data? Is the Lmax of 81 dBA an average of all the data that was used, or a worst-case sample? The value used for wheel squeal for the green line vehicles (Lmax = 86 dBA) may be reasonable; however, the FTA manual indicates that the level could be as high as 100 dBA (SEL = 136 dBA
2. 5.7.1.3 Noise Reference Levels, page 5-107, the data presented does not include any information relating to noise sources associated with the maintenance facility. Without this information, it is difficult to determine whether the noise generated from this facility is reasonably accounted for.
3. 5.7.1.3 Noise Predication Model, page 5-107, the description does not provide details explaining how the receptor locations were determined. It would be helpful to know if the positions were determined from current aerial photography, or perhaps older mapping data. If so, were receptors and buildings checked by on site inspection? How was it determined whether to use indoor or outdoor locations, and where can one find the exact point where the calculation was made? Assuming this type of information is available, it might be helpful to residents who would like to check whether the point used for the calculation is appropriate to them.
4. 5.7.1.3 Noise Predication Model, page 5-107, the description does not give details as to where and how noise levels from measurement locations were mapped to receptor locations to determine impact criteria. It is possible that some locations may have a higher or lower impact criteria because a noise level was used from a measurement location several hundred feet away, which a resident of the area may dispute as being typical for their residence. This is a technical problem which could lead to inaccurate results
5. 5.7.2 Noise Impacts, Table 5.7-1 and 5.7.-2, these tables aggregate the data for several individual locations into clusters of 1 to 19 buildings. We understand that this is necessary to avoid long tables with as many as 188 individual buildings. However, without a technical appendix providing data for each building, it is difficult for reviewers, residents or concerned citizens to determine what level of noise individual locations would be subjected to. It seems unlikely that clusters of as many as 19 buildings would be the same distance from the near track and would be subject to the same impact criteria. We would suggest that the assessment report should at least include readings for every building in the appendix.

6. 5.7.2 Noise Impacts, Table 5.7-1, there is an error in the totals for Potential Noise Impacts where the totals for the segment between Fitchburg Mainline and Medford Hillside Alternatives 1, 2, 3, and 4 should be 120 moderate impacts and 46 severe impacts. In addition, there are errors in the number of impacts for each of the alternatives in Tables 5.7-1 and 5.7-2 and the totals in the Impact Summary Table 5.7-3. Note that impacts refer to individual buildings and not units within buildings.

7. 5.7.2 Noise Impacts, page 5-113, in the first paragraph the text states, "typically, this increase [1-2 dB due to the green line trains] is not perceptible to humans". This statement appears to be based on cumulative calculated numeric Ldn values. However, in reality, because the frequency of green line trains is higher than commuter trains, it is likely that the noise from the green line trains will be perceptible when events occur. It should be noted that in many cases the noise from the green line trains, although not as noisy as the commuter trains, will easily be heard above background noise, and the cumulative effect of the two trains passing by at different intervals might be more annoying to residents than this statement suggests.

8. 5.7.2.1 Temporary Construction Noise Impacts, this paragraph only contains a cursory review of generic construction activity and suggests that "temporary noise impacts could result from construction activities...". In all likelihood construction activity will result in considerable noise impact to the various neighborhoods for perhaps a prolonged period of time. In addition, it may be necessary to conduct operations during nighttime when the impact is more severe. A more detailed accounting of likely construction activities, and a quantitative analysis relating noise levels to the predicted project noise levels would be useful to provide town officials and residents with a clearer picture of the real noise impact of the project. Such data could also be useful at a later stage of the project so that appropriate mitigation and its costs can be factored into the true cost of the project.

9. 5.7.3 Noise Mitigation, page 5-118, in the first paragraph it is noted that "at some locations projected to be exposed to noise impact, noise barriers may not be feasible or effective". There appears to be a wide range of areas for which noise barriers are prescribed earlier in the report; however, for various reasons will no be possible. The extent to which noise barriers, which are listed in Table 5.7-4 are unlikely to be a feasible alternative could have been shown in a separate table or figure. Table 5.7-4 may portray a misleading view of the level of mitigation that may be possible with this project. In some cases the height, location, or lack of egress through the barrier may pose a problem that may limit the use of barriers in other project areas than those mentioned. It should be noted that the Medford police chief and fire chief are concerned about possible safety issues associated with tall massive barriers. Although it is understood that barrier design details are not worked out until final design, Medford city officials would have preferred to see some perspective renderings of a typical barrier in one of the Medford neighborhoods. The generic barrier textures included in the assessment are not sufficient to portray the visual and safety consequences.

10. 5.7.3 Noise Mitigation, page 5-118, the last paragraph discusses wheel squeal on Somerville Avenue near Allen Street where rail lubrication is suggested as a mitigation technique. The discussion does not include a

rough cost estimate, as in the other mitigation options. It is possible that the cost of such an option would make this an unlikely mitigation option. It should be noted that, in the interest of exploring various mitigation options at this stage of the project, other techniques such as damped wheels, rubber wheels, flange modifications, improved wheel maintenance procedures, etc. could have been included. Ideally, a rough cost estimate, or explanations of practicality, might be included so that the likelihood of implementation might be assessed.

11. 5.7.3 Noise Mitigation, page 5-119, the last paragraph states that "the proposed noise barriers, potential sound insulation, and rail lubrication would be effective in mitigating all potential noise from the Project". However, to the extent that all these mitigation options are actually not feasible, this assumption is not valid. Therefore the summary statement "there would be no moderate or severe noise impacts from the Project" is likely to be inaccurate.

12. 5.7.3.1 Construction Noise Mitigation, page 5-119, the list of mitigation options is cursory and generic. It would have been useful to develop more detail for this potentially very significant noise problem for the project, including possible required nighttime activities.

Environmental Consequences – Vibration (5.8)

1. 5.8.1.2 Vibration Reference Levels, page 5-124, the section "Planned Operations" states that Green Line tracks will be on ballast and tie including a "boat section" which is a concrete slab approximately 2 to 3 feet thick. It is not clear from the discussion that follows in the section "Vibration Reference Levels" that the Green Line D Branch data, used for reference levels, is equivalent to the concrete slab mounting. The type of mounting can have an effect on vibration propagation. It would help to have a sentence stating that the concrete slab design was properly accounted for in the assessment process.

2. 5.8.1.2 Vibration Reference Levels, page 5-124, the text shows a range of 63 to 69 VdB for Green Line cars, and a range of 74 to 87 VdB for MBTA commuter trains. The discussion is not clear as to the actual value(s) used for level computations. It would be helpful to state the actual level used and the basis for using that particular value. It should be noted that the range of levels is consistent with measurements performed by KM Chng. The median of the range of levels is somewhat lower than the general ground surface vibration curves shown in the FTA manual for 50 mph speeds. The levels used for Amtrak trains were significantly less than the FTA vibration curve for locomotives. On occasion, KM Chng has recorded vibration levels for MBTA commuter trains that are greater than 87 dBA (MBTA Greenbush and South Coast measurements). When considering the implementation of the MBTA methodology, the large variance of MBTA commuter vibration levels should be considered. During recent measurements of the Greenbush line conducted by KM Chng, anecdotal remarks from residents living within

approximately 75 feet of the rail noted that some trains caused noticeable vibrations including "rattling of dishes and shaking of picture frames"; whereas, other trains were not discernible. This seemed to correlate with a measured range of approximately 75 to 95 VdB, normalized to 50 feet. for approximately 30 measurements. Finally, it should also be noted that the outcome of the KM Chng MBTA vibration measurement program showed that actual measured levels showed a range from 14 VdB above FEIR predictions to 12 VdB below predictions. When considered in total, the average was only 0.3 above the FEIR prediction, which indicates very good agreement with the methodology used, which Is similar to that used for this assessment. Nonetheless, it also true that, on an individual basis, several residents experienced vibration levels much greater than predicted in the FEIR.

3. 5.8.2 Vibration Impacts, page 5-127, Table 5.8-4, the aggregation of clusters of impacts and the lack of a technical appendix showing levels at individual receptors makes it difficult for the public to determine the magnitude of vibration on an individual basis.

4. 5.8.2 Vibration Impacts, page 5-127, Table 5.8-4, when comparing the impacts in the segment between Medford Hillside and Mystic Valley Parkway, to the impacts in the segment between Lechmere Station and Medford Hillside, the total number of impacts seems proportionally low. In particular, for the cluster listed as "Brookings Street", where distances to the track are similar to "Auburn Avenue near McGrath Highway", future commuter levels are 8 VdB less, and future Green Line levels are 5 VdB less at the Medford location. It would be helpful to explain these differences, particularly since it appears that ground propagation measurements were not performed in this section of the project.

5. 5.8.2.1 Temporary Construction Vibration Impacts, page 5-128, the discussion only mentions pile driving. It would be helpful to know what other activities, if any, might produce annoyance or structural damage. It would also be helpful to have an estimate for the duration and intensity of pile driving activities, and operations that may have to occur overnight.

6. 5.8.3 Vibration Mitigation, page 5-130, Table 5.8-6, much of the mitigation relies on the use of ballast mats, which are assumed to have a 10-15 VdB reduction in levels. Although this is the range of possible reduction stated in the FTA manual, there is some evidence that real world installations of ballast mats can fall short of manufacturer claims. KM Chng performed a very limited evaluation at one of the sections of the Greenbush line after the installation of ballast mats, which failed to show any significant measurable reduction in vibration level. Although the actual value used for vibration level reduction is not stated in the assessment, it would be helpful to know what the value is, and what the justification is for using that value. A similar argument might be made for the use of resilient fasteners, which can show significant variability in effectiveness, depending on several factors. We do recognize that ballast mats and resilient fasteners can be effective in reducing vibration; however, it is important to be realistic about what they can achieve. During our Greenbush vibration measurement program, some expressed the opinion that improving MBTA wheel maintenance may be a more cost effective solution to the problem of MBTA commuter train vibration levels.

Memo
To: Ed Hollingshead, FST

From: Clarissa Rowe, Brown, Richardson & Rowe

RE: **Visual Assessment Comments on the Draft Environmental Impact Report/Environmental Assessment and Section 4(f) Statement for the Green Line Extension Project in Cambridge, Somerville and Medford**

1. **Comments on the Visual Analysis Sections of the Executive Summary, and Section 4.14 " Visual Environment" in the Affected Environment, and Section 5.12 in Environmental Consequences.**

The DEIR finds that there is no negative affect to the visual quality of the City of Medford because the "natural visual resources...consist mostly of isolated, low-diversity habitat..." (page 5.) "Due to the urbanized character of the portions of Cambridge, Somerville, and Medford, and involved, there are no other significant visual resources associated with the Project" (page 4-83)

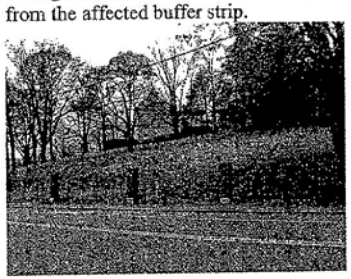
"The Proposed Project would not have a significant effect on the local visual environment. The changes proposed would occur in urbanized areas with and adjacent to the existing right-of-way and would have little visual impact on the public. The most significant change would the loss of forested areas along the right of way, reducing the green space visible from local residential areas. The addition of landscaping at the stations and both on and above the retaining walls will reduce the overall visual effect of vegetation losses. The proposed noise barriers would block the view of the right of way for adjacent homes and prevent any further visual impacts by obscuring the trains and rails that would otherwise be visible from residential back yards. "(Executive Summary, page ES-30)

The basic premise in these DEIR findings is that if the affected area is urban, there is little impact because there are so few trees and shrubs in this environment. Actually the reverse is true. Urban dwellers value their trees, even if they qualify as "isolated, low-diversity habitat", at least as much, and probably more than nonurban dwellers. In a city like Medford, the tree lined buffer between the existing rail lines and the houses and businesses means a lot to the community character of the neighborhoods and to Tufts University.

College Avenue at Tufts University

Boston Avenue near Tufts University

The wide stand of trees along Boston Avenue across from the Tufts campus buffers the rail corridor. The University's Tisch Library, at the top of the hill, overlooks this stand of trees. The partial loss of this buffer will greatly impact the ambiance of the College. Potential school applicants park in the garage right across Boston Avenue from the affected buffer strip.

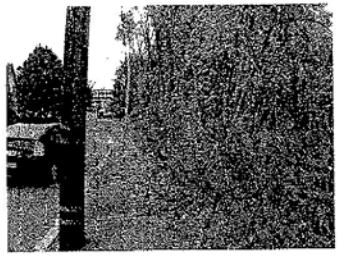


ufts University fence and well kept lawn

Treed buffer

Also, importantly for the citizens of Medford, the DEIR does not analyze the effects of the Green Line Extension on the small residential neighborhoods that line the rail corridor. For instance, the houses on Pigott Street are far more affected by the Green Line Extension because they are at almost the same elevation as the RR tracks. On the other hand, the small businesses at Winthrop Street are substantially above the RR alignment so they are not as affected by the visual presence of the corridor.

reed buffer at Pigott Street



Treed buffer at Picott Street

- During the final design phase, it will be important to analyze each residential neighborhood and how close it is to the existing and proposed alignment and its sidewalls. Is this study part of the final design scope of work?

- We recommend that the entire Medford stretch of the Green Line Extension be reviewed again, from a visual point of view, with an eye to the elevation of the abutters in relation to the elevation of the rail corridor. Again, is this study part of the scope of work during final design?

One's viewpoint will also change depending on which side of the tracks the viewer is standing. For instance again, the businesses and houses on Boston Avenue near the Winthrop Street are not as impacted as the residential houses that abut the same part of the corridor on the north side of the corridor, along Charnwood Road, Burget Avenue and along Colby and Winchester streets.

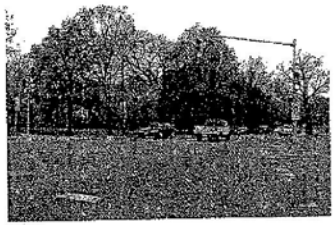
Charnwood neighborhood

iew from Winchester Road

- Cross sections of these areas should be prepared during final design to give the residents a true idea of the future work. There should be a series of cross sections, with different sound wall surfacing options, for all the residential streets within two blocks of the rail corridor. Is this coordination part of the final design scope of work?

We agree with the finding that special attention should be paid to the Mystic Valley River parklands area.

Parklands with mature trees and grass



Boston Avenue at the insection with Route 16

"Some existing vegetation would be removed, and new retaining walls and noise barriers would be built." (page ES-41). The Overhead Catenary System, 22 feet high, will also affect the quality of the visual environment. The assumption that the new retaining walls and noise barriers will have the same value in the visual environment as trees and plants is not valid. The promise of a "green" wall is a good idea, but its execution needs to be carefully detailed and viable. Two of the photographs on page5-116 show attractive noise walls, but the other two shots are not as attractive and are less unacceptable. The MBTA needs to work with each neighborhood to work out which kind of surface there should be on the noise wall. Plants will not grow in areas where they receive no sun. Therefore making the "green" walls along the "dark" side of the corridor may not work. Growing plants at the top of the walls may be the only option in these locations.

- Is it possible to do a shadow impact study during the final design to determine whether "green" walls will work along the corridor?

Each side of the corridor needs to be thought about differently. The alignment of the corridor varies from Ball Square to College Avenue to the Mystic Valley station. Station landscaping is a pleasant idea, but its exact specifications need to be worked out and its long-term maintenance needs to be factored in. At present, there is little or

no maintenance at the other MBTA stops in the region so there is little expectation that the future will bring better maintenance to the area. The planting at the three Stations cannot take the place of the planted buffer that exists today.

2. Comments on the Mitigation Commitments for the Visual Environment and Open Space

The Mitigation chart mentions the following efforts to ameliorate the visual changes: "Provide vegetation on and/or above retaining walls to minimize visual changes", and "Work with affected communities on design of noise barriers and vegetated walls prior to construction". (p. 6-2)

Also on page two of the *Chapter of Viability of Community Path Extension to Mystic Valley Parkway*, there is a quotation from the Secretary's Certificate saying that "Also, the DEIR should evaluate the viability of extending the Community Path to Route 16 to create a connection with the Mystic River parkway." (page two).The chapter goes on to say that in the Medford section of the project, it is not viable to provide a community path along or adjacent to the corridor. The recommendation made is for a shared bike path along Boston Avenue. However, Boston Avenue is too narrow a road to encourage bike traffic. The width of Boston Avenue varies from 32 feet to 44 feet curb to curb. It is probably not viable to put a bike lane on either side of the avenue. People who use bikes often ride on the narrow sidewalks.

The report goes onto say that a Community Path is not possible in Medford, so it is important to figure out what the mitigation should be for the City of Medford.

- One recommendation is for the final design team to do an inventory of the sidewalks on both side of Boston Avenue from Ball Square to the Mystic Valley Parkway. The condition of the sidewalks and their curbing should be inventoried. Is this possible?

- In the Tufts area of Boston Avenue, the sidewalks are not in good condition, are bituminous and have outdated precast curbing. This whole sidewalk area could be updated with new concrete and granite curbing as part of the College Station improvements. Is this possible?

Bikers on concrete sidewalk near Route 16

Bituminous walk & concrete curb at College Avenue

- We recommend also that the existing tree buffer be inventoried before it is removed. The City of Medford has a policy that if trees are removed, the same number of caliper inches need to replaced with new trees in the project. If the trees needed to replace the tree buffer do not fit in the project area, new trees could be planted on the streets of the City of Medford in the neighbors adjacent to the project area. Is this possible?

3. Comments on the Visual Impacts of the three MBTA Stations in the City of Medford

We have not commented on the visual quality of the two Power Stations because they are not located yet. Also, there may be screening elements that would improve the view of the Catenary system, but there is not enough detail in the DEIR to make any recommendations about its screening yet. It will be important for the City of Medford to review and comment on this missing information as it is developed. Is this possible?

Also, the DEIR talks about irrigation for the new plantings at the Station.

- We suggest that the plants be hardy natives that will not need irrigation in the long run. We also suggest that the T include a watering requirement in the planting specifications for all new station plantings for the first two summers after the plantings are installed instead of irrigation. Is this possible?

Ball Square Station

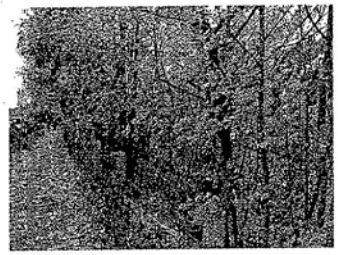
The Ball Square Station will be located in a very dense, heavily populated area, which is industrial and commercial. It would be hoped that with a well-designed T station, the Green Line Extension would actually improve the visual quality of the area. The increased foot traffic to and from the station may bring people to the small businesses in the area.

Ball Square area at present

The increased bike commuter use must be carefully planned for to make sure that the bike parking is adequate.

College Avenue Station/Tufts University

Like the Harvard T Station, the future College Avenue T Station will be the Tufts University station. The Station's architecture should blend into the surrounding University character, especially Professors Row, and the brick buildings, such as Robertson Hall, that surround that station location. The current visual character presently is pleasant because of the well kept university buildings, the historic wrought iron gates and fence, the large green lawn, and the treed buffer along College Avenue.



treed buffer that will be partially removed

Future station view

The advent of the Station will greatly enhance the area, but again the possible increase of bicycle commuters and vehicular commuters needs to be well planned for during the final design. Because the intersection of College Avenue and Boston Avenue is wide, there will be a temptation for outlying commuters to see that Station as an excellent place to drop off commuters and, again, to park in adjacent neighborhoods. Increased vehicular traffic would affect the visual quality of this area in a negative way. Because of the potential of increased vehicular traffic, it makes sense that the final designers need to rework the intersection to keep traffic moving through the intersection and to widen the pedestrian landing space at the top of the Station along Boston Avenue and in front of the Tufts Engineering Building.

From the DEIR, it is apparent that a part of the treed buffer along College Avenue may be removed. It is imperative that the T work with the City of Medford and Tufts University to make sure that the Tufts edge of the corridor as pleasant and as green an edge as possible during the final design phase of work.

Mystic Valley T Station

When the Green Line extension comes to the Mystic Valley Parkway, the Station's visual quality will need to add to, not destroy, the business renaissance in that area.

This part of Medford has turned from being a rundown industrial area to a thriving business area. It is also adjacent to a well-kept two family neighborhood.

When reviewing the plans for the Station, we see that there is a missed opportunity in the present siting of the Station. At present, the plan will eliminate some of the thriving businesses and will discharge large number of people right at the edge of the neighborhood. Why couldn't the primary access to the Station be through the other side of the tracks where the Whole Foods grocery store and the liquor store are located? There is already a large parking lot there and, more importantly a well-designed access point for vehicular traffic, which is off the Parkway, Route 16.

Possible entry to T behind white car

Entry off Route 16

Parking at Whole Foods

Again, this Station will have the same problem of a potential increase of vehicular traffic as the other two Medford Stations, but it is a far greater problem here because the station's location is also opening up ridership for people in West Medford and East Arlington. Again, increased vehicular traffic will have a negative visual affect on this area. The DCR's new Greenway in Arlington and Somerville will be

terminating only a block from the new station location, and will bring many walking and biking commuters to the Station.

The potential for vehicular drop off at this Station is the greatest of the three Medford stations. Because the T has opted not to provide parking at the Station, it is paramount that the T work to keep the commuting cars out of the residential neighborhood during the final design phase of work. Also, because there is already a large parking lot on the other side of the tracks, many commuters will think that they can park in that lot free of charge and then walk to the Station. It is good that the T has included a drop off area at this Station because there will obviously be a need for it. Unfortunately, the drop off area may require the removal of some of the largest trees in that whole project. Again, the T will need to replace them caliper inch per caliper inch with new tree plantings at this Station and elsewhere in Medford.

Increased bicycle traffic will also need to be accommodated and carefully designed. Until the two new bike cages were installed at the Alewife Station this past year, that Station had every railing festooned with bikes of all ages and conditions. This situation is bound to occur at the Mystic Valley Station as well unless there is room for two similarly scaled bike cages there too. At present, the Station schematic design has not devoted enough space for the bicycle traffic that will occur there.

The architecture of the Station will need to reflect well on the adjacent Mystic Valley parklands that are a beloved, regional, passive recreational facility. The materials of the Station Design need to be compatible with its context of a landscape of beautiful mature trees, expansive lawns and the Mystic River. The new stations at Wood Island Station and Airport Station in East Boston are good examples of stations that could be emulated.

Re: Green Line Extension Project
Cambridge/Somerville/Medford
Draft Environmental Impact Report (DEIR)
Project No 13886

Dear Secretary Bowles:

Please accept this comment letter on the DEIR prepared for the Green Line Extension Project. I have attended several public meetings on the Green Line Extension and chaired a public meeting when I was the Council President. Throughout this time period, I heard from the citizenry of what a unique opportunity we have! I agree with this philosophy and because of this, expect the project to be the best that it can be and serve not only the residents of Medford-Hillside, but far beyond this area.

While the DEIR is an extremely comprehensive document, I would like to address fundamental issues that I believe have been neglected or not adequately addressed in the document. In particular, is the issue of commenting on the College Ave Terminus vs. the Rt 16 Terminus. Likewise, the health issues that exist due to the proximity of the commuter rail line to residents' homes and further exacerbated by moving these tracks even closer to these homes with no mitigation.

L-007-001 **Medford Hillside**-For those of us who reside in Medford, we consider Medford-Hillside to include the area along Boston Avenue to Mystic River. I feel that in order to achieve the goals set forth in the SIP and the commitment from the Central Artery/Tunnel Project, the full scope of the project should be to Route 16 and should not be broken into a "Proposed Project" and a "Future Full Build" project. However, due to the format in the DEIR, it appears that one should comment on both potential terminuses.

L-007-002 **Terminus-College Avenue**—I do not support the terminus being as College Avenue due to the impact on that abutting neighborhood. I do not feel that enough consideration has been given to this terminus. For example, the added noise and vibration from this being the end of line. The track will reach well beyond College Ave and have a direct negative impact on residents west of College Ave. I support the terminus being at Route 16 for this reason. Further, should the terminus be College Ave., sufficient mitigation has not been provided for the portion of the commuter rail line (west of College Ave) that has been shifted northerly and closer to residents' homes.

L-007-001

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. The Proposed Project, with a terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Additionally, FEIR Chapter 4 includes a detailed description of College Avenue Station functioning as a terminal station.

L-007-002

Since the release of the DEIR/EA, a few stakeholders raised concerns that the proposed College Avenue Station, serving as a terminal station for the Proposed Project, would not adequately serve the Medford Hillside neighborhood. Serving this neighborhood was identified as part of the SIP description. To address and resolve these concerns, CTPS prepared a memorandum demonstrating that the College Avenue Station location does adequately serve the walk market area for the Medford Hillside neighborhood. This memorandum is provided in Appendix C of the FEIR.

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

L-007-003

Terminus-Route 16—On page ES-15 of the Executive Summary, reference is made in paragraph 1 that the "Future Full-Build Alternative could include parking at the terminal ...although none is currently proposed". During all public hearings, comments were made that there would not be a parking structure at this terminus (or College Ave). I strongly urge the Secretary to place a restriction on any parking structure as part of this project at this location.

L-007-004

Included in the DEIR is the prospect of land takings in order to complete the "Future Full Build Alternative". The DEIR makes reference to the loss to Medford of $205,935 in 1988 real estate taxes. This was corrected in a hand out that lists the tax loss in Medford at $15,777(Nov 9, 2009 Correction). Based on information from Medford's Assessor, Ed O'Neill, the tax losses in 2009 alone on one parcel in question, 200 Boston Ave would be $264,000. We urge the Secretary to obtain detailed information from City of Medford re: potential tax loss. Further, the executive summary on page ES-33 states "many of the jobs displaced would likely be relocated or replaced within the affected cities". This statement is clearly an opinion with no factual date to back it up. Additionally, the Commonwealth of Mass. recently worked with Italian Company, BioCell to build its corporate headquarter here in Medford at 200 Boston Avenue. We urge the Secretary to mandate that other scenarios be created that do not create a negative tax impact to the City nor displace these competitive companies. At a public meeting, DOT representatives made comment that this was the worst case scenario presented in the DEIR. As this is part of the written report, I felt the need to comment on this scenario.

L-007-005

Air Quality—As mentioned earlier, the intent of this project is to increase air quality! While overall, removing cars from the roads achieves this goal in totality, it seems unfair to subject abutters to poorer air quality after completion of the project than they had before. Further, it appears short sighted not to address the negative impact that the Commuter Rail has on this neighborhood with the disbursal of diesel particulates currently. This maybe further exacerbated by the moving of the rails closer to homes upon project completion. Many of these homes are at the same elevation as the tracks. The Secretary has an opportunity and duty to address this in the FEIR!

L-007-006

Tree Lined Buffer—Many of the residential homes along the current commuter rail line enjoy a buffer provided by trees. I urge the Secretary to take into consideration the visual impact of the project and means to mediate any loss of trees from the project.

In summary, I would like to request that the FEIR examine the Proposed Full Build in the same detail as required by the Secretary's Certificate. That the Terminus at Route 16 be prepared using the best case scenario not worst. That weight be given to the abutters and ensuring a better quality of life than they presently have. That the voice of the disabled be heard! That the Green Line Extension be the best it can be and not shortsighted by carving the project into two phases whereby negatively impacting the quality of life on abutters for a longer period of time.

Respectfully submitted,

Stephanie Muccini Burke, CPA

Medford City Councillor

L-007-003

The proposed station at Mystic Valley Parkway/Route 16, as presented in the "Preferred Alternative," includes neither a parking structure or lot. Similarly, the terminus station at College Avenue, for the Proposed Project, includes no station parking.

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

L-007-004

DEIR/EA Section 5.3 describes the Project's potential acquisitions. MassDOT will continue to evaluate opportunities to minimize these property impacts.

Socioeconomic impacts, including projected effects on businesses, jobs, tax revenues, and community disruptions, are described in DEIR/EA Section 5.3, Socioeconomic Impacts. Effects on land use and transit access are discussed in DEIR/EA Section 5.2, Land Use, and Section 5.15, Indirect and Cumulative Effects. As required by the Secretary's Certificate on the DEIR/EA, additional analysis of the socioeconomic effects of the maintenance facility alternatives are described in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. A series of Project workshops will provide opportunities to discuss broader impacts of the Project on job creation, economic development, housing affordability, and other community impacts.

L-007-005

The Green Line Extension will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality. As required by the Secretary’s Certificate on the DEIR/EA, the FEIR includes a narrative clarifying the relationships of air quality modeling data to MassDEP and EPA requirements for State Implementation Plan (SIP) consistency.

L-007-006

As the Project advances into preliminary engineering, efforts will be made to minimize the removal of trees where necessary. Also, opportunities to replace impacted landscaping outside of the MBTA's right-of-way will be considered.

LATE COMMENT

HJ

January 6, 2010

RECEIVED
JAN 12 2010
MEPA

Secretary Ian A.Bowles
Executive Office of Energy and Environmental Affairs
Attn: MEPA Office
Ms. Holly Johnson, EEA No. 13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles,

I would like to start my comment letter by stating that I am in favor of the Green Line coming to the City of Medford as far as it possibly can without disrupting the character of the community. I am also in favor of keeping on track with the proposed schedule. Although in favor of the Green Line, I would like to voice my concerns in regards to the DEIR, which was prepared for the Green Line Extension Project.

L-008-001
L-008-002
L-008-003

I believe that DEIR fails to sufficiently describe station design, parking, land takings, and access to the station by drivers, walkers, bicyclist, those arriving by bus, and those with disabilities. I do not believe that there is adequate mitigation in regards to air, vibration, and noise quality for those who live near and surround the area. Further review and study by the state as well as the City of Medford must take place before we continue to move forward on this project.

Thank You for your time and consideration.

Sincerely,

Breanna Lungo-Koehn

Breanna Lungo-Koehn

L-008-001

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

L-008-002

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

L-008-003

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

Dear Secretary Bowles,

Thank you for the opportunity for me to respond to the Green Line Extension Project DEIR. I write as a City Councillor, EOT Advisory Committee Member, and as a residential and business abutter. Throughout my participation in this process I have remained open to the various proposals and processes of the project. I have also encouraged open participation and mutual respect among citizens and interested parties in an effort to make this project the best it can be for Medford and to keep the project focused on its goal to improve air quality in the region and thus improve the citizens' quality of life. Although the responses from the Mayor of Medford and various department heads will be more detailed and technical, I do offer my own comments and observations and will limit them primarily to the part of the project which effects Medford. I also express my gratitude to those who have worked so hard to create the DEIR and to those who exercise the management the project.

While lengthy and pregnant with information, the DEIR does not provide enough detail about the impact of the proposed project, especially the degree of land taking in the second phase of building which would bring the line to the Mystic Valley Parkway. It is also deficient in offering mitigation measures to the direct abutters, does not offer a clear enough picture of socio-economic impacts and seems to minimize unrealistically traffic and parking impacts throughout the entire scope of the project.

L-009-001 The announcement of a two-phased build, phase one to College Ave. and phase two to the Mystic Valley Parkway, presents concerns and additional anxiety that still need to be addressed. Will the College Ave. Station be built as a terminus and then be abandoned as such? When will construction to the Parkway portion commence and when will additional design details be made available for public comment. The current plans to the Parkway will create additional land taking, loss of tax revenue and employment and present the most encroachment onto abutter's property. The traffic and parking studies need greater detail and mitigation plans need greater clarity and citizen input before the second phase of the project can proceed. A public parking facility at the terminus would not be advisable.

L-009-002

L-009-003 While levels of noise and vibration have been measured and mitigation efforts have been proposed, the mitigation efforts seem deficient. Those who live in the vicinity of College Ave. will bear the burden of the noise generated at the terminus. The delicate nature of some of the science facilities at Tufts University was given special attention. I am particularly concerned about the proximity of the homes and the need for domestic tranquility for all direct abutters and for the children who attend St. Clement Grammar and High Schools, many of whom come from struggling socio-economic backgrounds. St. Clement Parish is active throughout the day with many events and liturgical celebrations. Sensitivity for the many celebrations and solemn occasions marked in the church must be made a priority during the construction. For all immediate abutters, a promise of clear mitigation and protective measures is needed and must include structural inspections, soundproof windows and a promise for an unambiguous system to seek compensation for damages long after the construction has ended.

L-009-004 Medford is a community which has, throughout her history, enjoyed change and growth while at the same time preserved stability and a sense of continuity. To what degree will this project gentrify the adjacent areas, encourage transience and what impact will this have on the existing population? This topic needs further examination *vis-à-vis* economic justice, tax impact and social justice.

L-009-005 Access to stations needs further detailed study. Will these areas have sufficient ADA compliance for the population served? What will the impact of drop-off and pick-up traffic be? Will the needs of pedestrians and those traveling by bicycle be met? Today, the traffic and parking situation in the City of Medford is a source of community concern in need of solution. Yet, the City lacks the necessary means to deal with the problem. The project will undoubtedly amplify and add to parking and traffic problems. Mitigation measures will need funding to provide sufficient resources for the city to settle the traffic problems.

L-009-006

L-009-007 A process is necessary to create a construction management program that will welcome community input before the project commences. Such a process will need to avert any possibility of creating movement paralysis in the region. Diverted traffic will exaggerate problems on the project's periphery.

L-009-001

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch.

L-009-002

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A schedule for evaluating this segment has not been developed.

L-009-003

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

L-009-004

Socioeconomic impacts, including projected effects on businesses, jobs, tax revenues, and community disruptions, are described in DEIR/EA Section 5.3, Socioeconomic Impacts. Effects on land use and transit access are discussed in DEIR/EA Section 5.2, Land Use, and Section 5.15, Indirect and Cumulative Effects. As required by the Secretary's Certificate on the DEIR/EA, additional analysis of the socioeconomic

My remarks, Mr. Secretary, are not exhaustive nor are they full of good cheer. They are, taken in combination with the comments of other local officials, citizens and invested parties, an outline of items meant to be addressed before the project can take more active steps. I again point out that before phase two can proceed, an additional review process must be undertaken. I look forward to working with you and all the project collaborators to make this process a model for what is right about public transportation.

Sincerely yours,

Frederick N. Dello Russo, Jr.
Councillor

effects of the maintenance facility alternatives are described in FEIR Chapter 2, Maintenance Facility Alternatives Analysis.

L-009-005

The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), and the MBTA. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement as the station designs are refined.

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

L-009-006

DEIR/EA Chapter 6 and FEIR Chapter 8 list the traffic and parking measures to which MassDOT has committed to mitigate impacts. These mitigation measures address pedestrian and roadway traffic signal improvement needs, impacts during construction, and parking enforcement coordination. These measures will be further advanced during preliminary engineering.

L-009-007

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

Katherine Fichter
Executive Office of Transportation
10 Park Plaza, Room 4150
Boston, MA. 02116

December 30, 2009

Dear Secretary Bowles,

The Medford Board of Health has reviewed the Draft Environmental Impact Report/Environmental Assessment and Section 4(f) Statement for the Greenline Extension Project EEA #13886. Areas reviewed include, but are not limited to Noise, Vibration, Air Quality, Construction Mitigation (Noise/Pest/Dust control), Transport of Solids/Trash, and a Long Term Maintenance Plan for the Extension.

L-010-001
L-010-002

Shifting of the existing commuter rail tracks up to 18 feet toward the existing properties and homes to as little as 10 feet from the property line, will increase noise, vibration and the health effects of diesel particulates, a known carcinogen. Though it is a documented change, it appears that additional health assessment information would be necessary to plan appropriate remediation.

Air Quality

L-010-003

Though Air Quality Modeling methodology is an accepted evaluation tool, it appears to be lacking in information specific to the air quality in Medford between Ball Square and Mystic Valley Parkway. It would be useful to have more health assessment, in particular to the moving of the commuter rail closer to the homes with the impact of diesel particulate in closer proximity. "There is limited information on exposure to just diesel particulate matter but there is enough evidence to indicate that inhalation exposure to diesel exhaust causes acute and chronic health effects." "Acute exposure to diesel exhaust may cause irritation to the eyes, nose, throat and lungs, some neurological effects such as lightheadedness. Acute exposure may also elicit a cough or nausea as well as exacerbate asthma. Chronic exposure in experimental animal inhalation studies have shown a range of dose dependent lung inflammation and cellular changes in the

L-010-001

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. The stakeholder coordination process for project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

L-010-002

The preparation of a health study is beyond the scope of the Green Line Extension Project. However, the Project will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality.

L-010-003

The Green Line Extension will have a positive impact on outdoor air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality. As required by the Secretary's Certificate on the DEIR/EA, the FEIR includes a narrative clarifying the relationships of air quality modeling data to MassDEP and EPA requirements for State Implementation Plan (SIP) consistency. The DEIR/EA conducted an air quality analysis evaluating the relocation of the commuter rail tracks, which demonstrated no substantial change in air quality. In addition, new fuel standards from EPA will result in lower particulate matter emissions from locomotives, automobiles and buses.

lung, and there are also diesel exhaust immunological effects. Based upon human and laboratory studies, there is considerable evidence that diesel exhaust is a likely carcinogen."[1] Due to this knowledge and the closer proximity to homes, it would be most advantageous if the commuter line trains could be upgraded to a more environmentally aware technology. It was stated in the report that there is a "slight increase" in the diesel particulate exposure, where the tracks are closer to homes. Mitigation must include a requirement that there be no worsening of conditions, no matter how small, and an effort to maximize mitigation to improve the quality of life for residents living along the tracks.

L-010-004

The Transportation Reform Act signed by Governor Patrick on June 26, 2009 requires the Massachusetts Department of Public Health (MDPH) to study the health effects of exposure to fine and ultrafine particulate air pollution upon populations located close to the sources of such pollution. It is clear that long term effects have known outcomes, especially for those at risk. Consideration should be given to have MDPH study this area to ascertain inclusion of any findings in the remediation plan for the Greenline Extension.

L-010-005

The project states that there is a possibility of eliminating freight service from the rail lines. Movement of the freight to the roadways negates air quality improvements proposed in this project by adding Vehicle Miles traveled, VOC's and CO, as well as adding to the burdens on the already heavily traveled streets of Medford.

L-010-006

Wherever possible, review of bus routes should be considered for opportunities to shift to the Greenline, for additional air quality benefits, as well as removing bus exhaust in slow and congested traffic on Boston Avenue.

L-010-007

Reference to Exposure Levels and Health Effects from Air Toxics in section 5.6.6 states that "even if emission levels and concentrations of MSAT's could be accurately predicted, shortcomings in current techniques for exposure assessment and risk analysis preclude meaningful conclusions about project specific health impacts", causes concern for this public health department. Reference to national MSAT's does not take into consideration differences in climate, ambient conditions, urban impacts and population effects. Other health assessments should be added to this report to better inform decision makers and the public about the health effects.

L-010-008

Additional data is noted on the Fay, Spofford and Thorndike peer review including the attached memorandum from KM Chng Environmental Inc.

Stations

Station design in Medford has immediate public health and safety concerns for this department. Access to College Avenue off of the bridge, at an intersection with high traffic and pedestrian accidents appears to be a health and safety risk for pedestrians and motorists. This intersection has a high volume in the commuter rush hours in the morning and evening. It is a five point intersection, which in itself is a challenge for motorists and pedestrians to navigate. Recent

L-010-009

[1] Air Toxics in New England, EPA, http://www.epa.gov/eco/airtox/diesel.html, last updated June 24, 2009

L-010-004

It is anticipated that the Green Line Extension will have a positive impact on outdoor air quality within the study area. The modifications to commuter rail train engines is outside the scope of this project. However, new fuel standards from EPA will result in lower emissions from locomotives, automobiles, and buses.

L-010-005

The preparation of a health study is beyond the scope of the Green Line Extension Project. However, the Project will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality.

L-010-006

The Green Line Extension may impact some freight railroad access routes. However, alternate freight rail corridors are available to serve area clients.

L-010-007

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

L-010-009

improvements have made the area somewhat safer, but the station will add another facet for navigation issues. Re-design should be considered to remove the access off of the bridge, which is barely enough for pedestrians and two lanes of traffic.

L-010-010

The same health and safety issue for pedestrians and motorists comes from the location on Boston Avenue, for entrance and exit on Boston Avenue for the Mystic Valley Parkway station. This is a highly congested area, where even now entrance and exit of existing businesses is difficult during commuter hours. Redesign and reconfiguration of this location must be considered and the logical move is to the Parkway location of Whole Foods, where there are existing large entrances and exits to the roadway. In addition, Whole Foods could be included in a multi-use building to prevent the loss of this business.

L-010-011

A long term station maintenance plan for upkeep of bathroom facilities and trash maintenance will need to be submitted to the Medford Board of Health with contacts for corrective actions.

L-010-012

The indoor air quality plan which talks about the provision of outdoor air ventilation to improve indoor air quality via "ventilation system monitoring to help sustain station occupant comfort will reduce indoor air contaminants that are odorous, irritating or harmful to station occupants", does not address the effects of this ventilation on outdoor air quality for the inhabitants of these locations. Further information must be made available for review and comment.

Noise/Vibration

L-010-013

This reviewer believes that there is inadequate testing for Noise and Vibration in Medford's portion of the Greenline. Only 3 noise meters, 2 vibration and 1 combo unit were used for assessment. Additional noise and vibration impacts must be considered due to the proximity to homes, elderly housing, schools and businesses.

If a 10 dB increase equals a doubling of perceived loudness, which can effectively be met with a change in volume of a human voice, it is clear that this is truly a public health issue. Health effects analysis can associate changes in motor vehicle traffic volumes with health-related outcomes such as injuries, sleep disturbance, noise-related stress, diabetes, respiratory disease, and social cohesion. The report states that, "Since existing noise levels are relatively high at locations along the existing commuter rail line, even small increases in future noise levels are considered to have the potential for moderate to severe noise impact." Therefore, Noise barriers need to be installed throughout the entire Medford line due to the proximity to homes, Tufts dorms, elderly housing, and schools.

Noise barriers installed should be high enough to remediate any noise impact, but would assist in the Visual impact of the installed catenary lines. Illustrations, specific locations and height projections should be provided for review as soon as possible for further comment.

Existing noise conditions list the commuter train noise level as 88 – 99 dBA in Medford, at distances of 50 – 60 feet. The plans bring the commuter line to within 10 feet of the property line of some homes. Additional data for noise mitigation needs to be provided and should be emulated at such distances to ensure proper measures can be taken with the construction. In the

L-010-008

The Green Line Extension will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality. As required by the Secretary's Certificate on the DEIR/EA, the FEIR includes a narrative clarifying the relationships of air quality modeling data to MassDEP and EPA requirements for State Implementation Plan (SIP) consistency.

L-010-009

The long term mitigation proposed at this intersection is expected to improve pedestrian and vehicular traffic operations. FEIR Chapter 4, College Avenue, provides more detail.

L-010-010

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

L-010-011

MBTA, future operator of the Green Line Extension, will be responsible for all aspects of station and rail facilities maintenance.
Detailed maintenance plans will be addressed in later phases of the Project.

L-010-013 same section of the report,, a narrative states there were measurements listed in Table 4.8-1 for additional measurements taken in the College Ave. to Mystic Valley Parkway area. Only measurements at Burget Avenue and Orchard St. were completed at 71 Ldn, with a commuter train max. of 88-89. Additional sites should have measurements, as this stretch has dense residential areas with two and three family homes. This information is not adequate for a public health review. An pre-project assessment should be provided for all abutters of the project to document existing conditions of the homes/businesses foundations, walls and windows to make mitigation with insurers less complex during and after the project.

All noise and vibration control measures need to be implemented to mitigate noise and vibration impacts from train operations. More specific site plans are needed for evaluation and review.

L-010-014 It is a general feeling in Medford that the Route 16/Mystic Valley Parkway station needs to be reconfigured. To that end, vibration studies for 200 Boston Ave need to be included, as that is generally inhabited by Research and Development companies.

Homes on Morton, Granville and Winchester Pl. are within 15 – 19 feet from the future commuter line. Disruption of normal home environments, impeded sleep and wellness must be included in the studies of noise and vibration and installation of noise barriers and insulation measures on homes such as these must both be used to protect the health and wellness of the residents.

L-010-015 Consideration of tunneling from at least College Avenue to Mystic Valley Parkway should be reconsidered as a measure to control the effects of lessening the distance to homes in the area, where long term effects of these health indicators are most likely to effect the health and wellness of the neighborhood population.

L-010-016 Long term maintenance plans must be committed to the project, as current public nuisance complaints have been ignored by the MBTA, in particular the Wellington station location abutting residential properties. Residents are often answered by MBTA employees with curt and disregarding comments, including "the trains were there before the homes". When we are advocating for SMART building and transportation projects, this comment is not acceptable. Public Health needs a plan that can be guaranteed.

Additional data is noted on the Fay, Spofford and Thorndike peer review including the attached memorandum from KM Chng Environmental Inc.

Demolition/Construction/Hazardous Materials

L-010-017 Additional information is needed for demolition and construction remediation planning. Specific plans for noise control, dust/particulate matter control, trash disposal and health measures for demolition including lead and asbestos contamination, and unidentified hazardous waste is required to adequately comment from a public health perspective.

Medford has a robust set of regulations for demolition and construction including preventive baiting for pests, pest contracts including pre-demolition to post-construction have provided

L-010-012

The Green Line Extension will have a positive impact on outdoor air quality within the study area. Indoor air quality is unique to each individual building, and is outside the scope of this project.

L-010-013

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies. During preliminary engineering, MassDOT will conduct further analysis for several individual properties. As described in FEIR Chapter 8, MassDOT will then be able to identify the specific measures that will be appropriate for mitigating the Project's noise and vibration impacts.

L-010-014

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

L-010-017

Medford with fewer pest issues over the past years. Observance of these measures in Medford are needed by this project. Asbestos DEP notification copies should be submitted to the Medford Board of Health. Any unknown Hazardous waste findings should be reported to the Medford Board of Health when Massachusetts Department of Environmental Protection is notified. A more complete and detailed plan for Hazardous materials is needed for review by this department, as it is mentioned in the EIR, it is not detailed. Measures to protect the public health and safety will be agreed upon at the time of construction once the site specific Health & Safety plan is written and reviewed by this Board of Health.

L-010-018

Water treatment for dust control in the summer months is often not adequate to mitigate health effects. Calcium Chloride applied to surfaces has been a measure used by construction crews with good results. Expanded plans should include this measure. Tarps should be used to cover stockpiled soils to prevent the spread of dust in windy conditions, not just water application.

Control of particulate matter has been discussed, regarding construction equipment retrofitting, maintenance of all motor vehicles, machinery and equipment associated with construction activities and proper fitting of equipment with mufflers or other regulatory required emissions control devices. It also proposes to limit idling vehicles. Additional information is needed for public health to adequately address this concern.

Noise remediation is an important concern in the long term, but construction mitigation measures must be applied in a preventive plan to decrease health/wellness effects to the citizens in these neighborhoods. Areas which require pile driving should have robust plans to protect the public health, as well as heavy construction equipment impact on noise. The 10 decibel level, which doubles perceived sound, could easily be multiplied. Avoidance of night construction is imperative for areas where property lines close in on residences. The community requires adequate rest and stress relief during construction to maintain their health.

The effects on the Saint Clements schools must be studied in more detail, due to the impact of construction focused on day time hours to protect the health of inhabitants in the neighborhoods at the Harvard Street bridge. Additional information should be studied to limit the effects on students that will be studying within close proximity to the work.

Socioeconomic/Environmental Justice

L-010-019

Census 2000 does not adequately represent the City of Medford and it's citizens. When this Board of Health is preparing health assessment or statements for grants, it is the census of the schools that more appropriately identifies our community. In sharing this, it is clear that we have a higher immigrant population with non-English speaking families than represented in this report. A revision should be considered as it will most definitely affect citizens not identified previously.

L-010-020

Medford also has a very elderly population. 18% of our population is 65 years or older. It is not clear by the information presented that consideration of this population and the effects of this project to this at risk and isolated population has been sufficiently reviewed and considered. This project abuts an elderly housing project in Medford for which there is no specific mitigation

L-010-015

Tunneling alternatives were evaluated but dismissed, as described in DEIR/EA Appendix B, Section 7.

L-010-016

MBTA, future operator of the Green Line Extension, will be responsible for all aspects of station and rail facilities maintenance. Detailed rail transit operations and maintenance will be addressed in later phases of the Project.

L-010-017

As described in DEIR/EA Section 3.7, construction contractors will be required to comply with state regulations and local ordinances to mitigate air quality, noise, and vibration impacts. On-site resident engineers and inspectors will monitor all construction activities to ensure that mitigation measures are properly implemented.

An analysis of hazardous materials potentially present within the Green Line Extension Study Area is provided in DEIR/EA Section 5.14, Hazardous Materials. Additional investigation may be conducted during the next phases of the Project to determine the nature and extent of any contamination and remediate any sites as appropriate. This work would be conducted in accordance with the Commonwealth's Massachusetts Contingency Plan requirements.

L-010-018

Construction impacts of the Project are described in each environmental resource section in DEIR/EA Chapter 5, Environmental Consequences. Construction contractors will be required to comply with relevant federal, state, and local laws, regulations, and codes to eliminate or minimize adverse effects (such as noise and vibration levels, and traffic flow) to environmental and social resources. The Public Involvement Plan (PIP),

L-010-020

plan. A letter from the Medford Council on Aging Board of Director's to Mayor Michael J. McGlynn, dated November 20, 2009, confirms the general feeling that not enough accommodation was given to the large senior citizen population in Medford. (Attached)

Throughout the project, meetings with affected residents should occur, at a minimum quarterly, to assist in additional needs and disturbances not anticipated by the project. The Medford Board of Health would assist in hosting and facilitating these meetings with construction contractors and principles of this project.

Additional Permits

L-010-021

The City of Medford Board of Health requires permits for Rubbish Haulers, dumpsters and temporary septic (portable toilets). Applications can be made in the Board of Health office.

Closing Remarks

While the project is supported, the EIR is missing integral information for evaluation and review. While the overall project is to improve air quality, it appears that other measures can be made to make the cost and effort a more substantial gain. It is imperative that special consideration be given to the residents who will bear great disruption during construction despite the efforts of the mitigation and they will need a voice and response to any ongoing concerns.

Thank you for the opportunity to comment on the Draft Environmental Impact Report and we look forward to an open and honest working relationship with the principles of the Greenline Extension project.

Sincerely,

Karen L. Rose, RN, BC, BA, MS
City of Medford
Director of Public Health/Director of Elder Affairs

5

Chapter 6 of the FEIR, proposes a structure for community involvement during the next phases of the Project: design and construction. More detail on dust control equipment, noise remediation, and other construction elements will be developed during preliminary engineering.

L-010-019

Impacts to environmental justice populations are described in DEIR/EA Section 5.4, Environmental Justice. Additionally, the Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes specific outreach efforts to the environmental justice community that will be made as the Project progresses through its next phases.

L-010-020

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

L-010-021

MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses. This will help ensure compliance with legal requirements and, to the extent feasible, consistency with planning and other projects.

Hon. Mayor Michael McGlynn
Medford City Hall
Medford, MA
RE: Green Line Extension Project

November 20, 2009

Dear Mayor McGlynn,

As the board of the Medford Council on Aging, we applaud the efforts of the Executive office of Transportation, the MBTA, and the impacted city leaders, to bring regular transportation access to Medford with the Green Line Extension.

We look forward to seeing our residents have access to Somerville, Cambridge and Boston by train. I'm sure businesses in Medford look forward to the increased access to Medford business for residents of Boston, Cambridge and Somerville.

There are a couple of issues that we would like to see addressed, as a city, before the project moves forward at full speed. It is our belief that the environmental impact study has not been reviewed enough by the citizens of Medford who will be affected most directly by the construction of the project. We feel that this, and many other concerns affecting our seniors especially at the Walking Court residences are not being addressed partly because (and we think this is a big part) there has been no plan to have a hearing in Medford to specifically address Medford issues.

We think it would be in the best interests for all concerned – citizens because they will be heard and feel included, and for the DOT/MBTA because they would earn more public "buy in" of their project, if a hearing were to be held in Medford - where residents here (especially those with no car to travel to meetings) could hear first hand the details and ask questions so they could air their concerns and get the answers they desire.

In summary, we would like to urge you to request another public hearing in Medford before the major project work begins. Thank you for hearing our concern.

Sincerely,

The Medford Council on Aging Board of Directors

KM Chng Environmental Inc. **MEMORANDUM**

To: Ed Hollingshead (FST)

From: Tim Lavelle (KM Chng)

Subject: EOT Green Line Extension – EIR/EA
- Air Quality Review

Date: 4 December 2009

As requested, we have reviewed the document *Draft Environmental Impact Report/ Environmental Assessment and Section 4(f) Statement* for the Green Line Extension Project (EEA #13886). Our objective was to review the completeness, methodology, and data assumptions for the air quality analysis conducted for the Project.

SUMMARY

The document appears to be reasonably thorough and, for the most part, uses methodologies that are consistent with current EPA/DEP guidance. However, as discussed below, a number of issues with the analysis limit the verification of the accuracy of the results. Missing data and methodology details would need to be provided by the author to check the accuracy. However, the errors and inaccuracies described are not likely significant enough to change the overall conclusions presented in the Report, which states that the build alternatives would provide air quality benefits when compared to the No-Build Alternative.

The following brief summary points identify issues with the document's compliance with the Secretary's Certificate and also problems with missing or incomplete methodology details and data within the air quality sections of the Report. For more explanation of the summary points, this Summary section is followed by a section of Detailed Comments addressing each of the bulleted summary points.

Compliance With the Secretary's Certificate on the Expanded Environmental Notification Form

- The Certificate requires reporting of emission inventory results for CO and PM2.5, these results are not presented in the Report; and
- Quantitative PM10 and PM2.5 hotspot assessments that were not required in the Certificate were included in the analysis using methodology that is not currently endorsed by EPA or FHWA, and therefore the reported results may be misleading to the public.

Affected Environment – Section 4.7

- No description of PM10/PM2.5 persistence factors used to estimate 24-hour and annual results from the 1-hour modeled results is provided;
- Report does not provide description of modeling methodology for the Microscale Commuter Rail Evaluation; and
- The emissions inventory does not present results for CO or PM2.5.

Environmental Consequences – Section 5.6

- The 1-hour CO background concentration is suspect and the 8-hour CO background concentration is not presented;
- No description of the development of PM10/PM2.5 background concentrations is provided;
- The project-opening year, or construction completion year, is not included in the analysis; and
- As required in the Certificate, an attempt to provide a greenhouse gas emission inventory comparison between the alternatives is provided, however it is incomplete. Although greenhouse gas emissions are calculated for on-road motor vehicles, there is no accounting of greenhouse gas emissions for electricity generation to power the extended Green Line.

Air Quality Appendix

- The air quality study protocol is not provided in the Report Appendix for public review;
- It appears that the 8-hour CO concentration results were calculated incorrectly;
- It appears that there are multiple issues with the MOBILE motor vehicle emission factor modeling;
- There are issues with the background concentrations used in the CAL3QHC hotspot modeling for CO, PM10, and PM2.5; and
- There are data input issues with the emission factors used in the CAL3QHC hotspot modeling.

DETAILED COMMENTS

Compliance With the Secretary's Certificate on the Expanded Environmental Notification Form

L-010-022

- The air quality scope in the Secretary's Certificate requires that "the analyses should analyze the following emissions: VOC, NOx, greenhouse gases, carbon

L-010-022

Particulate Matter issues were raised during public participation meetings. As a result, it was deturmined that the DEIR/EA would evaluate Particulate Matter emissions. The emissions of carbon monoxide and particulate matter (PM10 and PM2.5) were evaluated as part of the microscale (hotspot) analysis. Particulate matter emissions were calculated as part of the microscale and mesoscale analyses to provide additional information.

The CAL3QHC is the one of the models recommended for calculating PM concentrations from roadways. In the user's guide (User's Guide to CAL3QHC Version 2.0: A Modeling Methodology for Predicting Pollutant Concentrations Near Roadway Intersections), it states:

The CAL3QHC Version 2.0 model has been slightly revised. The revisions to the model are reflected in this version of the user's guide. The CAL3QHC Version 2.0 input structure has been converted from a "fixed format" to a "free format". Also, the CAL3QHC source code has been enhanced to permit the calculating of Particulate Matter (PM) concentrations. These revisions to CAL3QHC Version 2.0 will not change previous model results.

The Green Line Extension will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality. As required by the Secretary's Certificate on the DEIR/EA, the FEIR includes a narrative clarifying the relationships of air quality modeling data to MassDEP and EPA requirements for State Implementation Plan (SIP) consistency.

L-010-022

monoxide, particulate matter (PM) and air toxics." Although it appears that CO and PM2.5 emissions were estimated for each alternative as data files in the Air Quality Appendix indicate, the results for these two pollutants are not presented in the EIR.

- The scope requires that the microscale analysis examine localized hotspots for CO concentrations only. Because the study area is located in an attainment area for PM10 and PM2.5 (meaning that EPA recognizes this area as meeting the regulated ambient air quality standards for these pollutants), there are no requirements for including PM10/PM2.5 hotspots in the analysis, and even more so for not including a *quantitative* analysis. Even if PM10/PM2.5 hotspots were required, current Transportation Conformity guidance endorsed by FHWA and EPA calls for *qualitative* assessments only. The agencies are currently in the process of finalizing *quantitative* methodology for PM10 and PM2.5 hotspots in conjunction with the completion and distribution of the MOVES emission factor model, which is scheduled to be released by the end of 2009. Therefore, PM10/PM2.5 modeled concentrations may not be accurate. The results presented are potentially misleading, and should not be included in this Report. This comment also applies to the PM2.5 hotspot analysis conducted for the Microscale Commuter Rail Evaluation, which has further questionable issues described under the Affected Environment section below.

Affected Environment – Section 4.7

L-010-023

- The section describes persistence factors used and how they were developed for modeling 8-hour CO concentrations, however no explanation of persistence factors is provided for the 24-hour PM10 and PM2.5 concentrations or annual PM2.5 concentrations. The persistence factor is used to estimate pollutant concentrations for longer averaging time periods than the 1-hour concentrations predicted by the modeling.
- The Report provides no description of the modeling methodology or the model used in the analysis for the Microscale Commuter Rail Evaluation.
- As discussed previously, meeting compliance with the Secretary's Certificate requires that the existing conditions mesoscale analysis include estimates of PM2.5 and CO emissions, which are not presented in the Report.

Environmental Consequences – Section 5.6

L-010-024

- As in the Affected Environment section, no persistence factors are provided for the PM10/PM2.5 hotspot modeling, no description of methodology for the Commuter Rail Evaluation is provided, and the mesoscale analysis does not present CO or PM2.5 emission results.
- The NAAQS for lead was revised to 0.15 ug/m^3 in October 2008. Table 5.6-1, *National Ambient Air Quality Standards*, should be updated to reflect this revision. This edit has no effect on the analysis or results.
- EPA recommends using the maximum applicable concentration from the last 3 years of monitoring data as the background concentration for microscale modeling. It appears that background concentrations used in the analysis were

L-010-023

The PM persistence factors were obtained from EPA's *Screening Procedures for Estimating the Air Quality Impact of Stationary Sources, Revised*. The 24-hour and annual persistence factors for particulate matter were obtained from EPA's modeling guidlines. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality. As required by the Secretary's Certificate on the DEIR/EA, the FEIR includes a narrative clarifying the relationships of air quality modeling data to MassDEP and EPA requirements for State Implementation Plan (SIP) consistency. The microscale analysis for the commuter rail evaluation was conducted using EPA's CAL3QHC Version 2 model.

L-010-024

The PM persistence factors were obtained from EPA's *Screening Procedures for Estimating the Air Quality Impact of Stationary Sources, Revised*.

The Green Line Extension will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality. As required by the Secretary's Certificate on the DEIR/EA, the FEIR includes a narrative clarifying the relationships of air quality modeling data to MassDEP and EPA requirements for State Implementation Plan (SIP) consistency.

The emission concentrations of the existing and design year conditions were substantially below the NAAQS. As a result, no interim years were evaluated. The 8-hour CO concentrations were calculated following EPA's *Guidelines for Modeling Carbon Monoxide from Roadway Intersections* dated November 1992. The PM persistence factors were

L-010-024

extracted from a report published in 2006. No 8-hour CO background concentration is presented in the Report.

- Although PM10 and PM2.5 background concentrations used in the hotspot analyses are presented, no description of how the concentrations were developed is provided. Also, it is unusual to see a 24-hour PM10 background concentration (23 ug/m^3) that is less than the 24-hour PM2.5 background concentration (29.7 ug/m^3), which, again, leaves the PM10/PM2.5 modeling suspect.
- Because of Federal and State-mandated emission controls, which reduce motor vehicle emission rates in future years, the project-opening year (or construction completion year) can often show higher emissions and concentrations than the project-design year. Therefore, the project-opening year is usually included in the air quality analysis for transit projects. The project-opening year for the Green Line Extension was not included in the analysis.
- Greenhouse gases are not a local or regional issue, but a global issue. Although greenhouse gas emissions were estimated for study-area on-road motor vehicle traffic, there is no accounting of emissions from power plants providing the electricity to power the Green Line Extension.

Air Quality Appendix

L-010-025

- The Certificate requires that a study protocol be developed for the Project. Although the Report text alludes to DEP consultation regarding development of the study protocol, the accepted protocol should be included in the Air Quality Appendix for public review.
- It appears that the 8-hour CO concentrations were calculated incorrectly. The analysis uses the 1-hour modeled concentration plus the background concentration multiplied by the persistence factor to calculate the 8-hour values, instead of applying the persistence factor to the 1-hour modeled concentrations and then adding in the 8-hour background concentration. Since no 8-hour CO background concentration is presented in the Report, the 8-hour CO concentration results could not be verified. Since PM10 and PM2.5 persistence factors are also not presented, the modeled microscale results for PM10 and PM2.5 could not be verified.
- Based on the review of the MOBILE emission factor model inputs, there appear to be multiple issues with the emission factor modeling for the 2007 and 2030 calendar years including: vehicle registration data, I/M program data, anti-tampering program data, diesel rebuild effects, diesel sales fractions, ambient temperatures, RVP values and diesel sulfur content. This means that emission factors developed for the project are not completely accurate according to the latest guidance from DEP.
- CAL3QHC CO files show a background ambient concentration of 5 ppm, not 3 ppm as presented in the Report.
- CAL3QHC PM10/PM2.5 files show all free flow links having 0.0 g/mi emission factors. This under-estimates the concentrations estimated for the PM10/PM2.5 microscale analyses. However, as noted previously, quantification of

obtained from EPA's *Screening Procedures for Estimating the Air Quality Impact of Stationary Sources, Revised*. The CAL3QHC is the one of the models recommended for calculating PM concentrations from roadways. In the user's guide (User's Guide to CAL3QHC Version 2.0: *A Modeling Methodology for Predicting Pollutant Concentrations Near Roadway Intersections*), it states: *The CAL3QHC Version 2.0 model has been slightly revised. The revisions to the model are reflected in this version of the user's guide. The CAL3QHC Version 2.0 input structure has been converted from a "fixed format" to a "free format". Also, the CAL3QHC source code has been enhanced to permit the calculating of Particulate Matter (PM) concentrations. These revisions to CAL3QHC Version 2.0 will not change previous model results."*

L-010-025

The 8-hour CO concentrations were calculated following EPA's *Guidelines for Modeling Carbon Monoxide from Roadway Intersections* dated November 1992.

Particulate Matter issues were raised during public participation meetings. As a result, it was determined that the DEIR/EA would evaluate Particulate Matter emissions. The emissions of carbon monoxide and particulate matter (PM10 and PM2.5) were evaluated as part of the microscale (hotspot) analysis. Particulate matter emissions were calculated as part of the microscale and mesoscale analyses to provide additional information. The CAL3QHC is the one of the models recommended for calculating PM concentrations from roadways. In the user's guide (*User's Guide to CAL3QHC Version 2.0: A Modeling Methodology for Predicting Pollutant Concentrations Near Roadway Intersections*), it states: *The CAL3QHC Version 2.0 model has been slightly revised. The revisions to the model are reflected in this version of the user's guide. The CAL3QHC Version 2.0 input structure has been converted from a "fixed format" to a "free format". Also, the CAL3QHC*

L-010-025

PM10/PM2.5 hotspot concentrations is not endorsed by FHWA/EPA and this error just leads to further misinterpretation of the results presented in the Report.

- CAL3QHC PM10/PM2.5 files show a background ambient concentration of 5 ug/m^3, which does not match any of the background concentrations presented in the Report. Therefore, based on issues already discussed, and errors of this magnitude, all air quality modeling for this project is considered suspect.

Although there are obvious errors in parts of the analysis, the overall conclusions presented in the Report would not likely change if the errors were corrected.

source code has been enhanced to permit the calculating of Particulate Matter (PM) concentrations. These revisions to CAL3QHC Version 2.0 will not change previous model results."

The MOBILE emission factor files were provided by DEP and CTPS to be consistent with the current SIP modeling requirements.

The air quality analysis actually used a 1 hour CO background values as presented in the Appendix. As a result, the CO values, which all be substantially below the NAAQS are conservative because the Project could have used a background of 3, which would lower all the 1-hour CO values by 2.

The CAL3QHC output files show 0.0 for the free flow emission factors for PM because the actual values are smaller. However, the CAL3QHC used the real values for calculating PM concentrations.

KM Chng Environmental Inc. **MEMORANDUM**

To: Ed Hollingshead (FST)

From: Martin Brien (KM Chng)

Subject: EOT Green Line Extension - EA
- Noise and Vibration Preliminary Review

Date: 25 November 2009

As requested, we have reviewed the document *Draft Environmental Impact Report/ Environmental Assessment and Section 4(f) Statement* for the Green Line Extension Project (EEA #13886). Our objective was to review the completeness and methodology of those documents with regard to possible noise and vibration exposure to neighbors of the project, with particular concern for the portions of the project within Medford city limits.

SUMMARY

The Noise and Vibration Sections of the subject Environmental Assessment (EA) document contain a complete noise and vibration assessment report and methodology, similar to that which would be developed for an Environmental Impact Statement (EIS). The document appears to be reasonably thorough and utilizes methodologies that are consistent with current general practice, as defined in the Federal Transit Administration (FTA) guidance manual *Transit Noise and Vibration Impact Assessment* (Report FTA-VA-90-1003-06, May 2006). The document also complies with the Secretary's Certificate for Noise and Vibration, as stated in the EA.

However, we would like to point out several portions of the assessment which may be lacking in detail, or which may provide a less than adequate and balanced perspective to the possible noise and vibration exposure to residents that live close to the proposed project. The following presents a summary of our concerns. The summary is followed by a detailed account with references to the EA document providing specific reasons for the concerns.

Environmental Consequences – Noise (Section 5.7)

L-010-026
- The summary statements imply that there will be no noise impacts with mitigation; however, several mitigation options may not work for practical reasons resulting in higher levels of impact than the report indicates. The report should address these conditions and the consequential reduction in impact mitigation.

L-010-027
- Construction noise impacts are not adequately analyzed such as effects from required nighttime construction and other operations that are likely to be very disruptive. The report should analyze in detail the types of equipment to be used and the time and frequency of operation and the likely impact from construction operations.

L-010-028
- The report lacks detail to determine impact levels and likely forms of mitigation at individual buildings, and how well the mitigation is expected to perform. The report should include a list of all impacted buildings, the type of mitigation, and whether the mitigation in practice is capable of reducing noise levels sufficiently.

L-010-029
- Noise source reference details for MBTA trains, equipment and maintenance yard activities is not complete and therefore it is not clear if the assessment is adequate. The report should include an appendix that lists all noise sources including the expected variation in the assumed noise levels.

L-010-030
- The methodology used to determine receptor locations and allocation of measurement data to establish impact criteria is not provided. It is possible that more measurements should have been conducted in areas of Medford other than near Tufts University buildings.

Environmental Consequences – Vibration (5.8)

L-010-031
- The performance of the proposed vibration mitigation options (ballast mats and resilient fasteners) is not sufficiently referenced and the stated performance levels (10 to 15 VdB for ballast mats) may be greater than what can be practically achieved. This may result in higher vibration levels to nearby residents than proposed. The report should either be more realistic about mitigation, or provide references of actual post installation tests, not conducted by manufacturers, to substantiate claims.

L-010-032
- The number of vibration impacts and vibration levels in the section between Medford Hillside and Mystic Valley Parkway seems proportionally less than other sections of the project. Also, no ground propagation tests were performed in areas to the north and south of the Tufts University ground propagation measurement site. Either more tests and analysis should be performed, or at least an explanation for the inconsistent data should be provided.

L-010-033
- The listing of vibration impacts does not include detailed information for each receptor making it difficult to determine the level of vibration to be expected at each building location. The document should include a list of all affected buildings, including predicted levels and mitigation details

L-010-026

Noise barriers proposed for the Project are considered to be feasible, reasonable and effective mitigation measures. Noise barriers have been used to mitigate potential noise impact for numerous transit lines across the United States and internationally. Sound insulation mitigation is being considered for some receptors where noise barriers may not be feasible or effective. As presented in the DEIR/EA, sound insulation has not been frequently used for rail projects, but it has been widely applied around airports to improve outdoor-to-indoor noise reduction and is considered to be an effective mitigation measure where it is implemented.

L-010-027

Construction impacts of the Project are described in each environmental resource section in the DEIR/EA Chapter 5, Environmental Consequences. Construction contractors will be required to comply with relevant federal, state and local laws, regulations, and codes to eliminate or minimize adverse effects (such as noise and vibration levels, and traffic flow) to environmental and social resources. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the next phases of the Project, design and construction.

L-010-028

The DEIR/EA reports noise levels for clusters of receptors which have similar noise environments. In accordance with FTA methodology, residential neighborhoods and relatively large outdoor noise-sensitive areas are typically clustered, simplifying the analysis that is required without compromising the accuracy of the analysis. More detail on clustering of receptors can be found in DEIR/EA Section 6.1.3 and Appendix C of the FTA guidance manual.

Existing Environment – Noise (4.8)

L-010-034
- The background discussion for noise may under emphasize the meaning of the measurement scale (dB) as it relates to human annoyance. For the reader who is not familiar with noise measurements, the quantitative results of the assesement may render the predicted noise level increases as less of an annoyance than will actually be experienced.

L-010-035
- The assessment relies on estimations of 24-hour Ldn from a one-hour noise measurement. This technique could lead to inaccurate characterization of the existing noise level that, in turn, can lead to inaccurate predictions. The report should have included more 24-hour measurements at more location, especially in parts of Medford other than where Tufts University is located.

Existing Environment - Vibration (4.9)

L-010-036
- Train vibration measurements were only performed at one location near the Tufts University sports fields and appear to have neglected the residential portions of Medford to the north and south of this area. Additionally, the vibration data shown in the report does not indicate the variation between different MBTA trains, which can be 15 VdB or more. This could lead to inaccurate predictions, or predicted levels that are less than the levels that may actually occur.

L-010-037
- The assessment does not include any mention of vibration sensitive businesses in Medford, such as a possible research and development facility which may be sensitive to vibration.

L-010-038
- The assessment should have included a technical appendix listing equipment used, certifications, etc.

L-010-039
- The discussion and assessment only pertains to effects felt by people. The background discussion should have included some discussion for assessment of possible house damage caused by large displacement oscillations of the rail track.

L-010-029

Section 5.7.1.3 of the DEIR/EA presents reference noise levels for MBTA trains. Noise and vibration modeling assumptions for the maintenance facility impact assessment are summarized in Chapter 2 of the FEIR and presented in detail as a technical appendix.

L-010-030

Section 4.8.2 of the DEIR/EA presents the methodology for quantifying existing noise conditions at sensitive receptors. Existing noise measurement sites were selected based on the location of noise-sensitive land uses along the proposed corridor, their proximity to the proposed alignment, and the existing terrain conditions. The distance from the measurement location to significant noise sources (e.g., commuter train line or streets where there is no existing train activity) was chosen to be representative of typical noise-sensitive locations in each area.

L-010-031

The expected performance of the proposed vibration mitigation reported in the DEIR/EA is based on vibration mitigation effectiveness and costs presented in Section 11.5 of the FTA guidance manual.

L-010-032

Potential vibration impact between Medford Hillside and Mystic Valley Parkway is less than other sections due primarily to the further setbacks of sensitive buildings to the rail alignment. Additional vibration measurements at sensitive receptor locations along the Proposed Project alignment have been conducted and will be further evaluated during preliminary engineering to provide more detail on vibration reduction mitigation measures needed for the Project. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

01/20/2010 13:35 17813932562 CITYOFMEDFORDHEALT PAGE 18

KM Chng Environmental - DETAILED COMMENTS

Affected Environment – Noise (4.8)

L-010-040

1. 4.8.1 Introduction, page 4-63, the first paragraph may under emphasize the meaning of a sound pressure decibel by stating that a 3 dB change is a "barely noticeable change outside the laboratory", whereas a "10 dB change would typically be perceived as a doubling (or halving) in loudness". The reference for this statement is not given. Earlier research (e.g. Stevens, 1956), suggests this phenomenon; however, other research indicates that there is a range of 1-3 dB that is noticeable to many people and that a 6-10 dB difference is generally perceived as a doubling in loudness (e.g. Warren 1970). This is particularly true of louder sounds (above approximately 70 dBA). It should be noted that all physics reference texts define a doubling of sound pressure level as 6 dB. The term "loudness" is a psycho-acoustic term which can be confusing to the general public. Also, the discussion does not mention possible practical effects of project noise increases, such as levels which would limit normal speech, require extreme level adjustments in telephones and television sets, levels which might cause elevated stress, or learning disabilities, etc.
2. Table 4.8-1 Exiting Noise Measurement Results, page 4-67, the use of long term and short term measurements in the same column is confusing. For the short-term measurements, apparently Ldn was estimated, and shows a significantly larger variability (58-80 dBA) compared to the long-term measurements. This result casts some doubt on the use of these types of data and their consequent veracity in describing the existing environment. The data indicate that it would be perhaps less speculative to omit the short term Ldn "measurements" from the assessment, or else measurements should have been obtained using a measurement system that had been recording data for a complete 24 hours period.
3. 4.8.3.2 Noise-Sensitive Land Use, page 4-68 to 4-70, the discussions for each section of the project corridor do not explain the specific reasons for the variations in measured sound level. The short-term levels vary from 59 to 80 dBA, which is a large range for a generally homogeneous urban area. Although the introduction states that, in general, the measured noise levels were dominated by the heavy rail activity (commuter and Amtrak trains), the assessment does not describe adequately the noise contributions from other sources. Since the Ldn near train corridors will mostly reflect the level and duration for train events, the reader would not know whether the area is otherwise relatively quiet or noisy. For example, why is the Ldn at LT-1 64 dBA at 60 feet from the nearest track, whereas the Ldn at LT-9 is 71 dBA, which is also 60 feet from the track? Also, if there is significant variation in noise levels between different MBTA trains, the assessment does not account for this.

L-010-033

In accordance with FTA methodology, the DEIR/EA reports vibration levels for clusters of receptors which have similar exposure to vibration. This procedure simplifies the analysis that is required without compromising the accuracy of the analysis.

L-010-034

Comment noted regarding background discussion of noise.

L-010-035

Conducting short-term noise measurements is a methodology approved by the FTA for quantifying existing noise. More details are provided in Appendix D: Option 4 of the FTA guidance manual *Transit Noise and Vibration Impact Assessment*.

L-010-036

Additional vibration measurements at sensitive receptor locations along the Proposed Project alignment have been conducted and will be evaluated during preliminary engineering to provide more detail on vibration mitigation reduction needed for the Project.

L-010-037

As presented in Section 5.8.2 of the DEIR/EA, the research facility at 200 Boston Avenue, which contains vibration-sensitive equipment, would be expected to be acquired as part of the Project if it is extended to Mystic Valley Parkway.

L-010-038

Comment noted on listing measurement equipment used.

L-010-040

4. For the record, it would have been useful to have a technical appendix that lists the type and model of microphone, sound level meters, and other equipment or software used to measure the existing environment. The text mentions that audio recordings were made; however, there is no mention of anything learned from the audio recordings, assuming that observation personnel were not deployed for the full 24-hour measurement periods.

Affected Environment – Vibration (4.9)

L-010-041

1. 4.9.1 Introduction, page 4-71, the discussion briefly explains the common use of velocity amplitude to measure vibration levels for transportation projects. However, the text does not mention the relationship of ground displacement to certain types of structural damage. In some cases, a relatively large displacement of the rail, which can be caused by poorly maintained wheels and wheel truck suspensions, can cause cracks in surface building materials such as wallboard joints, and occasionally hairline cracks in concrete blocks and other similar rigid building materials.
2. 4.9.2 Methodology, page 4-72, the assessment only utilized one location to measure commuter train levels at Tufts University Alumni Field, and two other locations in Somerville to measure vibration propagation characteristics of the soil. In the interest of Medford residents living in dwellings north of the Tufts University athletic fields, the assessment should have included both existing train vibration measurements and soil/ground propagation measurements in this area between the proposed College Avenue station and the Mystic Valley station.
3. 4.9.4 Existing Vibration Conditions, page 4-73, the discussion and Figure 4.9-2 do not indicate how many trains were measured or what variation in levels were recorded. The range of levels can be significant since MBTA equipment on other lines has shown large variations, and receptors can be exposed to levels 10 dB or more greater than the average (KM Chng Greenbush Study).
4. 4.9.5 Vibration-Sensitive Land Use, pages 4-74 to 4-76, although the general discussion states that vibration is "generally dominated by trains" on the MBTA commuter rail lines, the individual discussion for each section do not identify any other source of vibration. It seems unlikely that there would not be any other vibration sources, such as heavy trucks on uneven pavement. If other sources exist, it might be helpful to know what and where they are, and what the typical levels are, to compare them to commuter rail levels.
5. 4.9.5 Vibration-Sensitive Land Use, page 4-76, the assessment only mentions Tufts University buildings as sensitive land use. According to Medford city officials, there may be corporate R&D facilities in this section, which employ hundreds of Medford residents that may also be sensitive to project induced vibration effects.

L-010-039

It is extremely rare for vibration from train operations to cause any building damage, even minor cosmetic damage.

L-010-040

Noise impact is assessed against criteria established by the FTA which are based on well-documented research on the human response to community noise. Conducting short-term noise measurements is a methodology approved by the FTA for quantifying existing noise. More details are provided in Appendix D: Option 4 of the FTA report, "Transit Noise and Vibration Impact Assessment."
The contribution of existing noise source to the measurement results are described for all noise-sensitive land use areas along the Proposed Project alignment in Section 4.8.3.2 of the DEIR/EA. As presented in the DEIR/EA, the significantly lower existing noise environments are where there is no existing train activity.

There are several factors for why the existing noise levels from MBTA commuter trains vary according to location. Site LT-1, for example, is on the Fitchburg Line, which has a different number of commuter trains operating than sites along the Lowell Line. Further, commuter rail trains at this site are generally traveling at a much slower speed than along sections of the Lowell Line. Topographical features such as retaining walls and sloped terrain also account for differences in existing noise levels from the commuter trains.

Comment noted on listing measurement equipment used.
As stated in Section 4.8.2 of the DEIR/EA, audio recordings were used to identify train activity.

L-010-041

Vibration impact for potential human annoyance and potential damage to nearby buildings is assessed according to FTA guidelines on the

L-010-041

6. As stated for the noise section, it is useful to include a technical appendix, which would at least contain a list of the measurement equipment, software, and any techniques that would be required to obtain results similar to those shown in the assessment.

Environmental Consequences – Noise (5.7)

L-010-042

1. 5.7.1.3 Noise Reference Levels, page 5-107, the data presented for noise reference levels does not contain details to explain the appropriateness of using the Green Line D Branch data. There is no technical appendix to show this data so that others can assess it. For example, can it be assumed that the rail and track system that will be used for the Green Line Extension will be the same as the D Branch? What is the variance for the measured D Branch data? Is the Lmax of 81 dBA an average of all the data that was used, or a worst-case sample? The value used for wheel squeal for the green line vehicles (Lmax = 86 dBA) may be reasonable; however, the FTA manual indicates that the level could be as high as 100 dBA (SEL = 136 dBA
2. 5.7.1.3 Noise Reference Levels, page 5-107, the data presented does not include any information relating to noise sources associated with the maintenance facility. Without this information, it is difficult to determine whether the noise generated from this facility is reasonably accounted for.
3. 5.7.1.3 Noise Predication Model, page 5-107, the description does not provide details explaining how the receptor locations were determined. It would be helpful to know if the positions were determined from current aerial photography, or perhaps older mapping data. If so, were receptors and buildings checked by on site inspection? How was it determined whether to use indoor or outdoor locations, and where can one find the exact point where the calculation was made? Assuming this type of information is available, it might be helpful to residents who would like to check whether the point used for the calculation is appropriate to them.
4. 5.7.1.3 Noise Predication Model, page 5-107, the description does not give details as to where and how noise levels from measurement locations were mapped to receptor locations to determine impact criteria. It is possible that some locations may have a higher or lower impact criteria because a noise level was used from a measurement location several hundred feet away, which a resident of the area may dispute as being typical for their residence. This is a technical problem which could lead to inaccurate results
5. 5.7.2 Noise Impacts, Table 5.7-1 and 5.7.-2, these tables aggregate the data for several individual locations into clusters of 1 to 19 buildings. We understand that this is necessary to avoid long tables with as many as 188 individual buildings. However, without a technical appendix providing data for each building, it is difficult for reviewers, residents or concerned citizens to determine what level of noise individual locations would be subjected to. It seems unlikely that clusters of as many as 19 buildings would be the same distance from the near track and would be subject to the same impact criteria. We would suggest that the assessment report should at least include readings for every building in the appendix.

vibration velocity inside buildings. Vibration generated by commuter and light rail trains is generally much lower in level than what is needed to produce even minor cosmetic damage to buildings.

Additional vibration measurements at sensitive receptor locations along the locally-preferred alternative have been conducted and will be evaluated during preliminary engineering. At residential buildings, the vibration levels of other sources such as heavy trucks on uneven pavement are not relevant to the assessment of potential impact from the Proposed Project.

Noise and vibration impact has been assessed at all locations known to be sensitive along the project corridor. Medford City officials may be referring to the building at 200 Boston Avenue which contains research and development equipment that is sensitive to vibration. As presented in Section 5.8.2 of the DEIR/EA, the research facility at 200 Boston Avenue, which contains vibration-sensitive equipment, would be expected to be acquired as part of the Project if it is extended to Mystic Valley Parkway. The locally-preferred alternative does not extend to this building. MassDOT will coordinate with Tufts University to confirm/identify the locations of vibration-sensitive equipment on the campus and the future Integrated Research Lab, assess the potential for impact and propose mitigation as needed. Findings of impact and mitigation recommendations will be evaluated during preliminary engineering.

L-010-042

As described in Section 5.7.1.3 of the DEIR/EA, measurements were conducted on the existing Green Line which uses jointed rail. The Proposed Project intends to use continuous-welded rail which typically generates lower noise levels than jointed rail. The maximum noise level and SEL at 50 feet and 50 mph on ballast and tie track reported in the DEIR/EA is an average level based on measurements of many trains at

L-010-042

6. 5.7.2 Noise Impacts, Table 5.7-1, there is an error in the totals for Potential Noise Impacts where the totals for the segment between Fitchburg Mainline and Medford Hillside Alternatives 1, 2, 3, and 4 should be 120 moderate impacts and 46 severe impacts. In addition, there are errors in the number of impacts for each of the alternatives in Tables 5.7-1 and 5.7-2 and the totals in the Impact Summary Table 5.7-3. Note that impacts refer to individual buildings and not units within buildings.

7. 5.7.2 Noise Impacts, page 5-113, in the first paragraph the text states, "typically, this increase [1-2 dB due to the green line trains] is not perceptible to humans". This statement appears to be based on cumulative calculated numeric Ldn values. However, in reality, because the frequency of green line trains is higher than commuter trains, it is likely that the noise from the green line trains will be perceptible when events occur. It should be noted that in many cases the noise from the green line trains, although not as noisy as the commuter trains, will easily be heard above background noise, and the cumulative effect of the two trains passing by at different intervals might be more annoying to residents than this statement suggests.

L-010-043

8. 5.7.2.1 Temporary Construction Noise Impacts, this paragraph only contains a cursory review of generic construction activity and suggests that "temporary noise impacts could result from construction activities...". In all likelihood construction activity will result in considerable noise impact to the various neighborhoods for perhaps a prolonged period of time. In addition, it may be necessary to conduct operations during nighttime when the impact is more severe. A more detailed accounting of likely construction activities, and a quantitative analysis relating noise levels to the predicted project noise levels would be useful to provide town officials and residents with a clearer picture of the real noise impact of the project. Such data could also be useful at a later stage of the project so that appropriate mitigation and its costs can be factored into the true cost of the project.

L-010-044

9. 5.7.3 Noise Mitigation, page 5-118, in the first paragraph it is noted that "at some locations projected to be exposed to noise impact, noise barriers may not be feasible or effective". There appears to be a wide range of areas for which noise barriers are prescribed earlier in the report; however, for various reasons will no be possible. The extent to which noise barriers, which are listed in Table 5.7-4 are unlikely to be a feasible alternative could have been shown in a separate table or figure. Table 5.7-4 may portray a misleading view of the level of mitigation that may be possible with this project. In some cases the height, location, or lack of egress through the barrier may pose a problem that may limit the use of barriers in other project areas than those mentioned. It should be noted that the Medford police chief and fire chief are concerned about possible safety issues associated with tall massive barriers. Although it is understood that barrier design details are not worked out until final design, Medford city officials would have preferred to see some perspective renderings of a typical barrier in one of the Medford neighborhoods. The generic barrier textures included in the assessment are not sufficient to portray the visual and safety consequences.

10. 5.7.3 Noise Mitigation, page 5-118, the last paragraph discusses wheel squeal on Somerville Avenue near Allen Street where rail lubrication is suggested as a mitigation technique. The discussion does not include a

a range of operating speeds. The modeling assumption for potential wheel squeal is based on detailed measurements of light rail trains on tight-radius curves for a similar transit system.

Detailed noise and vibration modeling assumptions for the maintenance facility impact assessment are presented as a technical appendix to the FEIR. As described in Section 5.7.1.3 of the DEIR/EA, noise impact is assessed at locations whichever is closer between outdoor areas with frequent human use and the façade of the building. Existing noise measurements were mapped to each sensitive receptor based on many factors including proximity to the measurement location, intervening terrain and the speed of existing commuter trains. The DEIR/EA reports noise levels for clusters of receptors which have similar noise environments. In accordance with FTA methodology, residential neighborhoods and relatively large outdoor noise-sensitive areas are typically clustered, simplifying the analysis that is required without compromising the accuracy of the analysis. More detail on clustering of receptors can be found in DEIR/EA Section 6.1.3 and Appendix C of the FTA guidance manual.

The results in Tables 5.7-1, 5.7-2 and 5.7-3 are correct as shown in the DEIR/EA. Footnote 5 and 6 of Table 5.7-1 explain that receptors at Burget Avenue refer to either Alternative 1 and 3 or Alternative 2 or 4. These footnotes have been revised in the FEIR to make this more apparent to the reader.

L-010-043

Construction impacts of the Project are described in each environmental resource section in DEIR/EA Chapter 5, Environmental Consequences. Pedestrian and vehicular access to abutting properties will be maintained at all times. Construction contractors will be required to comply with relevant federal, state, and local laws, regulations, and codes to eliminate or minimize adverse effects (such as noise and vibration levels,

L-010-044

rough cost estimate, as in the other mitigation options. It is possible that the cost of such an option would make this an unlikely mitigation option. It should be noted that, in the interest of exploring various mitigation options at this stage of the project, other techniques such as damped wheels, rubber wheels, flange modifications, improved wheel maintenance procedures, etc. could have been included. Ideally, a rough cost estimate, or explanations of practicality, might be included so that the likelihood of implementation might be assessed.

11. 5.7.3 Noise Mitigation, page 5-119, the last paragraph states that "the proposed noise barriers, potential sound insulation, and rail lubrication would be effective in mitigating all potential noise from the Project". However, to the extent that all these mitigation options are actually not feasible, this assumption is not valid. Therefore the summary statement "there would be no moderate or severe noise impacts from the Project" is likely to be inaccurate.

L-010-045

12. 5.7.3.1 Construction Noise Mitigation, page 5-119, the list of mitigation options is cursory and generic. It would have been useful to develop more detail for this potentially very significant noise problem for the project, including possible required nighttime activities.

Environmental Consequences – Vibration (5.8)

L-010-046

1. 5.8.1.2 Vibration Reference Levels, page 5-124, the section "Planned Operations" states that Green Line tracks will be on ballast and tie including a "boat section" which is a concrete slab approximately 2 to 3 feet thick. It is not clear from the discussion that follows in the section "Vibration Reference Levels" that the Green Line D Branch data, used for reference levels, is equivalent to the concrete slab mounting. The type of mounting can have an effect on vibration propagation. It would help to have a sentence stating that the concrete slab design was properly accounted for in the assessment process.

2. 5.8.1.2 Vibration Reference Levels, page 5-124, the text shows a range of 63 to 69 VdB for Green Line cars, and a range of 74 to 87 VdB for MBTA commuter trains. The discussion is not clear as to the actual value(s) used for level computations. It would be helpful to state the actual level used and the basis for using that particular value. It should be noted that the range of levels is consistent with measurements performed by KM Chng. The median of the range of levels is somewhat lower than the general ground surface vibration curves shown in the FTA manual for 50 mph speeds. The levels used for Amtrak trains were significantly less than the FTA vibration curve for locomotives. On occasion, KM Chng has recorded vibration levels for MBTA commuter trains that are greater than 87 dBA (MBTA Greenbush and South Coast measurements). When considering the implementation of the MBTA methodology, the large variance of MBTA commuter vibration levels should be considered. During recent measurements of the Greenbush line conducted by KM Chng, anecdotal remarks from residents living within

and traffic flow) to environmental and social resources. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the next phases of the Project: design and construction.

L-010-044

All noise barriers proposed for the Project in Table 5.7-4 of the DEIR/EA are expected to be feasible, reasonable, and effective. Detailed noise barrier designs will be completed during the final design of the project. Receptors where potential noise barriers may not be feasible or effective and sound insulation mitigation is being considered are specified in Section 5.7.3 of the DEIR/EA. Mitigation recommendations for these receptors will be evaluated during preliminary engineering. MassDOT will coordinate with emergency response providers to plan for appropriate site access at noise barrier locations during preliminary engineering.

When necessary and feasible, rail lubrication mitigation is considered a reasonable expenditure according to FTA. Mitigation proposed for the project is considered to be necessary, effective and feasible; therefore, the summary statement that no moderate or severe noise impacts would result from Project is accurate.

L-010-045

As described in DEIR/EA Section 3.7, construction contractors will be required to comply with state regulations and local ordinances to mitigate air quality, noise, and vibration impacts. On-site resident engineers and inspectors will monitor all construction activities to ensure that mitigation measures are properly implemented.

L-010-046

Comment noted regarding description of the proposed trackform. Comment noted regarding consistency in vibration results reported in the

L-010-046

approximately 75 feet of the rail noted that some trains caused noticeable vibrations including "rattling of dishes and shaking of picture frames"; whereas, other trains were not discernible. This seemed to correlate with a measured range of approximately 75 to 95 VdB, normalized to 50 feet, for approximately 30 measurements. Finally, it should also be noted that the outcome of the KM Chng MBTA vibration measurement program showed that actual measured levels showed a range from 14 VdB above FEIR predictions to 12 VdB below predictions. When considered in total, the average was only 0.3 above the FEIR prediction, which indicates very good agreement with the methodology used, which is similar to that used for this assessment. Nonetheless, it also true that, on an individual basis, several residents experienced vibration levels much greater than predicted in the FEIR.

3. 5.8.2 Vibration Impacts, page 5-127, Table 5.8-4, the aggregation of clusters of impacts and the lack of a technical appendix showing levels at individual receptors makes it difficult for the public to determine the magnitude of vibration on an individual basis.

4. 5.8.2 Vibration Impacts, page 5-127, Table 5.8-4, when comparing the impacts in the segment between Medford Hillside and Mystic Valley Parkway, to the impacts in the segment between Lechmere Station and Medford Hillside, the total number of impacts seems proportionally low. In particular, for the cluster listed as "Brookings Street", where distances to the track are similar to "Auburn Avenue near McGrath Highway", future commuter levels are 8 VdB less, and future Green Line levels are 5 VdB less at the Medford location. It would be helpful to explain these differences, particularly since it appears that ground propagation measurements were not performed in this section of the project.

L-010-047

5. 5.8.2.1 Temporary Construction Vibration Impacts, page 5-128, the discussion only mentions pile driving. It would be helpful to know what other activities, if any, might produce annoyance or structural damage. It would also be helpful to have an estimate for the duration and intensity of pile driving activities, and operations that may have to occur overnight.

L-010-048

6. 5.8.3 Vibration Mitigation, page 5-130, Table 5.8-6, much of the mitigation relies on the use of ballast mats, which are assumed to have a 10-15 VdB reduction in levels. Although this is the range of possible reduction stated in the FTA manual, there is some evidence that real world installations of ballast mats can fall short of manufacturer claims. KM Chng performed a very limited evaluation at one of the sections of the Greenbush line after the installation of ballast mats, which failed to show any significant measurable reduction in vibration level. Although the actual value used for vibration level reduction is not stated in the assessment, it would be helpful to know what the value is, and what the justification is for using that value. A similar argument might be made for the use of resilient fasteners, which can show significant variability in effectiveness, depending on several factors. We do recognize that ballast mats and resilient fasteners can be effective in reducing vibration; however, it is important to be realistic about what they can achieve. During our Greenbush vibration measurement program, some expressed the opinion that improving MBTA wheel maintenance may be a more cost effective solution to the problem of MBTA commuter train vibration levels.

DEIR/EA with other studies.

The DEIR/EA reports noise levels for clusters of receptors which have similar noise environments. In accordance with FTA methodology, residential neighborhoods and relatively large outdoor noise-sensitive areas are typically clustered, simplifying the analysis that is required without compromising the accuracy of the analysis. More detail on clustering of receptors can be found in DEIR/EA Section 6.1.3 and Appendix C of the FTA guidance manual.

Comment noted regarding variability in vibration level projections.

L-010-047

As described in DEIR/EA Section 3.7, construction contractors will be required to comply with state regulations and local ordinances to mitigate air quality, noise, and vibration impacts. On-site resident engineers and inspectors will monitor all construction activities to ensure that mitigation measures are properly implemented.

L-010-048

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Additional vibration measurements at sensitive receptor locations along the Proposed Project have been conducted and will be evaluated during preliminary engineering to provide more detail on vibration mitigation reduction needed for the Project. The stakeholder coordination process for project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

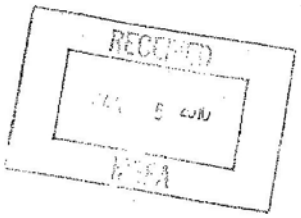
#3



December 30, 2009

Secretary Ian Bowles
Executive office of Energy and Environment
MEPA Office
Attention: Holly Johnson, MEPA Analyst
EEA Number # 13886
100 Cambridge Street
Boston, MA 02114

I have reviewed the Green Line Extension Project Draft Environmental Impact Report dated October 2009. There are several areas of this report that I am commenting on with respect to my jurisdiction as Building Commissioner that concern building code and zoning ordinance issues.

Building Code Issues

L-011-001

The proposed stations at College Avenue and Mystic Valley Parkway/Route 16 are shown outlined on aerial photos, and are depicted in several schematic sketches throughout this report. A full set of construction documents will be required to determine that these stations will be built in compliance with the Massachusetts State Building Code. In addition to architectural and structural drawings, I will also need borings and subsurface exploration reports to determine that the soil bearing capacity at these sites is sufficient to support these new structures.

L-011-001

The DEIR/EA and FEIR include only conceptual station designs and station design criteria. Designs for each station and the entire project alignment will be refined during the Project's preliminary engineering stage. A full set of construction documents will also be prepared. Additionally, supporting data such as geotechnical, survey, and hazardous materials testing will be developed to support the design work. The process for coordinating with the local communities during station design are described in the Public Involvement Plan, Chapter 6 of the FEIR.

Green Line Extension Report

Page Two

L-011-002

The report shows an enlargement of the existing embankment within the MBTA right of way at the College Avenue station to accommodate the new station and green line tracks. In order to do this a large section of the existing embankment will be removed, and new retaining walls will be erected. This embankment is a steep slope, and I would need to see plans on the retaining wall design to ensure the new wall construction will be capable of resisting the hydrostatic pressure of the soils it will be retaining, as well as earthquake loads and vibratory loads from the trains. There was no plan on how to retain this embankment during construction of the station and new retaining walls. I will need to know if any sheet piling will be installed, or if there is any other method being planned to provide temporary support and shoring of the embankment during construction.

There are several areas along the train route where excavation of the hillside will be performed in close proximity to existing structures. Therefore, I need to see detailed plans on the methods of constructing the stations and retaining walls in order to assure none of the footings and foundations of these structures will be undermined in any way, and that the structural integrity of these structures will not be compromised. The report also did not mention anything about pre-construction surveys of any structures that may be affected by this construction.

L-011-003

The report did discuss using ballast mats and special trackwork to minimize any vibratory loads from the trains, but there were no specific details listed on how these items will work to achieve this goal.

L-011-004

I will also need to know what type of excavation will be involved in this work; whether there will be any blasting, pile driving, vibratory compactor operations, and just what type of site work will be performed in order to assure proper bracing of existing embankments and structures adjacent to this construction.

There was also not a detailed plan of construction operations. I need to know what type of staging areas for equipment and material will be utilized, where these areas will be located, and how certain operations will be performed; such as any pile driving equipment, heavy duty cranes, concrete pumping equipment, etc. The report did not specify any details regarding delivery of heavy equipment or pre-fabricated building components of a large magnitude to the site that would necessitate delivery by large tractor trailers that could involve special delivery arrangements, and coordination of police details, closing public roads, etc.

L-011-002

The DEIR/EA and FEIR include conceptual Project designs. Designs for all project elements, including retaining walls and construction techniques, will be refined during the Project's preliminary engineering stage. The process for coordinating with local communities during Project design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

L-011-003

MassDOT will comply with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Mitigation measures will be further refined during the preliminary engineering phase.

L-011-004

MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses. This will help ensure compliance with legal requirements and, to the extent feasible, consistency with planning and other projects.

Green Line Extension Report

Page Three

L-011-004

I would also like to receive details on where construction materials will be stored, and where contractors will be parking their vehicles during hours of construction. Any temporary office trailers will also have to be located on the plans, and permitted by this office.

Zoning Issues

L-011-005

I will need to know if any of this work involves the taking of land along any areas other than the Mystic Valley Parkway/Route 16 station. If this is the case I will need to review plans to see if there would be any zoning ordinance violations, or if any existing non-conforming properties will have their non-conforming nature increased, which is not allowed under the City of Medford Zoning Ordinance. Any lots that may be subject to reconfiguration due to a land taking may require a subdivision plan that needs to be endorsed by the Planning Board.

L-011-006

The Mystic Valley Parkway/Route 16 station is going to require the demolition of 6 buildings, with #'s 196 & 200 Boston Avenue, and the u-haul building being among them. I will need to know if any other structures will also be demolished. The report also states that this area will be redeveloped for a mixed use type of development, with the possibility of a parking garage. However there are no specific plans to determine if this new development will be in conformance with the allowed uses and dimensional requirements of the City of Medford Zoning Ordinance. A more detailed plan will need to be reviewed in order to determine such compliance. In addition to the 6 buildings mentioned that may be demolished, I will also need to know if there are any other properties in this area that may be involved with a land taking to determine if there would be any zoning violations at these sites also.

L-011-005

DEIR/EA Section 5.2 describes the Project's potential acquisitions. MassDOT is currently conducting detailed property surveys to obtain more specific data. MassDOT will continue to evaluate opportunities to minimize these property impacts.

L-011-006

All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

Green Line Extension Report

Page Four

Conclusion

I will need to receive more detailed plans, construction documents, and a construction schedule to determine compliance with the Massachusetts State Building Code and the City of Medford Zoning Ordinance. I will also need a detailed cost of construction for the stations and retaining walls to determine the applicable building permit fees that would need to be applied to this project.

Very truly yours,

Paul F. Mochi
Building Commissioner

Ian A. Bowles, Secretary
Executive Office of Energy and Environmental Affairs
MEPA Office
Attention: Holly Johnson, MEPA Analyst
EEA# 13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

Please accept these comments on behalf of the City of Medford's Office of Community Development. While the Draft Environmental Impact Report/Environmental Assessment provides useful diagrams and maps, the substance of the report is lacking the detail necessary to be reviewed as a final document. The project is proposed to be constructed in two separate phases and should be reviewed accordingly. The DEIR does not provide sufficient detail regarding the proposed station location, access and impacts at the preferred terminus at Boston Avenue and Mystic Valley Parkway nor does it recognize the fact that the station location at Boston Avenue and College Avenue will operate and function as a terminus until or unless the Mystic Valley Parkway station is constructed. A Final EIR should be prepared with College Avenue as a proposed terminus. A Draft EIR should be prepared for the extension from College Avenue to Mystic Valley Parkway. I appreciate your consideration of the comments that follow.

L-012-001

1. Land Use, Social and Environmental Resources

L-012-002

L-012-003

The DEIR did not sufficiently identify impacts on properties within the project area, determine changes in land use, and describe how it will contribute to gentrification of existing residents and businesses. Alternative designs of the extension to Mystic Valley Parkway should have been provided to minimize the taking of private properties which will create significant job and tax revenue loss.

While the creation of mixed use high density transit oriented development may be desired in underutilized areas adjacent to stations in Somerville, whether high density development is feasible in the areas around Ball Square, College Avenue and Mystic Valley Parkway within Medford warrants further study.

L-012-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

L-012-002

Direct and indirect impacts to land use are described in DEIR/EA Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for sustainable land use, which could further reduce automobile traffic congestion and improve air quality.

L-012-003

All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

L-012-004

The DEIR failed to present the corridor planning study as required and provides little useful information to evaluate social and economic impacts within Medford. The Secretary should require MassDOT to conduct a full corridor study prior to the submission of the FEIR. It was never the City of Medford's understanding that an earmark of funding for the City to do land use planning alleviated the EOT from meeting its obligation to do so as part of the DEIR.

Direct effects of land acquisition are caused by the project. The extension to Medford Hillside will result in the full acquisition of 662, 664, and 665 Broadway for the construction of the Ball Square Station. Portions of 474, 590 and 179 Boston Avenue will be taken for laying of track (Table 5.2-1). These takings are within the street right of way.

The proposed extension to Mystic Valley Parkway/Route 16 will add twelve (12) takings including a partial taking of 590 Boston Avenue (Gas Station lot), 474 Boston Avenue (lot of Tufts Student offices/coffee shop), 220 Boston Avenue (office) and 200 Boston Avenue (R & D). There are additional street right of way takings along Boston and College Avenue and a small taking of land from a house lot on Piggott Road and from a lot on 200R Boston Avenue.

The anticipated tax effects from the construction of Alternative I (Extension to College Avenue) is $15,777 with no jobs lost. The Extension to Mystic Valley Parkway is anticipated to result in a loss of $182,886 in tax revenue. Job loss is as follows: 600 Mystic Valley Parkway (13), 222 Boston Avenue (30) 200 Boston Avenue (194). The report assigns the loss of five (5) jobs at 662/664 to Somerville.

The report states that the loss of 224 jobs in Medford as a result of constructing the MVP/Rte 16 station does "not represent a significant fraction of jobs in these three cities" and later the report states the jobs at stake "represent at most a minimal economic impact". This conclusion is self serving and does not provide any recognition of the importance of retaining jobs in the current economy. Of more importance is the effect of job loss on individuals and their families and businesses in Medford.

L-012-005

The FEIR should contain an analysis of the true cost of job loss and the cost of job creation. The assertion is made that these jobs will be relocated locally with no substantiation of the claim.

2. Environmental Justice

L-012-006

The report does not adequately address impacts to the Walking Court elderly housing development. Access by the elderly and the disabled to public transit and to area businesses and services during construction must be more fully evaluated. The shift

L-012-007

of the existing commuter rail tracks to the east should be more fully evaluated for health impacts to special populations.

L-012-004

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

L-012-005

Socioeconomic impacts, including projected effects on businesses, jobs, tax revenues, and community disruptions, are described in DEIR/EA Section 5.3, Socioeconomic Impacts. Effects on land use and transit access are discussed in DEIR/EA Section 5.2, Land Use, and Section 5.15, Indirect and Cumulative Effects. As required by the Secretary's Certificate on the DEIR/EA, additional analysis of the socioeconomic effects of the maintenance facility alternatives are described in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. A series of Project workshops will provide opportunities to discuss broader impacts of the Project on job creation, economic development, housing affordability, and other community impacts.

L-012-006

Impacts to environmental justice populations are described in DEIR/EA Section 5.4, Environmental Justice. Additionally, the Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes specific outreach efforts to the environmental justice community that will be made as the Project progresses through its next phases. Construction impacts of the Project are described in each environmental resource section in DEIR/EA Chapter 5, Environmental Consequences. Pedestrian and vehicular access to abutting properties will be maintained at all times. Construction contractors will be required to comply with relevant federal, state, and local laws, regulations, and codes to eliminate or minimize adverse effects (such as noise and vibration levels, and traffic flow) to environmental and social resources. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community

L-012-008 Meetings should be conducted with special populations that are less likely to attend a large public hearing in an adjacent city. These should be required prior to the acceptance of any environmental review document proposing the extension to Mystic Valley Parkway.

3. Air Quality

L-012-009 The report does not contain specific information that measures the current versus full-build analysis on the residential neighborhoods between College Avenue and Mystic Valley Parkway that could be adversely affected by the shift of existing commuter rail tracks with diesel run cars, to the east.

4. Noise and Vibration

L-012-010 Noise impacts due to the introduction of the more frequently run Green Line trains versus existing operations, as well as the shift of the existing commuter rail lines, will increase noise levels. Moving the commuter rail lines to the east will adversely impact residents. Additionally, the close proximity of homes on Allston Street and Piggott Road will be especially burdened. Homes and businesses close to bridges that must be reconstructed will also be adversely affected during construction. Nightime construction should not be allowed. Noise barriers should be installed the length of the right of way in Medford. In addition to and not in place of barriers, sound insulation techniques should be employed at homes as well as businesses along the right of way. The report identifies that the extension to MVP/Rte.16 will add an additional 50 moderate and 24 severe residential noise impacts. Given that the majority of homes in Medford are older, opening windows will lessen the value of sound insulation techniques resulting in unacceptable noise levels.

Vibration impacts will similarly impact properties and are expected to be especially adverse at locations near bridges where there will be pile driving. Compacting will also result in adverse noise level. The DEIR identifies over ninety (90) homes and three (3) institutional buildings that will be adversely affected with no mitigation proposed during construction.

L-012-011 The proposal to construct a tunnel from College Avenue to Mystic Valley Parkway should be further evaluated for its benefits to air quality and noise.

5. Visual

L-012-012 The report inadequately addresses visual impacts from the loss of vegetation in or near people's yards, construction of noise barriers and station designs. Additional information including more detailed designs and alternative designs are necessary along with adequate public involvement to reduce the proposed impacts to the visual environment.

3

involvement during the next phases of the Project: design and construction.

L-012-007

The preparation of a health study is beyond the scope of the Green Line Extension Project. However, the Project will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality.

L-012-008

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach, including to environmental justice populations, in the next phases of the Project.

L-012-009

The Green Line Extension will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality. As required by the Secretary's Certificate on the DEIR/EA, the FEIR includes a narrative clarifying the relationships of air quality modeling data to MassDEP and EPA requirements for State Implementation Plan (SIP) consistency. The segment from College Avenue to Mystic Valley Parkway is not part of the Proposed Project.

L-012-012 The final approval of the project should prohibit the MBTA from installing or leasing property to construct billboards or cellular towers along the right of way in Medford.

6. Historic Resources

L-012-013 The proposed extension to MVP/Rte 16 should include an alternative analysis that includes reconstructing the rail bridge crossing at Mystic Valley Parkway and moving the station platform in that direction. This may enable less impact to commercial properties in Medford and allow for better access by buses, vehicles, pedestrians and bicyclists. Changes should be done with respect to the character of the historic structures eligible for National Register designation which should be inventoried as well as the one historic archeological site, a portion of the Middlesex Canal. Project representatives should meet with the local Historic Commission during the next stage of design.

7. Hazardous Materials

L-012-014 The project involves construction in several areas with known environmental issues. The removal of existing rail lines treated with chemicals requires a comprehensive approach along with coordination with state and local officials to insure proper remediation. Area residents should be informed as to the status of identification and remediation of sites and protected during remediation. Stockpiling of removed contaminated rail ties should not be allowed. Best management practices should be used when addressing removal of hazardous materials. A project representative should be available to address concerns raised by neighbors, businesses and governmental officials relative to all hazardous material issues including dust control. The individual's telephone number should be made available to the public for quick response.

8. Traffic

The No-Build Alternative assumes the Urban Ring transit service is operational. The peak hour estimates of pedestrians and bicycles at Ball Square is 670 and at College Avenue is 760 with an additional 30 and 40 persons respectively being picked up or

L-012-015 dropped off. The report does not adequately account for the high estimates of walkers and low estimates of pick up/drop off.

The report states the intersection level of services would be improved by signal timing and phasing at Main Street/High Street/Salem/Forest and Riverside. The report projects the morning peak hour would improve from F to E and the evening peak hour from D to C. Additionally, the report asserts an improvement at Mystic Valley Parkway/Route 16 at Boston Avenue from F to E in the AM peak hour but continues to operate in a failed condition during the evening peak hour. Level of service degradation would occur at Boston Avenue/Winthrop Street from E to F in the evening peak hour. Boston Avenue/College Avenue would degrade from E to F in the AM peak hour.

4

L-012-010

As described in DEIR/EA Section 3.7, construction contractors will be required to comply with state regulations and local ordinances to mitigate air quality, noise, and vibration impacts. On-site resident engineers and inspectors will monitor all construction activities to ensure that mitigation measures are properly implemented. Mitigation measures for noise and vibration in the vicinity of College Avenue functioning as a terminus are described in FEIR Chapters 5 and 8.

L-012-011

Tunneling alternatives were evaluated but dismissed, as described in DEIR/EA Appendix B, Section 7.

L-012-012

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project, including addressing impacts to the visual environment.

L-012-013

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

L-012-016 For a public transit project of this magnitude and expense it is unacceptable for the local roadway network to not have a discernable improvement in operations. The Proponent should be required to make improvements to all intersections to a level of Service of D or better. Local communities cannot be expected to bear the burden of correcting the unacceptable roadway operations. The Proponent should be required to provide additional information on the intersections of Harvard Street with Willis Avenue and Harvard Street and Mystic Avenue. Truck trips, especially with the impact of the loss of freight rail must be addressed along with the identification of acceptable trucking routes.

L-012-017 The following signals should be reconstructed as required mitigation of the project and synchronized with lighting along the corridor.

1. Mystic Avenue/Harvard Street
2. Harvard Street/Willis Avenue
3. Harvard Street/Boston Avenue
4. Boston Avenue at Winthrop Street
5. Boston Avenue at North Street
6. Boston Avenue at MVP
7. Boston Avenue at High Street
8. College Avenue at George Street
9. George Street at Main Street
10. Main Street at South Street
11. Main Street at MVP
12. Main Street at High Street, Forest and Salem Streets

L-012-018 The proponent was requested by this Office to evaluate the feasibility of reducing the five-legged intersection at Boston and College Avenue by prohibiting north bound traffic from the Somerville direction on College Avenue. This traffic change would also have allowed a much greater area for pedestrians and a possible station entry point on College Avenue itself. This concept should be explored in the FEIR.

L-012-019 In order to insure maximum pedestrian access the proponent should be required to fund the design of a DCR path linking the terminus to the Condon Shell pathway system. Pedestrian access from West Medford must be improved.

9. Parking

L-012-020 The Secretary's Certificate required the development of the traffic scope of work with the local municipality. I do not recall a meeting in regard to this matter. Furthermore, the DEIR was to contain useful information regarding approaches to issues such as traffic enforcement. The FEIR should contained a detailed parking and enforcement plan prepared in consultation with the City to minimize parking impacts in local residential and businesses areas.

5

L-012-014

An analysis of hazardous materials potentially present within the Green Line Extension Study Area is provided in DEIR/EA Section 5.14, Hazardous Materials. Additional investigation may be conducted during the next phases of the Project to determine the nature and extent of any contamination and remediate any sites as appropriate. This work would be conducted in accordance with the Commonwealth's Massachusetts Contingency Plan requirements.

L-012-015

Ridership projections presented in DEIR/EA Section 3.7 were developed by CTPS and include estimates for various access modes, including walking, biking, bus and car. Methods for developing the ridership estimate are described in DEIR/EA Section 3.4, Ridership Methodology. Additional details required by the Secretary's Certificate on the DEIR/EA are provided in FEIR Chapter 3, Air Quality.

L-012-016

As directed by the Secretary of Environmental Affairs in his December 2006 Certificate on the EENF, the purpose of the DEIR analysis "is not to hold EOT (now MassDOT) responsible for mitigating longstanding congestion problems but, rather, to identify the specific impacts and benefits of this project." In this spirit, MassDOT has made several suggestions for traffic mitigation at locations where the Proposed Project contributes to a decline in overall intersection level of service. The proposed mitigation is sufficient to mitigate Project impacts, but in most cases not sufficient to provide superior levels of service where they do not exist today.

Of the locations identified in the comment, the intersection of Boston Avenue and Winthrop Street and Boston Avenue at College Avenue are locations where LOS declines as a result of the Project. As discussed in

10. Construction Impacts

L-012-021 Traffic related construction impacts including temporary bridge closures, restrictions, traffic detours, and loss of parking during construction were highlighted as issues with no plan proposed to address them. The Proponent should be required to submit a more detailed assessment of these impacts and a plan to address construction impacts within the FEIR.

L-012-022 In summary, I respectfully request that given the need to provide a more comprehensive analysis and information, the Proponent should be required to file a Final Environmental Impact Report for Alternative 1. Additionally, I request that the Secretary determine that insufficient information has been provided for the project to be to reviewed past College Avenue and that a separate filing of a Draft EIR be required for that portion of the project.

Very truly yours,

Lauren DiLorenzo
Director

Postscript

To insure that Medford residents were well represented during this environmental review process, Mayor McGlynn asked that I coordinate the involvement of the various department heads organizing briefings on the project and facilitating their review of these voluminous documents. Several of these individuals will submit letters to you identifying concerns or issues that are related to their particular area of expertise.

However, I would like to highlight the letter of one individual in particular, my colleague Brian Boudreau, Superintendent of Wires. Brian passed away suddenly and unexpectedly December 5, 2009. He held his position with the City for less than one year. He took his responsibility to represent the residents of Medford in this process seriously, reprioritizing his daily activities to learn about this complex project so that he could identify any potential concerns. His memorandum to Mayor McGlynn is attached.

LD/ab

Attachment

6

the DEIR/EA, mitigation that improves intersection operations is proposed at these locations.

L-012-017

DEIR/EA Chapter 6 and FEIR Chapter 8 list the traffic and parking measures to which MassDOT has committed to mitigate impacts. These mitigation measures address pedestrian and roadway traffic signal improvement needs, impacts during construction, and parking enforcement coordination. These measures will be further advanced during preliminary engineering.

L-012-018

If College Avenue were converted to a one-way, southbound street at the intersection, reverse direction trips would need to make a significant detour via either Winthrop Street or Harvard Street. Potential benefits to pedestrians at the intersection may be outweighed by impacts to vehicular circulation. Air quality emissions may also increase as a result of increased vehicle miles traveled, having a detrimental effect on the surrounding neighborhood. A shorter one way couplet could be created with Dearborn Road. However, vehicle queuing for vehicles exiting Dearborn Road would encourage northbound traffic to use Bromfield Road as a potential cut through route. This potential impact to the local neighborhood is unacceptable and therefore this option was not considered further.

L-012-019

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

L-012-020

The City of Medford Office of Community Development was contacted in February 2008 to provide input into the traffic study being undertaken. At that time, the input provided by the City was to contact Tufts University and include any known projects in the development of the future traffic condition. No other suggestions were offered. At subsequent meetings with Town officials and residents, two additional intersections were requested to be included into the analysis for the DEIR/EA. MassDOT increased the scope of the traffic study to include these two intersections as requested.

DEIR/EA Table 6-1, Project Mitigation Commitments, lists the traffic and parking measures to which MassDOT has committed to mitigate impacts. These mitigation measures include parking enforcement coordination; which will be further detailed during preliminary engineering.

L-012-021

Construction impacts of the Project are described in each environmental resource section in DEIR/EA Chapter 5, Environmental Consequences. Affected bridges are described in DEIR/EA Section 3.7.2. Detour routes, construction period parking management, and emergency access during construction will be developed during preliminary engineering as part of the Traffic Management Plan. At least one bridge will need to be closed during construction (Medford Street). A temporary bridge may be able to maintain a single lane of traffic at the Broadway Bridge. For all other bridges, at least one lane will be maintained during construction. Pedestrian and vehicular access to abutting properties will be maintained at all times. Project bridge designs and construction staging plans will be refined during preliminary engineering. Construction contractors will be required to comply with relevant federal, state, and local laws, regulations, and codes to eliminate or minimize adverse effects (such as noise and vibration levels, and traffic flow) to environmental and social

Memorandum to: Mayor Michael J. McGlynn

From: Brian Boudreau BB
Superintendent of Wires

Re: Proposed Green Line Extension Project

Date: November 9, 2009

After reviewing the Green Line Extension Project Draft Environmental Impact Report, below I have listed my concerns and questions.

L-012-023
- Additional information is needed regarding the power substation location, design and any adverse affects on the immediate surroundings to businesses and/or residents.
- With regards to bridge upgrades, I will need to see more information on how they plan to relocate and upgrade utilities in and around the 4 Medford bridges intended to be reconstructed.
- Who will own, maintain, operate and pay the electric bills for the suggested pedestrian/traffic lights?

L-012-024
- A review of the Boston Avenue entrance to the Mystic Valley Parkway/Rt. 16 Station needs to be conducted, I feel a traffic light at this location is necessary.

L-012-025
- I would like to review the electrical/fire alarm design layout for the proposed College Avenue and Rt. 16 stations as well as the power substation.

L-012-026
- Along the new stretch of railway will safety lighting be installed to help prevent injury and/or vandalism to the passengers, trains and the track?

resources. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during design and construction.

L-012-022

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

L-012-023

The DEIR/EA and FEIR include conceptual Project designs. Designs for all project elements, including traction power substations, will be refined during the Project's preliminary engineering stage. The process for coordinating with local communities during Project design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

MassDOT will coordinate with utilities providers to minimize impacts to existing utility lines. Utilities on bridges identified for reconstruction would be rebuilt with the bridges. The existing MBTA drainage system will be reconstructed with proposed connections to the existing municipal drainage system.

In most cases, traffic signal improvements included in the Project are modifications to existing signals. The current signal owner will be responsible for maintaining and providing power to these signals. Where new signalized intersections are created, the jurisdiction maintaining the roadway will be responsible for signal maintenance.

L-012-024

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are no

longer included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16.

L-012-025

The DEIR/EA and FEIR include conceptual station designs. Designs for each station will be refined during the Project's preliminary engineering stage. MassDOT has and will continue to coordinate with the Study Area cities, as well as state and local agencies, at appropriate milestones as the Project progresses. This will help ensure compliance with legal requirements and, to the extent feasible, consistency with planning and local priorities.

L-012-026

The DEIR/EA and FEIR include conceptual Project designs. Designs for the Project, including lighting and other safety measures, will be refined during the Project's preliminary engineering stage. The process for City coordination during Project design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

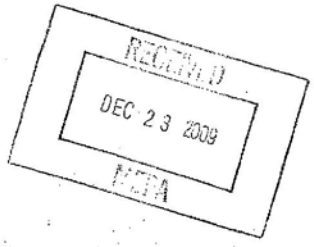
Secretary Ian A. Bowles
Executive Office of Energy and Environmental Affairs (EEA)
Attn: MEPA Office
EEA No. 13886
100 Cambridge Street, Suite 900
Boston, MA 02114



Re: Draft Environmental Impact Report
Green Line Extension Project

Dear Secretary Bowles:

The City of Medford's Energy & Environment (E&E) Office appreciates the opportunity to comment on the Green Line Extension Project (the Project) Draft Environmental Impact Report (DEIR). The E&E Office is responsible for overseeing and implementing environmentally sound programs in the City of Medford including energy efficiency, air quality, climate change protection, wetlands protection, open space conservation, and stormwater management. The following comments and recommendations have been provided to assist in the MEPA assessment to fully describe the proposed project impacts and mitigation.

Wetlands

The Medford Conservation Commission protects the wetlands and waterways, conservation land and open space in accordance with the Massachusetts Wetlands Protection Act (M.G.L. c.131 Section 40) and the City Wetland's Ordinance (Chapter 87). Wetlands, waterways and their associated buffer zones and riverfront areas are extraordinarily important as they play a key role in protecting wetland functions and values like sediment/toxicant retention, floodflow alteration, fish habitat, nutrient removal/retention/transformation, sediment/shoreline stabilization, aesthetics, wildlife habitat and recreation for the public.

L-013-001 | Although this DEIR indicates that the proposed Project would not be located in any wetland resource areas or protection zones, the future full build alternative also proposed within the DEIR in Medford, Massachusetts appears that it may have a potential adverse impact to the wetland resource areas in Medford, therefore the full build alternative would require the filing of a Notice

L-013-001

There are no jurisdictional wetlands within the Proposed Project area, as described in DEIR Section 4.11, Wetlands. Study of the segment from College Avenue to Mystic Valley Parkway/Route 16 will be conducted when this phase is advanced.

L-013-001

of Intent application to the Medford Conservation Commission under the MA Wetlands Protection Act and the City of Medford Wetlands Ordinance (refer to DEIR Figure ES-1).

Plants

In accordance with the City of Medford's Climate Action Plan (2001), urban forestry can serve as an effective measure to achieve substantial CO2 reductions in addition to providing other social, economic and ecological benefits. Trees contribute to reducing CO2 by sequestering carbon and mitigating the effects of urban heat islands. Strategic planting of trees can shade buildings and air conditioning units from the direct rays of the sun, thereby reducing electricity needed for air conditioning. Lowering temperatures lessens the energy demand for cooling, which in turn reduces the burning of fossil fuels and the emission of CO2 and other air pollutants. **The City continues to demonstrate a proven commitment to tree planting and has a replanting policy that requires large projects like the Green Line Project to replace trees that are removed and replant with new native trees throughout the City. The Final EIR should indicate how the Proponent will comply with this policy.**

L-013-002

Air Quality

The goals of the Project are consistent with Medford's Climate Action Plan to reduce the amount of community greenhouse gas emissions by providing a means for alternative transportation among residents of Medford. Motor vehicle usage in Medford alone accounted for 38% of community emissions in 1998. Out of this, personal vehicles were more than 21%. The proposed Project and alternatives would result in a reduction of 5,031 to 22, 176 kilograms of CO2 emissions daily (Refer to Table 5.6-9). However these estimates do not indicate whether these greenhouse gas emission reductions include the additional greenhouse gas emission increases from vehicle trips created as a result of passenger drop off at new T-stops. These additional greenhouse gas emission increases from drop off vehicles should be included in the reduction analysis. **The FEIR should indicate whether increased vehicle trips from passenger drop off was or was not included in the greenhouse gas emission reduction analysis, and provide a table indicating the drop off estimates, and a description of the method used for determining the drop off vehicle rate.**

L-013-003

Thank you for the opportunity to comment on this project and we look forward to reviewing a Final EIR that fully describes the project impacts and mitigation.

Sincerely,

Patricia L. Barry, Director
Energy & Environment Office

Enclosure

cc. Mayor Michael J. McGlynn
Lauren DiLorenzo, OCD Director

Page 2 of 2

L-013-002

As the Project advances into preliminary engineering, efforts will be made to minimize the removal of trees where necessary. Also, opportunities to replace impacted landscaping outside of the MBTA's right-of-way will be considered.

L-013-003

The Green Line Extension will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality. As required by the Secretary's Certificate on the DEIR/EA, the FEIR includes a narrative clarifying the relationships of air quality modeling data to MassDEP and EPA requirements for State Implementation Plan (SIP) consistency.

MEDFORD FIRE DEPARTMENT

120 Main Street
Medford, Massachusetts 02155-4510

Emergency - 911
Business (781) 396-9400
Fire Prevention (781) 396-9831

FAX: (781) 396-4377
TDD: (781) 395-7587

FRANK A. GILIBERTI, JR.
Chief of Department

December 21, 2009

Ian Bowles
Secretary
Executive Office of Energy and Environment
MEPA Office
Attention: Holly Johnson, MEPA Analyst
EEA Number #13886
100 Cambridge Street
Boston, MA 02114

Dear Secretary Bowles:

The Medford Fire Department submits the following public safety concerns regarding the Green Line extension:

L-014-001
- **Land Use**: The land use alternatives may, depending on the plan chosen, require demolition of up to 10 structures in Medford. If the track relocation results in steep walls, etc., as it implies, then emergency access points along the length of the tracks needs to be considered.

L-014-002
- **Socioeconomic Conditions**: Job loss could be affected by various plans. Increased usage could affect access to the stations and the area around the stations (pedestrians, bicycles, vehicle travel, and parking).
- **Environmental Justice**: Not applicable to the fire department.
- **Existing Transportation Systems**: Not applicable to the fire department.

L-014-003
- **Traffic**: Regarding traffic, considerable thought must be given to what are referred to as peak hour turning movement volumes at these locations. Specifically, how will these calculation projections effect emergency responses, not only to these facilities, but also through the area to other sections of the city. Alternative response routes as well as CAD generated traffic congestion reports should be considered relative to other subjects such as pedestrians, bicycles, parking, and public bus transportation (e.g. Mystic Valley Parkway/Route 16 Station). On a temporary level, construction, bridge work, road detours, etc. and all other aspects of infrastructure disruption need to be addressed.

L-014-004

L-014-001

During preliminary engineering, further attention will be given to emergency access points throughout the corridor as the Project is constructed and operational. MassDOT will specifically coordinate with emergency response providers to plan for appropriate site and community access during the construction phase.

L-014-002

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

L-014-003

In many cases, when compared to the No Action condition, delay and congestion is being improved by the project through the optimization of signal timings and coordination of phasing. Traffic mitigation is proposed for any impacts to traffic circulation and flow that are caused specifically by the Proposed Project.

- **Air Quality**: Not applicable to the fire department.

L-014-005
- **Noise:** Noise mitigation with 6 foot to 12 foot possible walls. Access along these walls needs to be addressed.

- **Vibration:** Not applicable to the fire department.

L-014-006
- **Storm Water**: Possible overflow of storm water at discharge into Mystic River with pollutants, etc. is a serious concern.

- **Wetlands**: Not applicable to the fire department.

- **Fish, Wildlife, and Plants**: Not applicable to the fire department.

- **Parks and Recreation:** Not applicable to the fire department.

L-014-007
- **Visual environment**: Noise mitigations, walls, access, etc.

L-014-008
- **Historical and Archaeological Resources:** No historical and archaeological resources are affected except possibly the Middlesex Canal.

L-014-009
- **Hazardous Materials:** Permits will be required for any demolition. 21E forms and FP290 Forms may also be required.

L-014-010
Indirect and Cumulative Effects – Phase 1 College Avenue (2014), and Phase 2 Boston Avenue and Route 16 (2030).

L-014-011
NFPA Standard 130: Standards for Fixed Guideway Transit systems will be the main reference and within it a number of other NFPA guidelines according to the compartmentalized subjects.

Respectfully submitted,

Frank A. Giliberti, Jr.
Chief of Department

FAG:dh

CC: Mayor Michael J. McGlynn

Pedestrian and bicyclist safety in the vicinity of any of the station sites will be taken into consideration during preliminary engineering. Worker safety for MBTA employees as well as for emergency response personnel will be planned for in both the construction and operational phases. MassDOT will specifically coordinate with emergency response providers to plan for appropriate site and community access during the construction phase.

L-014-004

DEIR/EA Chapter 6 and FEIR Chapter 8 list the traffic and parking measures to which MassDOT has committed to mitigate impacts. These mitigation measures address pedestrian and roadway traffic signal improvement needs, impacts during construction, and parking enforcement coordination. These measures will be further advanced during preliminary engineering.

L-014-005

During preliminary engineering, MassDOT will coordinate with emergency response providers to plan for appropriate site and community access while the Project is constructed and operating.

L-014-006

As described in DEIR/EA Section 5.9, the Project would be required to comply with federal and state stormwater discharge permit requirements during both the construction and operational phases. Compliance with these standards would include using Best Management Practices to prevent contamination of stormwater and control erosion and accretion (sedimentation) from stormwater runoff from the railroad alignment, stations, and maintenance facility.

L-014-007

Please see response to Comment L-014-005.

L-014-008

The historic Middlesex Canal is identified as an archaelogical resource in Section 4.15.3 and shown in Figure 4.15-10 of the DEIR/EA. This location is not within the Proposed Project area, and would therefore not be impacted by Green Line Extension to College Avenue Station.

L-014-009

An analysis of hazardous materials potentially present within the Green Line Extension Study Area is provided in DEIR/EA Section 5.14, Hazardous Materials. Additional investigation may be conducted during the next phases of the Project to determine the nature and extent of any contamination and remediate any sites as appropriate. This work would be conducted in accordance with the Commonwealth's Massachusetts Contingency Plan requirements.

L-014-010

Anticipated indirect and cumulative effects of the Project, including impacts on corridor transportation and traffic, growth, property values, land use, transit-oriented and economic development are described in DEIR/EA Section 5.15, Indirect and Cumulative Effects.

L-014-011

All stations will be designed in accordance with NFPA Standard 130.

MEPA

Dear Secretary Bowles,

In my capacity of Diversity Director for the City of Medford I serve as A.D.A. Coordinator, as well as the formal liaison to the Medford Commission for persons with Disabilities. I recently reviewed the Green Line Extension Draft Environmental Impact Report, specifically focusing on the Ball Square, College Ave., and Mystic Valley Parkway Stations.

L-015-001

It is imperative that all Green Line Stations be in full compliance with 521CMR Sect. 18 and 28CFR Part 36 Sect. 10.3.1.
Beyond the stations, the path of travel to each station from various areas around the stations, access within the station, and access to and within various level changes, and from the platform to the rail cars are also crucial. Although the regulations are occasionally referenced in the report, there is absolutely no detail whatsoever in this report.

Issues

- Elevators - (minimum of two at each location?) no design information
- Accessible route to entry of building and at drop off areas not detailed with dimensions or slope
- Sidewalks – no width, cross slope, running slope, and in most cases no curbcuts, including where necessary, reciprocal curbcuts

L-015-001

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. Designs for each station will be further developed during the Project's preliminary engineering stage. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. Specific design details and station elements will be further developed during preliminary engineering. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access. The process for stakeholder coordination during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

- Unobstructed paths of travel outside and within each station not detailed
- Width of entrances, noting the specifications to show they are accessible and the width of turn styles, and fare transaction locations within each station not detailed
- There is no mention of the distance and/or gap from the platform to the rail vehicle (vertically or horizontally) or plates to fill that gap
- No mention of platform detectable warnings bands
- Outside areas covered from the harsh weather?
- Platform width is not designated with width or length criteria and there is no mention if any ramps are located anywhere in any of the structures at any point.
- No notation of detectable warnings at vehicular ways
- Plan shows no seating areas
- Compliant visual and audible announcements in platform and seating areas?
- Alludes to tactile/braille signage with no information given of placement or detail
- Clear width of escalators and tread design not noted
- Accessible Restrooms – no design

I find it impossible to review these plans and documents for access as there is little or no detail provided other the mention of access and/or a color coded picture that provided no actual detail for review. It is impossible for me to give an opinion on the compliant handicap accessibility of this project based on illustrations and statements of compliant intention.

I am requesting detailed site plans and specifications in order to complete my review.

Sincerely,

Diane McLeod
Diversity Director

Dear Secretary Bowles:

I am respectfully submitting my concerns regarding the Draft Environmental Impact Report of the Green Line Extension Project into the City of Medford.

In short, there are many issues of concern regarding the environmental impact report as presented. I will summarize what I have been able to determine.

L-016-001 Construction: There is no mention in the plan regarding the size or scope of the individual construction sites. It is assumed that this will be left to the contractors to determine. Adequate notice must be provided to the police and fire departments, as well as public notification. It is assumed that there will be extensive road and bridge closures, detours, lane restrictions, etc. throughout the duration of the project. There was also no mention of how construction workers and equipment would be accessing the site or how emergency personnel would be able to respond in time of need. Also of concern are the parking requirements for the construction workers.

L-016-002 The reconstruction of the various bridges will cause a tremendous disruption of traffic throughout the surrounding neighborhoods and the entire Hillside and South Medford area. We know this from the relatively recent experience of reconstruction of all of the same bridges.

Quality Policing Through Community Involvement

L-016-001

Detailed construction plans will be developed in the next phase of the Project. Further attention will also be given to the safety of both MBTA employees and emergency response personnel during construction and operational phases. MassDOT will specifically coordinate with emergency response providers to plan for appropriate site and community access during the construction phase.

L-016-002

DEIR/EA Chapter 6 and FEIR Chapter 8 list the traffic and parking measures to which MassDOT has committed to mitigate impacts. These mitigation measures address pedestrian and roadway traffic signal improvement needs, impacts during construction, and parking enforcement coordination. These measures will be further advanced during preliminary engineering.

Intersections: Seventy-five (75) intersections throughout the project were studied. At least fifteen (15) of these are in Medford. Many of the intersections have greater than average crash rates, namely Mystic Valley Parkway/Rte 16 at Winthrop Street, Boston Avenue at Winthrop Street, Boston Avenue and Harvard Street. Three (3) intersections are on the State's current High Crash Location list: Mystic Valley Parkway/Rte 16 and Boston Avenue (ranking 412), Mystic Valley Parkway/Rte 16 and Winthrop Street (ranking 501) and Salem Street and High Street (ranking 659).

Five (5) signalized intersections studied in Medford are rated at Level of Service LOS E + LOS F or least efficient or failing.

Six (6) non-signalized intersections studied were rated at LOS E + LOS F. It was noted that the volume of traffic at these intersections far exceeded the physical capacity of the intersection.

L-016-003 | Intersection ratings for pedestrians at nine (9) intersections in Medford fell below average to failing PLOS D – F. However, any change to the pedestrian walk cycles will have an adverse effect on motor vehicle LOS increasing delays and vice-versa.

L-016-004 | Traffic Mitigation: A major concern that I have with the various proposed mitigation measures was the elimination of parking spaces which are necessary to keep the Hillside business district vibrant.

Parking Mitigation: The report states that they conducted a limited parking inventory within 500 feet of the proposed stations. This is not large enough. It further states that a majority of parking spaces in the vicinity of Tufts University are regulated by parking permit for use by faculty, staff and students. This is inaccurate unless it is referring to the campus property itself.

L-016-005 | The report forecasts a need to accommodate 200 park and ride patrons who would drive to the proposed Mystic Valley Parkway Station. However, if that is not included in the project, the result would be the overflow onto nearby residential streets, creating additional problems.

L-016-006 | Drop-off and pick-up areas were not adequately addressed.

L-016-007 | Parking mitigation needs to be addressed early in this project. It must be determined what will be allowed as public parking and what will be permit only parking. A major concern is the loss of existing available parking spaces.

L-016-008 | Traffic Control Signal upgrade must be considered at the following locations: Boston Avenue and Harvard Street, Boston Avenue and College Avenue, Boston Avenue and Winthrop Street and Boston Avenue and North Street. The same must be done along Boston Avenue from the west side including Boston Avenue and Harvard Avenue and Boston Avenue and Arlington Street. Further consideration should be given to the Harvard Street corridor.

L-016-003

Increased pedestrian walk cycles will have an effect on motor vehicle LOS. However, these changes are required to ensure proper clearance times for pedestrians to cross the street and are regulated by the Americans with Disabilities Act and associated state regulations. Where possible, traffic signal timings were adjusted to minimize the amount of additional delay that would occur.

L-016-004

DEIR/EA Chapter 6 and FEIR Chapter 8 list the traffic and parking measures to which MassDOT has committed to mitigate impacts. These mitigation measures address pedestrian and roadway traffic signal improvement needs, impacts during construction, and parking enforcement coordination. These measures will be further advanced during preliminary engineering.

L-016-005

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout and access at Mystic Valley Parkway/Route 16, with attention given to neighborhood parking impacts. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

L-016-006

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed

L-016-009

I understand that it is believed that the majority of people that will utilize this extension of the Green Line will walk or bicycle to the station. This may be so, but it is only assumed. I believe that there will be a tremendous influx of motor vehicular traffic in the area on our roads which already receive a failing grade. This will put pedestrians in jeopardy and will further congest our neighborhoods in terms of traffic, parking and pollution.

Thank you in advance for your acceptance and consideration of my comments and concerns regarding the Green Line Extension and the Draft Environmental Impact Report.

Respectfully submitted,

Leo A. Sacco Jr.

Leo A. Sacco, Jr.
Chief of Police

CC: Mayor Michael McGlynn
City of Medford

LAS/ae

College Avenue Station and new Lechmere Station, respectively. In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations will be refined during preliminary engineering.

L-016-007

The lack of available long-term parking at the Green Line Extension stations may encourage some motorists to park on local streets. Increasing parking enforcement or changing local parking restrictions to restrict commuter parking would be effective in reducing neighborhood impacts. As stated in FEIR Section 8.3, MassDOT will work with the affected communities to develop acceptable parking enforcement plans for the areas within one-half mile of the stations in order to limit potential impacts.

L-016-008

DEIR/EA Chapter 6 and FEIR Chapter 8 list the traffic and parking measures to which MassDOT has committed to mitigate impacts. These mitigation measures address pedestrian and roadway traffic signal improvement needs, impacts during construction, and parking enforcement coordination. These measures will be further advanced during preliminary engineering.

L-016-009

The Project is intended, in part, to relieve traffic congestion, as described in DEIR/EA Chapter 2, Purpose and Need. Some station access points for parking or passenger drop-off/pick-up are likely to impact local traffic flow, as outlined in DEIR/EA Section 5.5, Traffic. As described in DEIR/EA Chapter 6, Draft Section 61 Findings and Mitigation Commitments, and in FEIR Chapter 4, College Avenue, these impacts will be minimized to the extent practical.

Re: Comments on the Green Line Extension Project DEIR

Dear Secretary Bowles, Ms. Johnson:

On behalf of the City of Medford and in my capacity as its City Engineer, I am providing the following comments and concerns regarding the proposed project and its potential adverse impacts; as well as a request for additional analyses in the FEIR. In my comments, the term "Applicant" means the project proponents, or the Massachusets Executive Office of Transportation (newly reorganized as the Massachusetts Department of Transportation) and the Federal Transit Administration.

General

L-017-001 It is uncertain if or when the Project will be extended to the proposed terminus at Route 16. However, the draft EIR does not appear to fully address the impacts of having the College Avenue Station serve as the terminus station, including impacts to sensitive receptors that are caused by the turnaround and storage of train consists and support elements such as exterior lighting, access roads, etc. The final EIR should correct this deficiency.

L-017-002 The DEIR shows only one cross section along the Medford portion of the project and this is a deep 'cut' section, i.e. the tracks are well below grade. As this is not the typical terrain in Medford and thus might be deceptive in terms of understanding impacts, the FEIR should provide additional cross sections that more accurately show the types of terrain (cut, fill, at-grade, a blend) encountered along the right of way.

L-017-001

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

L-017-002

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in DEIR/EA Chapter 6, Draft Section 61 Findings and Mitigation Measures. The mitigation measures required by the Secretary's Certificate on the DEIR are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments. Areas where these mitigation measures would be implemented are not necessarily shown in sketches within the DEIR/EA or FEIR. The DEIR/EA and FEIR include conceptual Project designs. Designs for all project elements will be refined during the Project's preliminary engineering stage.

Jan 04 10 11:46a p.3

Green Line Extension Comments
Page 2 of 4

L-017-003 It is also requested that, in early Spring of 2010, the Applicant provide access to the Right of Way for City technical staff. The preferred method would be via a Hi-rail trip with opportunities to stop at proposed station locations and other areas of interest.

Construction Staging and Sequencing

L-017-004 In general, activity for the new Green Line extension will be dictated by bridge reconstruction, alternate construction by-pass routes, pedestrian access, commuter rail service, freight rail service, access to commercial and residential areas, contractor work zone requirements, contractor lay down requirements, contractor access/egress requirements, temporary easement requirements, and Life Safety vehicular access. These are items, issues and concerns that need to be properly addressed during the initial planning and permitting stages. A more detailed study and investigation is warranted to further evaluate, understand, address, and make additional recommendations at this stage to fulfill the EIR requirements.

Bridge/Road Reconstruction

L-017-005 The two preferred alternatives involve the reconstruction of the Harvard Street railroad bridge and the College Avenue roadway bridge (Alternative 1, Medford Hillside) as well as, for Alternative 2A (Route 16), Winthrop and North Street roadway bridges. Though none of these bridges are proposed to be fully closed during construction, I am concerned about the inevitable shift in traffic from these streets to other streets in close proximity, and whether the surface condition and capacity of those nearby streets can accommodate the increased traffic. I request the Applicant investigate and identify possible detour routes for bridges that are proposed to be partially closed and identify traffic impacts and mitigation such as improving the existing roadway surface.

A second concern is the widening of these bridges and the subsequent impact to roadway approach grades; above and below-ground utilities; and driver/pedestrian safety. I ask that the Applicant address this concern in the final EIR, indicating the extent of roadway reconstruction work at each bridge and identifying/mitigating potential impacts to truck clearances, existing intersections and driveways within or near these extents. I am also
L-017-006 concerned about grade changes that could affect utilities (e.g. if the road is lowered at the
L-017-007 Harvard Street Bridge). Finally, any change in grade will affect sight distances and other driver/pedestrian elements (e.g. some senior citizens and these items do not appear to be adequately considered in the DEIR.

Temporary Easements/Laydown areas

L-017-008 Temporary easements are mentioned in the DEIR but not shown. The FEIR should indicate potential locations for temporary easements and construction lay down areas using similar projects as an example. Further studies need to be completed to develop additional typical construction staging sketches that will enable a further detailed discussion of the potential constraints and conditions to be encountered. Also addressed

L-017-003

MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses. This will help ensure compliance with legal requirements and, to the extent feasible, consistency with planning and other projects.

L-017-004

During preliminary engineering, construction management plans will be developed and MassDOT will coordinate with local municipalities and emergency response personnel.

L-017-005

DEIR/EA Chapter 6 and FEIR Chapter 8 list the traffic and parking measures to which MassDOT has committed to mitigate impacts. These mitigation measures address pedestrian and roadway traffic signal improvement needs, impacts during construction, and parking enforcement coordination. These measures will be further advanced during preliminary engineering.

Affected bridges are described in DEIR/EA Section 3.7.2. Detour routes and emergency access during construction will be developed during preliminary engineering as part of the Traffic Management Plan. At least one bridge will need to be closed during construction (Medford Street). A temporary bridge may be able to maintain a single lane of traffic at the Broadway Bridge. For all other bridges, at least one lane will be maintained during construction. Pedestrian and vehicular access to abutting properties will be maintained at all times. Project bridge designs and construction staging plans will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during design and construction.

Jan 04 10 11:47a p.4

Green Line Extension Comments
Page 3 of 4

L-017-008

should be whether or not there are any potential contractor lay down areas available off-site. If it is determined that potential sites do exist, their locations should be identified in the EIR.

Storm water runoff and groundwater discharge

I concur with the Applicant's proposal to prepare a Storm Water Pollution Prevention Plan for both construction and operational activities, and for treatment prior to discharge to ground or surface waters. However, this is not enough. I have a number of concerns regarding storm water. These include:

L-017-009

- The collection of runoff and flooding on Harvard Street under the railroad bridge during most rain events, as caused by the low elevation of the railroad bridge and the corresponding concave profile of the road underneath. This adverse impact -- both to roadway safety and public health - must be mitigated as part of the Project. I request that the FEIR identify and explore solutions in this area such as collection/storage of storm water and release after rain events have ceased. In addition to investigating storage and release technologies, the FEIR should not limit itself to the roadway as the possible location for a storage tank but look at adjacent properties as well.

- Any pumping or discharge of groundwater to the City's already over-capacity stormwater system. Groundwater should be infiltrated on-site or routed through the MBTA's existing storm drainage system and discharged to the river.

- Any increase in impervious surface which results in an increase of storm water flow to our system. I request the FEIR evaluate whether the Project can commit to no net runoff to the City's storm drain system. If that is not possible, the Project must prevent any peak flows from entering said system.

- The preservation of the City's current storm water connections to the MBTA's existing drainage system, some of which, I understand, is discharged to the Mystic River via the rail right of way.

Existing and Proposed Utilities

L-017-010

The Applicant should identify any existing municipal utilities, such as water and sewer lines, that either cross beneath the tracks or are otherwise located within the Right of Way. I request that, as part of the track reconstruction and expansion, that the segment of pipes beneath the existing/proposed tracks be upgraded and set in casing pipe to allow future access for isolation (e.g. valves) and maintenance.

In the FEIR, the Applicant should identify any proposed water use beyond that mentioned for the train stations, such as any need for fire hydrants along the right of way.

L-017-006

MassDOT will coordinate with utilities providers to minimize impacts to existing utility lines. Utilities on bridges identified for reconstruction would be rebuilt with the bridges. Utility impacts due to modified street grades at bridges will be evaluated during preliminary engineering.

L-017-007

These issues are discussed in the DEIR/EA and FEIR at the appropriate level for the current design level. Additional attention to safe pedestrians and bicyclists facilities near stations, and for sight distance and ADA compliance will be given during preliminary engineering.

L-017-008

DEIR/EA Section 5.2 describes the Project's potential acquisitions. Temporary easement and contractor lay down areas will be determined during preliminary engineering. MassDOT will continue to evaluate opportunities to minimize these property impacts.

L-017-009

The issues cited would be addressed in preliminary engineering. The Project would be required to comply with federal and state stormwater discharge permit requirements during both the construction and operational phases. Compliance with these standards would include using Best Management Practices to prevent contamination of stormwater and control erosion and accretion (sedimentation) from stormwater runoff from the railroad alignment, stations, and maintenance facility.

Appropriate geotechnical and hydrogeologic studies will be undertaken as needed during preliminary engineering. Discharges of pumped groundwater, if needed, will be managed in accordance with regulatory

Jun 04 10 11:47a p.5

Green Line Extension Comments
Page 4 of 4

L-017-010

Connections to our system for water supply and sewer discharge must meet City of Medford standards.

Roadway and sidewalk

L-017-011

In areas of proposed increased pedestrian and vehicular activity - such as the vicinity of the proposed drop-off area along Boston Avenue - I request the Project commit to not only sidewalk reconstruction but improvements to the roadway surface in order to accommodate the future flow of traffic.

Sincerely,
City of Medford, Ma

Cassandra Koutalidis, P.E.
City Engineer

John Buckley, Medford DPW Commissioner
Lauren DiLorenzo, Director, Medford Office of Community Development

requirements and, to the extent feasible, within the existing drainage system.

L-017-010

MassDOT will coordinate with utilities providers to minimize impacts to existing utilities. Utilities on bridges identified for reconstruction would be rebuilt with the bridges. The existing MBTA drainage system will be reconstructed with proposed connections to the existing municipal drainage system. Project utility needs and utility compatibility will be evaluated during preliminary engineering.

L-017-011

The DEIR/EA and FEIR include conceptual station designs. Designs for each station will be refined during the Project's preliminary engineering stage. Improvements to the sidewalk and roadway in the immediate vicinity of the station are planned as part of station design and construction. The specific locations and measures are to be determined during preliminary engineering.

MEPA

Secretary Ian Bowles
Executive Office of Energy & Environment
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA # 13886
100 Cambridge Street
Boston, MA 02114

Dear Secretary Bowles,

As Director of Veterans Services for the City of Medford, I am in constant contact with the Veteran population, those with disabilities, as well as, living in senior housing complexes, throughout the city. I recently reviewed the Green Line Extension Draft Environmental Impact report (DEIR/EA) and I am particularly concerned with College Avenue, and Mystic Valley Parkway Stations/Rte 16.

L-018-001 Although this report states that all Green line stations meet the requirement of the American with Disabilities Act (ADA). I do not see any handicapped parking for those Veterans/ seniors who use wheel chairs. Nor do I see an indication of covered outside areas with seating, and in addition there seems to be no plan for parking at the route16 station. This combined with lack of ramps; unclear dimensions of the sidewalk (for wheelchair accessibility) and handicap railing for restrooms would present a problem.

L-018-002 In addition, since EOT in not presently studying the possibility of extending the Green line beyond the Mystic River into West Medford, which is densely populated, and has a significant amount of Senior & Veterans whom currently use the #95 Bus, which has an average weekly ridership of one thousand two hundred and fifty three (1,253) passages. My suggestion is that bus routes should be increased for ridership accommodation.

L-018-001

Only Lechmere Station will include station parking. In accordance with Americans with Disabilities Act, 1990 (ADA), parking will be provided at this station for customers with disabilities. The locations and number of these parking spaces will be defined during preliminary engineering.

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

The preliminary station access and platform designs are based on requirements and guidance provided by ADA, the Commonwealth of Massachusetts Architectural Access Board (MAAB), and the MBTA. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for stakeholder involvement as the station designs are advanced.

L-018-002

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

L-018-003

For accessibility purposes there needs to be an in-depth site plan with the details of various platform widths , lengths, slopes, as well as, actual recorded or actual announcement for arrivals, and departures.

If possible, please provide an additional site plan for review and comments.

Respectfully,

Earnest L. Lindsay
Director of Veterans Service

CC: Michael J. McGlynn, Mayor
Lauren DiLorenzo, O.C.D. Director

mla

L-018-003

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. These stations are designed to be consistent with MBTA standards and compliant with ADA. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

Re: Green Line Extension DEIR/EA

Dear Secretary Bowles:

I am writing to recommend prompt MEPA approval of MassDOT's Draft Environmental Impact Report (DEIR)/Environmental Assessment (EA) for the Green Line Extension as a Final Environmental Impact Review (FEIR) document; conditioned upon a written commitment from MassDOT to (1) eliminate the Yard 8 maintenance facility from consideration; (2) complete the design and engineering to the Route 16 terminus so that if resources are made available, the Route 16 terminus can be constructed at the same time as the rest of extension; and (3) complete the 100% design of the Community Path from Lowell Street to Northpoint, while assisting the City to secure funding for construction.

Closing the MEPA process now will allow the project to advance toward its mandated 2014 deadline, thereby ensuring the greatest accrual of environmental benefit to our community and the region.

In addition, I strongly urge that the MEPA certificate direct MassDOT to improve station design and location – with an emphasis on multimodal connectivity - during the preliminary engineering process and commit to a robust public process going forward.

Introduction

L-019-001 I want to begin by thanking Governor Patrick, Secretary Mullan, former Secretary Aloisi, and the entire Green Line project team for the hard work that went into producing the DEIR. The transition to preliminary engineering represents a key milestone in this critical, but long delayed, regional transportation project.

Somerville does not just want the Green Line, it needs the Green Line. Our community is one of the densest in the nation, having been built around a vibrant transit network that was in place through the early part of the 20th century but subsequently dismantled. Today, we are burdened with a street network that hosts significantly more cars per square mile than any other metro Boston municipality and barriers created by two raised highways that divide our city. Further, freight and commuter rail lines crisscross our neighborhoods and a massive maintenance facility (the Boston Engine Terminal - BET) dominates our largest economic development district. All of these factors contribute to making travel across Somerville hazardous, significantly increasing our levels of air pollution, and severely inhibiting commercial development within our 160 acre Inner Belt/Brickbottom District.

Today, with only one rapid transit station in Somerville at Davis Square and access to two adjacent stops in Cambridge at Porter Square and Charlestown at Sullivan Square, 29% of Somerville residents use transit to commute to work. This percentage is as high as Brookline which houses 16 transit stations. The Green Line Extension represents a tremendous opportunity to significantly increase the ridership on the MBTA, a benefit felt both locally and throughout the entire region through reduced congestion and improved air quality.

That said, public transit generally, and the Green Line specifically, must be more than a means of transporting people. It must be designed to solve existing problems and anticipate future needs. Though an expanded light rail system will inherently improve air quality by reducing the region's long term over-reliance on cars, the environmental benefits of the project will be vastly increased through station design and siting that prioritizes bus, bike, and pedestrian connectivity and a robust public process before, during and after construction – including a prescribed system for mitigating noise and vibration impacts. The City's ongoing strategic land use decisions will further contribute to facilitate transit-
L-019-002 oriented development around the stations thereby generating new riders for the system and economic development for the Commonwealth. Accordingly, the City will work in partnership with MassDOT, the Department of Housing and Community Development, and other agencies to maximize the project's benefits.

This letter further outlines our proposed key elements of a successful Green Line Extension. An accompanying letter from Monica Lamboy, Executive Director of the Mayor's Office of Strategic Planning and Community Development, will provide a more detailed breakdown of our specific comments and requests.

ONE CALL to CITY HALL 3 1 1 SOMERVILLE

L-019-001

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

L-019-002

MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses. This will help ensure compliance with legal requirements and, to the extent feasible, consistency with planning and other projects.

Direct and indirect impacts to land use are described in DEIR/EA Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for sustainable land use, which could further reduce automobile traffic congestion and improve air quality.

Maintenance Facility

Throughout the planning process I have taken the position that, should MassDOT make a compelling case, Somerville would be willing to locate a second maintenance facility within our borders, provided that it would be designed and operated to meet criteria in three key categories:

- Quality of life - Any facility should not adversely impact the quality of life of residents in the area.
- Economic development - Any facility should not impede or deter future economic development in the InnerBelt and Brickbottom districts, including on the site of the facility itself; and
- Access - Any facility should not augment the existing access barriers between Inner Belt and Brickbottom and instead, should be designed to reduce barriers to the greatest extent possible.

I have also made clear that, as a matter of environmental justice, Somerville should absorb only those functions and facilities related to the extension project -- and that our community should not be further burdened by regional infrastructure that does not serve our residents and business community, unless mitigation measures are provided.

L-019-003 Yard 8 fails to meet each of the three criteria above and must be summarily eliminated from consideration as part of the Green Line Extension project. The Yard 8 location would immediately and severely degrade the quality of life for the district's only residents, occupy a prime development parcel, and create a permanent barrier between the Inner Belt, Northpoint, and Route 28. *Moreover, Yard 8's continued inclusion as the preferred alternative would indicate complete disregard for unified opposition to the site from Somerville and Cambridge public officials and community members.* Simply put, this would not bode well for the planning process going forward particularly in light of Somerville's stated willingness to accept a facility.

L-019-004 Indeed, while the City continues to believe that Mirror H is the best location for the facility, we acknowledge that Option L represents a real opportunity to meet both the operational needs of MassDOT and the City's key criteria. Once Mirror H or Option L is selected, the MassDOT should implement a vigorous and public planning and engineering process to ensure that the maintenance facility is designed to have minimal negative impact on our long-burdened community.

Station Location and Design

The Green Line's environmental benefits will only be fully realized if the project serves to eliminate noxious land uses and, where appropriate, promote high-density, high-value, transit oriented development. Stations located on major streets should have access from both sides of the street to increase visibility, encourage use and raise land values. The architectural design should be compatible with its environs yet highlighted as a distinctive landmark.

L-019-005 The Brickbottom/Washington Street Station, as proposed, is not properly situated or sized to meet the current and future needs of the Inner Belt and Brickbottom Districts and needs to be

Somerville

www.somervillema.gov
ONE CALL > CITY HALL 3 1 1 SOMERVILLE

L-019-003

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

L-019-004

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Mirror H location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

L-019-005

The conceptual plan for the Brickbottom Station will be refined during the preliminary engineering stage, taking into consideration municipal, neighbor, and other stakeholder concerns to the extent practical. The

L-019-005 significantly refined during the design process. First, it must have access points designed to meet the needs of the existing neighborhoods to the north, as well as the future development in the Inner Belt and Brickbottom Districts, which is anticipated to be between 7 and 10 million square feet. Second, it should be relocated to Washington Street to provide the best bus, pedestrian, and bicycle connectivity possible. The community commits to work closely with MassDOT on the strategic refinement and relocation of this station.

L-019-006 The proposed Union Square Station has the opportunity to significantly stimulate economic development in the Union Square and Boynton Yards areas. Attention must be paid during the design process to facilitate access directly into Boynton Yards to the south, as well as the heart of Union Square to the north.

L-019-007 At Gilman Square, only the minimum amount of the City's property (aka "Homan's Building") should be taken to facilitate the Green Line Extension. Our intent is to use the balance of the property for transit oriented development that will support transit ridership in the area. I am in the process of determining how to complete the transfer of land at no cost to the extension project.

Community Path & Multi-modal Connectivity

L-019-008 The Community Path Extension will provide a critical and safe link for bicyclists and pedestrians from surrounding neighborhoods and beyond. The existing path serving Davis Square receives tremendous use and has significantly increased ridership, offered air quality benefits and improved the lives of residents. It is imperative that MassDOT recommit to funding the 100% design of the path from Lowell Street in Somerville to North Point in Cambridge as a part of the Green Line Extension. The Path provides the most direct connectivity for bicyclists and pedestrians and its creation will help to support the system's success as well as the City's efforts to promote active and healthy transportation options. To this end, the City commits to providing the link between Cedar Street and Lowell Street and to working with MassDOT to secure funding to complete construction of the Community Path simultaneously to the Green Line Extension. Such an approach would both save money and improve the overall benefits of the project.

L-019-009 In order for MassDOT to achieve the full environmental benefits of the Green Line Extension, stations must be designed and located to facilitate multi-modal connections. In short, by enhancing these connections we will remove cars from our streets and make our community safer and healthier. Providing light rail alone will not accomplish this difficult task. We need a coherent and efficient

L-019-010 network to support bus, rail, bike, and pedestrian connections. The existing bus system should be analyzed and modified in conjunction with ongoing Green Line planning and construction. Bus routes and stops should be moved, added, or eliminated as needed to provide direct and efficient connections to the new rail station as soon as they become active. As stated above, the Community Path design should

L-019-011 allow for safe and easy access to stations for bicyclists and pedestrians. Finally, while Somerville supports bus pull-in areas, we request that the MEPA certificate recommend against MassDOT's current plan to provide "kiss n'ride" vehicle drop-off points and ensure that only the minimum amount of land

Somerville 2009

ONE CALL to CITY HALL 3 1 1 SOMERVILLE

Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

L-019-006

DEIR/EA Section 3.7.8 describes bus, pedestrian, and bicycle access at the proposed Union Square Station. In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

L-019-007

DEIR/EA Section 5.2 describes the Project's potential temporary and permanent acquisitions. MassDOT will continue to evaluate opportunities to minimize these property impacts.

L-019-008

MassDOT is committed to completing all planning, design, and engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community Path between Lowell Street and Inner Belt Road. MassDOT is not able at this point to commit to funding the construction of the Community Path. The limits of the path were predicated on the connections to Lechmere being made through the Inner Belt area via Inner Belt Road and the proposed Urban Ring Bridge into the Lechmere area. However, the cessation of planning for the Urban Ring Project has changed the timing of this anticipated connection. MassDOT is unable to assume responsibility for designing the Urban Ring Bridge as part of the Green Line Extension Project. That being said, MassDOT is committed to working with the City of Somerville, residents and businesses in the Brickbottom and Inner Belt neighborhoods, and Community Path

L-019-011 necessary is set aside for parking of maintenance vehicles.

Long Term Connectivity

L-019-012 Although the Commonwealth is planning for a specific project today, great care needs to be taken to ensure that future transit extensions are not precluded based upon current constraints or demand. In particular, the station design and location at the terminus of both spurs—Union Square and Route 16—should not preclude the potential to extend the Green Line to link with Porter Square or West Medford. Further, an additional future station in the vicinity of Boynton Yards must be anticipated, albeit to be constructed some time in the future.

Public Process

L-019-013 Although the DEIR process has provided a significant official public input component for the Green Line plans, it should not represent the end of proscribed community involvement. In order for stations to be successfully woven into our pre-existing urban fabric, as well as anticipated future development, neighbors and business owners must be consulted on specific plans for station design, access, location and construction. Both the efficiency and effectiveness of the planning process will be increased by proactive and predictable community engagement. Moreover, while the DEIR spells out projected noise

L-019-014 and vibration impacts, MassDOT should clearly define procedures for further mitigation if stated targets are not reached, or if construction produces unanticipated effects. Similarly, a procedure for determining compensation should be included for instances where secondary mitigation proves insufficient. Therefore, I respectfully request that MassDOT clearly define an ongoing proactive public process beyond the conclusion of the MEPA process.

Conclusion

The most serious environmental impact associated with the Green Line Extension is delay. The project is long overdue and risks failing to meet a court mandated deadline of 2014. Meanwhile, Somerville continues to suffer the costs of the Commonwealth's transportation infrastructure while reaping few of the benefits. We must now put the latest delay associated with the maintenance facility behind us and move the project forward.

L-019-015 I ask that EOEEA assist us in this historic effort by now issuing a certificate that accepts the DEIR as a final submission; provided a written commitment from MassDOT to eliminate Yard 8 as an option for the maintenance facility, ensure design and engineering of the entire Green Line to Route 16 and Union Square, and 100% design of the Community Path extension between Northpoint and Lowell Streets. The Secretary's certificate should provide overarching guidelines for the design/build process going forward, particularly in the areas of station location and design, multimodal connectivity, long range planning and community engagement.
I have attached prior correspondence on Green Line issues to this letter for inclusion in the DEIR review process.

Somerville 2009

advocates to design the Path to create improved connectivity within the Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension.

L-019-009

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

L-019-010

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able at this point to commit to funding the construction of the Community Path. Station and path design will promote safe and convenient pedestrian and bicycle access to the stations.

L-019-011

The only Green Line Extension station that will provide parking is Lechmere Station. Drop-off and pick-up areas will be provided at at several stations. These will accommodate expected kiss-and-ride activity.

L-019-012

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

Re: Analysis of Green Line Maintenance Facility and Future Planning for City of Somerville

Dear Secretary Aloisi:

We sincerely thank you for the opportunity to meet and discuss the transportation opportunities and challenges faced by the City of Somerville. Over the past few years, the City has enjoyed a fruitful collaboration with EOT and the Massachusetts transportation agencies, particularly while planning for the Green Line and Urban Ring and reconstructing Somerville Avenue. With your assistance, we look forward to continuing and enhancing our relationship in the years to come.

I wanted to follow up with regard to two items we discussed in detail at our meeting. These include the City's technical review of the impacts of the proposed Green Line Maintenance Facility and the need for City-State collaboration on additional planning efforts in the Inner Belt/Brickbottom district and citywide.

Technical Review of the Proposed Green Line Maintenance Facility

From the beginning of discussions regarding a potential facility, I have taken the position that, should your office make a compelling case, Somerville would be willing to locate such a facility within our borders, provided that it would be designed and operated to meet criteria in three key categories:

3 1 1 SOMERVILLE
Somerville City Hall • 93 Highland Avenue • Somerville, Massachusetts 02143
(617) 625-6600, Ext. 2100 • TTY: (617) 666-0001 • Fax: (617) 625-3434 • www.somervillema.gov
mayor@somervillema.gov

L-019-019

Please see Comments L-019-023 through L-019-026.

L-019-020

Included as attachment to L-020, Somerville, City of, Board of Aldermen.
Please see Comments L-020-007 through L-020-009.

1. **Quality of life** - Any facility should not adversely impact the quality of life of residents in the area.
2. **Economic development** - It should not impede or deter future economic development in the InnerBelt and Brickbottom districts, including on the site of the facility itself;
3. **Access** - It should not augment the existing access barriers between Inner Belt and Brickbottom (and instead, it could possibly reduce barriers);

As mentioned to you, although we acknowledge the thought and creativity used by your team to develop the most recent alternatives, our initial review indicates that EOT's preferred alternative would not meet the three criteria detailed above. Moreover, EOT's own analysis indicates that there are more cost-effective options. We have forwarded these concerns to your design team, together with our redesign based on EOT's alternative H, and are willing to offer any assistance needed to determine possible improvements or changes. Indeed, it is critical to identify an alternative, or redesign, that will satisfy a thorough environmental review process so that the extension project can remain on its 2014 timeline.

While I acknowledge that the entire Green Line Extension project must meet transportation and engineering objectives, I know you will agree that it is not in the Commonwealth's best interest to diminish the economic opportunity that would arise were the Inner Belt and Brickbottom districts developed to their full potential. That potential development, in turn, would actively support the Green Line Extension by providing thousands of additional daily riders.

Additional Planning Efforts

The City of Somerville recognizes the need to be flexible, cooperative and creative in working with the Commonwealth to address the transportation challenges faced in such a dense and diverse urban environment. I strongly believe that through coordinated and collaborative planning, we can collectively optimize the opportunity presented by the Green Line Extension and mitigate any potential negative impacts. To accomplish this in a timely and efficient manner, I directed my staff to develop specific projects and funding strategies designed to expand our planning efforts around the Green Line Extension. As I briefly described these initiatives to you, they involve:

L-019-021

- **Citywide Multimodal Transportation Plan and Modeling** – The proposed analysis will identify solutions to improve mobility by all modes of transportation today, coupled with the identification of future improvements needed to accommodate planned development throughout the city (taking into account the impacts of the Green Line Extension and the Orange Line Station planned at Assembly Square). An important deliverable will be a computer model allowing analysis of various development scenarios and their impacts upon the transportation network, citywide. This three-year program is estimated to cost $634,000.

311 SOMERVILLE
Somerville City Hall • 93 Highland Avenue • Somerville, Massachusetts 02143
(617) 625-6600, Ext. 2100 • TTY: (617) 666-0001 • Fax: (617) 625-3434 • www.ci.somerville.ma.us
mayor@ci.somerville.ma.us

L-019-021

MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses. This will help ensure compliance with legal requirements and, to the extent feasible, consistency with planning and other projects.

L-019-022

- **100% Design for the Community Path from Cedar St. to North Point** – To date, the EOT has been clear that its responsibility is to prepare the conceptual design of the Community Path. However, we all recognize the Community Path extension along the proposed Green Line alignment has to be designed and built in lock step with the Green Line Extension. This is a complex endeavor that is inherently tied to the light rail project. Therefore, significant cost savings will be achieved by having the same consultants design both projects. The estimated design cost for this effort is $816,000.

As mentioned during our meeting, we have identified two earmarks available to the City of Somerville that we are willing to use for funding the above-mentioned $1.45 million programs. To match the City's commitment of $1,160,000, we are seeking 20% state matching funds, or $290,000 from the Commonwealth.

L-019-023

It is my sincere hope that we can continue to work together to resolve the challenges facing us in a mutually supportive manner. It is incumbent upon us to eliminate obstacles certain to generate community concern in order to ensure that the Green Line Extension remains on its 2014 timeline. To achieve that goal, we will need a high level of coordination and cooperation than can be best achieved by combining our efforts. We remain willing and committed to provide financial, technical, and other support to your efforts, in a way that will achieve expedited completion of the Green Line Extension.

Please let me know if you or your team needs additional details on our initiatives or if you have any general questions or concerns.

Sincerely,

Joseph A. Curtatone

Re: Ongoing Analysis of Green Line Maintenance Facility & Future Planning for City of Somerville

Dear Secretary Cohen,

Thank you for your recent visit to Somerville. I appreciate the time you took to speak with us about the transportation opportunities and challenges faced by the City. With your assistance, we have enjoyed a long and fruitful collaboration with EOT and the Massachusetts transportation agencies. We look forward to continuing and enhancing our relationship in the years to come.

I wanted to follow up with regard to two items we discussed in detail at our meeting. These include the City's technical review of the impacts of the proposed Green Line Maintenance Facility and the need for City-State collaboration on additional planning efforts in the Inner Belt/Brickbottom and citywide.

Technical Review of the Proposed Green Line Maintenance Facility

From the beginning of our discussions regarding a potential facility, I have taken the position that, should your office make a compelling case, Somerville would be willing to consider locating such a facility within our borders, provided that it would be designed and operated to meet criteria in three key categories:

1. Economic development - It would not impede or deter future economic development in the Inner Belt and Brickbottom districts; including on the site of the facility itself.
2. Access - It would not augment the existing access barriers between Inner Belt and Brickbottom (and instead, it could possibly reduce barriers); and;
3. Quality of life - Any facility should not adversely impact the quality of life of residents in the area.

ONE CALL TO CITY HALL 311 SOMERVILLE
Somerville City Hall • 93 Highland Avenue • Somerville, Massachusetts 02143
(617) 625-6600, Ext. 2100 • TTY: (617) 665-0001 • Fax: (617) 625-3434 • www.ci.somerville.ma.us
mayor@ci.somerville.ma.us

You will recall that I have repeatedly conveyed to EOT the City's priorities regarding the Inner Belt and Brickbottom areas and the crucial role that the Green Line Extension and its associated infrastructure will play in the future economic vitality of the area. I have also indicated that, as a matter of environmental justice, the City of Somerville should absorb those functions and facilities related only to the extension project. The Inner Belt has been historically burdened by poorly-designed transportation projects. Somerville should not be further burdened by infrastructure that does not serve its residents and business community.

As mentioned to you last week, although we acknowledge the thought and creativity used by your team to develop the most recent alternatives our initial review indicates that EOT's preferred alternative, as presented, would not meet the three criteria detailed above. We have forwarded these concerns to your design team and are willing to offer any assistance needed to determine possible improvements or changes. Indeed, it is critical to identify an alternative, or redesign, that will satisfy a thorough environmental review process so that the extension project can remain on its 2014 timeline.

While I acknowledge that the entire Green Line Extension project must meet transportation and engineering objectives, I know you will agree that it is not in the Commonwealth's best interest to diminish the economic opportunity that would arise were the Inner Belt and Brickbottom districts developed to their full potential. That potential development, in turn, would actively support the Green Line Extension by providing thousands of additional daily riders.

Additional Planning Efforts

The City of Somerville recognizes the need to be flexible, cooperative and creative in working with the Commonwealth to address the transportation challenges faced in such a dense and diverse urban environment. I strongly believe that through coordinated and collaborative planning, we can collectively optimize the opportunity presented by the Green Line Extension and mitigate any potential negative impacts. To accomplish this in a timely and efficient manner, I directed my staff to develop specific projects and funding strategies designed to expand our planning efforts around the Green Line Extension. As I briefly described these initiatives to you, they involve:

L-019-024

1. *Inner Belt / Brickbottom Master Plan* – This effort will result in a land use plan, a proposed transportation network, urban design concept, and market analysis that will paint a comprehensive picture of the area's significant development potential. The master plan will also include a preliminary estimate of infrastructure costs and recommendations on how to structure needed financing. This work will take 9 to 12 months by consultants already well-versed in the project and will cost an estimated $350,000. That said, we anticipate receiving actionable preliminary results within 60-90 days.
2. *Citywide Transportation Modeling and Action Plan* – The proposed analysis will identify solutions to improve mobility by all modes of transportation today, coupled with the identification of future improvements needed to accommodate planned development throughout

L-019-024

the city (taking into account the impacts of the Green Line Extension and the Orange Line Station planned at Assembly Square). An important deliverable will be a computer model allowing analysis of various development scenarios and their impacts upon the transportation network, citywide. This three-year program is estimated to cost $634,000.

L-019-025

3. *100% Design for the Community Path to North Point* – To date, the EOT has been clear that its responsibility is to prepare the conceptual design of the Community Path. However, we all recognize the Community Path extension along the proposed Green Line alignment has to be designed and built in lock step with the Green Line Extension. This is a complex endeavor that is inherently tied to the light rail project. Therefore, significant cost savings will be achieved by having the same consultants design both projects. The estimated design cost for this effort is $816,000.

As mentioned during our meeting, we have identified two earmarks available to the City of Somerville that we are willing to use for funding the above-mentioned $1.8 million programs. To match the City's commitment of $1,440,000, we are seeking 20% state matching funds, or $360,000 from the Commonwealth. To that end we have also initiated discussions with the Executive Office of Housing and Economic Development (EOHED) in order to identify potential sources.

L-019-026

It is my sincere hope that we can continue to work together to resolve the challenges facing us in a mutually supportive manner. It is incumbent upon us to eliminate obstacles certain to generate community concern in order to ensure that the Green Line Extension remains on its 2014 timeline. To achieve that goal, we will need a high level of coordination and cooperation than can be best achieved by combining our efforts. We remain willing and committed to provide financial, technical, and other support to your efforts, in a way that will achieve expedited completion of the Green Line Extension.

Please let me know if you or your team needs additional details on our initiatives or if you have any general questions or concerns.

Sincerely,

Joseph A. Curtatone
Mayor

L-019-025

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

L-019-026

MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses. This will help ensure compliance with legal requirements and, to the extent feasible, consistency with planning and other projects.

Re: Green Line Maintenance Facility: Evaluation of "Mirror H" Alternative

Dear Secretary Aloisi:

Thank you very much for meeting with Congressman Capuano, our state delegation, and me on April 16th. I sincerely appreciate your willingness to consider our viewpoint on the future location of the maintenance facility. It speaks well of the process and our strong partnership that Somerville is willing to take the facility within its borders and that EOT is willing to consider a secondary site.

L-019-027

I wanted to take this opportunity to, once again, lay out the benefits of Mirror Scheme H as well as to offer a response to some of the counter-arguments raised by the Green Line project team. It is essential to note that we have presented our case to Cambridge City Manager Robert Healey and he raised no immediate objections to the Mirror H location.

Benefits of Scheme H - Simply put, Mirror Scheme H meets all three of our community's criteria for an acceptable site while also meeting EOT's own key engineering requirements:

- Somerville Criterion #1: No Negative Impact on Quality of Life – Mirror Scheme H moves the away from the district's only residents. Even assuming the future development of Northpoint, Scheme H would border (or be potentially submerged under) parking garages. Moreover, the facility could offer a strategic buffer between the future Northpoint neighborhood and the Boston Engine Terminal. In contrast, EOT's original proposal ("Yard 8") places the facility within feet of the Brickbottom Artists Association complex and, regardless of extensive and expensive mitigation would inherently degrade residents' quality of life.
- Somerville Criterion #2: No Negative Impact on Economic Development Potential – Mirror Scheme H requires less acreage in takings than EOT's proposal and would allow for the construction of a new, already permitted 196,000 sq. ft. building at 150 Inner Belt Road (projected to occur within two years). Moreover, the mere threat of EOT's current proposal has endangered the current art restoration and storage use that has recently revitalized 200 Inner Belt Road.

Somerville City Hall • 93 Highland Avenue • Somerville, Massachusetts 02143
(617) 625-6600, Ext. 2100 • TTY: (617) 666-0001 • Fax: (617) 625-3434 • www.somervillema.gov
mayor@somervillema.gov

L-019-027

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Mirror H location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

Again, even assuming the eventual build-out of Northpoint, Mirror Scheme H could provide a potential foundation for Northpoint's parking garages. Additionally, given that the Northpoint parcels in Somerville have neither been zoned nor permitted, the City would be willing to consider height and density bonuses in return for the incorporation of the facility.

- Somerville Criterion #3: Minimal Impact on Future Access to District – Mirror Scheme H takes advantage of existing transportation infrastructure and is located in such a way as to not further isolate the Inner Belt district. Moreover, the new location allows for easy connectivity between Inner Belt and Northpoint – thereby benefitting both districts. A Yard 8 location effectively permanently locks Inner Belt off from Brickbottom, Northpoint and McGrath Highway due to the increased costs and unattractiveness of the required long tunnels.
- EOT Key Engineering Requirement #1: Operations – EOT's report on Mirror Scheme H, authored by VHB/PB identifies two operational shortcomings with the City's proposed design but proposes several reasonable fixes "that would appear to eliminate these operational defects" (page 3). According to VHB/PB, with the fixes in place, Mirror Scheme H would gain the same operational level as the original Scheme H which received 20 points in VHB/PB's orginal report dated November 6, 2008. This score represented the second highest score of the five alternatives and was 1.5 points *higher* than EOT's ultimate proposed location at Yard 8.
- EOT Key Engineering Requirement #2: Cost – According to EOT, Mirror Scheme H costs $3 million less than the Yard 8 proposal. Moreover, this figure does not take into account the extensive mitigation (for Brickbottom and 200 Inner Belt Road) that would be required by a Yard 8 location. In addition, if EOT does not change locations, the City will seek concurrent construction of air rights development as well as a tunnel to connect Inner Belt and Brickbottom. *This level of mitigation could reach well over $100 million in additional costs to the project.*

EOT's Remaining Issues - EOT's secondary issues can also be readily addressed if the Mirror H alternative is selected. These include:

- Timeline: At our meeting, EOT project managers raised the concern of a possible short delay if the facility site was changed. The entire Somerville community, however, has recognized that the Green Line Extension, and its associated infrastructure, represents a once-in-a-lifetime opportunity to reverse decades of public transit neglect, vastly improve residents' quality of life, offer heavy and consistent ridership to the MBTA, and spur economic development. Surely it is worth the time to get this decision right.
- Northpoint Development: Based on the VHB/PB analysis, the potential impacts of Mirror H on Northpoint serve as the key deterrent to a change in location. However, for three key reasons, these concerns are not warranted.
  1. *Lack of zoning & Permitting:* Mirror H contemplates a building site that is entirely in Somerville. The Northpoint developers have no permits, nor zoning, for any buildings within the Somerville portion of the Northpoint site. If Mirror H becomes the selected site for the maintenance facility, Somerville would be inclined to not only offer the needed zoning, but would propose height or density bonuses as well.

Somerville City Hall • 93 Highland Avenue • Somerville, Massachusetts 02143
(617) 625-6600, Ext. 2100 • TTY: (617) 666-0001 • Fax: (617) 625-3434 • www.somervillema.gov
mayor@somervillema.gov

2. *Mitigates impact of BET:* A maintenance facility in the Mirror H location would not only allow for the envisioned parking structures but it would also serve as a buffer between Northpoint and the Boston Engine Terminal. I understand that noise emanating from the BET has long been an issue for nearby residents and a well designed facility in this location could act as a noise and visual barrier.
3. *Provides opportunity for air rights:* Unlike Yard 8, Mirror H provides a natural location for air rights development as an extension of Northpoint. Because the Mirror H site does not have the grade change and access challenges associated with Yard 8, Northpoint's parking garages could be built over existing rail lines and allow for better use of the Somerville parcels slated for development.

Once again thank you very much for working with me and for the people of Somerville. We appreciate your thoughtful approach to this issue and stress, once again, the remarkable willingness of our residents to accept a facility that will benefit multiple communities. We ask now that this willingness be rewarded with a sensible and sensitive siting of the maintenance facility.

Please call if you have any questions and I look forward to providing you with a tour of the district.

Sincerely,

Joseph A. Curtatone

CITY OF SOMERVILLE, MASSACHUSETTS
BOARD OF ALDERMEN

January 8, 2010

RECEIVED
JAN 8 2010
MEPA

Ian Bowles, Secretary
Executive Office of Energy and Environmental Affairs
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

L-020-001 The Somerville Board of Aldermen is in support of prompt MEPA approval of MassDOT's Draft Environmental Impact Report (DEIR)/Environmental Assessment (EA) for the Green Line Extension. We support this document as the Final Environmental Impact Review (FEIR) document conditioned upon a written commitment from MassDOT to (1) eliminate the Yard 8 maintenance facility from consideration; (2) complete the design and engineering to the Route 16 terminus so that if resources are made available, the Route 16 terminus can be constructed at the same time as the rest of extension; (3) complete the 100% design of the Community Path from Lowell Street to Northpoint, while assisting the City to secure funding for construction.

Closing the MEPA process now will allow the project to advance toward its mandated 2014 deadline, thereby ensuring the greatest accrual of environmental benefit to our community and the region.

L-020-002 In addition, we strongly urge that the MEPA certificate direct MassDOT to improve station design and location—with an emphasis on multimodal

CITY HALL • 93 HIGHLAND AVENUE • SOMERVILLE, MASSACHUSETTS 02143
(617) 625-6600 EXT. 4100 • TTY: (866) 808-4851 • FAX: (617) 625-4239
www.somervillema.gov

L-020-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time.

MassDOT has committed to completing the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able at this point to commit to funding the construction of the Community Path.

L-020-002

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. These stations are designed to be consistent with MBTA standards and compliant with ADA. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local

L-020-002 connectivity—during the preliminary engineering process and commit to a robust public process going forward.

Thank you for your attention to this critically important issue to our community.

Re: Green Line Maintenance Facility: Evaluation of "Mirror H" Alternative

Dear Secretary Aloisi:

Thank you very much for advancing the City's interests as they relate to both the Green Line Extension and the Community Path. We look forward to participating in the design process for these important projects over the upcoming weeks and months.

We wanted to take this opportunity to address one major outstanding issue associated with the Green Line – the proposed location of the maintenance facility. Since the Executive Office of Transportation released their preferred location ("Yard 8") we have heard an increasing chorus of protest from our constituents, particularly since the City developed an alternative proposal ("Mirror Scheme H") for a location within Somerville's borders.

L-020-003

Our review of the EOT's reports - "Mirror Scheme H" and the original "Alternatives Analysis" – indicates quite clearly to us that Mirror Scheme H scores higher than Yard 8 in the criteria identified by the EOT. Moreover, as the legislative body charged with overseeing land use in the City of Somerville, we dispute the EOT's significant markdown of Scheme H based upon its impact on the future, and uncertain, Northpoint development.

Mirror Scheme H vs. Scheme H – According to the EOT's review of Mirror Scheme H, the City's proposal had a number of operational defects. In the course of the review, however, the EOT's consultants "identified a set of modifications to Mirror Scheme H that would appear to eliminate these operational defects (page 3). The report then turns its analysis to the Original Scheme H: "Nevertheless, even with these modifications, the Mirror Scheme H Modified would still have the shortcomings of the Original Scheme H, shortcomings that caused EOT to eliminate Original Scheme H from further consideration." *This Board of Alderman's review of the EOT's own analysis, however, finds that Mirror Scheme H outscores Yard 8 in four out of five categories:*

1. Operational Criteria - Based on the EOT's seventeen operational criteria, Scheme H earns 20 points and Yard 8 earns18.5 points (page 69).

L-020-003

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Mirror H location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

2. **Property Impacts** – Scheme H requires 5.3 acres of taking and Yard 8 requires 6.2 acres of taking (page 70). Moreover, Yard 8's taking would eliminate a key development parcel adjacent to 200 Inner Belt and disrupt the current sensitive art restoration uses at the existing building. Scheme H would not require taking "any developable lots (page 70).
3. **Cost and Constructability** – Scheme H was estimated to cost $16 million less than Yard 8 (page 71).
4. **Compatibility with Other Transportation Proposals** – Scheme H accommodates the three most important transportation proposals in the vicinity of the Inner Belt (Community Path Expansion, Urban Ring, and Fitchburg Line Realignment at Red Bridge, page 72). Scheme H would not allow for a North-South Rail Line Portal at Fitchburg (a project that the Commonwealth no longer officially supports) or for the expansion of the BET (a project that the City strongly opposes). Yard 8, on the other hand, would require alignment modification to accommodate the Urban ring (a project supported by both the Commonwealth and the City).
5. **Compatibility with Land Use** – Based on the EOT's seven land use criteria, Scheme H earns 10.5 points and Yard 8 earns 13 points (page 74). This Board of Aldermen, however, strongly opposes the EOT's scoring and allocation system. Yard 8 loses only two points for its impact on Brickbottom residences. As you are aware, the Brickbottom Artist Building is one of the oldest living and working artist colonies in the country and represents the only residences in the vicinity of the proposed maintenance facility. Scheme H, on the other hand, loses six points based on its proximity to the proposed Northpoint development. Northpoint is neither zoned nor permitted in Somerville and the existing master plan, approved only by Cambridge, calls for parking garages adjacent to the Scheme H site. Given these facts, the Board of Aldermen seeks a re-evaluation of the Yard 8 site in terms of land use.

Once again thank you for your work on behalf of the people of Somerville. We appreciate your thoughtful approach to this issue and stress, once again, the remarkable willingness of our residents to accept a facility that will benefit multiple communities. We ask now that the Yard 8 proposal be reconsidered and that the EOT accept the alternative of Mirror Scheme H.

Sincerely,

RECEIVED
JAN 8 2010
MEPA

Ian Bowles, Secretary
Executive Office of Energy and Environmental Affairs
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

The following are my comments with respect to the MassDOT's Draft Environmental Impact Report (DEIR)/Environmental Assessment (EA) for the Green Line Extension. I am in overall support of the Green Line Extension but do have some concerns with the DEIR.

L-021-001

The Yard 8 maintenance facility should be eliminated from consideration. I previously expressed my view at the public hearing on November 18, 2009, that the proposed Yard 8 maintenance facility would have serious fiscal consequences because of its impact on the City's proposed development of the surrounding area, including the Brick Bottom/Inner Belt area. In a nutshell, the proposed location would effectively isolate the Brick Bottom/Inner Belt area from Route 28 and would preclude the construction of a normal street grid for the area with connections to Route 28. The noise that would be generated from the Yard 8 location presents serious health and quality of life issues for the existing residents of the neighborhood. It would also discourage the development of additional housing in the surrounding area since it is unlikely people would want to move into residences near a maintenance facility. One purpose of the Green Line is to promote transit oriented development in Somerville. Such transit oriented development would include a mixed use of office, retail and housing with open space. As discussed above, the location of the maintenance facility in Yard 8 actually would thwart transit oriented development in much of the Brick Bottom/Inner Belt area. Therefore, the location of the maintenance facility in Yard 8 is contrary to one of the most important purposes of the Green Line Extension. The economic cost to Somerville far outweighs any possible benefits. The alternatives to Yard 8 that are included in the DEIR make much more sense when judged on their economic and environmental impacts to the surrounding area.

L-021-002

L-021-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

L-021-002

Direct and indirect impacts to land use are described in DEIR/EA Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for sustainable land use, which could further reduce automobile traffic congestion and improve air quality. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

L-021-003
L-021-004

I also believe that the Route 16 terminus should be constructed at the same time as the rest of extension and that MassDOT should complete the 100% design of the Community Path from Lowell Street to Northpoint, while assisting the City to secure funding for construction.

I also join in the sentiments expressed by the Mayor and my colleagues on the Somerville Board of Aldermen in their comments sent to you.

Thank you for your consideration of these comments.

Very truly yours,

William A. White, Jr.

L-021-003

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time.

L-021-004

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

Re: Comments on DEIR for Green Line Extension from:
Office of Strategic Planning & Community Development (OSPCD)
City of Somerville

Dear Secretary Bowles:

L-022-001 Along with Mayor Curtatone, I am writing to recommend prompt MEPA approval of MassDOT's Draft Environmental Impact Report (DEIR)/Environmental Assessment (EA) for the Green Line Extension as a Final Environmental Impact Review (FEIR) document; conditioned upon a written commitment from MassDOT to (1) eliminate the Yard 8 maintenance facility from consideration; (2) complete the design and engineering to the Route 16 terminus so that if resources are made available, the Route 16 terminus can be constructed at the same time as the rest of extension; and (3) complete the 100% design of the Community Path from Lowell Street to Northpoint, while assisting the City to secure funding for construction.

L-022-002 In addition, I strongly urge that the MEPA certificate direct MassDOT to improve station design and location – with an emphasis on multimodal connectivity - during the preliminary engineering process and commit to a robust public process going forward.

As Mayor Curtatone has repeatedly stressed, the Green Line must be designed to solve existing problems and anticipate future needs. Although an expanded light rail system is certain to improve air quality by reducing the region's long term over-reliance on cars, the environmental benefits of the

CITY HALL • 93 HIGHLAND AVENUE • SOMERVILLE, MASSACHUSETTS 02143
(617) 625-6600 EXT. 2500 • TTY: (617) 666-0001 • FAX: (617) 625-0722
www.somervillema.gov

ONE CALL = CITY HALL 3 1 1 SOMERVILLE

L-022-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

MassDOT is committed to completing all planning, design, and engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community Path between Lowell Street and Inner Belt Road. The limits of the path were predicated on the connections to NorthPoint being made through the Inner Belt area via Inner Belt Road and the proposed Urban Ring Bridge into the Lechmere area. However, the cessation of planning for the Urban Ring Project has changed this anticipated connection. MassDOT is unable to assume responsibility for designing the Urban Ring Bridge as part of the Green Line Extension Project. That being said, MassDOT is committed to working with the City of Somerville, residents and businesses in the Brickbottom and Inner Belt neighborhoods, and Community Path advocates to design the Path to create improved connectivity within the Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line

project will be vastly increased through sensitivity to connections to the neighborhoods and ongoing public involvement to refine the design as it moves forward.

This letter will provide a detailed breakdown of our specific comments. The comments are structured to highlight the mandate from the EENF Certificate, summarize how the issue is treated within the DEIR, and provide the City of Somerville's response to the topic.

I. Maintenance Facility

- *EENF Certificate Requirement:* Requires the study of a combined Boston Engine Terminal (BET)/Green Line Maintenance Facility and the evaluation of Yard 8 in an effort to avoid, mitigate, and minimize negative impacts (EENF page 9, paragraph 2).

- *DEIR Submission:* An unchanged Yard 8 remains MassDOT's preferred alternative, however, the DEIR indicates that additional study will be conducted on two locations, Option L and Mirror Scheme H, which abut the Boston Engine Terminal (DEIR, Vol. 1, page ES-22, paragraphs 3 & 4).

L-022-003

- *City Response:* Yard 8 does not meet any of three basic criteria (quality of life, transportation access, economic development) developed by the City and would clearly block essential future connections between Inner Belt, Brickbottom, and Route 28. The location simply does not allow for the avoidance, mitigation, or minimization of negative impacts as is required in any environmental review certificate. Moreover, unified opposition to the location in the form of expected litigation would delay the project and jeopardize New Starts funding.

  Therefore, Yard 8 must be eliminated from consideration and replaced by Mirror Scheme H or Option L. Although Mirror Scheme H meets all of the City's criteria as proposed and remains the City's preferred alternative, Option L will also prove acceptable to the City, provided some additional design changes are incorporated to meet MEPA's requirement of avoiding, mitigating, and minimizing negative impacts. In particular, further consideration is needed regarding whether aspects of the Green Line maintenance facility can be combined with the BET.

  Following is a summary of our analysis of the three proposed maintenance facility locations. For more details on the comparison of engineering merits, operational efficiencies and proposed relative timelines, see the attached letters from the City.

  Yard 8 - Fails to meet all three of the City's criteria:

  - No Negative Impact on Quality of Life – Yard 8 would directly abut Brickbottom Artist Collaborative - the only residents in the area - and have negative sound and vibration impacts. Moreover; several stories of the artists housing would be blocked from light by the facility.

Extension.MassDOT has and will continue to coordinate with the City of Somerville at appropriate milestones as the Project progresses.

L-022-002

In accordance with the Secretary's Certificate on the DEIR/EA, station designs and bicycle, pedestrian, bus and automobile access at each station will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public involvement in the next phases of the Project.

L-022-003

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering.

- No Negative Impact on Economic Development Potential – Yard 8 would eliminate a permitted project at 150 Inner Belt Road (190,000 square feet commercial building). Noise and vibration could additionally disrupt sensitive commercial operations at 200 Inner Belt. The mere threat of MassDOT's current proposal has endangered the current art restoration and storage use that has recently revitalized 200 Inner Belt Road. Yard 8 would occupy premier development parcels on the key border between Inner Belt, Brickbottom, and Route 28 corridor. In addition, City study suggests that air rights development at Yard 8 would be extremely difficult and cost prohibitive.

- Minimal Impact on Future Access to District – Yard 8 would permanently sever Brickbottom from Inner Belt and prevent a new street grid from being established, as the facility would be built up three to six feet higher than street level, on retained fill. This option would then require 300+ feet of tunnels to penetrate and provide connection between Inner Belt and Brickbottom, an inordinately expensive and ineffective option.

Mirror H - Meets all three of the City's criteria:

- No Negative Impact on Quality of Life – Mirror Scheme H moves the facility away from the district's only residents. Even assuming the future development of Northpoint, Scheme H would border (or be potentially submerged under) parking garages and not directly affect residents. Moreover, the facility could be designed to mute the impacts of the existing Boston Engine Terminal.

- No Negative Impact on Economic Development Potential – Mirror Scheme H requires less acreage in takings than MassDOT's other proposals and would allow for the construction of a new 190,000 sq. ft. building at 150 Inner Belt Road (projected to occur within two years).

  Again, even assuming the eventual build-out of Northpoint, Mirror Scheme H could provide a potential foundation for Northpoint's parking garages. Additionally, given that the Northpoint parcels in Somerville have neither been zoned nor permitted, the City would be willing to consider height and density bonuses in return for the incorporation of the facility. Such an approach conforms to the Commonwealth's stated goal of implementing smart land use planning and transit oriented development.

- Minimal Impact on Future Access to District – Mirror Scheme H takes advantage of existing transportation infrastructure and is located in such a way as to not further isolate the Inner Belt district. Moreover, Mirror H allows for easy connectivity between Inner Belt and Northpoint – thereby benefitting both districts.

Option L – Has strong potential, with limited modifications, to meet City's three criteria:

As currently proposed, Option L moves the facility further away from the Brickbottom Artists

Collaborative and onto lower valued parcels abutting the BET. Moreover, Option L's location does not preclude critical multimodal connections to be established between the Inner Belt, Northpoint, Brickbottom and Route 28 and it allows for a better alignment of the Community Path. In addition, according to MassDOT, the operational benefits of Option L exceed those of its alternatives, and would allow for more efficient Green Line service. We recommend that the design for Option L be revised to:

- **Plan for future air rights developments:** Based upon its location, Option L has the potential to allow for air rights development and, indeed, would provide an ideal location for a future parking garage built above the facility. It will be important for the ongoing design efforts to plan for air rights development so that it can be easily facilitated in the future.

- **Share parking with BET** – Somerville has limited land for economic development. Throughout the City, the Board of Aldermen is rezoning properties to require structured parking instead of surface lots which are inefficient uses of land. To this end, the 100 surface parking spots for the exclusive use of the Green Line Maintenance Facility should be eliminated and any short-term surface parking should be shared with the adjacent BET. If the existing BET parking lot was re-striped for maximum efficiency and shift changes between the BET and Green Line facility were coordinated, we are confident that sufficient space would exist to meet the needs of both facilities.

- **Move storage tracks away from developable areas and toward BET:** At present, there are two areas proposed for storage tracks, one of which is relatively close to the Brickbottom Artists Collaborative and is very close to prime future economic development areas. The storage tracks should be concentrated in areas closest to the BET and the amount of storage reduced to the number of trains needed to serve the Extension only.

- **Ensure storage tracks do not impact automobile/community path/Urban Ring Bridge:** Any storage must be designed so that it does not adversely impact the planned bridge which will provide a critical link between Inner Belt and Northpoint. Specifically, the width of the tracks should be minimized to limit the size of the span and make sure that the ramps leading up to the bridge do not create an additional barrier within the Inner Belt.

- **Minimize noise & vibration:** The City requests that noise and vibration effects be carefully mitigated in order to lessen the facility's impact on surrounding parcels. At present, there is limited development in the vicinity of Option L, but in the future, this will become a mixed use environment with between 7 and 10 million square feet of additional development.

The City understands that MassDOT has estimated the cost for Option L to be higher that other options, however, it is critical to recognize that the opportunity costs for Yard 8 in terms of lost economic development and future revenues to the Commonwealth and City of Somerville are far in excess of Option L. The 7 to 10 million square feet of new development anticipated in the

ONE CALL to CITY HALL 3 1 1 SOMERVILLE

Inner Belt/Brickbottom simply will not occur if Yard 8 is selected. This will result in worsened environmental conditions as this development will be required to move further away from the central core of the Boston Metro Area where transit is less accessible or outside of Massachusetts at a loss to all taxpayers.

Comments for All Maintenance Facility Alternatives

With the introduction of any maintenance facility in the area, it is critical that several elements be taken into account including:

L-022-004

- Properly size the facility to serve Extension only: While Somerville has gone on record with its willingness to accept another regional maintenance facility, the City and its residents should not be forced to accept the burden of storing trains cars in excess of the 38 vehicles (Appendix C: Green Line Support Facility Alternatives Analysis, page 1, paragraph 5) needed to serve the Extension. East Somerville is an environmental justice community that has already absorbed the negative impacts of the 23 acre BET. Adding storage beyond what is specifically required to facilitate the Green Line Extension will further adversely impact this community. Rail storage creates additional barriers to both future development and access points. In addition, it reduces the City's taxable land in an area slated for intense future development. Storage for the 80 cars proposed in the DEIR is far in excess of what is required to complete the project and each acre of land will diminish Somerville's ability to secure economic development and the associated tax base and jobs for the community. There is no justification for requiring Somerville to address longstanding storage needs of the entire Green Line system. Those needs should be addressed elsewhere.

L-022-005

- Centralize MBTA facilities at new maintenance building: Presently, the MBTA has considerable commuter rail uses scattered throughout the Inner Belt including office space and a significant amount of outdoor storage. Great potential exists to consolidate these new uses at the Maintenance Facility site, particularly at a combined BET/Option L site. If possible, the plans for the Green Line Maintenance Facility should include adequate office space to incorporate the MBTA commuter rail command center and the grounds of BET facility should be redesigned to move all the outdoor storage in the area so that it is next to BET. Finally, we request that any vacated MBTA parcels be provided to the City for future development.

L-022-006

- Improve access into Inner Belt and Brickbottom Districts: The addition of another layer of transportation infrastructure presents an opportunity for the Commonwealth to ease historic burdens that it has placed upon the Inner Belt and Brickbottom Districts. Currently, the only access to the Option L maintenance facility is provided for by "tubes" underneath the raised Lowell commuter rail line. These makeshift access points often cause back-ups or even stuck vehicles and are clearly inadequate for more intense use of the district. Opportunities include, but are not limited to: expanding and multiplying the access points beneath the Lowell Line,

L-022-004

The Green Line Extension storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the Project. Chapter 2 of the FEIR fully describes the environmental impacts of the proposed storage and maintenance facility. In order to maximize operating efficiencies, the facility must be constructed within the same timeframe as the Green Line Extension Project, in the vicinity of the Green Line Extension right-of-way, and north of downtown Boston.

The storage and maintenance facility alternatives include storage for Green Line Extension vehicles and replacement of the existing Lechmere Station vehicle storage. Storage capacity is also provided for vehicles currently stored in trackways between Lechmere Station and Government Center; this storage will be lost due to the Green Line Extension.

L-022-005

As explained in FEIR Chapter 2, MassDOT has explored opportunities for the Green Line Extension storage and maintenance facility to share resources with the Boston Engine Terminal. The independent needs and constraints of these facilities limit opportunities for shared resources. MassDOT will coordinate with the MBTA during preliminary engineering to maximize efficient land utilization between these storage and maintenance facilities, if possible.

L-022-006

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. The evaluation considers site access, as well as land use and connectivity impacts and opportunities associated with each maintenance facility site alternative. The DEIR/EA and FEIR include conceptual Project designs; the process

L-022-006

moving the Lowell Line, or building bridges or tunnels out to Route 28 and Brickbottom.

L-022-007

- Ensure storage tracks are covered: In order to minimize the adverse impacts of the storage, including noise, vibration and visual appearance, it is important that the storage tracks be covered and screened properly. The appearance of the maintenance facility will directly impact the area's attractiveness to future business investment. In addition, by covering the tracks, the Green Line cars will be secured from vandalism and graffiti, thereby reducing future operating costs.

II. Station and Rail Location and Design

- *EENF Certificate Requirement:* Requires that the Extension maximize the public benefit and preserve the integrity and character of neighborhoods (EENF, page 2, paragraph 1). Moreover, the Extension should spur development and take into account local and regional growth plans. Similarly, communities should pass zoning to complement the Project (EENF, page 5, paragraph 5 & 6). The Certificate also acknowledges that the key themes running through extensive public comments included calls for enhanced land use planning, further analysis of station locations, clear identification of land takings, and mitigation of environmental impacts (EENF, page 2, paragraph 2). Finally, the Certificate calls for alternatives regarding service to Brickbottom/Twin City, Winthrop Street, and Route 16 (EENF, page 10, paragraph 2).

- *DEIR Submission:* MassDOT's submission provides analysis of each stations' affected environment (DEIR, Volume 1, Chapter 4), as well as 10%-level layout, plan, circulation, and elevation (DEIR, Volume 2 – Figures). The DEIR does not provide a full alternatives analysis of the Twin City or Winthrop Street stations.

L-022-008

- *City response:* It is difficult for the City to offer specific comments due to the preliminary nature of the station designs but it is clear that during the upcoming engineering stage modifications will be needed to respond to the key themes identified below. Therefore, the MEPA certificate should call for four overarching approaches to station design and siting, specific examples of which are provided below:

  - Station designs need to reflect local integrity and character – Somerville is a community made up of diverse and disparate neighborhoods, each of which has a distinct and vibrant character. However, MassDOT's 10% drawings represent an attempt to replicate near identical designs throughout the Extension while adapting for site specific access issues. The City does not wish to request designs that include expensive materials or delicate details, but ones that simply acknowledge the surrounding environment. Different neighborhoods will require different treatments. The Gilman Square station, for example, will be located on the triangle of land that currently hosts City Hall, the High School and the Library, and is defined by historic brick and stone structures. Union Square, alternatively, is a bustling and quirky central business district at the heart of the City's arts community zoned for intense development.

www.somervillema.gov

ONE CALL to CITY HALL 3 1 1 SOMERVILLE

for stakeholder coordination as these designs are refined is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

L-022-007

At this stage it is not financially feasible to cover the storage area. However, the design of the maintenance facility does not preclude future potential overbuild or air rights development.

L-022-008

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. These stations are designed to be consistent with MBTA standards and compliant with ADA. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

L-022-008

The Lowell Street station will be located amidst a dense residential district, whereas the Ball Square station will support a commercial strip of small storefront businesses. The Washington Street station has the ability to redefine an existing railroad legacy and create a link with the abutting neighborhood. The City wishes to work with MassDOT to develop architectural designs that meet the MBTA's operational needs while also creating important neighborhood landmarks.

L-022-009

- **Station locations should maximize public benefit and support thoughtful transportation oriented development** – Stations need to have clear frontage and provide easy access from the surrounding neighborhoods. Furthermore, the location of stations and proposed construction staging areas should be strategically sited to eliminate unwanted uses and provide parcels for future smart-growth development. Significant opportunity for transit oriented development on or adjacent to stations exists at Gilman Square, Ball Square, and the Rt. 16 terminus. (A 199 unit TOD development has already been permitted at the Lowell Street Station.) Somerville pledges to be a partner in identifying those parcels where opportunity exists and to donate municipal land whenever possible. In exchange, the City would seek to receive the residual land left over after station construction or at least the opportunity to work with MassDOT on developing plans for the sites.

L-022-010

- **Station locations and design should anticipate future system expansion** - Full design and engineering should not only be completed to Route 16 but, as required by the EENF certificate, the feasibility of a second-phase Brickbottom/Twin City location should be determined so that the final design and construction of the Extension does not preclude an additional station in the future. Further, the Union Square station location should not prevent a future connection to Porter Square. At present, it appears that the alignment of the station would prevent it from continuing past Prospect Street. Lastly, the Route 16 terminus should be designed to facilitate potential extension to West Medford in the future and should show clear connections to the Minuteman and Alewife Brook paths.

L-022-011

- **Station design needs to acknowlege other transportation projects** - Although we recognize that planning and engineering has to acknowledge current constraints, accommodation needs to be made for changes to the existing landscape. The City is currently working with the Commonwealth to lower McGrath Highway and create a boulevard. If possible, the Green Line Extension should accommodate this beneficial change. Similarly, the rail lines through the Brickbottom district will need to be elevated or depressed in order to allow future connections between Inner Belt, Brickbottom and Cambridge. The City is in the process of analyzing the necessarily elevation and hopes to work with MassDOT as the engineering is further refined.

In addition to the three overarching principles, the City has significant specific comments related to one station:

CITY HALL • 93 HIGHLAND AVENUE • SOMERVILLE, MASSACHUSETTS 02143
(617) 625-6600 EXT. 2500 • TTY: (617) 666-0001 • FAX: (617) 625-0722
www.somervillema.gov

ONE CALL to CITY HALL 3 1 1 SOMERVILLE

L-022-009

Direct and indirect impacts to land use are described in DEIR/EA Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for sustainable land use, which could further reduce automobile traffic congestion and improve air quality.

L-022-010

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

L-022-011

DEIR/EA Section 3.9 describes the compatibility of the Green Line Extension with other regional projects, such as the conceptual reconstruction of McGrath Highway and the Urban Ring transit corridor initiative. MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses to ensure, to the extent feasible, consistency with planning and other projects.

L-022-012

- Brickbottom / Washington Street Station location and design should be refined – The planned Brickbottom Station is the lynchpin for future development in the Inner Belt and Brickbottom Districts anticipated at between 7 and 10 million square feet of new development. Unfortunately, the design included in the DEIR is inadequate to address existing and future ridership needs in this area. First, given that the Secretary's certificate requires the Extension to spur development and take into account local and regional growth plans, the Brickbottom/Washington Street station should be moved to Washington Street. This will allow improved multi-modal access when compared to a station that is 240 feet away from this major arterial on a side street. In addition, it is essential that access be provided to the residential neighborhood to the north, the Inner Belt to the east and Brickbottom to the south and west. Consideration should also be made whether the platform length should be increased to facilitate the movement of the large numbers of riders who will access this station.

III. Multi-Modal Connectivity

- *EENF Certificate Requirement:* Stresses the need for MassDOT to provide clear access for bikes, pedestrians, and buses (EENF, page 10, paragraph 1). Existing bus routes should be examined and changes delineated (EENF, page 11, paragraph 3). Future projects, including the reconstruction of Route 28, Northpoint, a relocated Lechmere, the Community Path, and the Minuteman Path should all be taken into account during Green Line Planning (EENF, page 6, paragraph 4). Designing and building the Community Path along with the Green Line is critical (EENF, page 6, paragraph 5).

- *DEIR Submission:* Due to the only 10% drawings and unclear station elevations, multimodal access points for each station remain inconsistent or unclear (DEIR, Vol. 2 – Figures). Furthermore, MassDOT argues that no change in bus routes would be necessitated by the Extension (DEIR, Vol. 1, page 5-37, paragraph 3) and that the Community Path completion would not impact the number of bike-based commuters (DEIR, Vol. 1, page 5-37, paragraph 1). Finally, the DEIR commits only to "progressing the design of the Community Path" and explicitly states that construction of the Path is not intended to be part of the Green Line project (DEIR, Vol. 1, page 3-58, paragraph 2).

L-022-013

- *City Response:* An early priority for the preliminary engineering process should be to establish strong bus, bike and pedestrian (including ADA) connections, particularly by clearly incorporating the Community Path, strong connections between the path and the stations, and providing sufficient bike parking.

- Bus connections should be improved – Accommodating safe and easy transfer to the bus system is one means to ensure high levels of ridership for the Extension. Therefore, the location of bus stops should be the subject of considerable focus and attention. In terms of the bus routes themselves, MassDOT's definitive statement that a new light rail system

Somerville Massachusetts 2009

www.somervillema.gov
ONE CALL to CITY HALL 3 1 1 SOMERVILLE

L-022-012

The conceptual plan for the Brickbottom Station will be refined during the preliminary engineering stage, taking into consideration municipal, neighbor, and other stakeholder concerns to the extent practical. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process. Based on the analysis conducted during development of the DEIR/EA, it was determined that only one station would be warranted in the vicinity of the Brickbottom neighborhood and Washington Street. This analysis can be found in Appendix A of the DEIR/EA.

L-022-013

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

L-022-013

with seven stops will not impact existing bus service simply defies logic. Further studies should be undertaken and if data show a need, MassDOT should be prepared to coordinate bus reroutings, additions or eliminations in advance of the Extension completion. The City is very willing to work with MassDOT on the re-routing and is currently collaborating with MassDOT and MIT to analyze the bus routes. In addition, all kiss n'ride design elements planned in Somerville, with the exception of Rt. 16, need to be eliminated as the City has no desire to encourage auto drop off at the stations. Instead, the kiss n'rides could be converted to bus pull-ins to create the strongest and safest possible link.

L-022-014

- Explicit commitment to fully design and construct the Community Path along the Extension (NorthPoint to Lowell Street) is needed – Despite Secretary Aloisi's written commitment to complete design of the Path (Letter to Mayor Curtatone, Feb 11, 2009), the DEIR does not echo this obligation. Additionally, although the MEPA certificate need not require construction of the Community Path along with the Green Line extension, MassDOT should retract their statement that the Path is not intended to be part of the project. For cost-effectiveness, the Path should be constructed in conjunction with the Extension, with funding as part of the project or a combination of outside sources. Construction of the Path with the Extension is the most realistic and effective way for the Path to be completed. Additionally, an analysis should be done to see if construction of the path would improve the Green Line Extension's New Starts application and, if the Path's positive impact on ridership would strengthen the application, construction of the path should be included in the project. Past precedents of the Orange Line Southwest Corridor project and the Linear Path over the Red Line prove path construction to be a feasible and effective way of increasing multi-modal connections to the stations. Additionally, attention will need to be paid to the design of the path to ensure that it is very visible and intuitive for riders. At the 10% design stage, it is unclear how the path moves across the Green Line tracks from the Inner Belt to Brickbottom or how riders in the vicinity of the High School/Medford and School Streets will have access to the Gilman Square Station.

L-022-015

- Increased bicycle parking is necessary - The amount of bicycle parking presently described in the plans (270 spaces) will be completely insufficient for the expected number of bicyclists coming to the stations. The current 270 spaces will only serve approximately 1% of the expected ridership. Based on the present parking at Red Line stations, bike parking at 3-5% of ridership levels may be needed. A quick visit to the Davis Square Station where bicycles are locked to every possible pole, rack or tree provides a vivid picture of the demand for bicycle parking in Somerville, a community with a median age of 31.1 years. The stations should be redesigned to incorporate bike parking equivalent to approximately 5% of ridership at the Union Square, Route 16 and Lowell Street stations and 3% at the others. Bicycle parking locations should be as close to as possible to the entrances and in well lit and safe locations. Bicycle parking should be

Somerville

SOMERVILLE

L-022-014

MassDOT is committed to completing all planning, design, and engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community Path between Lowell Street and Inner Belt Road. MassDOT is not able at this point to commit to funding the construction of the Community Path. The limits of the path were predicated on the connections to Lechmere being made through the Inner Belt area via Inner Belt Road and the proposed Urban Ring Bridge into the Lechmere area. However, the cessation of planning for the Urban Ring Project has changed the timing of this anticipated connection. MassDOT is unable to assume responsibility for designing the Urban Ring Bridge as part of the Green Line Extension Project. That being said, MassDOT is committed to working with the City of Somerville, residents and businesses in the Brickbottom and Inner Belt neighborhoods, and Community Path advocates to design the Path to create improved connectivity within the Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension.

L-022-015

The amount of bicycle storage at each station is based on ridership projections developed by CTPS. DEIR/EA Appendix D includes the methods CTPS used to analyze demand for bicycle parking. Detailed bicycle parking designs will be further developed during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

L-022-015 | covered if at all possible and racks should incorporate city standards.

III. Public Process

- *EENF Certificate Requirement:* Calls for strong proactive coordination between MassDOT, MBTA, citizens, cities and other stakeholders throughout planning, design, and construction, (EENF, page 1, paragraph 2) using Urban Ring planning process as a model (EENF, page 6, paragraph 2). Impacted areas targeted for noise, vibration, and construction mitigation should be identified and specific measures described. Commitments should be clear and responsible parties defined (EENF, page 13, paragraph 1 and page 14, paragraph 3).

- *DEIR Submission:* Although MassDOT documents an extensive public participation process to-date, as well as close coordination with staff and elected officials from impacted cities, no response is given to the Certificate's call for future proactive coordination. Potential noise and vibration impacts were projected for numerous sites along the Extension (DEIR, Vol. 1, Chapter 5). According to MassDOT, planned mitigation measures would prevent moderate and severe noise impacts and keep vibration effects below residential impact levels. Construction mitigation measures are also described in detail (DEIR, Vol. 1, Chapter 5 and 6).

- *City Response:* Community involvement and proactive public coordination should intensify as the Extension progresses and continue beyond the completion of the project.

L-022-016 |
- **Advisory Group structure should be developed and regular meetings scheduled** - A new project-wide Advisory Group should be convened and, if needed, an additional group developed to focus on maintenance facility planning and design. A regular meeting schedule should be established for an on-going two-way dialogue as issues and opportunities present themselves during the project's development, rather than calling ad-hoc meetings to present updated plans. Station area community meetings should be held before any further design and engineering take place.

L-022-017 |
- **A transparent and predictable system of adjudicating noise, vibration, and construction impacts should be defined** – A supplemental EIR document should include clearly delineated procedures for determining further mitigation or compensation if stated noise and vibration targets are not reached. Such a system should protect abutters from having to resort to legal options in the event of continued noise and vibration impacts.

L-022-018 | Once again, I thank you for this opportunity to provide the City's perspective on the Green Line Extension DEIR submission. We believe that a Certificate should be issued accepting the DEIR as the FEIR thus allowing the long delayed Extension to enter preliminary engineering, provided that MassDOT commits in writing to the elimination of Yard 8, and the complete design of the Green Line to Route 16 and the Community Path from Lowell Street to NorthPoint in Cambridge. Our other requests can be incorporated into a short supplemental document or the engineering process

L-022-016

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

L-022-017

As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds. FEIR Chapter 8 describes specific proposed mitigation measures, plans for monitoring after construction, and next steps pertaining to mitigation. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

L-022-018

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

L-022-018 itself.

Attached please find prior correspondence related to the Green Line Extension for inclusion in the DEIR review.

Please do not hesitate to contact me at 617.625.6600 x.2510 or mlamboy@somervillema.gov if you have any questions.

Sincerely,

Monica R. Lamboy
Executive Director

Stephen Woelfel
Executive Office of Transportation
10 Park Plaza, Suite 3170
Boston, Massachusetts 02116

Re: **Public Comment on annual update and status report for transit projects required by 310 CMR 7.36 (2)(f) through (j)** – Conceptual designs for Green Line Stations

Dear Mr. Woelfel,

The City of Somerville would like to provide comment on the conceptual designs for the Green Line Extension running through Somerville to Medford. We understand that these designs are subject to change as the design process for the Green Line Extension moves forward and wanted to provide you with comments to contribute to the development of the next iteration of designs. A separate letter from Mayor Curtatone has been sent to you regarding comments relative to the proposed Maintenance Facility.

Overall Comments

L-022-019

1. **Bus Connectivity** – At all stations, adequate bus connections are critical to contribute to ridership and ensure that the disabled community can fully access the benefits of the extension. These routes will obviously affect the entire community in terms of bus service and will more directly impact businesses and residences in the immediate vicinity of the new stations. The City of Somerville would like to work closely with EOT on the development new routes or alternation of existing routes in response to the anticipated Green Line stations.

L-022-020

2. **Bicycle Parking** – As can be seen from Davis Square, many Somerville residents use bicycles to access mass transit. With the impending extension of the Community Path parallel with the Green Line Extension, we can anticipate that demand for bicycle parking will be significant. It is very important that sufficient bicycle parking be built into the design of every station.

L-022-021

3. **Kiss and Rides** – with the exception of the Route 16 / Mystic Valley Parkway station, we strongly believe that Kiss and Rides are not appropriate in an urban area such as Somerville.

ONE CALL. CITY HALL. 311 SOMERVILLE

Somerville City Hall • 93 Highland Avenue • Somerville, Massachusetts 02143
(617) 625-6600, Ext. 2500 • TTY: (617) 666-0001 • Fax: (617) 625-0722 • www.somervillema.gov

L-022-019

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

L-022-020

The amount of bicycle storage at each station is based on ridership projections developed by CTPS. DEIR/EA Appendix D includes the methods CTPS used to analyze demand for bicycle parking. Detailed bicycle parking designs will be further developed during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

L-022-021

The only Green Line Extension station that will provide parking is Lechmere Station. Drop-off and pick-up areas will be provided at at several stations. These will accommodate expected kiss-and-ride activity. The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

L-022-021

It is our anticipation that the vast majority of riders from Somerville will be walking or bicycling to the stations. As an alternative, "bump outs" along the adjacent roadways for quick drop-off/pick-up could be provided, but we do not wish to see the extensive Kiss and Rides shown on the conceptual plans included in the plans.

L-022-022

4. **Parking** – with the potential exception of the Route 16 / Mystic Valley Parkway station, parking for riders is not appropriate in Somerville and should not be planned for.

Route 16 / Mystic Valley Parkway

L-022-023

1. **Terminus** – although the terminus of the Green Line Extension has not yet been determined, it should be recognized that the proposed station location is within Somerville and that a station in this location would provide service to many residents of West Somerville that presently do not have access to rapid transit. In particular, it would provide access to the future residents of the approximately 200 unit Capen-Conwell assisted living / senior affordable housing development.

L-022-024

2. **Pedestrian and bicycle connections** – accessibility in the vicinity of the station for cyclists and pedestrians is presently inadequate. We suggest that considerable attention be paid to this issue to ensure safe access to the station.

3. **Mystic River Plan** – the ongoing MAPC and DCR planning efforts should be consulted in relation to station planning in this area.

4. **Gateway to Mystic Valley** – the station will serve as a gateway to the recreational opportunities along the Mystic River and we recommend that space be set aside for an interpretive center that would include historic information and a map of paths, etc.

5. **Kiss and Ride** – this would be the single location in Somerville where a Kiss and Ride might be appropriate. However, we suggest that the proposed configuration should be modified to allow the entrance to the site at Broadway and exit at Mystic Valley Parkway. This would eliminate left turns from Mystic Valley Parkway and reduce potential pedestrian-vehicle conflicts. At a minimum, the entrance to/exit from the Kiss and Ride needs to be moved further away from the overpass to improve sight lines.

Ball Square

L-022-025

1. **Entrance** - the two-level entrance at this location is much appreciated as it would facilitate pedestrian traffic to the station from all directions.

2. **Kiss and Ride** - No rider parking or Kiss and Ride should be included at this location.

3. **Existing structures** – it is unclear what is intended for the existing structures on this. We believe that transit oriented development would be opportune at this location and, given their historic nature, retaining the existing structures should be strongly considered. We suggest

L-022-022

With the exception of replacing the existing parking at Lechmere Station, no station parking is planned at any of the proposed Green Line Extension stations.

L-022-023

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

L-022-024

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. Page 3

L-022-025

that the EOT and representatives of the City of Somerville and City of Medford meet to discuss how to facilitate development since city border runs through property.

Lowell Street

1. **Connectivity from Community Path** – we support the request for a lower level entrance directly from Community Path

2. **Platform location** – we would encourage you to place the platform as close to Lowell Street as possible for ease of access to all riders in this area.

3. **Switchback** – we understand that there will likely be a switchback next to VNA property to allow connectivity from the Community Path to Lowell Street. This should be shown on the plans and incorporated as part of the Green Line Extension project.

Gilman Square

1. **Homan's Building** – this building represents a key development site for the City of Somerville and only the absolute minimum area should be taken as part of the Extension project, if anything is needed. The parking lot also needs to be preserved for the building.

2. **Kiss and Ride** - No rider parking or Kiss and Ride should be included at this location.

3. **Size and elevation** - This station seems significantly larger than shown at other locations. The only entrance should be at the upper level off of Medford Street and not from the parking lot for the Homan's Building since this will be a development site.

4. **Connection with High School and Community Path** – We believe that direct access to the platform should be provided from the Community Path and Somerville High School because Medford Street access alone will be not sufficient for the key potential rider groups. High School students will be one of the key user groups for this station and their paths should be carefully considered in the planning effort to make sure they do not develop cut-through paths that are contrary to safety at this location.

5. **School Street** – Allowing direct access from School Street should be considered.

Inner Belt / Brickbottom

1. **Two stations needed** - Under full development scenarios, two stations are needed in the Inner Belt and Brickbottom areas therefore, planning for the Green Line Extension needs to include two stations even if one is not built until a later date when demand increases. Preliminary data shows the potential for 8 to 10 million square feet of development in this area; one station will be insufficient to meet demand.

2. **Kiss and Ride** - No rider parking or Kiss and Ride should be included at this location.

311 SOMERVILLE
Somerville City Hall • 93 Highland Avenue • Somerville, Massachusetts 02143
(617) 625-6600, Ext. 2100 • TTY: (617) 666-0001 • Fax. (617) 625-3434 • www.ci.somerville.ma.us
mayor@ci.somerville.ma.us

rail transit corridor be entirely separated from vehicular, pedestrian, and bicycle traffic. This separation would not allow at-grade track crossing for pedestrians and/or bicycles at any point. Plans for Lowell Station and the Community Path connection will be further refined during preliminary engineering. The process for coordinating with the local communities during the design process for stations, trackways, and the Community Path is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

MassDOT has and will continue to coordinate with the Study Area cities, as well as state and local agencies, at appropriate milestones as the Project progresses. This will help ensure compliance with legal requirements and, to the extent feasible, consistency with planning and local priorities.

DEIR/EA Section 5.2 describes the Project's potential acquisitions. MassDOT will continue to evaluate opportunities to minimize these property impacts.

L-022-025

3. **Access to station** - The planned station near Washington Street must have access from Joy Street and New Washington Street (i.e., east and west sides) due to the numbers of riders who will come from the existing neighborhoods as well as to serve future development.

4. **Washington Street location** - It is strongly recommended that the station be moved to Washington Street. As presently conceived, the station will not be visible from the key access point of Washington Street and is less accessible to existing neighborhoods than it should be. The fact that the parking lot owner on Joy Street has indicated an interest in selling to the EOT is not an adequate rationale for locating the station here.

Thank you for taking these comments into consideration as we move forward on the Green Line Extension project. I can be reached at 617-625-6600 x 2500 if you have any questions or concerns.

Sincerely,

MONICA R. LAMBOY
Executive Director

Re: Green Line Extension
Union Square growth projections

Dear Mr. Woelfel,

L-022-026

The purpose of this letter is to respectfully request that the Executive Office of Transportation and Public Works (EOT) include growth projections for the Union Square area in the ridership figures for the environmental review of the Green Line Extension. As you are aware, the City of Somerville has been working on a rezoning proposal for the Union Square and Boynton Yards areas in anticipation of the opening of a new Green Line station in Union Square in 2014.

The proposal was submitted to the Board of Aldermen (BOA) on October 23, 2008 and is presently under review by the Planning Board and the Land Use Committee of the BOA. We anticipate that the proposal will be approved in February 2009.

Rezoning Proposal

The proposed rezoning includes the mapping of several new districts. These include:

- Arts Overlay District (AOD) – will facilitate the retention and expansion of arts-related uses including artist live/work housing, art studios, galleries, theaters, etc. This zone provides a modest density bonus for arts-related uses. (Note that to be conservative we have not projected any growth specifically related to the AOD zone.)
- Corridor Commercial District (CCD) – will manage development along heavily traveled transportation corridors such as Somerville Avenue and Washington Street. This includes an increase in Floor Area Ratio (FAR) from 2.0 to 3.0, an increase in residential density, and a reduction in required parking.
- Transit Oriented Development Districts (TODs) – will encourage mixed-use transit-oriented development near transit connections and commercial squares. There will be four TODs ranging in height from 55 feet and 4.0 FAR (TOD 55) to 135 feet and 5.5 FAR (TOD 135). All of the TOD zones include an increase in FAR from the present

Somerville City Hall • 93 Highland Avenue • Somerville, Massachusetts 02143
(617) 625-6600, Ext. 2500 • TTY: (617) 666-0001 • Fax: (617) 625-0722 • www.ci.somerville.ma.gov

L-022-026

In accordance with FTA transportation modeling guidance, foreseeable growth trends and specific permitted developments were included in the ridership projections.

zoning coupled with an increase in residential density and a significant decrease in required parking. These zones will be mapped along Prospect Street, in the Boynton Yards area, and at key locations along the Fitchburg Rail right-of-way such as the Target site and the Pat's Tow Lot site.

Public comment on the proposed rezoning has been supportive and especially cognizant of the potential benefits that transit oriented development will bring Somerville including increased commercial development and associated employment opportunities.

Attached please find the October 23, 2008 submittal to the Board of Aldermen, an update memo dated December 3, 2008, and a large scale map of the proposal. Please note that Attachment III of the October 23rd report contains a succinct table that specifies the differences between the new zones and the existing Central Business District (CBD) mapped in the study area.

Growth Projections

We have prepared growth projections at the sub-TAZ level to facilitate the Union Square Transportation Study that is currently underway, as well as for use in the environmental review of the extension. As you will see, we are projecting over 10 million square feet of net new space to be added to the Union Square and Boynton Yards areas within the next 30 years. As you will also note, the rate of construction prior to the station opening is considerably slower than construction anticipated afterward.

Although we do not know the exact breakdown between commercial and residential development, we have made estimates based on the existing and anticipated future character of the different sub-areas. Overall, we project that residential development will account for approximately 30% of the new space with commercial or light industrial uses constituting the balance. This will result in the construction of over 3,500 new housing units and over 23,000 new jobs. As you can imagine, this will contribute significantly to future ridership on the Green Line.

We are available to respond to any questions you may have. In addition, Howard Stein Hudson (HSH) has already initiated modeling based upon some of the figures we produced earlier this fall. We will be transmitting these enclosed projections to them shortly and I anticipate it will not take them long to recalibrate their model accordingly. We would be very happy to convene a meeting between your two organizations if you believe that would be helpful.

Attached please find a map of the sub-TAZ zones, an overview of growth by different zoning district, and additional information related to each sub-area. We can provide you with electronic copies of these spreadsheets if it would be helpful.

Relationship to Inner Belt / Brickbottom & Need for Additional Station

In addition to having this data included in the environmental analysis for the Green Line extension as it relates to the Union Square station, I am hopeful that you will acknowledge the relevance of these materials to two additional aspects of the extension project.

Stephen Woelfel
December 30, 2008
Page 3

L-022-027

First, while planning for the Inner Belt / Brickbottom areas remains at the master plan level, as opposed to zoning, the City of Somerville anticipates that the ultimate density in this area will be equal or greater to that planned for Union Square. I would strongly recommend that the EOT apply these densities to Inner Belt / Brickbottom and use this information to calculate future ridership in these two districts.

L-022-028

Second, as referenced in my September 12th letter, the City of Somerville seeks the inclusion of an additional station in this area – whether on the main line or on the Union Square spur. While we recognize that such a station might not be constructed during the current extension project, we believe that the identification of the location and proper alignment of the tracks to allow future construction is absolutely essential to accommodate the build out potential for these areas. Very real potential exists for tens of thousands of new workers to be coming to this quadrant of Somerville, along with several thousand new residents, all of whom will demand adequate rapid transit service.

**

L-022-029

I want to thank you in advance for incorporating this information into the analysis of the environmental impacts of the Green Line extension. As you can see from the proposed rezoning, the City of Somerville clearly sees the enhanced transit access as an opportunity to increase development within the city which will, in turn, increase ridership on the Green Line.

Please do not hesitate to contact me if you have any questions or concerns. I can be reached at 617-625-6600 x 2510 or mlamboy@somervillema.gov.

Sincerely,

MONICA R. LAMBOY
Executive Director

Re: **Zoning Permits for 150 Inner Belt Road, Somerville, MA**

Dear Mr. Woelfel,

This letter is a follow up to our conversation a few weeks ago during which I informed you that 150 Inner Belt Road was in receipt of several zoning permits from the City of Somerville. I wanted to provide you with more detailed information and copies of the relevant board decisions.

Permitted Use

At present, 150 Inner Belt Road has a land use permit that would allow for construction of a 190,000 s.f. structure that is approximately 64 feet in height along with associated site improvements including surface parking, landscaping, and drainage, etc. Since the zoning permit has been accessed as a result of the construction of 200 Inner Belt Road, our legal counsel indicates that the property owner continues to have the authority to construct the second building and would just need to apply for a building permit to exercise that right.

Background

In March 2000 (Appeal #2000-06), 150-200 Inner Belt Road was permitted for two buildings, each totaling approximately 190,000 s.f. in size and 64 feet in height. The use was projected to be telecommunication businesses in 75% of the space. The remaining 25% of the buildings would be devoted to general office use. Site improvements included surface parking for approximately 335-400 vehicles, landscaping, and an underground storm water drainage system.

In November 2001 (Appeal #2001-66), the site was granted permission to change the use to biotechnology manufacturing and laboratory use. At the same time, the Applicants specifically wished to clarify that the second building did not need to be constructed to be in compliance with the requirements of the decision.

Somerville City Hall • 93 Highland Avenue • Somerville, Massachusetts 02143
(617) 625-6600, Ext. 2500 • TTY (617) 666-0001 • Fax (617) 625-0722 • www.somervillema.gov

Later permits in 2005 and 2008 allowed a change in use for 200 Inner Belt Road so that it could be used for wholesale storage for an arts storage facility. These permits did not affect the use of 150 Inner Belt Road, so the authorized use for 150 Inner Belt Road remains for biotechnology manufacturing and laboratory use.

Conclusion

L-022-030

The City of Somerville hereby requests that the EOT acknowledge the existence of the land use permits related to 150 Inner Belt Road as it continues to evaluate the relative merits of the potential sites for the Green Line Extension maintenance facility and storage. As can be seen, the selection of Yard 8 would result in the loss of an already-permitted 190,000 s.f. commercial structure.

Thank you for taking these comments into consideration as we move forward on the Green Line Extension project. I can be reached at 617-625-6600 x 2500 if you have any questions or concerns.

Sincerely,

MONICA R. LAMBOY
Executive Director

L-022-030

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

RE: Green Line Extension Draft EIR (EEA #13886)

Dear Secretary Bowles,

The Belmont Citizens Forum (www.belmontcitizensforum.org) is supported by about 700 families in Belmont and neighboring communities who are concerned with protecting the environment, protecting open space, preserving historic and archeological resources, controlling the growth of traffic and improving pedestrian safety. A major project of the Forum is to develop a shared use community path from Belmont Center to Brighton Street in Belmont, where it will connect with the soon to be constructed Alewife to Belmont extension of the Minuteman Bike Trail (MassHighway has recently let a contract for the construction of this segment along with rebuilding of the Alewife to Davis Square linear park). The common denominator among the Forum's Belmont Center to Brighton Street path project, the MassHighway Alewife to Davis Square project and the Somerville Community Path is that they are all segmetns of the Mass Central Rail Trail. Together they will provide an off road route from Belmont Center into Boston (and eventually will connect to points further West along the MCRT route). The critical eastern section of the Mass Central Rail Trail is the Somerville Community Path that will bring this linear park to Cambridge, the Charles River and into Boston. Clearly, the way to build this last section is with the construction of the Green Line extension from Cambridge to Somerville and Medford.

Therefore, we have reviewed the Draft EIR for the Green Line extension. The citizens Forum wholeheartedly supports the design and construction of the Green Line extension but offer the following comments to insure successful extensions of both the Green Line and the Somerville Community Path.

O-001-001

- The DEIR should clearly state that the extension of the Community Path will be designed by MassDOT's contractors as agreed to in a February 24, 2009 letter from the EOT. We understand that this design will be for the section from Lowell St. to Lechmere.
- The only way the Path can realistically and cost effectively be constructed is together with the Green Line construction. Therefore the Green Line and Community Path extensions will be designed and constructed as one project and described as such in the DEIR and Green Line planning documents

MassDOT should commit to working with the City and other State and Federal agencies to obtain the necessary funding for the construction of the Community Path extensions, including applying for Federal New Starts funding for applicable costs (The FTA has recently proposed a policy that "pedestrian improvements located within one-half mile and all bicycle improvements located within three miles of a public transportation stop... may be eligible for FTA funding: http://edocket.access.gpo.gov/2009/E9-27240.htm)

There are many other reasons why these requests are reasonable and appropriate in addition to completing

O-001-001

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

MassDOT is committed to completing all planning, design, and engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community Path between Lowell Street and Inner Belt Road. The limits of the path were predicated on the connections to Lechmere being made through the Inner Belt area via Inner Belt Road and the proposed Urban Ring Bridge into the Lechmere area. However, the cessation of planning for the Urban Ring Project has changed the timing of this anticipated connection. MassDOT is unable to assume responsibility for designing the Urban Ring Bridge as part of the Green Line Extension Project. That being said, MassDOT is committed to working with the City of Somerville, residents and businesses in the Brickbottom and Inner Belt neighborhoods, and Community Path advocates to design the Path to create improved connectivity within the Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension.

the Mass Central Rail Trail:

- The Somerville Community Path will provide desirable off-road bicycle and pedestrian access to the stations, offering superior connections to the neighborhoods (like in Davis Sq.), thereby attracting more riders in a very cost-effective manner.
- In the vicinity of Lowell St., Gilman Sq. and Washington St. stations, the Community Path is in integral part of the station access.
- There are at least 2 precedents in the Boston area for community paths constructed and paid for by transit projects:
  - The Linear Path over the Red Line Paths with the Red and Orange line extensions that were part of the overall transit construction project
  - The Southwest Corridor Path alongside and over the Orange Line

Thank you very much for considering these comments for the extension of the Green Line relative to the Somerville Community Path.

John Dieckmann

Vice-President

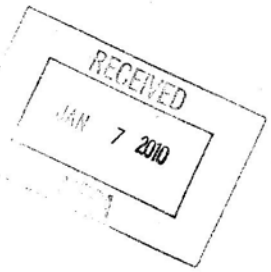
Brickbottom Artists Building/Condominium Trust
1 Fitchburg St. C101
Somerville, MA 02143

January 6, 2010



Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
100 Cambridge Street, Suite 900
Boston, MA 02114

RE: Green Line Extension Project
EEA #13886

Dear Secretary Bowles and Ms. Johnson,

As the Trustees for the Brickbottom Artists Building/Brickbottom Condominium Trust, we are writing to comment on the DEIR/EA for the Green Line Extension Project, EEA #13886.

Generally, we are excited about this project and fully support the extension of the Green Line all the way to Rt. 16 ("Alternative 2b"). Somerville needs the improved public transportation and air quality benefits that the extension will bring, and believes the Project, if properly designed and mitigated, will greatly benefit the economic development of the Brickbottom and Inner Belt districts.

However, certain aspects of the Project have not been adequately addressed in the DEIR and warrant further MEPA review – the most significant being the proposed siting of the maintenance facility and storage yard, the evaluation of related impacts and the development of specific mitigation measures.

MAINTENANCE FACILITY AND STORAGE YARD

We vehemently oppose MassDOT's preferred siting of a maintenance facility and storage yard at the "Yard 8" site. MassDOT's preference for siting these facilities at Yard 8 is the result of a flawed and incomplete alternatives analysis, which, among other deficiencies, failed to appropriately account for the costs and significant adverse impacts associated with the Yard 8 alternative – on Brickbottom, the surrounding community and Somerville more broadly.

O-002-001

Yard 8 should be removed from further consideration and MassDOT should be required to complete its analyses of alternative locations for the maintenance facility and storage yard within the MEPA process. Siting the maintenance facility and storage yard at the "Yard 8" site:

- Would remove 11.5 acres of land from the City of Somerville's commercial tax base, a significant cost particularly given that most of this land is privately held and zoning approvals have already been issued for the development of that land.
- Would prevent ongoing efforts to build neighborhood cohesion and interconnections in this area by creating a permanent and impermeable barrier between the Inner Belt and the

O-002-001

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

Brickbottom areas – in direct conflict with Smart Growth Principles and established municipal planning initiatives.

- Would derail future development of the Yard 8 site, which is one of the last remaining areas of developable land in our neighborhood and Somerville.
- Would disproportionately impact Brickbottom given Yard 8's proximity to Brickbottom and would disproportionately impact this area of Somerville by constituting a second large rail maintenance facility and storage yard within this small area (in addition to the Boston Engine Terminal, or BET, commuter rail maintenance facility). With the introduction of the Green Line Extension, residents of the Brickbottom Artists Building will also be living in perpetuity with two Green Line spurs on either side of its buildings, in addition to the commuter and freight lines that are already there. These disproportionate impacts are in direct conflict with the Certificate on the EENF (Environmental Justice, p. 7), which stated that "no segment of the population should be denied environmental benefits, or should bear a disproportionate burden of environmental impacts."
- Would directly abut the Brickbottom Artist Building, an existing residential building that serves as home and work space for over 220 people, and would result in significant adverse impacts on our quality of life and property values due to noise, vibration, air pollution, visual impacts, loss of potential future interconnections to Inner Belt, etc… MassDOT has not sufficiently evaluated or accounted for these significant adverse impacts to Brickbottom.
- Has been opposed by the City of Somerville, the Somerville Chamber of Commerce, community groups, Brickbottom residents, and many other interested parties since it was first proposed. At the recent DEIR public hearing on November 18th and the meeting related to DOT's ongoing review of maintenance facility alternatives held at the Cambridge Multicultural Arts Center on December 16th, opposition to Yard 8 was unanimous.
- May force the Green Line Extension main line tracks to be closer to Brickbottom and does not leave room for the community path to continue along the tracks. If these facilities were sited elsewhere, it may be possible to shift the Green Line tracks farther away from Brickbottom (which would help decrease noise and vibration impacts from the lines themselves) and to route the community path along the tracks. The loss of these attributes were not properly considered in DOT's evaluation of the Yard 8 alternative – as costs associated with the Yard 8 alternative (or, on the flip side, as benefits associated with siting those facilities elsewhere).
- Was a preference developed without involvement and input from project's Citizen's Advisory Group. The CAG was not involved in DOT's evaluation of potential sites for the maintenance facility and storage yard before Yard 8 was identified as DOT's preferred alternative. Although DOT communicated its preference for Yard 8 to the CAG and at public meetings, it did not provide any meaningful opportunity for the Citizen Advisory Group, Brickbottom or other interest persons to participate in DOT's evaluation process. Additionally, mandated land use planning was not performed in connection with DOT's evaluation of alternatives for the siting of these facilities. DOT's flawed review process was in direct conflict with the community involvement requirements of the Secretary's Certificate on the EENF (Smart Growth/Land Use, p. 5).

O-002-002

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. The evaluation considers connectivity and other land use impacts and opportunities associated with each maintenance facility site alternative.

As stated in FEIR Section 6.4.4, MassDOT and the MBTA will conduct a series of public workshops to gather input on land use and facility design issues from the communities. These workshop offer an opportunity to discuss how facility design can influence indirect and cumulative effects, such as economic development.

O-002-003

As explained in FEIR Chapter 2, MassDOT has explored opportunities for the Green Line Extension storage and maintenance facility to share resources with the Boston Engine Terminal. The independent needs and constraints of these facilities limit opportunities for shared resources. MassDOT will coordinate with the MBTA during preliminary engineering to maximize efficient land utilization between these storage and maintenance facilities, if possible.

O-002-004

The Green Line Extension storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the Project. Chapter 2 of the FEIR fully describes the environmental impacts of the proposed storage and maintenance facility. The facility must be constructed in the vicinity of the Green Line Extension right-of-way to maximize operating efficiencies.

The storage and maintenance facility alternatives include storage for Green Line Extension vehicles and replacement of the existing Lechmere Station vehicle storage. Storage capacity is also provided for vehicles currently stored in trackways between Lechmere Station and

Regardless of the final choice of site, any maintenance facility and storage yard for the Green Line Extension should be planned in conjunction with comprehensive land use and economic development planning and designed so as to:

O-002-002
- Minimize adverse impacts on economic development and neighborhood connectivity.

O-002-003
- Consolidate all rail facilities (the new facilities and existing facilities) to the extent feasible by, for example, maximizing the use of the BET land (43 acre commuter rail maintenance facility) and consolidating other MBTA land uses (tracks, offices, etc) in the Inner Belt area.
- Minimize the facilities' footprint(s). For example:

O-002-004
  - MassDOT should be required to revisit its stated "needs" as related to the maintenance facility and storage yard. These facilities should be designed to accommodate only the needs of the Green Line Extension, not to address the existing additional needs and shortcomings of the Green Line facilities. By attempting to address the larger set of needs and existing shortcomings, MassDOT has defined its maintenance facility and storage yard "needs" such that many potentially viable siting alternatives were ruled out as too small and, therefore, not subjected to further analysis (see, e.g., p. ES-23 to ES-25 and 3-7 to 3-10). **To the extent MassDOT seeks to address system-wide maintenance and storage needs and shortcomings, it should be required to conduct a searching reexamination of all feasible alternatives, including evaluation of sites (or combination of sites) elsewhere in the Green Line system, not merely those along the Green Line Extension.**
  - Avoid construction of separate employee parking areas for MBTA workers if existing or new parking facilities can be shared.

O-002-005
- Blend with future mixed-use development, not perpetuate the area's historical industrial character (which Somerville planning initiatives seek to move away from in this area).

O-002-006
- Evaluate and plan rail traffic patterns, including switching and reversal of cars, as well as curvature in the railway tracks, so as to minimize noise and vibration impacts on nearby residences associated with the rail movements.

O-002-007
- Otherwise incorporate design measures to minimize the adverse impacts associated with the facilities (in addition to required off-site mitigation measures), such as by enclosing or screening the storage yard, thoughtful lighting designs and landscaping, etc…

O-002-008
- Incorporate construction and operational protocol consistent with sustainable design principles.

MassDOT acknowledges in the DEIR that it has not completed its review of alternatives for the siting of the maintenance and storage yard facilities. We were pleased to see that MassDOT has identified in the DEIR – and subsequently in its *Additional Maintenance Facility Study* report – two additional alternative sites for these facilities: Mirror H and Option L – that it represented it would evaluate further. That ongoing evaluation should be conducted within the MEPA framework.

O-002-009
From Brickbottom's perspective, the Mirror H site is probably the best of the proposed sites and Brickbottom would support Mirror H as the preferred alterative in a Final EIR.

Government Center; this storage will be lost due to the Green Line Extension.

O-002-005

Direct and indirect impacts to land use are described in DEIR/EA Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for sustainable land use, which could further reduce automobile traffic congestion and improve air quality.

O-002-006

FEIR Chapter 2 presents an analysis of noise and vibration impacts for each site alternative. The storage and maintenance facility and its rail approaches will be designed to minimize noise and vibration impacts to neighboring properties and stakeholders. Noise and vibration mitigation measures are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

O-002-007

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, Option L is identified as the preferred maintenance facility site. Design of the facility, in preliminary engineering, will take into consideration visual impact.

O-002-008

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include

O-002-010

The "Option L" site also appears to be a promising compromise location. However, further analysis of that option (including analysis of the potential design configurations, impacts and mitigation measures) is needed. Additional review of the Option L alternative should address the bulleted design items listed above. Specifically related to Option L, the review should also:

- Be done in conjunction with the 2010 Somerville master planning process for the Brickbottom/Inner Belt area.
- Minimize parking areas, possibly by sharing parking facilities with BET.
- Move storage farther away from Brickbottom (for example, by using the land currently reserved for parking).
- Minimize the amount of train storage required.
- Reduce track curvature at the western end (closest to Brickbottom), as higher noise and vibration levels are associated with tighter curves.
- Maximize consolidation and coordination opportunities with the BET commuter rail maintenance facility and other rail uses in the area wherever possible to minimize the total rail use footprint required in the Brickbottom/Inner Belt area.

It appears that one of the biggest potential downsides of Option L, as indicated in the *Additional Maintenance Facility Study*, is its projected cost, particularly the land acquisition cost. That cost is listed as $52 million (*Table 3-6 Order-of-Magnitude Conceptual Capital Cost Estimate for Option L)*. However, it is unclear how that number was developed. It appears from our own review of the Somerville assessor's database that the projected cost is significantly overstated and is more likely on the order of $16 million. The basis for this lower figure is described in the written comments being submitted on Brickbottom's behalf by its engineer, Tom Houston of Professional Services Corporation, PC.

PROJECT IMPACTS AND MITIGATION

While the DEIR, including the "Draft Section 61 Findings and Mitigation Commitments", identifies various mitigation measures as related to the extended rails and the maintenance and storage facilities, many are couched with caveats such as "to the extent practicable" and "where feasible." Many are also described only categorically or generally. The mitigation measures outlined in the DEIR and Draft Section 61 Findings do not adequately respond to the requirements of the Certificate on the EENF or MEPA's regulatory requirements more generally.

O-002-011

MassDOT should be required to more fully evaluate potential mitigation measures and to identify them more specifically in an FEIR and revised draft Section 61 Findings.

MassDOT should be required to attempt in good faith to negotiate Mitigation Agreements with the impacted communities and Brickbottom during the FEIR process (of the sort negotiated in connection with the Greenbush Line). These agreements would serve to more clearly specify enforceable mitigation goals, measures and deadlines and should establish an agreed upon process by which the community and affected abutters can seek redress if those goals, measures and/or deadlines are not met. These agreed-upon measures would facilitate and could be incorporated into MassDOT's Proposed and Final Section 61 Findings.

conceptual designs. Detailed designs for each station, the maintenance facility, and the entire Project will be refined during the preliminary engineering phase. As stated in DEIR/EA Section 3.7, the Project will emphasize low-energy, low-impact, "green" design. The process for coordinating with the local communities during Project design is described in the Public Involvement Plan, Chapter 6 of the FEIR.

O-002-009

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Mirror H location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

O-002-010

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, Option L is identified as the preferred maintenance facility site.

As explained in FEIR Chapter 2, MassDOT has explored opportunities for the Green Line Extension storage and maintenance facility to share resources with the Boston Engine Terminal, including employee parking. The independent needs and constraints of these facilities limit opportunities for shared resources. MassDOT will coordinate with the MBTA during preliminary engineering to maximize efficient land utilization between these storage and maintenance facilities.

O-002-011

MassDOT has developed proposed mitigation measures / draft Section

O-002-012 The DEIR lists the sequencing for most mitigation as not occurring until after construction. However, for the sake of the residents affected, mitigation (particularly for noise and vibration) should be established before construction begins wherever possible.

O-002-013 MassDOT should be required to more fully evaluate the cumulative impacts of the Project on Brickbottom – as needed to identify appropriate mitigation. With the introduction of the Green Line Extension, residents of the Brickbottom Artists Building will live in perpetuity with two Green Line spurs on either side of the building in addition to the commuter and freight lines that are already there (in addition to impacts from the maintenance facility and storage yard if located at Yard 8). While the DEIR discusses the Green Line Extension main line tracks on the east side of Brickbottom, it does not include any study of the Union Square branch tracks on the south side of the building. The tracks on that side are already noisy due to commuter train traffic on the Fitchburg Line and large Amtrak engines, freight trains and commuter trains that idle on the dead-end railhead, and the reverberating echo of all of those trains when they travel under the McGrath Highway overpass. The collective noise and vibration impacts of these and the projected Union Square spur need to be measured and projected to assess required noise and vibration mitigation.

O-002-014 The Brickbottom mitigation discussion in the DEIR is also confusing and the level of detail is insufficient. It lists only 40 of the 155 units in Brickbottom as designated for soundproofing, but gives no indication which units those are, how they were identified, or what that mitigation would be. Given the building's proximity to both lines of the extension, much more should be done including building-wide soundproofing and noise quieting systems at the trains themselves (e.g. acoustical absorption under the cars, HVAC fans designed to be more efficient and quieter, switching to EPA Level 3 diesel engines on the commuter rail trains).

The DEIR focuses on mitigation for indoor spaces at Brickbottom. However, outdoor mitigation is also needed for the only outdoor green space in the area, the award-winning Brickbottom Courtyard, which will be severely impacted by noise and vibration. The courtyard is open at both ends from the North and South and will reverberate with noise from both the proposed Yard 8 maintenance and storage facility and from both sides of the Green line.

O-002-015 Similarly, the DEIR does not address changes in indoor air quality that would result from having to keep windows closed in order for any building soundproofing to function.

O-002-016 MassDOT's repeated assurances in the DEIR that it will work further with Brickbottom during future design stages to evaluate impacts and to identify appropriate mitigation in the future is an unacceptable substitute for it conducting these efforts within the MEPA context. See, e.g., 301 CMR 11.07(6)(h) (Assessment of Impacts), 11.07(6)(j) (Mitigation Measures) and 11.07(6)(k) (Proposed Section 61 Findings). Among other things, the information derived from those efforts is critical to MassDOT's assessment of the feasibility and appropriateness of siting the

O-002-017 maintenance and storage yard facilities at Yard 8. MassDOT's evaluation of alternatives is incomplete and inadequate where it has not yet completed its evaluation of impacts associated with the feasible alternatives under consideration. See, e.g. 301 CMR 11.07(6)(f)(4) (requiring "an analysis of the principal differences among the feasible alternatives under consideration, particularly regarding potential environmental impacts.")

61 findings for the Green Line Extension Project. These are provided in DEIR/EA Chapter 6, Draft Section 61 Findings and Mitigation Measures. Mitigation measures for the College Avenue and Lechmere Stations are further described in FEIR Chapters 4 and 5, respectively. The mitigation measures and procedures required by the Secretary's Certificate on the DEIR are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments. As the Project advances into preliminary engineering and further detailed designs on mitigation are developed, MassDOT will work with abutters, as appropriate, to consider recommendations for mitigation.

O-002-012

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8. To the extent possible, MassDOT will work to implement appropriate mitigation measures prior to construction,

O-002-013

Anticipated indirect and cumulative effects of the Project, including impacts on corridor transportation and traffic, growth, property values, land use, transit-oriented and economic development are described in DEIR/EA Section 5.15, Indirect and Cumulative Effects. As stated in FEIR Section 6.4, MassDOT and the MBTA will conduct a series of public workshops to gather input on land use and facility design issues from the communities. These workshops will offer an opportunity to discuss how facility design can influence indirect and cumulative effects. The DEIR/EA did evaluate the noise impacts at the Brickbottom residences for both proposed Green Line branches.

Potential noise and vibration impacts were assessed for the southwest

ONGOING MEPA REVIEW AND COMMUNITY INVOLVEMENT

O-002-018 We respectfully request that further MEPA review be required – with particular focus being on further evaluation of alternative locations for the maintenance facility and storage yard and the related impacts and mitigation measures. MassDOT should be required to prepare an FEIR and revised, more comprehensive Proposed Section 61 Findings.

O-002-019 We also request that you consider establishment of a Special Review Process, pursuant to 301 CMR 11.09, which includes establishment of a Citizens Advisory Committee (CAC) pursuant to 301 CMR 11.09(3) – to oversee and facilitate the ongoing MEPA review process and to ensure meaningful opportunity for community input in this process.

O-002-020 As discussed above, MassDOT should also be required to attempt in good faith to negotiate Mitigation Agreements with the impacted communities and Brickbottom during the FEIR process (of the sort negotiated in connection with the Greenbush Line). These agreements would serve to more clearly specify enforceable mitigation goals, measures and deadlines and should establish an agreed upon process by which the community and affected abutters can seek redress if those goals, measures and/or deadlines are not met. These agreed-upon measures would facilitate and could be incorporated into MassDOT's Proposed and Final Section 61 Findings.

O-002-021 If efforts to negotiate Mitigation Agreements are unsuccessful, MassDOT should, alternatively, identify and commit unilaterally to more clearly specified and enforceable mitigation goals, measures and deadlines and should commit to establishing a process by which the community and affected abutters can seek redress if those goals, measures and/or deadlines are not met.

COMMUNITY PATH

O-002-022 In order to have the most impact and the best integration between neighborhoods, pedestrians, bicyclists and the Green Line, the Community Path should be designed and built in conjunction with the Green Line Extension.

O-002-023 The preliminary designs included in the DEIR are flawed in that they would provide Brickbottom with access to the Community Path only at Washington Street. As the only residents in the immediate area, and as an arts destination for Gallery shows, Open Studios, and other events, MassDOT should be required to evaluate designs/configurations that would provide more direct access between Brickbottom and the Community Path.

BRICKBOTTOM/WASHINGTON STREET STATION

O-002-024 MassDOT should be required to evaluate the location of this station directly at Washington Street – rather than south of it as proposed – in order to better serve the surrounding neighborhoods.

It should also be required to evaluate designs that would allow access from both sides of Washington Street and that would directly connect it to nearby bus stops.

facade of the Brickbottom Artists Building, which abuts the existing MBTA Fitchburg Commuter Rail line. Because the northeast façade represents the location of the building with a potential for more severe noise impact, findings for the southwest façade were not originally reported in the DEIR/EA. These findings have been included in FEIR Chapter 8. All noise projections take into account proposed changes to the topography of the alignment, including things such as retaining walls and grading.

During preliminary engineering, MassDOT will conduct further analysis for several individual properties, including the Brickbottom Artists Lofts. As described in FEIR Chapter 8, MassDOT will then be able to identify the specific measures that will be appropriate for mitigating the Project's noise and vibration impacts. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

O-002-014

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

O-002-015

The Green Line Extension will have a positive impact on outdoor air quality within the study area. Indoor air quality is unique to each individual building, and is outside the scope of this project.

POTENTIAL FOR FUTURE STATIONS

O-002-025 The extension should be designed so that it does not preclude the possibility of future stations between Lechmere Station and Washington Street on the main line or between Lechmere and Union Square on the spur.

BRICKBOTTOM LAND TAKING

O-002-026 A strip of land on the south side of Brickbottom is listed as one of the land takings for the project. The details of this taking should be provided more clearly and more fully evaluated, as this taking has the potential to significantly impact the Brickbottom community.

CONCLUSION

The Green Line Extension is a great project that will have immense benefits for the communities that it will serve and we strongly support it. However, we request that the project not move to a Final EIR/EA with "Yard 8" as the preferred maintenance facility and storage yard location, and without written mitigation and citizen advisory committee agreements in place. A Supplemental EIR could be used to address these issues.

O-002-027 Also please find attached a petition against "Yard 8" with 231 signatures, including over 120 from people who do not live at Brickbottom, but who have attended one of several recent arts events in the building.

Sincerely,

Ramon Beuno, Trustee

Lee Busch, Trustee

O-002-016

MassDOT has been coordinating with the Brickbottom Artists Building Trust throughout the MEPA process. As described in Chapter 2 of the FEIR, the analysis of the maintenance facility alternatives considered issues raised by the Brickbottom Artists Building Trust. Chapter 6 of the FEIR describes the Public Involvement Plan for the design and construction process.

O-002-017

Chapter 2 of the FEIR provides an evaluation of the three maintenance facility alternatives as required by the Secretary's Certificate on the DEIR/EA.

O-002-018

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

O-002-019

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

O-002-020

The stakeholder coordination process for project mitigation is described in FEIR Section 6.3, Public Outreach Strategies. As the Project advances into preliminary engineering and further detailed designs on mitigation are developed, MassDOT will work with abutters, as appropriate, to consider recommendations for mitigation.

O-002-021

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in DEIR/EA Chapter 6, Draft Section 61 Findings and Mitigation Measures. Mitigation measures for the College Avenue and Lechmere Stations are further described in FEIR Chapters 4 and 5, respectively. The mitigation measures and procedures for implementation required by the Secretary's Certificate on the DEIR are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments. As the Project advances into preliminary engineering and further detailed designs on mitigation are developed, MassDOT will work with abutters, as appropriate, to consider recommendations for mitigation.

O-002-022

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

O-002-023

MassDOT is committed to completing all planning, design, and engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community Path between Lowell Street and Inner Belt Road. MassDOT is committed to working with the City of Somerville, residents and businesses in the Brickbottom and Inner Belt neighborhoods, and Community Path advocates to design the Path to create improved connectivity within the Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension.

O-002-024

The conceptual plan for the Brickbottom Station will be refined during the preliminary engineering stage, taking into consideration municipal, neighbor, and other stakeholder concerns to the extent practical. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process. Based on the analysis conducted during development of the DEIR/EA, it was determined that only one station would be warranted in the vicinity of the Brickbottom neighborhood and Washington Street. This analysis can be found in Appendix A of the DEIR/EA.

O-002-025

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

O-002-026

DEIR/EA Section 5.2 describes the Project's potential acquisitions. MassDOT is currently conducting detailed property surveys to obtain more specific data. MassDOT will continue to evaluate opportunities to minimize these property impacts.

O-002-027

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, Option L is identified as the preferred maintenance facility site.

A PETITION OPPOSING THE SITING OF THE GREEN LINE MAINTENANCE AND STORAGE FACILITY IN "YARD 8"

RECEIVED JAN 8 2010 MEPA

O-003-001 We, the undersigned, oppose the siting of the proposed Green Line Maintenance and Storage Facility on the Yard 8 parcel in Somerville, Massachusetts. We strongly feel that siting the facility at Yard 8 will have a lasting, significant, and seriously adverse impact on the Brickbottom Artists Building and the surrounding community, and that mitigating measures will not be effective. Accordingly, an alternative site should be found.

Project Draft Environmental Impact Report/Environmental Assessment and Section 4(f) Statement
Green Line Extension Project

Subject Comments on the Draft Environmental Impact Report

Impacts of the Mainline Green Line Extension, the Union Square Branch, and the Yard 8 Maintenance and Storage Facility on Brickbottom Condominium Association Residents

Professional Services Corporation, PC (PSC) has been engaged by the Brickbottom Condominium Association to review the Draft Environmental Impact Report for the Green Line Extension Project and to submit comments on the Draft EIR on its behalf.

The residents of the Brickbottom Condominiums strongly support the Green Line Extension Project and recognize its significant benefits to the State, Somerville, and Brickbottom residents. However, the Brickbottom Condominiums will be significantly impacted by construction and operation of the mainline Green Line Extension and the Union Square Branch and to an even greater extent by construction and operation of the Yard 8 Maintenance and Storage Facility. The mainline Green Line Extension tracks will be constructed within 18 feet of the Brickbottom Condominiums and the project will necessitate acquisition of property from the Brickbottom Condominium Association. The Yard 8 Green Line

Ten Lincoln Road
Suite 201
Foxboro, MA 02035-1387

Tel. 508.543.4243
Fax 508.543.7711

Maintenance and Storage Facility is proposed for construction adjacent to the mainline Green Line Extension abutting the Brickbottom Condominiums.

Based upon our review, we find that the "Draft Environmental Impact Report" (Draft EIR) and related documents for the Green Line Extension are fundamentally inadequate. Among other issues (as identified in the additional comments letters that will be submitted by and on behalf of Brickbottom), the documents fail to properly evaluate alternatives to the Yard 8 site, fail to identify and evaluate the probable impacts of the Green Line Extension Project on the Brickbottom Condominium residents, and fail to provide commitments sufficient to mitigate the significant adverse impacts of the Project on the Brickbottom Condominiums.

Of even greater concern, the Draft EIR fails to document provisions to avoid and minimize significant adverse impacts on the Brickbottom Condominiums caused by construction and operation of the Yard 8 Maintenance and Storage Facility. The Yard 8 Maintenance and Storage Facility is inconsistent with the purpose and intent of the MEPA process because its construction and operation cause significant adverse impacts which cannot be effectively alleviated through incorporation of proposed mitigating measures.

The Brickbottom Condominium residents regard construction of the Yard 8 Maintenance and Storage Facility as intrinsically unacceptable and will exhaust all administrative and legal remedies to preclude its construction. However, should such efforts prove unsuccessful, we are concerned that MassDOT has not sufficiently evaluated and identified effective and sufficient mitigation measures – or demonstrated that there are any measures capable of effectively mitigating the significant adverse impacts of the Yard 8 Maintenance and Storage Facility.

O-004-001

We request that the Executive Office of Energy and Environmental Affairs (EEA) retain continuing jurisdiction beyond the Draft EIR and we request that any finding that the "Environmental Impact Report" adequately and properly complies with MEPA be withheld until MassDOT (1) completes its analysis of alternatives to Yard 8 (in a manner that addresses the substantive and procedural defects identified in this memorandum), (2) completes a meaningful evaluation of the potential impacts of the Project on the Brickbottom Condominium residents, (3) completes a meaningful analysis of design and other measures to avoid and minimize those impacts (whether or not Yard 8 remains the preferred site for the Maintenance and Storage Facility), and (4) provides specific and binding commitments to effectively mitigate the significant adverse impacts of the Project on the Brickbottom Condominiums.

PROCEDURAL ISSUES

VHB's December 9, 2009 "Technical Memorandum, Green Line Extension Project Additional Maintenance Facility Alternatives Analysis" – issued after publication of the Draft EIR – purports to contain "…a preliminary analysis of the additional alternatives [to Yard 8] … as well as a preliminary

O-004-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA. The following responses to comments address these specific issues.

evaluation of potential environmental impacts…"[1] However no analysis of environmental impacts is actually included. The Memorandum states that "…a full environmental analysis has been conducted for the Yard 8 location"; however, MassDOT proposes to conduct "…a full analysis of environmental impacts (to natural resources, air quality, noise and vibration, historic resources, as well as social and economic impacts)…in a Notice of Project Change" after MassDOT has already reached a decision to substitute a Maintenance and Storage Facility Alternative for the Yard 8 Maintenance and Storage Facility. The process advanced by MassDOT is fundamentally inconsistent with the purpose of MEPA. The purpose of environmental documents under MEPA is to provide the State decision maker with a decision making tool allowing the decision maker to integrate concerns for the preservation and enhancement of environmental quality into the overall state decision process.

O-004-002 In an earlier document entitled "Executive Office of Transportation and Public Works, Green Line Extension Project, Green Line Support Facility Alternatives Analysis," MassDOT provided a conceptual analysis of maintenance and storage facility alternatives.[2] However, this document should not be regarded as an effective evaluation of alternatives because as stated "Of the numerous sites considered in the screening process, only Yard 8 with the Adjacent Parcel was of a sufficient size and configuration to effectively store the required cars and house a support facility while providing the operational flexibility that is needed for such a facility…" Fundamentally, MassDOT defined a "program" requiring a site containing a minimum area of approximately 10 acres to achieve the goals of the program. The analysis evaluated numerous sites which did not contain the defined minimum requisite 10 acres of land. MassDOT then rejected these sites as ineffective in that they could not meet the minimum functional requirements for the maintenance and storage facility. The fundamental reason for the failure of these sites to meet the program objectives is that none of the sites except Yard 8 contained the purported minimum requisite area of 10 acres.

DEFICIENCIES OF THE ENVIRONMENTAL IMPACT ANALYSIS RELATING TO IMPACTS ON THE BRICKBOTTOM CONDOMINIUMS

O-004-003 The Draft EIR does not properly identify and evaluate the probable impacts of the mainline Green Line Extension and the Yard 8 Maintenance and Storage Facility on the Brickbottom Condominiums. As such MassDOT will not have an accurate documentation of the probable impacts caused by construction and operation of the mainline Green Line Extension and the Yard 8 Maintenance and Storage Facility on the Brickbottom Condominiums. Without an accurate evaluation of impacts, MassDOT cannot properly develop and implement measures to mitigate impacts on the Brickbottom Condominiums or conduct an adequate comparison of the siting alternatives.

[1] VHB/Vanasse Hangen Brustlin, Inc. and PB Americas, Inc., "Technical Memorandum, Green Line Extension Project Additional Maintenance Facility Alternatives Analysis," December 9, 2009, Page 1-1.
[2] Vanasse Hangen Brustlin, Inc., "Executive Office of Transportation and Public Works, Green Line Extension Project, Green Line Support Facility Alternatives Analysis," November 6, 2008.

O-004-002

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

O-004-003

The DEIR/EA did evaluate the impacts of both Green Line Extension branches on the Brickbottom Artists Building, in combination with the impacts of Yard 8. FEIR Chapter 2 expands this analysis to include impacts from Option L, the preferred storage and maintenance facility location.

The following sections of this memorandum identify specific deficiencies in the analysis of environmental impacts for the mainline Green Line Extension and the Yard 8 Maintenance and Storage Facility.

LAND USE IMPACTS

The evaluation of land use impacts as set forth in the Draft EIR is based on property displacements and acquisitions. The Draft EIR states "For this section, direct effects or direct impacts on land use are defined as displacements of properties or property acquisitions required for the Project." The basis of evaluating land use impacts particularly as they relate to the Brickbottom Condominiums is flawed and inadequate.

O-004-004

The basis of contemporary land use control is locating land uses in proximity to land uses that are compatible in terms of their environmental effects such as noise, traffic, visual quality, etc. The Brickbottom Condominiums which is a residential use is incompatible with and will be negatively impacted by construction and operation of the Yard 8 Green Line Maintenance and Storage Facility in immediate proximity to the Brickbottom Condominiums. The Yard 8 Maintenance and Storage Facility will adversely impact the Brickbottom Condominiums in terms of noise, vibration, visual quality, and other effects. The Yard 8 Maintenance and Storage Facility is fundamentally incompatible with residential land use, as well as with local planning initiatives.

Under the provisions of the "Somerville Zoning Ordinance," the Brickbottom Condominiums consisting of artist live and work space in excess of 7 units is a use permitted in the IA District under Special Permit with Site Plan Review. [3] It is inaccurate to represent that industrial and other high intensity uses such as warehouse and retail could be located in proximity to the Brickbottom Condominiums absent strict control of any incompatible aspects of these uses. Under the Zoning Ordinance, uses having environmental affects potentially affecting artist live and work space are permitted by Special Permit with Site Plan Review, particularly for uses exceeding minimum floor area thresholds, typically 10,000 sq.-ft. GFA. The Special Permit process accords the Special Permit Granting Authority, broadly based discretion to impose limitation on the nature and scale of the use and to impose requirements for mitigation such as buffers and fencing. Accordingly, industrial uses and other high intensity uses would only be allowed under the provisions of a restrictive Special Permit and Site Plan Review process which would protect the Brickbottom residents and ensure compatibility with the existing Brickbottom residences.

Representations that the Maintenance and Storage Facility is a permitted use in the IA District are incorrect. Railroad terminals and yards, including operations conducted outside enclosed buildings are

[3] The Somerville Zoning Ordinance adopted on March 23, 1990, and further updated through Ord. No. 2009-12, adopted June 25, 2009, Section 3.e.

O-004-004

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site. Land use impacts from Option L are also described in FEIR Chapter 2.

prohibited in the IA District.[4] Prior to construction, the Somerville Zoning Ordinance must be amended in order to permit the storage facility portion of the Yard 8 Maintenance and Storage Facility. As such an amendment would be limited to a specific location and would benefit solely MassDOT; it would reasonably be categorized "spot zoning" which is not permissible.

The Draft EIR does not identify and evaluate the land use impacts of either the Mirror H Maintenance and Storage Facility or the Option L Maintenance and Storage Facility.

O-004-005

- The Mirror H Maintenance and Storage Facility can be designed such that it is fully compatible with adjacent land uses. It is compatible with the adjacent Boston Engine Terminal. Where the NorthPoint Development is not built-out and the portion of the development adjacent to the Mirror H Maintenance and Storage Facility is not constructed, there is an opportunity to adapt the NorthPoint development to minimize any incompatible elements as the Mirror H Maintenance and Storage Facility will predate development of sites within the NorthPoint development that immediately abut the Mirror H Maintenance and Storage Facility.

- The Option L Maintenance and Storage Facility could be compatible with adjacent land uses. It is compatible with the adjacent uses which are exclusively industrial in nature.

The Brickbottom Condominiums will also be adversely impacted by the Green Line Extension, including the Union Square branch; however, these impacts can to some extent be mitigated through measures proposed by MassDOT and as set forth hereinafter in this memorandum.

O-004-006

With respect to property acquisition, the Draft EIR states that 954 sq.-ft. of land will be acquired from the Brickbottom Condominiums in order to construct track improvements for the Union Square branch under Alternatives 1, 2, and 5.[5] However, there is no evaluation of the impacts that this acquisition will have on the Brickbottom Condominiums in terms of access, circulation, parking, etc. – and given the limited space in this area for these activities, the impacts may be significant. For Alternatives 3 and 4, 1,356 sq.-ft. would be acquired from the Brickbottom Condominiums for track improvements. Similarly, there is no evaluation of the impacts that this acquisition will have on the Brickbottom Condominiums. Acquisition impacts for Alternative 6 with respect to Brickbottom Condominiums are not clearly identified.

[4] City Of Somerville, Ordinance No. 2009-14, in the Board Of Aldermen: November 12, 2009, "An Ordinance Amending the Somerville Zoning Ordinance to Alter Uses Allowed in the IA, IB, And IP Industrial Districts and to Make Associated Map Changes," Article 7: Permitted Uses, 15. Communications, Utility, and Transportation Uses, 5. Railroad Terminals and Yards, Including Operations Conducted Outside Enclosed Buildings, a and b.
[5] Draft Environmental Impact Report, Table 5-5.2.

O-004-005

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives, including land use impacts, is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Mirror H location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

O-004-006

DEIR/EA Section 5.2 describes the Project's potential acquisitions. MassDOT is currently conducting detailed property surveys to obtain more specific data. MassDOT will continue to evaluate opportunities to minimize these property impacts.

Memorandum
January 7, 2010
Page 6

SOCIOECONOMIC IMPACTS

O-004-007 The Draft EIR utilizes property tax increases and decreases as a measure of impact. The basis of evaluating socioeconomic impacts based upon property tax impacts as they relate to the Brickbottom Condominiums is flawed and inadequate. Construction and operation of the Yard 8 Maintenance and Storage Facility in immediate proximity to the Brickbottom Condominiums will have a blighting effect on the Brickbottom Condominiums in terms of noise, vibration, structural damage from vibration, and visual quality. Accordingly, the property value and related property assessments and property taxes on units within the Brickbottom Condominiums will decrease. As the total assessed value of the Brickbottom Condominiums is in an order of magnitude of $40 million, the impact on City tax revenues could be significant.

Construction of the Yard 8 Maintenance and Storage Facility will require land acquisition and will require "voiding" an existing building permit for a 190,000 sq.-ft. building. The loss of potential property tax revenue form this site far exceeds losses in potential property tax revenues from Mirror H or Option L.

O-004-008 The Draft EIR does not identify and evaluate the socioeconomic impacts of the Mirror H or Option L Maintenance and Storage Facility alternatives.

- Whereas the portion of the NorthPoint Development adjacent to the Mirror H Maintenance and Storage Facility is not constructed, there is an opportunity to adapt the NorthPoint development to minimize any incompatible elements and the Mirror H Maintenance and Storage Facility will not affect the current property tax revenue from the NorthPoint development site nor should it diminish the assessed value or property tax revenue following redevelopment

- The Option L Maintenance and Storage Facility will necessitate the acquisition of two developed properties and will decrease existing property tax revenue. However, this reduction in property tax revenue could be mitigated if these businesses were to be relocated within the City of Somerville. The Option L Maintenance and Storage Facility is fully compatible with adjacent industrial land uses and will not adversely impact property tax revenues from adjacent sites.

NOISE IMPACTS

With respect to the Brickbottom Condominiums, the Draft EIR categorizes the increase in noise as a "severe impact." Noise at the "northeast façade" of the Brickbottom Condominiums will increase from 57.6 Ldn to 76.4 Ldn for Alternatives 1, 2, 3, and 4 and from 57.6 Ldn to 79.2 Ldn for Alternatives 5 and 6.

O-004-007

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives, including socioeconomic impacts, is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site. The City of Somerville anticipates redeveloping the entire area surrounding the Brickbottom Artists Building in a way that would increase property values. In general, access to rail transit also increases property values.

O-004-008

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering.

Memorandum
January 7, 2010
Page 7

O-004-009 The noise impact analysis is deficient in that it fails to identify and evaluate interior noise levels within the Brickbottom Condominiums building. It does not identify the noise attenuation characteristics of the existing structure and the extent to which insulation or glazing will, or will not, decrease interior noise levels.

The noise analysis is deficient in that it fails to identify noise levels other than the northeast façade, particularly given the location of Green Line tracks on two sides of the Brickbottom Condominium building.

The noise analysis is deficient in that it fails to identify noise levels within the ground level courtyard which is intensively used by residents and will be impacted by increased noise.

The noise analysis is deficient in that it fails to identify feasible mitigation for the projected severe noise impacts. For the Brickbottom Condominiums and other impacted buildings, the Draft EIR states that

> During the preliminary engineering phase of the project, the existing outdoor-to indoor noise reduction of the buildings will be measured. An analysis will be made as to whether the noise reduction of the building could be improved by five decibels or more with sound insulation treatments. The effectiveness of potential noise barriers to reduce interior noise levels at these locations will also be assessed.[6]

Failure to perform the analysis required to identify feasible noise mitigation is inconsistent with the required Scope for the Draft EIR. Based upon the lack of required analysis, there is no basis for the conclusion that "With mitigation, there would be no moderate or severe noise impacts from the Project."[7]

O-004-010 The Draft EIR does not identify and evaluate the noise impacts of Mirror H Maintenance and Storage Facility. Noise generated by the Mirror H Maintenance and Storage Facility should not adversely impact the adjacent Boston Engine Terminal. Where the NorthPoint Development is not built-out and the portion of the development adjacent to the Mirror H Maintenance and Storage Facility is not constructed, there is an opportunity to incorporate noise abatement measures in the design of the NorthPoint development.

The Draft EIR does not identify and evaluate the noise impacts of Option L Maintenance and Storage Facility. The adjacent land uses which are exclusively industrial in nature are not sensitive to any noise generated by the Option L Maintenance and Storage Facility.

[6] Draft EIR, p. 118.
[7] Draft EIR, p. 120.

O-004-009

Potential noise and vibration impacts were assessed for the southwest facade of the Brickbottom Artists Building, which abuts the existing MBTA Fitchburg Commuter Rail line. Because the northeast façade represents the location of the building with a potential for more severe noise impact, findings for the southwest façade were not originally reported in the DEIR/EA. These findings have been included in FEIR Chapter 8. In addition, the outdoor-to-indoor noise level reductions of the existing Brickbottom Artists Building façades have been measured and future interior noise levels have been projected and assessed against appropriate criteria. These findings are reported in the FEIR, including more detailed mitigation recommendations.

Based on recent site visits to the property, exterior land use with frequent human use has been identified at Brickbottom Artists Building and potential noise impact and mitigation will be assessed accordingly. Findings and associated mitigation commitments will be evaluated during preliminary engineering.

O-004-010

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives, including noise impacts, is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Mirror H location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

Memorandum
January 7, 2010
Page 8

VIBRATION IMPACTS

The Draft EIR projects that vibration levels will increase from 18 VdB to 77 VdB at the "northeast façade" of the Brickbottom Condominiums for Alternatives 1, 2, 3, 4, and 5. Vibration levels are not provided at this location for Alternative 6. The projected 77 VdB exceeds the criterion of 72 VdB for frequent events.

O-004-011

The analysis is deficient in that it fails to identify vibration levels other than the northeast façade, which is critical given the location of Green Line tracks on two sides of the Brickbottom Condominium building.

The analysis is deficient in that it fails to evaluate the effectiveness of proposed mitigation. Vibration mitigation is proposed along a 500 foot long segment of Green Line track along the northeasterly side of the Brickbottom Condominiums.

Although Green Line tracks will be constructed on two sides of the Brickbottom Condominiums, no vibration mitigation is proposed along the Union Square branch.

A menu of potential vibration attenuation measures are listed in Section 5.8.3 but there are no specific measures designated. The Draft EIR does not project vibration levels following implementation of the mitigating measures. The Draft EIR states that

> "During the preliminary engineering phase of the project, vibration measurements will be conducted at several properties expected to be impacted by vibration. These measurements will further refine the vibration reduction needed to mitigate potential impact. A vibration reduction goal for mitigation measures, such as ballast mats or resilient fasteners, will be specified in the bid documents." [8]

Failure to perform the analysis required to identify feasible mitigation is inconsistent with the required Scope for the Draft EIR. Based upon the lack of required analysis, there is no basis for the conclusion that:

> "Vibration mitigation, including up to 19,700 track-feet of vibration mitigation… and the relocation or use of specially-engineered trackwork…for 12 crossovers and turnouts, would be effective in keeping future vibration levels at or below existing levels for commuter trains and reducing future vibration from Green Line trains below the impact criterion." [9]

[8] Draft EIR, p. 131.
[9] Draft EIR, p. 132.

O-004-011

As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds. FEIR Chapter 8 describes specific proposed mitigation measures, plans for monitoring after construction, and next steps pertaining to mitigation. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

O-004-012 The Draft EIR does not identify and evaluate the vibration impacts of the Mirror H and Option L Maintenance and Storage Facility alternatives.

- Vibration caused by the Mirror H Maintenance and Storage Facility should not adversely impact the adjacent Boston Engine Terminal. Where the NorthPoint Development is not built-out construction phase vibration impacts will not affect undeveloped sites.
- The adjacent land uses which are exclusively industrial in nature are not sensitive to vibration caused by the Option L Maintenance and Storage Facility.

HISTORICAL RESOURCE IMPACTS

O-004-013 The Brickbottom Condominiums, formerly the A&P Grocery Warehouse, is eligible for listing in the National Register.[10] The Brickbottom Condominium Association has engaged a professional consultant to facilitate the nomination process to include the former A&P Grocery Warehouse building on the National Register of Historic Places. The Draft EIR is deficient in that it fails to identity adverse indirect impacts on this National Register eligible property.

O-004-014 Indirect impacts from construction of the Yard 8 Maintenance and Storage Facility include visual impacts and other impacts on the setting and character-defining features of the A&P Warehouse Building (Brickbottom Condominiums).

O-004-015 Noise and vibration from the Green Line tracks will adversely impact the A&P Warehouse Building (Brickbottom Condominiums), particularly the "severe impacts" from noise. The evaluation of impacts is deficient in that there is no basis for the statement following listing of the A&P Warehouse Building as a severely impacted property that "None of these properties are considered sensitive to noise..."[11]

O-004-016 The analysis of indirect impacts is deficient in that it fails to identify and evaluate the visual impacts of the Yard 8 Maintenance and Storage Facility on the setting of the A&P Warehouse Building (Brickbottom Condominiums).

O-004-017 The Draft EIR does not identify and evaluate impacts on historical resources caused by the Mirror H Maintenance and Storage Facility or the Option L Maintenance and Storage Facility. There are no national register eligible properties identified in proximity to either the Mirror H or the Option L sites. Accordingly neither the Mirror H Maintenance and Storage Facility or the Option L Maintenance and Storage Facility should impact historical resources.

[10] Draft EIR, p. 150.
[11] Draft EIR, p. 151.

O-004-012

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives, including vibration impacts, is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, Option L is identified as the preferred maintenance facility site.

O-004-013

As stated in Section 5.13.2.2 of the DEIR/EA, there would be indirect visual impacts to nearby historic architectural resources from the Yard 8 storage and maintenance facility but the effects are not expected to be adverse. As noted above, the Yard 8 site has been eliminated from further consideration, and Option L has been selected as the preferred maintenance facility site.

O-004-014

Please see response to Comment O-004-013.

O-004-015

The quoted sentence concludes with "... the increase in noise would not alter the characteristics that qualify these properties for listing in the National Register." That is, a sense of quiet is not a factor in the listing eligibility determination for this property.

O-004-016

As stated in Section 5.13.2.3 of the DEIR/EA, indirect visual impacts on the setting of nearby historic architectural resources are expected from the Yard 8 facility, but the effects are not expected to be adverse. In any event, the Yard 8 site has been eliminated from further consideration for the storage and maintenance facility; Option L is the preferred site.

Memorandum
January 7, 2010
Page 10

ARCHAEOLOGICAL RESOURCE IMPACTS

The Draft EIR acknowledges the potential for archeologically sensitive strata below railroad and upper fill deposits in the Yard 8 Maintenance and Storage Facility impact area.

O-004-018 If the Yard 8 Maintenance and Storage Facility continues to be considered for implementation, then subsurface testing as part of an intensive (locational) archaeological survey may be warranted in consultation with the FTA, MassDOT, and MHC. Should any significant and National Register-eligible archaeological resources be identified, then measures to avoid, minimize, or mitigate any adverse effects will required and may include an archaeological data recovery program din accordance with state and Federal requirements. Based upon the above, continued consideration of the Yard 8 Maintenance and Storage Facility could significantly impact the Project schedule.

O-004-019 The Draft EIR does not identify and evaluate impacts of Mirror H Maintenance and Storage Facility on archaeological resources.

The Draft EIR does not identify and evaluate impacts of Option L Maintenance and Storage Facility on archaeological resources. However, the Option L Maintenance and Storage Facility site was extensively disturbed to construct the two modern buildings on these sites and therefore should have relatively low sensitively with respect to archaeological resources.

SECTION 4(f)

O-004-020 The Draft EIR states that 954 sq.-ft. of land will be acquired under Alternatives 1, 2, and 5 and 1,356 sq.-ft. of land will be acquired under Alternatives 3 and 4 from the Brickbottom Condominiums in order to construct track improvements. The A&P Warehouse Building (Brickbottom Condominiums) is eligible for nomination to the National Register. Pursuant to Section 106 of the National Historic Preservation Act of 1966 and Section 4(f) of the U.S. Department of Transportation Act of 1966 the proposed land taking from an historic site of national, state, or local significance cannot be authorized unless there is no feasible and prudent alternative.

Neither the Mirror H Maintenance and Storage Facility site nor the Option L Maintenance and Storage Facility site have structures having characteristics making them eligible for inclusion on the National Register. Provisions of Section 106 of the National Historic Preservation Act of 1966 and Section 4(f) of the U.S. relating to land takings would not apply.

INDIRECT IMPACTS

The Draft EIR's evaluation of "Indirect and Cumulative Effects" includes proposals for air rights development over the proposed Yard 8 Maintenance and Storage Facility which would be consistent with

O-004-017

In accordance with the Secretary's Certificate on the DEIR/EA, impacts to selected environmental resources from the alternative maintenance facility sites are evaluated in the FEIR, Chapter 2.

O-004-018

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

O-004-019

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives, including archaeological resources. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering.

O-004-020

Section 4(f) and Section 106 regulations would apply to any land acquisition required from the former A&P Warehouse property. During preliminary engineering, MassDOT will continue to evaluate opportunities to minimize property acquisitions and impacts.

An expanded technical and environmental analysis of the light rail

Memorandum
January 7, 2010
Page 11

the MBTA's stated desire for a covered facility and would also foster Transit Oriented Development. MassDOT also proposes to enhance the aesthetic features of the exterior of the maintenance facility to help encourage quality redevelopment nearby. MassDOT proposes heavy visual screening by landscaping or walls, especially adjacent to the outdoor rail car storage area.

O-004-021 Enclosing, screening, and shielding the Yard 8 Maintenance and Storage Facility would help to minimize potential adverse visual, noise and access impacts on Brickbottom residents. However, the environmental analysis is deficient in that it does not evaluate the potentially significant impacts of various air rights development options on the Brickbottom Condominiums. One MassDOT proposal is for a parking deck over the storage yard. While this would provide weather protection for the Green Line cars, an extensive parking deck could also pose its own visual quality concerns as viewed from the upper floors of the Brickbottom Condominiums. MassDOT suggests using air rights development to create new open space would generally have very positive impacts on Maintenance and Storage Facility; however; active recreation such as MassDOT's proposal for playing fields could raise noise and lighting concerns. Any air rights development should be limited to uses that are compatible with and enhance the residential use of the Brickbottom Condominiums and must be appropriate in scale to avoid impacts arising from over development.

The Draft EIR is deficient in that it does not contain sufficient information to evaluate the impacts of these air rights development options. The selection, refinement and development of any air rights development in the Brickbottom area should be developed and evaluated with formal input from the Brickbottom Condominiums and other impacted residents and the City of Somerville.

O-004-022 The Draft EIR does not identify or evaluate indirect impacts of the Mirror H Maintenance and Storage Facility or the Option L Maintenance and Storage Facility. Due to the similar nature of the use, any indirect impacts of the Mirror H Maintenance and Storage Facility should not adversely affect the adjacent Boston Engine Terminal. Where the NorthPoint Development is not built-out and the portion of the development adjacent to the Mirror H Maintenance and Storage Facility is not constructed, there is an opportunity to adapt the design of the NorthPoint development to minimize any indirect impacts. Any indirect impacts of the Option L Maintenance and Storage Facility should not adversely affect the adjacent industrial uses.

VISUAL IMPACTS

O-004-023 The Yard 8 Maintenance and Storage Facility would introduce a preeminent and discordant visual focal point into corridor which would be uniquely visible from the Brickbottom Condominiums. The scale and utilitarian nature of the maintenance building and the scale and unsightly character of the massive open storage facility will have a blighting effect on the Brickbottom Condominiums and are incompatible with residential use.

storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

O-004-021

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

O-004-022

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement

Proposals for air rights development cannot change the massive scale of the Maintenance and Storage Facility and visual impacts of such an extensive facility will be negative.

O-004-024 The Draft EIR does not identify and evaluate the visual impacts of the Mirror H and Option L Maintenance and Storage Facility alternatives.

- The adjacent Boston Engine Terminal will not be impacted. Where the NorthPoint Development is not built-out and the portion of the development adjacent to the Mirror H Maintenance and Storage Facility is not constructed, there is an opportunity to incorporate adapt the design of the NorthPoint development to minimize any visual impacts caused by the Mirror H Maintenance and Storage Facility.
- The adjacent land uses to Option L, which are exclusively industrial in nature, should not be adversely impacted.

CONSTRUCTION IMPACTS

Identification and evaluation of the construction phase impacts of mainline Green Line Extension and the Yard 8 Maintenance and Storage Facility are measurably deficient. Construction phase impacts are significant but are generally presented in a qualitative and cursory manner. A more thorough analysis of construction phase impacts should be provided with detail proportionate to the significance of the impact.

The Yard 8 Maintenance and Storage Facility and continuous mainline Green Line Extension right-of-way and the Union Square branch right-of-way comprise the largest single construction site within the corridor. In general, construction phase impacts for this extensive area are summarily and non-quantitatively evaluated.

O-004-025 There is no quantification for fugitive dust during construction of Yard 8 Maintenance and Storage Facility and adjacent Green Line Extension rights-of-way and no information on the properties of on-site soils. There is no quantitative evaluation of the type and number of construction vehicles and equipment, the duration of their use on-site, or the routes to be used by construction equipment.

There is no evaluation of hours of operation during construction of the Yard 8 Maintenance and Storage Facility including evaluation of work on weekend days and holidays.

There is no evaluation of construction phase traffic for the Yard 8 Maintenance and Storage Facility including the type and number of construction truck and equipment trips and construction worker trips and no evaluation of routes for construction truck and worker trips.

There is no quantitative and no detailed qualitative evaluation of construction phase noise impacts for Yard 8 Maintenance and Storage Facility and adjacent Green Line rights-of-way. In fact, the entire

during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

O-004-023

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

O-004-024

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes an evaluation of the visual impacts of the three maintenance facility alternatives, and impacts to land uses. As documented in the FEIR, Option L is MassDOT's preferred location for the maintenance facility. Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering.

O-004-025

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

For any maintenance facility site, construction contractors will be

O-004-025 construction phase evaluation of noise impacts encompasses 70 words. It is likely that the building required for the Yard 8 Maintenance and Storage Facility will be pile supported as well as components of the Green Line itself. Pile driving causes potentially significant noise impacts, but there is no quantitative or detailed qualitative evaluation of noise impacts from pile driving. There is no information on the number or location of piles or the anticipated duration of pile driving.

Pile driving whether impact or vibratory has the potential to cause significant vibration impacts. There is no quantitative or detailed qualitative evaluation of noise impacts from pile driving. There is no information on the number or location of piles or the anticipated duration of pile driving. In fact the entire evaluation of construction phase vibration impacts encompasses 36 words.

O-004-026 The Draft EIR does not identify and evaluate construction impacts of the Mirror H or Option L Maintenance and Storage Facility alternatives.

- Construction of the Mirror H Maintenance and Storage Facility should not adversely impact the adjacent Boston Engine Terminal. Where the NorthPoint Development is not built-out and the portion of the development adjacent to the Mirror H Maintenance and Storage Facility is not constructed, construction impacts such as noise, vibration, and dust will not impact adjacent undeveloped sites within the NorthPoint development.
- The adjacent land uses to Option L, which are exclusively industrial in nature, are not sensitive to any noise, vibration, dust, and other construction impacts.

INSUFFICIENT COMMITMENTS TO IMPACT MITIGATION FOR THE BRICKBOTTOM CONDOMINIUMS

O-004-027 As the Draft EIR does not properly identify and evaluate the probable impacts of the mainline Green Line Extension and the Yard 8 Maintenance and Storage Facility on the Brickbottom Condominiums, effective measures to mitigate impacts cannot be identified. To the extent that project impacts are identified and evaluated in the Draft EIR, MassDOT has not committed to implement the full extent of measures required to effectively mitigate impacts on the Brickbottom Condominiums. The following sections of this memorandum identify specific mitigation recommend to mitigate impacts of the mainline Green Line Extension and the Yard 8 Maintenance and Storage Facility on the Brickbottom Condominiums (assuming Yard 8 continues to be MassDOT's preferred, or even a viable, alternative).

GENERAL

We recommend and request that MassDOT commit to the following:

required to comply with relevant federal, state, and local laws, regulations, and codes to eliminate or minimize adverse effects (such as noise and vibration levels, and traffic flow) to environmental and social resources. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the next phases of the Project: design and construction.

O-004-026

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

O-004-027

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction

O-004-028 1. MassDOT shall submit copies of the final all design plan submissions for the mainline Green Line Extension and the Union Square branch and the Yard 8 Maintenance and Storage Facility to Brickbottom Condominiums for review.

O-004-029 2. MassDOT shall reimburse the Brickbottom Condominium Association for the services of a professional engineer engaged by the Brickbottom Condominiums Association to review the design plan submissions on its behalf.

O-004-030 3. Should MassDOT select the Yard 8 Maintenance and Storage Facility Alternative over the objections of Brickbottom residents (and others), MassDOT shall submit to local Special Permit and Site Plan Review procedures and, in that context, shall submit copies of the Special Permit and Site Plan Review plans and application materials to the Brickbottom Condominiums Association for review prior to or concurrent with submission to the City of Somerville board(s).

O-004-031 4. MassDOT shall submit copies of any follow on environmental studies, supplemental data collection, and monitoring to the Brickbottom Condominium Association for review including without limitation copies of any documents pertaining to noise, vibration, air quality, hazardous materials, and historical resources.

O-004-032 5. MassDOT shall submit copies of all foundation engineering reports for walls or other components of the mainline Green Line Extension or the Union Square branch and for the Yard 8 Maintenance and Storage Facility to the Brickbottom Condominium Association for review and said studies shall include specific requirements for pile installation including alternative methods to minimize noise and vibration.

O-004-033 6. Should MassDOT select the Yard 8 Maintenance and Storage Facility Alternative, MassDOT shall prepare - in active coordination with Somerville officials and the Brickbottom Association – a long term Operations Plan for the facility addressing hours of operation, operational requirements to limit noise and vibration, lighting, maintenance and repair of the faculty and exterior operation areas and equipment.

LAND USE

No mitigation is proposed for land use impacts.

O-004-034 The Yard 8 Maintenance and Storage Facility is a prohibited use under the provisions of the Somerville Zoning Ordinance. Should MassDOT elect to proceed with the Yard 8 Maintenance and Storage Facility, MassDOT must (by law and through a commitment by MassDOT to comply with the Ordinance) petition the Board of Aldermen to amend the Zoning Ordinance to allow "Railroad Terminals and Yards, Including Operations Conducted Outside Enclosed Buildings" in the IA District. However, such an

monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

O-004-028

The conceptual plan for the Brickbottom Station will be refined during the preliminary engineering stage, taking into consideration municipal, neighbor, and oher stakeholder concerns to the extent practical. Yard 8 is no longer MassDOT's preferred site for the maintenance facility, which is currently proposed for the Option L site.

O-004-029

While MassDOT intends to share appropriate design documents with interested parties, it is not MassDOT policy to reimburse individuals or their consultants for design reviews. The responsibility for review lies with the individuals.

O-004-030

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

O-004-031

All previous and future environmental documents, including but not limited to the DEIR/EA, FEIR, and Final EA, describe the environmental impacts resulting from the Proposed Project. Each of these documents will be made available to the public.

O-004-032

MassDOT will share electronic versions of appropriate design

O-004-034

Memorandum
January 7, 2010
Page 15

amendment may be precluded as "spot zoning" because it would be limited to one specific site and would benefit MassDOT individually.

We recommend and request that MassDOT commit to the following measures:

O-004-035 1. MassDOT should select the Mirror H or Option L location for the Maintenance and Storage Facility to avoid adverse impacts in terms of noise, vibration, mass and scale, visual quality, lighting, and barriers to pedestrian and vehicular circulation.

O-004-036 2. MassDOT should evaluate alternative designs for the Community Path including one or more alternative alignments along the southerly side of the mainline Green Line Extension which will afford direct access to the Community Path for Brickbottom residents. Construction of the Community Path should be integral with construction of the Green Line improvements.

O-004-037 3. Should MassDOT select the Yard 8 Maintenance and Storage Facility Alternative over the objections of Brickbottom residents, efforts should be made to minimize the impact of the facility by reevaluating the program as follows:

   a. The parking area should be minimized.

   b. The storage requirements should be reevaluated on a system wide basis with storage provided only for the minimum number of cars required for the northerly Extension of the Green Line.

   c. Efforts should be made to locate additional storage locations remote from Brickbottom where trains entering service prior to 7:00 AM and after 7:00 PM can be stored.

   d. The storage area, switches, and curved track segments should be moved farther away from Brickbottom.

   e. To the extent that the footprint of the maintenance and storage facility can be consolidated, the mainline Green Line Extension tracks should be moved away from the Brickbottom Condominiums.

O-004-038 4. If the Yard 8 Maintenance and Storage Facility is selected, MassDOT should commit to formal presubmission consultation with Brickbottom Condominiums representatives and other neighborhood residents with respect to the architectural design of the Yard 8 Maintenance and Storage Facility

O-004-039 5. If the Yard 8 Maintenance and Storage Facility is selected, MassDOT should commit to formal presubmission consultation with Brickbottom Condominiums representatives and other

documents to requesting individuals as they become available and are ready for release.

O-004-033

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

O-004-034

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

O-004-035

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, Option L is identified as the preferred maintenance facility site.

O-004-036

MassDOT is committed to completing all planning, design, and engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community Path between Lowell Street and Inner Belt Road. MassDOT is committed to working with the City of Somerville, residents and businesses in the

O-004-039 neighborhood residents with respect to the air rights development encapsulating the maintenance facility and the storage yard.

O-004-040
6. MassDOT should restrict the hours of operation of the Yard 8 maintenance facility to 7:00 AM to 7:00 PM weekdays, 9:00 AM to 7:00 PM on Saturday with no work on Sundays or legal holidays.

7. MassDOT should restrict the hours of operation of the Yard 8 storage facility to 7:00 AM to 7:00 PM. Alternative locations remote from the Brickbottom Condominiums should be identified and developed for storage operations prior to 7:00 AM and after 7:00 PM.

AIR QUALITY

The construction phase air quality mitigation measures set forth in Section 6 of the Draft EIR are not sufficient.

O-004-041 We recommend and request that MassDOT commit to additional measures as follows:

1. MassDOT should develop and implement a more detailed plan to control fugitive construction dust that includes the following:

   a. Commitments to revegetated or otherwise stabilize any are left disturbed for more than 30 days.

   b. Daily street sweeping of all streets within one quarter mile of construction entrances.

NOISE

O-004-042 The MassDOT commitment to mitigate noise impacts by providing noise mitigation in the form of noise barriers, home sound insulation, and rail lubrication to mitigate all moderate and severe noise impacts prior to completion of construction is generally appropriate but must be described in more detail as it relates to the Brickbottom Condominiums site.

The commitment to install continuously welded rail for light rail tracks prior to completion of construction is appropriate and will abate noise impacts of the mainline Green Line Extension and the Union Square tracks on the Brickbottom Condominiums.

We recommend and request that MassDOT commit to additional measures as follows:

Brickbottom and Inner Belt neighborhoods, and Community Path advocates to design the Path to improve connectivity within the Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension.

O-004-037

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

O-004-038

Please see response to Comment O-004-037.

O-004-039

Please see response to Comment O-004-037.

O-004-040

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, Option L is identified as the preferred maintenance facility site.

O-004-041

Construction impacts of the Project are described in each environmental resource section in DEIR/EA Chapter 5, Environmental Consequences. Pedestrian and vehicular access to abutting properties will be maintained at all times. Construction contractors will be required to comply with relevant federal, state, and local laws, regulations, and codes to

O-004-043

1. MassDOT should install sound deadening insulation and glazing for all units within the Brickbottom Condominiums that experience moderate of severe noise impacts.
2. MassDOT should provide for voluntary relocation and market rate purchase of any units where noise abatement measures fail to reduce interior noise levels below moderate impact.
3. MassDOT should commit to installing central air conditioning systems and air exchangers permitting windows to be closed at all times.
4. MassDOT should provide a monetary subsidy to offset the operating cost of air conditioning.
5. MassDOT should commit to replacing all building windows with windows of the same design to ensure that the façade retains a harmonious and unified appearance.
6. MassDOT should commit to providing a ground level noise barrier to protect the Brickbottom ground level courtyard. MassDOT should allow the Brickbottom Condominium representatives to determine the style, materials, color, and finish of the noise barrier.

O-004-044

7. MassDOT should select the Mirror H or Option L location for the Maintenance and Storage Facility to avoid adverse impacts of noise generated by construction and operation of the maintenance facility.

O-004-045

8. If the Mirror H Maintenance and Storage Facility Alternative or the Option L Maintenance and Storage Facility Alterative is chosen, MassDOT should commit to relocating the mainline Green Line Extension tracks further away from the Brickbottom Condominiums in order to decrease noise impacts.

O-004-046

9. If the Yard 8 Maintenance and Storage Facility is selected, MassDOT should commit to the following:
    a. Consolidating the footprint of the maintenance and storage facility by minimizing parking and minimizing the size of the storage facility.
    b. Moving the storage area, switches, and curved track segments away from Brickbottom to minimize noise for Brickbottom residents.
    c. To the extent that the footprint of the maintenance and storage facility can be consolidated, move the mainline Green Line Extension tracks away from the Brickbottom Condominiums to minimize noise along the northeast property line.

eliminate or minimize adverse effects (such as noise and vibration levels, and traffic flow) to environmental and social resources. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the next phases of the Project: design and construction.

O-004-042

As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds. FEIR Chapter 8 describes specific proposed mitigation measures, plans for monitoring after construction, and next steps pertaining to mitigation. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

O-004-043

Please see response to Comment O-004-042.

O-004-044

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further

Memorandum
January 7, 2010
Page 18

O-004-047

10. If the Yard 8 Maintenance and Storage Facility is selected, MassDOT should commit to enclosure of the maintenance facility and the storage facility with walls and roofs optionally as components of air rights development.

11. MassDOT should restrict the hours of operation of the Yard 8 maintenance facility to 7:00 AM to 7:00 PM weekdays, 9:00 AM to 7:00 PM on Saturday with no work on Sundays or legal holidays.

12. MassDOT should restrict the hours of operation of the Yard 8 storage facility to 7:00 AM to 7:00 PM. Alternative locations remote from the Brickbottom Condominiums should be identified and developed for storage operations prior to 7:00 AM and after 7:00 PM.

VIBRATION

O-004-048

The MassDOT commitment to mitigate vibration impacts by providing vibration mitigation in the form of ballast mats and special trackwork to mitigate vibration impacts prior to completion of construction is generally appropriate but must be described in more detail as applied to the Brickbottom Condominiums site.

We recommend and request that MassDOT commit to additional measures as follows:

O-004-049

1. In addition to the vibration mitigation rail section proposed in Location 1 along the northeasterly properly line of the Brickbottom Condominiums, MassDOT should provide an additional approximately 500 foot long vibration mitigation rail section adjacent to the Brickbottom Condominiums encompassing both tracks on the Union Square branch.

O-004-050

2. MassDOT should select the Mirror H or Option L location for the Maintenance and Storage Facility to avoid vibration impacts during construction and operation of the facility.

O-004-051

3. If the Mirror H Maintenance and Storage Facility Alternative or the Option L Maintenance and Storage Facility Alterative is chosen, MassDOT should commit to relocating the mainline Green Line Extension tracks further away from the Brickbottom Condominiums in order to decrease vibration impacts.

O-004-052

4. If the Yard 8 Maintenance and Storage Facility is selected, MassDOT should commit to the following:

    a. Consolidating the footprint of the maintenance and storage facility by minimizing parking and minimizing the size of the storage facility.

consideration and Option L is identified as the preferred maintenance facility site.

O-004-045

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies. During preliminary engineering MassDOT will consider opportunities to shift tracks farther from the Brickbottom Condominiums if possible.

O-004-046

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

O-004-047

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

O-004-052

b. Moving the storage area, switches, and curved track segments away from Brickbottom to minimize noise for Brickbottom residents.

c. To the extent that the footprint of the maintenance and storage facility can be consolidated, move the mainline Green Line Extension tracks away from the Brickbottom Condominiums to minimize noise along the northeast property line.'

O-004-053

d. Utilizing all feasible measures to avoid pile supported foundations at Yard 8 Maintenance and Storage Facility.

e. If pile supported foundations are to be used, using alternative techniques for the installation of piles such as hydraulic installation or bored piling installation.

HISTORICAL RESOURCES

The MassDOT commitment to mitigate impacts on historical resources by constructing noise barriers with materials and colors compatible with adjacent historic properties and by providing noise mitigation (sound insulation) for sensitive historic structures that cannot be protected using noise barriers prior is appropriate. The application of these methods to the Brickbottom Condominiums site is discussed in additional detail hereinafter.

O-004-054

1. MassDOT should commit to using all feasible methods to avoid land takings from the National Register eligible A&P Warehouse Building (Brickbottom Condominiums.)

O-004-055

2. MassDOT should use historically appropriate window designs for noise abatement. All building windows should be replaced with the same window design in order to preserve the harmonious and unified appearance of the façade.

O-004-056

3. MassDOT should select the Mirror H or Option L location for the Maintenance and Storage Facility to avoid adverse impacts on the National Register eligible A&P Warehouse Building (Brickbottom Condominiums.)

O-004-057

4. If the Yard 8 Maintenance and Storage Facility is selected, MassDOT should develop a facility design that minimizes indirect impacts on the National Register eligible A&P Warehouse Building (Brickbottom Condominiums) including a design that encloses the maintenance facility and the storage facility with walls and roofs.

O-004-048

As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds. FEIR Chapter 8 describes specific proposed mitigation measures, plans for monitoring after construction, and next steps pertaining to mitigation. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

O-004-049

Please see response to Comment O-004-048.

O-004-050

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, Option L is identified as the preferred maintenance facility site.

O-004-051

Please see response to Comment O-004-048.

An expanded technical and environmental analysis of the light rail

Memorandum
January 7, 2010
Page 20

VISUAL IMPACTS

The MassDOT commitment to mitigate visual impacts by providing vegetation on and/or above retaining walls to minimize visual changes prior to the completion of construction is appropriate, as is the commitment to work with affected communities on design of noise barriers and vegetated walls prior to completion of construction. However, these measures are too limited to address visual impacts on the Brickbottom Condominiums. Additional measures are required to mitigate the impacts of the Yard 8 Maintenance and Storage Facility on the Brickbottom Condominiums.

We recommend and request that MassDOT commit to additional measures as follows:

O-004-058

1. MassDOT should select the Mirror H or Option L location for the Maintenance and Storage Facility to avoid adverse impacts in terms of noise, vibration, mass and scale, visual quality, lighting, and barriers to pedestrian and vehicular circulation.

2. If the Yard 8 Maintenance and Storage Facility is selected, MassDOT should commit to the following:

O-004-059

   a. Formal presubmission consultation with Brickbottom Condominiums representatives and other neighborhood residents with respect to the architectural design of the Yard 8 Maintenance and Storage Facility;

   b. Enclosure of the maintenance facility and the storage facility with walls and roofs optionally as components of air rights development.

   c. Formal presubmission consultation with Brickbottom Condominiums representatives and other neighborhood residents with respect to the air rights development encapsulating the maintenance facility and the storage yard.

   d. Consolidating the footprint of the maintenance and storage facility and by moving the maintenance facility and the storage area away from Brickbottom.

CONSTRUCTION

We recommend and request that MassDOT commit to additional measures as follows:

O-004-060

1. MassDOT should commit to restrict the hours of construction work to 7:00 AM to 7:00 PM weekdays, 9:00 AM to 7:00 PM on Saturday with no work on Sundays or legal holidays.

storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

O-004-053

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

O-004-054

DEIR/EA Section 5.2 describes the Project's potential acquisitions. MassDOT will continue to evaluate opportunities to minimize these property impacts, consistent with the requirements of the Section 4(f) and Section 106 regulations.

O-004-055

As stated in Section 6.5.4.7 of the DEIR/EA, new doors, windows, or other insulating treatments will be appropriate for the historic property and meet the Secretary of the Interior's standards for rehabilitation.

O-004-056

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

O-004-061 2. MassDOT should develop and implement a more detailed plan to control fugitive construction dust.

O-004-062 3. MassDOT should develop and implement a more detailed plan for construction noise control.

O-004-063 4. MassDOT should commit to installing noise abatement measures as otherwise required at Brickbottom Condominiums prior to construction in order to have these measures in place to control construction phase noise.

O-004-064 5. MassDOT should provide Brickbottom Condominium representatives with 24 hour contact information for the construction superintendent responsible for all work in proximity to the Brickbottom Condominiums.

O-004-065 6. MassDOT should select the Mirror H or Option L location for the Maintenance and Storage Facility to avoid adverse impacts in terms of noise, vibration, mass and scale, visual quality, lighting, and barriers to pedestrian and vehicular circulation.

O-004-066 7. If the Yard 8 Maintenance and Storage Facility is selected, MassDOT should commit to utilizing all feasible measures to avoid pile supported foundations at Yard 8 Maintenance and Storage Facility.

O-004-067 8. If pile supported foundations are to be used, MassDOT should commit to using alternative techniques for pile installation such as hydraulic installation or bored piling installation.

COMPARATIVE EVALUATION OF IMPACTS FOR YARD 8 MAINTENANCE AND STORAGE FACILITY VERSES MIRROR H AND OPTION L ALTERNATIVES

O-004-068 Technical Memorandum, Green Line Extension Project Additional Maintenance Facility Alternatives Analysis contains a comparative evaluation of the impacts of the Yard 8 Maintenance and Storage Facility verses the Mirror H and the Mirror H and Option L Maintenance and Storage Facility Alternatives. This Technical Memorandum was prepared after issuance of the Draft EIR and has not been formally submitted for public comment as part of the Draft EIR review process. It underscores the point that the Draft EIR is wholly deficient in its review of alternatives for the siting of the Maintenance and Storage Yard Facilities. Moreover, it is also merely "preliminary" – and emphasizes the need for further review of these alternatives.

More specific comments on the Technical Memorandum follow Table 4-1.

O-004-057

Please see response to Comment O-004-054.

O-004-058

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, Option L is identified as the preferred maintenance facility site.

O-004-059

Please see response to Comment O-004-058.

O-004-060

Construction impacts of the Project are described in each environmental resource section in DEIR/EA Chapter 5, Environmental Consequences. Pedestrian and vehicular access to abutting properties will be maintained at all times. Construction contractors will be required to comply with relevant federal, state, and local laws, regulations, and codes to eliminate or minimize adverse effects (such as noise and vibration levels, and traffic flow) to environmental and social resources. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the next phases of the Project: design and construction.

O-004-061

Construction impacts of the Project are described in each environmental resource section in DEIR/EA Chapter 5, Environmental Consequences. Pedestrian and vehicular access to abutting properties will be maintained at all times. Construction contractors will be required to comply with relevant federal, state, and local laws, regulations, and codes to eliminate or minimize adverse effects (such as noise and vibration levels,

Criteria	Rating	Yard 8 Subarea	Rating	Mirror H Subarea	Rating	Option L Subarea
Location		Inner Belt Road, Somerville (fullpanel), 200 Inner Belt Road, Somerville (partial parcel - vacant land only)		MetroPoint development site ABC-DISC - Located partly in Cambridge and Somerville; MBTA BET facility, Boston		20 Third Avenue, Somerville (fullpanel); 48 Third Avenue, Somerville (fullpanel); 70 Inner Belt Road, Somerville (partial parcel - unused vacant land only); 200 Inner Belt Road, Somerville (partial parcel - small corner of vacant land only (would not preclude future planned construction))
Description		This alternative proposes a new maintenance facility to be located adjacent to the proposed Green Line alignment and accessed from Inner Belt Road in Somerville.		This alternative proposes a new maintenance facility partly on NorthPoint parcels C2/D&F and storage on Parcels A and B, and partly on MBTA land currently used for storage by BET		This alternative proposes a new maintenance facility to be located immediately adjacent to BET, outside the current BET fence line - along the southern and southeastern flings of the existing Inner Belt industrial area
Ability to meet the MBTA Maintenance Facility Program	-1	This alternative generally meets the 80-car storage program and approximately 100 employee parking spaces.	-1	This alternative generally meets the 80-car storage program and approximately 100 employee parking spaces.		This alternative generally meets the 80-car storage program and approximately 100 employee parking spaces
Order-of-Magnitude conceptual capital cost estimate ($2008)	0 0-1	Approximately $90 Million (Estimated cost is likely to substantially increase if the cost of "voiding the existing building permit is accurately quantified. Accordingly, the rating on Yard 8 should be revised to "-1.")	0	Approximately $80 Million	-1	Approximately $-$80 Million $90 Million. (See attached Tables 1 and 2)
Property impacts	-3 -3-5	This alternative requires the acquisition of approximately 8.6 acres of land, which is estimated at approximately $15 million. This alternative would impact the planned NorthPoint project site, which has received MEPA's environmental clearance and has begun construction. The project would need to be revised to reflect the market value and assessed valuation of the Brickbottom and Maintenance Facility. Accordingly, the rating should be revised to "-3."	-3	This alternative requires the acquisition of approximately 3.1 acres of Dev Ap parcels that would impact the planned NorthPoint project site, which has received MEPA's environmental clearance and has begun construction. Railcorp properties which is estimated at approximately $8 million. This alternative would need to be routed NorthPoint has also received	-4-8	This alternative requires the acquisition of approximately 10.2 acres of land and railroad rights-of-way, which is estimated at approximately $40 million. This alternative requires relocation of certain businesses, as well as demolition of non-existing buildings.
Operational impacts	-1	This alternative would generally support the Green Line operations, and would not have an impact on Pan Am Railways operations.	-1	This alternative would generally support the Green Line operations, and would not preclude existing railroad operations.	1+1	This alternative would generally support the Green Line operations, but and preclude maintain a level of functionality for its rail freight operations equivalent to that existing prior to removal of the Wiley track.
Compatibility with other transportation projects in the project area	+1	This alternative is compatible with the Urban Ring, Somerville Community Path, North-South Rail Link, and MBTA Fitchburg Commuter Rail Improvement projects.	-1	This alternative would preclude the Urban Ring, North-South Rail Link project and MBTA Fitchburg Commuter Rail Improvement projects. This alternative is compatible with Urban Ring and Somerville Community Path projects.	-1	This alternative is compatible with the Urban Ring, Somerville Community Path, North-South Rail Link, and MBTA Fitchburg Commuter Rail Improvement projects
Compatibility with existing land use	-1	The project area for this alternative is currently zoned for industrial use and would not require rezoning.	-1	The project area for this alternative is zoned for mixed-use including residential use and would not require rezoning for the maintenance facility within Cambridge	-1	The project area for this alternative is currently zoned for industrial use and would not require rezoning.
Future Economic Development Opportunities	-1	This alternative would likely not be compatible with long-term development goals.	-1	This alternative would likely not be compatible with long-term development goals.	0	This alternative would likely not preclude long-term development goals
Ability to meet project schedule	-1-1	A comprehensive evaluation including an environmental review was performed of this alternative, which was filed on October 15, 2008. Given that the neighborhood residents is expected to result in administrative and legal issues which will significantly delay the project.	-1	This alternative requires acquisition of land from the NorthPoint development project, which has completed the MEPA process and started construction, and would delay the Green Line Extension project schedule.	0+1	This alternative requires the acquisition and relocation of existing businesses, which is expected to result in administrative and legal issues which will significantly delay the project. Changes would be required to the alignment of the Green Line Extension project as the preferred alignment includes a station at this site. It is expected to delay the Green Line Extension project schedule.
Environmental impacts	-1	An assessment in the DEIR/EA, on impacts to water, land, wetlands, no direct losses to businesses and jobs, and no direct effects on EJ or environmental justice populations are anticipated. There would be no accurate estimate, impacts from noise after mitigation (sound insulation) are expected to be minimal. Potential archaeological concerns. The site was historically used as a rail yard. Potential contamination issues with former uses, Brickbottom Artists Lofts, which has 185 residential units, is in close proximity to the site.	-1	Based on a preliminary evaluation, no impacts to public, wetlands, or historic resources; no direct losses to businesses and jobs are anticipated. With respect to the NorthPoint development would have to be renegotiated, with the City of Cambridge. This alternative would preclude the NorthPoint Development Project. Area residential properties include the NorthPoint Development Site, 3 Triangle Buildings (239 units), Archdrive (650 units) and Glass Factory (184 units)	0	Based on a preliminary evaluation, no impacts to public, wetlands, or historic resources; no direct losses to businesses and jobs are anticipated. There would be no accurate estimate, impacts from noise after mitigation (sound insulation) are expected to be minimal. Potential archaeological concerns. This site is likely to have underground utilities, is likely to have hazardous materials impacts. This site would have direct loss of businesses and jobs. Environmental Justice populations would be affected. Business displacements or relocations to City of Somerville locations would be anticipated, with the would require disposal of solid waste, may include residential, industrial or hazardous materials, may require additional clean-up costs.
Intersection interruptions and	-1	There are some limitations on the current topography which could present challenges for constructing streets and access roadways between adjacent neighborhoods.	0	There are no fatal defects on the current topography which would prevent the constructing of streets and access roadways between adjacent neighborhoods.	0	There are no fatal defects on the current topography which would prevent from constructing streets and access roadways between adjacent neighborhoods

and traffic flow) to environmental and social resources. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the next phases of the Project: design and construction.

O-004-061

Construction impacts of the Project are described in each environmental resource section in DEIR/EA Chapter 5, Environmental Consequences. Pedestrian and vehicular access to abutting properties will be maintained at all times. Construction contractors will be required to comply with relevant federal, state, and local laws, regulations, and codes to eliminate or minimize adverse effects (such as noise and vibration levels, and traffic flow) to environmental and social resources. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the next phases of the Project: design and construction.

O-004-062

Please see response to Comment O-004-061.

O-004-063

Please see response to Comment O-004-061.

O-004-064

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project, including construction.

O-004-065

An expanded technical and environmental analysis of the light rail

Memorandum
January 7, 2010
Page 23

The comparative evaluation of impacts contained in the Technical Memorandum is summarized in "Table 4-1 Comparison of Maintenance Facility Alternatives." As Table 4-1 may prove to be a critical element considered by MassDOT in determining whether a new preferred maintenance and storage facility should be selected, an accurate and objective evaluation of impacts should be provided. Based upon our evaluation of project impacts as set forth in the Technical Memorandum, Green Line Extension Project Additional Maintenance Facility Alternatives Analysis and the Draft EIR, Professional Services Corporation (PSC) recommends that the comparative evaluation of impacts as summarized in Table 4-1 be revised as set forth hereinafter.

O-004-069

The values in Table 4-1 are ranked from -1 to 0 to +1. For "Order-of-Magnitude Conceptual Capital Cost Estimate ($2008)" Yard 8 is ranked "0." However, one of the parcels to be acquired has already been issued a building permit for a six story building and the Technical Memorandum acknowledges that the building permit must be "voided." It is unlikely, that the cost of "voiding" this building permit is accurately reflected in the parcel acquisition cost. The method of deterring parcel acquisition and in particular the cost of "voiding" the building permit should be documented.

With respect to "Order-of-Magnitude Conceptual Capital Cost Estimate ($2008)," Option L is ranked "-1," principally because of parcel acquisition cost. PSC independently calculated parcel acquisition cost using published Somerville Assessors data. As indicated in the attached Table 1, the property acquisition cost for Option L is approximately $16 million based upon published assessor's data. As indicated in the attached Table 2, the Order of Magnitude Conceptual Capital Cost Estimate for Option L is $94 million, which is the same order of magnitude as the cost of Yard 8 and Mirror H Alternatives. Accordingly, it is appropriate to revise the rank of Option L as "0" in Table 4-1.

The "property impacts" of the Yard 8 Maintenance and Storage Facility were assigned a ranking of "0" in Table 4-1. However, this ranking does not reflect the adverse effects of construction of the Yard 8 Maintenance and Storage Facility on the market value and assessment of units located in the Brickbottom Condominiums. Property values will be adversely impacted by noise, vibration, and degraded views caused by the Yard 8 Maintenance and Storage Facility. Decreased market value will directly impact Brickbottom residents. As the total assessed valuation of Brickbottom units exceeds $40 million, any measurable decrease in assessed values will also adversely impact tax revenues to the City of Somerville. Accordingly, it is appropriate revise the ranking of the "property Impacts" of Yard 8 Maintenance and Storage Facility from "0" to "-1."

The "property impacts" of Option L are ranked as "-1" based in substantial part upon the stated acquisition cost of $52 million. However as indicated in the attached Table 1, the anticipated property acquisition cost should be revised from $52 million to $16 million. Based upon the corrected valuation of $16 million, the assigned ranking for the "property impacts" of Option L should be revised from "-1" to "0."

storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, Option L is identified as the preferred maintenance facility site.

O-004-066

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

O-004-067

The DEIR/EA and FEIR include conceptual Project designs. Designs for the storage and maintenance facility will be refined during the Project's preliminary engineering stage. The process for coordinating with local communities during Project design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

O-004-068

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance

PSC

Memorandum
January 7, 2010
Page 24

O-004-069

The "operational impacts" of Option L are ranked as "-1" because it would have an impact on Pan Am Railways operations. However, reactivation of the Yard 10 lead would provide a level of functionality for Pan Am Railway freight operations that is functionally equivalent to that existing prior to removal of the Wiley track. Accordingly, the assigned ranking for the "operational impacts" of Option L should be revised from "-1" to "+1."

The ability to meet project schedule is ranked as "+1" for Yard 8. However opposition by the City of Somerville and neighborhood residents is expected to result in administrative and legal review which will significantly delay the project. Accordingly, the assigned ranking for "ability to meet project schedule" for Yard 8 should be revised from "+1" to "-1."

The ability to meet project schedule is ranked as "0" for Option L; however, the text supporting the ranking is inconsistent with the ranking assigned. The paragraph concludes "…selection of this site is not expected to delay the Green Line Extension project schedule." Accordingly, the assigned ranking for "ability to meet project schedule" for Option L should be revised from "0" to "+1."

While the criteria listed in Table 4-1 are not all of equivalent importance and cannot effectively be quantitatively summarized, the values in Table 4-1 were nonetheless totaled by VHB/Vanasse Hangen Brustlin, Inc. and PB Americas, Inc. and serve to provide a generalized indication of the relative merits of the three maintenance and storage facility alternatives. Originally rankings for Yard 8 summed to 0 with negative and positive values offsetting. Originally the rankings for Mirror H summed to -3 and for Option L summed to 0. Using these rankings Yard 8 and Option L were equivalent and Mirror H was less consistent with the criteria specified. With the revised rankings set forth above, Yard 8 sum to -4, Mirror H sums to -3, and Option L sums to +5. Using the revised rankings, Option L is clearly the preferred Maintenance and Storage Facility Alternative.

facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

RE: EEA #13886 – Green Line Extension Project
Comments on Draft Environmental Impact Report

Dear Secretary Bowles and Ms. Johnson:

I write on behalf of the Brickbottom Condominium Trust and the 220+ residents of the Brickbottom residential/artist community (collectively, "Brickbottom") to submit comments on the Draft Environmental Impact Report ("DEIR") submitted in connection with the Green Line Extension Project (the "Project"). These comments supplement the many comments already submitted by and on behalf of Brickbottom, including (1) the comment letter submitted by Brickbottom's Trustees dated January 6, 2010 ("Brickbottom's 1/6/10 Letter") and (2) the Memorandum submitted by an engineer retained by Brickbottom – Thomas C. Houston, AICP, PE, Professional Services Corporation PC ("PSC") – dated January 7, 2010 ("PSC's 1/7/10 Memorandum").

INTRODUCTION

As discussed more fully in Brickbottom's 1/6/10 Letter and PSC's 1/7/10 Memorandum, there are many significant deficiencies in the Draft EIR, in MassDOT's evaluation methodologies and in the review process leading to the Draft EIR. Brickbottom's greatest concern is with respect to MassDOT's proposed construction and operation of a maintenance facility and a train storage yard on "Yard 8," adjacent to Brickbottom's property. Siting those facilities at Yard 8 will result in severe and disproportionate adverse impacts to Brickbottom (and the surrounding community) – impacts that MassDOT has not yet sufficiently evaluated and has understated.

O-005-001

As discussed more fully in Brickbottom's 1/6/10 Letter and PSC's 1/7/10 Memorandum, MassDOT's preference for siting the maintenance and storage facilities at Yard 8 was prematurely developed. Its preference was developed with no meaningful input from the impacted community and (1) prior to completing a meaningful analysis of other feasible alternatives, (2) prior to sufficiently evaluating and comparing impacts associated with the Yard 8 site and other alternative sites (including cumulative impacts), and (3) prior to evaluating the extent to which the significant impacts to Brickbottom could be effectively mitigated, or not.

Printed on Recycled Paper

O-005-001

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

O-005-002 **In short, the DEIR and the process leading to the DEIR fall short of what is required by MEPA. Further MEPA review should be required (and, as a matter law, must be required).**

STATUTORY AND REGULATORY FRAMEWORK

The Massachusetts Environmental Policy Act, M.G.L. c. 30, §§ 61-62H ("MEPA"), and implementing regulations at 301 CMR 11.00 require all agencies, in carrying out their activities, to use "all practical means and measures to minimize damage to the environment." G.L. c. 30, § 61. Any determination made by a state agency "shall include a finding describing the environmental impact, if any, of the project and a finding that all feasible measures have been taken to avoid or minimize said impact." Id. The section 61 finding is to be based upon an environmental impact report, where required (as here), under G.L. c. 30, § 62. See Secretary of Environmental Affairs v. Massachusetts Port Authority, 366 Mass. 755, 778 (1975).

An agency must do more than rationalize decisions already made – as MassDOT has attempted to do here. For projects subject to MEPA, the agency must first proceed through MEPA's review process, supervised by the Secretary, "for thorough consideration of the potential environmental impact" of the project. G.L. c. 30 § 61. As part of that process, the agency must prepare an environmental impact report ("EIR") which describes:

> the nature and extent of the proposed project and its environmental impact; all measures being utilized to minimize environmental damage; any adverse short-term and long-term environmental consequences which cannot be avoided should the project be undertaken; and reasonable alternatives to the proposed project and their environmental consequences....

G.L. c. 30 § 62B (emphasis added). The EIR "shall be prepared and disseminated to inform the originating or permitting agency, reviewing agencies, the appropriate regional planning commission, the attorney general and the public of the environmental consequences of state actions and the alternatives thereto prior to any commitment of state funds for and prior to the commencement of the project if undertaken by an agency ...." Id.

The MEPA regulations require the EIR to include, among other things:

- "[a] description and analysis of ... all feasible alternatives [to the Project], including but not limited to those indicated in the Scope [of the Project as set forth by the Secretary]." 301 CMR 11.07(6)(f)(1) (emphasis added).
- "an analysis of the principal differences among the feasible alternatives . . . particularly regarding potential environmental impacts." 301 CMR 11.07(6)(f)(4).

O-005-002

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

- a "detailed description and assessment of the negative and positive potential environmental impacts of the Project and its alternatives." 301 CMR 11.07(6)(h).

- "a description and assessment of … measures and management techniques designed to limit negative environmental impacts or to cause positive environmental impacts during development and operation of a Project," requiring that the EIR "specify in detail: the measures to be taken . . . to avoid, minimize, and mitigate potential environmental impacts …." 301 CMR 11.07(6)(j).

- a discussion of "alternatives to the proposed mitigation measures considered by the Proponent or suggested in comments by any Agency or Person, noting the relative benefits and costs of these alternative mitigation measures." 301 CMR 11.07(6)(j).

- proposed Section 61 Findings that "specify in detail: all feasible measures to be taken . . . to avoid Damage to the Environment or, to the extent Damage to the Environment cannot be avoided, to minimize and mitigate Damage to the Environment to the maximum extent practicable. 301 CMR 11.07(6)(k).

"The purpose of [MEPA] is to require that impact reports be prepared before an irreversible commitment to a project is made." Secretary of Environmental Affairs v. Massachusetts Port Authority, 366 Mass. 755, 776 (1975). Defects in the environmental review process constitute "harm" and that injury is almost inevitably irreparable once an agency becomes heavily invested in a project.[1]

As recently emphasized by the Massachusetts Supreme Judicial Court ("SJC") in Allen v. Boston Redevelopment Authority, 450 Mass. 242, 257 (2007):

> The overarching purpose of MEPA and the regulations promulgated thereunder is "to provide *meaningful* opportunities for public review of the potential environmental impacts of Projects for which [State] Agency Action is required, and to assist each Agency in using ... all feasible means to avoid Damage to the Environment or, to the extent Damage to the

[1] Commonwealth of Massachusetts v. Watt, 716 F.2d 846, 952 (1st Cir. 1983) ("In the present case, the plaintiffs would suffer harm if they were denied an injunction, if the lease sale took place, and if the Court then held that a supplemental EIS was required.... [The] chain of bureaucratic commitment...will become progressively harder to undo the longer it continues. Once large bureaucracies are committed to a course of action, it is difficult to change that course - even if new, or more thorough, NEPA statements are prepared and the agency is told to "redecide."..."). Accord, Sierra Club v. Marsh, 872 F.2d 497, 500-504 (1st Cir. 1989) ("[T]he difficulty of stopping a bureaucratic steamroller, once started, ...[is] a perfectly proper factor for a district court to take into account in assessing" a motion for preliminary injunctive relief and that "when a decision to which NEPA obligations attach is made without the informed environmental consideration that NEPA requires, the harm that NEPA intends to prevent has been suffered"); Environmental Defense Fund v. Tennessee Valley Authority, 468 F.2d 1164, 1183-84 (6th Cir. 1972); Jones v. District of Columbia Redevelopment Land Agency, 499 F.2d 502, 511 (D.C. Cir. 1974); Arlington Coalition on Transportation v. Volpe, 458 F.2d 1323, 1332 (4th 1972).

Printed on Recycled Paper

> Environment cannot be avoided, to minimize and mitigate Damage to the Environment to the maximum extent practicable" (emphasis added). 301 Code Mass. Regs. § 11.01(1)(a). See G.L. c. 30, § 61.

In Allen, the SJC recognized that the Secretary has "considerable discretion over the scope of an EIR." However, the SJC also admonished that "[t]he process by which the information is gathered, identified, and applied to the statutory standards under MEPA must be logical, and not arbitrary or capricious." Allen, 450 Mass. at 254. Ultimately, in Allen, the SJC held that the Final EIR issued for the Biolab facility was arbitrary and capricious in failing to consider likely damage to the environment caused by the release of a contagious pathogen and that the Secretary's Certificate on that Final EIR was arbitrary and capricious due to the developer's failure to address alternative locations.

DECEMBER 1, 2006 CERTIFICATE ON EXPANDED ENVIRONMENTAL NOTIFICATION FORM ("EENF")

The December 1, 2006 Certificate issued on the EENF for this Project echoed and supplemented the detailed statutory and regulatory requirements discussed above. It established a broad and detailed set of substantive and procedural requirements applicable to the ongoing MEPA review process for this Project and required MassDOT to "comprehensively address" those requirements.

The scope of MEPA review required for this Project was appropriately broad, reflecting the magnitude and importance of this Project and the significant environmental impacts associated with it. For example, the Certificate noted the following:

- "This project is a hallmark of the Commonwealth's commitment to the principles and practice off smart growth." (EENF Certificate, p. 1).
- "For this project to achieve its potential . . . [the agencies] must design the project carefully and coordinate proactively and effectively with state and city agencies, citizens, local businesses and other stakeholders during all aspects of the project – planning, design and construction." (EENF Certificate, p. 1).
- "The project should be designed to maximize benefits for local residents while preserving the integrity and character of existing neighborhoods." (EENF Certificate, p. 2).
- "Commenters want to protect and enhance the character and vitality of this corridor, its neighborhoods and business centers ...." (EENF Certificate, p. 2).
- "Even the most committed supporters of this project identify the need for additional analysis, information and commitment to mitigation measures to ensure the success of this long-term improvement." (EENF Certificate, p. 2).

The Certificate then proceeded to impose a broad set of requirements for the continued MEPA process – requiring comprehensive analyses of Project alternatives, impacts and specific measures to avoid, minimize and mitigate impacts.

NEED FOR FURTHER MEPA REVIEW

Although the EENF Certificate opened the door to the possibility of the DEIR being treated as an FEIR,[2] MassDOT has not adequately addressed the Scope established in the EENF Certificate or otherwise met the statutory and regulatory requirements for FEIRs – as discussed in detail in Brickbottom's 1/6/10 Letter and PSC's 1/7/10 Memorandum. Accordingly, further MEPA review should be required.

Brickbottom's requests with respect to the scope of further MEPA review that should be required are discussed in detail in Brickbottom's 1/6/10 Letter and PSC's 1/7/10 Memorandum. They are not repeated or comprehensively summarized here. Among the requests discussed in those submittals (without limitation) are that MassDOT and the MBTA should be required – in connection with its preparation of an FEIR – to do the following:

O-005-003

- Re-evaluate and describe in detail their justification for their stated "needs" with respect to the maintenance facility and storage yard facilities (including footprints, design features, etc… which were the bases for ruling out many potential alternative sites for these facilities). These facilities should be designed to accommodate only the needs of the Green Line Extension, not to address the additional needs and shortcomings of the *existing* Green Line facilities.
    - In the event MassDOT/MBTA continue to seek to address system-wide maintenance and storage needs and shortcomings through these proposed facilities – particularly if they are proposed for Yard 8 – they should be required to conduct a searching reexamination of all feasible alternatives, including evaluation of sites (or combination of sites) elsewhere in the Green Line system, not merely those along the Green Line Extension.

O-005-004

- Complete their ongoing identification and evaluation of feasible alternatives to the siting of the maintenance and storage facilities at Yard 8, and, in that regard,
    - Remove Yard 8 from further consideration in light of the overwhelming local opposition to that alternative, its inconsistency with local planning initiatives and smart growth principles, and the significant and disproportionate adverse impacts that siting these facilities at Yard 8 would have on Brickbottom and the surrounding community.

[2] The Certificate noted (p. 4) that "[i]f the DEIR provides a reasonably complete and stand-alone description and analysis of the project, project alternatives and environmental impacts, and adequately addresses mitigation, the regulations allow the DEIR to be reviewed as an FEIR." It then stated that if the DEIR is "thorough" and MassDOT and the MBTA "comprehensively address the Scope" of the EENF Certificate, the DEIR may be deemed adequate to serve as the FEIR.

Printed on Recycled Paper

O-005-003

The Green Line Extension storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the Project. Chapter 2 of the FEIR fully describes the environmental impacts of the proposed storage and maintenance facility. In order to maximize operating efficiencies, the facility must be constructed within the same timeframe as the Green Line Extension Project, in the vicinity of the Green Line Extension right-of-way, and north of downtown Boston.

The storage and maintenance facility alternatives include storage for Green Line Extension vehicles and replacement of the existing Lechmere Station vehicle storage. Storage capacity is also provided for vehicles currently stored in trackways between Lechmere Station and Government Center; this storage will be lost due to the Green Line Extension.

O-005-004

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area. Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes

O-005-004

- Continue evaluation of the Mirror H and Option L alternatives that were identified in, but not evaluated prior to, preparation of the DEIR.
- Further evaluate potential alternatives that utilize land currently used for rail facilities (BET) and those that involve separating the maintenance facility from the storage yard – each of which separately requires a smaller footprint than the combination of facilities (of course), rendering feasible the use of smaller sites for each facility and greater design flexibility (for these facilities and the track layouts).
- Identify, evaluate more thoroughly and compare the impacts associated with each feasible alternative – including cumulative impacts with consideration of other aspects of the Project and existing rail facilities.
- Identify and evaluate more thoroughly the costs and scheduling issues associated with each alternative – accounting for potential costs and delays associated with reasonably anticipated litigation.
- Identify and evaluate the extent to which each alternative is consistent with local planning initiatives and smart growth principles.
- Revisit and describe in detail the factors considered, and the weight given to each factor, in evaluating alternatives and developing the siting preference – and afford greater weight to impacts to existing residential buildings and uses, such as Brickbottom, than to potential impacts to contemplated future residential spaces (such as those at the Northpoint development).

➢ Evaluate further the impacts on Brickbottom associated with the Project – including impacts from the maintenance facility, storage yard and track configurations ultimately proposed in the FEIR,

O-005-005
- including cumulative impacts with consideration of existing rail infrastructure in the area,

O-005-006
- including impacts to indoor and outdoors spaces at Brickbottom,

O-005-007
- including impacts associated with the proposed taking of land from Brickbottom.

O-005-008
➢ Identify, evaluate and describe in detail specific siting, design and configuration measures considered and proposed to effectively minimize such impacts.

O-005-009
➢ Identify, evaluate and describe in detail specific measures considered and proposed to effectively mitigate such impacts.

proposed mitigation measures and related monitoring after the construction phase.

As explained in FEIR Chapter 2, MassDOT has explored opportunities for the Green Line Extension storage and maintenance facility to share resources with the Boston Engine Terminal. The independent needs and constraints of these facilities limit opportunities for shared resources. MassDOT will coordinate with the MBTA during preliminary engineering to maximize efficient land utilization between these storage and maintenance facilities.

O-005-005

An expanded analysis of potential noise and vibration impacts at the Brickbottom Artists Buildings is included in FEIR Chapter 8. These projections take into account the collective impacts of rail uses in the area.

O-005-006

As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds.

O-005-007

DEIR/EA Section 5.2 describes the Project's potential acquisitions. MassDOT is currently conducting detailed property surveys to obtain more specific data. MassDOT will continue to evaluate opportunities to minimize these property impacts.

O-005-008

Please see response to Comment O-005-004.

O-005-009

- This evaluation should include site-specific evaluation of existing conditions at Brickbottom and projected impacts to Brickbottom -- indoors and outdoors, and during and after construction.
- It should result in a detailed schedule of mitigation measures determined, after evaluation, to effectively mitigate Project-related impacts in a manner agreeable to Brickbottom.

O-005-010

- Attempt in good faith to negotiate Mitigation Agreements with the impacted communities and Brickbottom, with such agreements serving to more clearly specify enforceable mitigation goals, measures and deadlines and to establish an agreed upon process by which the community and affected abutters can seek redress if those goals, measures and/or deadlines are not met relating to construction and post-construction activities.

O-005-011

- For any impacts that are not addressed through Mitigation Agreements, identify and commit unilaterally to more clearly specified and enforceable mitigation goals, measures and deadlines and identify and commit to establishing a process by which the community and affected abutters can seek redress if those goals, measures and/or deadlines are not met – relating to construction and post-construction activities.

O-005-012

- Evaluate further designs and processes for construction of the Community Path in conjunction with this Project, including designs that would accomplish more direct access to/from Brickbottom than the designs including in the DEIR.

O-005-013

- Evaluate further Brickbottom/Washington Street Station designs that would provide greater access to pedestrians and bus commuters (with access from both sides of the station).

To be clear, the above set of scoping requests supplements the more comprehensive set of requests that Brickbottom has submitted through Brickbottom's 1/6/10 Letter and PSC's 1/7/10 Memorandum.

Thank you for your consideration of these comments.

Sincerely,

Jeffrey L. Roelofs

cc: Kate Fichter (MassDOT, by email)
Monica Lamboy (City of Somerville, by email)
Noah Chesnin (CLF, by email)
Brickbottom Condominium Trust (by email)
Thomas C. Houston, AICP, PE (by email)

O-005-009

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in DEIR/EA Chapter 6, Draft Section 61 Findings and Mitigation Measures. The mitigation measures and procedures for implementation required by the Secretary's Certificate on the DEIR are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

O-005-010

The stakeholder coordination process for project mitigation is described in FEIR Section 6.3, Public Outreach Strategies. As the Project advances into preliminary engineering and further detailed designs on mitigation are developed, MassDOT will work with abutters, as appropriate, to consider recommendations for mitigation.

O-005-011

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

O-005-012

MassDOT is committed to completing all planning, design, and engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community Path between Lowell Street and Inner Belt Road. MassDOT is not able at this point to commit to funding the construction of the Community Path. The limits of the path were predicated on the connections to Lechmere being made through the Inner Belt area via Inner Belt Road and the proposed Urban Ring Bridge into the Lechmere area. However,

the cessation of planning for the Urban Ring Project has changed the timing of this anticipated connection. MassDOT is unable to assume responsibility for designing the Urban Ring Bridge as part of the Green Line Extension Project. That being said, MassDOT is committed to working with the City of Somerville, residents and businesses in the Brickbottom and Inner Belt neighborhoods, and Community Path advocates to design the Path to create improved connectivity within the Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension.

O-005-013

The conceptual plan for the Brickbottom Station will be refined during the preliminary engineering stage, taking into consideration municipal, neighbor, and other stakeholder concerns to the extent practical. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

To: Secretary Ian Bowles/Holly Johnson (MEPA Analyst)

Subject: **Regarding EEA #13886 Green Line extension DEIR**

Letter: Dear Secretary Ian Bowles,,

The community members engaged with CCP would like to see all decisions related to the planning of the Green Line and the land use in the ½ mile areas around the 7 proposed stations to reflect this list of Corridor Core Principles. Please see third paragraph for list of Core Principles and corresponding suggested changes to Draft Environmental Impact Report (DEIR).

O-006-001

The Community Corridor Planning project, a grassroots effort to engage community members in the land use planning along the Green Line extension, has brought together hundreds of people to frame a list of core principles to guide their recommendations for land use along the extension in upcoming months. We ask that these principles be taken into consideration as the Mass. Department of Transportation finalizes its Environmental Impact Report.

Core Community Principles for
Neighborhood Development Along the Green Line Corridor

• More Local Jobs: We want a fixed percentage of respectable jobs of all types with good wages and benefits for Somerville residents, from construction to permanent.

• Increase Commercial and Economic Development: We want to see the creation of squares as destinations, with careful attention to mixed use of commercial/residential, reuse of buildings, and economic development to increase the tax base.
o Draft Environmental Impact Report (DEIR) does not address Department of Transportation (DOT) commitment to economic development
o New MA DOT is supposed to work with Secretary of Economic Affairs to promote station location and design that promotes economic development and the community needs to show MA DOT how to do this – to change the paradigm pro-actively.

• Improve the Green Environment: We want a safe, environmentally friendly neighborhood with more green space, trees, and gardens; reduction of noise; avoidance of light pollution; and prevention of toxic chemicals in the air.
o Response to DEIR: Given this principle, it is important that more attention be given to:
o Noise of operations
o Mitigation during construction for noise, vibration, etc.
o How close the tracks will be to the Brickbottom Building and other buildings along the right of way
o The need to involve neighborhoods affected regarding noise and vibration
o Recommendation that testing be done immediately after project begins to determine if estimates for vibration and noise done for the DEIR are accurate.
o Possibly transfer at Ball Square but only if Commuter rail is electric not diesel because of the pollution it would create for neighbors
o Rep. Provost noted in comments made that diesel trains should not stop in Somerville. This should only be permitted if trains are electrified
o Consider dual-mode conversion of existing commuter trains
• Encourage Walking and Biking: We want to encourage walking and cycling, through safe, bike/pedestrian friendly design of streets and paths around and between stations.
o Pedestrian accessibility is poor for the station designs in the DEIR
o The design required in the MEPA Scope (EENF) does not sufficiently address the detailed concerns and requirements for each station.
o In the DEIR design and engineering is insufficient for moving the project to a final EIR because of a range of unaddressed issues (i.e., station design, siting, bike parking, community path integration)
o Bike access and bike parking at all stations needs to be improved.
o New Light Rail Vehicles (LRVs) should be designed to accommodate bicycles (like Portland LRVs)
o The Community Path and its important station connections must be designed and

O-006-001

MassDOT has reviewed and considered the “Core Community Principles” for station area land use, presented by Community Corridor Planning. As described in the FEIR, Section 6.2 of the Public Involvement Plan, MassDOT will hold land use workshops to discuss related issues with the community.

constructed simultaneously with the Green Line extension in order to facilitate direct pedestrian and bicycle access to the stations and to ensure a safe, attractive, and highly-functional Community Path.

• Create Community Gathering Spaces: We want both indoor and outdoor safe, public gathering spaces for community members.

• Improve Access: We want above standard, safe access to and between stations for people with disabilities, strollers, and pedestrians in general

• Community Involvement: We want to make sure residents are included on an ongoing basis in the planning, design, and zoning changes to the stations and areas around them. Youth, artists, and others should help design stations, with attention to amenities. We need an easy and clear process for residents to address problems as they come up, with ways of immediately resolving unseen impacts.
o Ongoing Community participation in the next phase (presumed to be done as a design/build project) is necessary
o Public involvement will help to keep decision-making public (transparency)
o Need to have a field office that residents can go to with concerns on an ongoing basis
o Need neighborhood based community groups to be involved in planning around each station,
• Connecting Buses and Trains: We want to ensure inter-modal access between neighborhoods and stations, for new train service to be adequate and speedy, and for existing bus lines to continue to serve areas not connected by train.
o Need opportunity for future connection with other lines, such as Red Line at Porter Square.
o Several stations do not show bus stops, or nearest bus stop is located outside of station. Would be helpful to design station and alter bus route to allow for stops at the stations.

• Keep and Add Local Businesses: We want locally owned, culturally diverse, clean businesses in commercial areas with employees who live in Somerville.

• Keep Somerville Affordable: We want to make sure people of all economic means have the ability to afford housing and living costs, so that Somerville residents, such as child care workers, cab drivers, local business employees and others can stay here affordably.

• Maintain Our Diversity: Preserve and encourage economic and ethnic diversity of residents and businesses.

O-006-002

The state needs to plan all transportation projects on the basis of guiding principles for Transit Oriented Develoment (TOD), smart growth and quality of live impacts. For example, TOD and land use are the planning and organizing focus of the South Coast Rail project, but have been ignored in the Green Line extension planning despite the requirement by the Secretary to address these concerns in the EENF.

O-006-002

Direct and indirect impacts to land use are described in DEIR/EA Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for sustainable land use, which could further reduce automobile traffic congestion and improve air quality.

MEPA

Regarding EEA #13886

Dear Secretary Ian Bowles:

O-007-001

The community members engaged with CCP would like to see all decisions related to the planning of the Green Line and the land use in the ½ mile areas around the 7 proposed stations to reflect this list of Corridor Core Principles, with specific attention to those principles relevant to the scope of MA DOT. Please see next page for list of Core Principles and corresponding suggested changes to DEIR. The highlighted principles are those we think are directly related to recommendations presented in the DEIR.

The Community Corridor Planning project, a grassroots effort to engage community members in the land use planning along the Green Line extension, has brought together hundreds of people to frame a list of core principles to guide their recommendations for land use along the extension in upcoming months. While this list of core principles was not generated specifically for MA DOT, it does demonstrate the broad values and priorities of the community which residents would like to see reflected in all planning processes regarding the Green Line Corridor. ***We ask that these principles be taken into consideration as the Mass. Department of Transportation finalizes its Environmental Impact Report.***

O-007-001

MassDOT has reviewed and considered the “Core Community Principles” for station area land use, presented by Community Corridor Planning. As described in the FEIR, Section 6.2 of the Public Involvement Plan, MassDOT will hold land use workshops to discuss related issues with the community.

Core Community Principles for
Neighborhood Development Along the GreenLine Corridor

♦ **Increase Commercial and Economic Development:** We want to see the creation of squares as destinations, with careful attention to mixed use of commercial/residential, reuse of buildings, and economic development to increase the tax base.

- Draft Environmental Impact Report (DEIR) does not address Department of Transportation (DOT) commitment to economic development
- New MA DOT is mandated to work with Secretary of Economic Affairs to promote station location and design that promotes economic development and the community needs to show MA DOT how to do this – to change the paradigm pro-actively.

♦ **Improve the Green Environment:** We want a safe, environmentally friendly neighborhood with more green space, trees, and gardens; reduction of noise; avoidance of light pollution; and prevention of toxic chemicals in the air. Given this principle, it is important that more attention be given to:

- Noise of operations
- Mitigation during construction for noise, vibration, etc.
- How close the tracks will be to the Brickbottom Building and other buildings along the right of way
- The need to involve neighborhoods affected regarding noise and vibration
- Recommendation that testing be done immediately after project begins to determine if estimates for vibration and noise done for the DEIR are accurate.
- Possible transfer at Ball Square but only if Commuter rail is electric not diesel because of the pollution it would create for neighbors
- Consider dual-mode conversion of existing commuter trains

♦ **Encourage Walking and Biking:** We want to encourage walking and cycling through safe, bike/pedestrian friendly design of streets and paths around and between stations.

- The design required in the MEPA Scope (EENF) does not sufficiently address the detailed concerns and requirements for each station.
- In the DEIR design and engineering is insufficient for moving the project to a final EIR because of a range of unaddressed issues (i.e., station design, siting, bike parking, community path integration)
- Pedestrian accessibility is poor for the station designs in the DEIR
- Bike access and bike parking at all stations needs to be improved.
- New Light Rail Vehicles (LRVs) should be designed to accommodate bicycles (like Portland LRVs)
- The Community Path and its important station connections must be designed and constructed simultaneously with the Green Line extension in order to facilitate direct pedestrian and bicycle access to the stations and to ensure a safe, attractive, and highly-functional Community Path.

♦ **Create Community Gathering Spaces:** We want both indoor and outdoor safe, public gathering spaces for community members.

♦ **Improve Access:** We want above standard, safe access to and between stations for people with disabilities, strollers, and pedestrians in general.

♦ **Community Involvement:** We want to make sure residents are included on an ongoing basis in the planning, design, and zoning changes to the stations and areas around them. Youth, artists, and others should help design stations, with attention to amenities. We need an easy and clear process for residents to address problems as they come up, with ways of immediately resolving unseen impacts.

- Ongoing community participation in the next phase (presumed to be done as a design/build project) is necessary
- Public involvement will help to keep decision-making public and transparent
- Need to have a field office that residents can go to with concerns on an ongoing basis
- Need neighborhood based community groups to be involved in planning around each station.

♦ **Connecting Buses and Trains:** We want to ensure inter-modal access between neighborhoods and stations, for new train service to be adequate and speedy, and for existing bus lines to continue to serve areas not connected by train.

- Need opportunity for future connection with other lines, such as Red Line at Porter Square.
- Several stations do not show bus stops, or nearest bus stop is located outside of station. Design the stations and alter bus routes to allow for stops at the stations.

♦ **More Local Jobs:** We want a fixed percentage of respectable jobs of all types with good wages and benefits for Somerville residents, from construction to permanent.

♦ **Keep and Add Local Businesses:** We want locally owned, culturally diverse, clean businesses in commercial areas with employees who live in Somerville.

♦ **Keep Somerville Affordable:** We want to make sure people of all economic means have the ability to afford housing and living costs, so that Somerville residents, such as child care workers, cab drivers, local business employees and others can stay here affordably.

♦ **Maintain Our Diversity:** Preserve and encourage economic and ethnic diversity of residents and businesses.

O-007-002

The state needs to plan all transportation projects on the basis of guiding principles for Transit Oriented Development (TOD), smart growth and quality of life impacts. For example, TOD and land use are the planning and organizing focus of the South Coast Rail project, but have been ignored in the Green Line extension planning despite the requirement by the Secretary to address these concerns in the EENF.

O-007-002

Direct and indirect impacts to land use are described in DEIR/EA Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for sustainable land use, which could further reduce automobile traffic congestion and improve air quality.

CONSERVATION LAW FOUNDATION

November 18, 2009

RECEIVED
NOV 23 2009
MEPA

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst, EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Re: Comments at November 18, 2009 Green Line Extension DEIR/EA Public Hearing

Dear Secretary Bowles:

I appreciate the opportunity to testify at the Green Line Extension DEIR/EA public hearing tonight and hereby would like to also provide my comments in writing. In the interest of time, I intend to keep my comments brief.

O-008-001

The release of the DEIR/EA marks an important milestone for the Green Line Extension project. We would like to thank MassDOT and the Executive Office of Energy and Environmental Affairs for all their work on getting the Green Line Extension project environmental review process to this crucial stage. The Green Line Extension project will provide significant environmental benefits and mobility improvements for residents of Somerville, Medford and Cambridge. If done right, this project also has great potential to further environmental justice, economic development and smart growth.

O-008-002

One of the outstanding issues of the Green Line Extension project concerns the location of the maintenance facility. The last paragraph of page 3-10 of the DEIR/EA states that the Commonwealth intends to perform a complete analysis of the maintenance facility alternatives and that the results will be made available to the public for input and discussion. The location of the maintenance facility is of great interest to many supporters of this project. For meaningful public participation to take place, it is essential that the analysis of the alternatives is not only released to the public, but with enough time to allow for public comment.

Thank you again for the opportunity to comment at this time. The Conservation Law Foundation will submit further and more detailed comments in writing before the expiration of the extended comment period.

Sincerely,

Rafael Mares
Staff Attorney

O-008-001

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

O-008-002

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

CONSERVATION LAW FOUNDATION

Protecting New England's Environment

January 8, 2010

RECEIVED
JAN 8 2010
MEPA

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office, Attn. Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Ian Bowles:

O-009-001

The Conservation Law Foundation ("CLF") appreciates the opportunity to comment on the Draft Environmental Impact Report/Environmental Assessment ("DEIR/EA") for the Green Line Extension Project ("Project"). As you know, CLF has been a long-time champion of the Project. It will provide significant and urgently needed transportation, environmental justice, land use, climate and air quality benefits to the Greater Boston area. CLF continues to strongly support its timely completion. We appreciate, as well, your and the Massachusetts Department of Transportation's ("MassDOT") efforts to move this project forward consistent with the Commonwealth's transit commitments.

O-009-002

CLF originally supported MassDOT's request for a single environmental impact report ("SEIR") to the extent that mechanism would accelerate the environmental review process. However, CLF's support was contingent upon MassDOT's preparation of a comprehensive SEIR sufficient to demonstrate that the selected project will deliver the required air quality benefits and, overall, be most beneficial to the communities it will serve. Unfortunately, the DEIR/EA, as described in detail below, is not responsive to a number of significant requirements set forth in the Secretary's Expanded Environmental Notification Form Certificate ("EENF Certificate") and the proposed project does not comply with the Massachusetts State Implementation Plan ("SIP").

Accordingly, we respectfully request that MassDOT be required to submit a final environmental impact report ("FEIR") addressing and remedying the outstanding issues we raise below. We believe that the FEIR does not need to be a stand-alone document but, as is permitted by 301 CMR 11.07(4), can be limited in scope to the aspects of the project or issues that require further review or analysis, such as those raised in these and other comments. Under the circumstances, a continued environmental review process would provide an opportunity to advance this project in a way that will help guarantee its ultimate success.

62 Summer Street, Boston, Massachusetts 02110-1016 • Phone: 617-350-0990 • Fax: 617-350-4030 • www.clf.org

O-009-001

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

O-009-002

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

I. MassDOT Has Not Satisfied EENF Certificate Requirements

Section 62A of the Massachusetts Environmental Policy Act ("MEPA"), M.G.L., c. 30, §§ 61, 62-62H, states that "[t]he secretary shall determine the form, content, level of detail and alternatives required for the [environmental impact] report." The Supreme Judicial Court, in *Allen v. Boston Redevelopment Authority*, 450 Mass. 242 (2007), held that, where the Secretary defines the appropriate scope of an environmental impact report and the proponent fails to meet these requirements, there is no rational basis for certification of compliance with MEPA and its regulations. Similarly, MassDOT has failed to meet the following requirements of the EENF Certificate:

A. *Failure to Satisfy EENF Certificate Requirements Concerning Air Quality Analysis*

To place our comments in context, it is useful to recall that, since 2006, there have been three relevant individual rounds of air quality analyses involving the Project. As set forth in greater detail below, each of these analyses employed a different set of underlying assumptions and data inputs, making valid comparisons between them impossible.

In December of 2006, for purposes of the proposed SIP revisions that were ultimately codified in federal law in 2008, the revised package (1,000 additional commuter rail parking spaces in greater Boston, Fairmount Line improvements, and Green Line extension to Medford Hillside with a spur to Union Square) as well as the original package of transit commitments (Green Line extension to Ball Square, Arborway restoration, and Red-Blue connector construction) were analyzed to determine the impact on relevant air pollutant emissions. See Central Transportation Planning Staff ("CTPS"), "Description of Modeling Assumptions and Analysis Methodology for the State Implementation Plan Transit Commitment Projects Current and Proposed Substitutions," December 28, 2006, revised March 15, 2007 ("2006 SIP Analysis").

In 2009, for purposes of the DEIR/EA, MassDOT modeled air quality impacts associated with each of the alternatives considered for the Green Line Extension ("2009 DEIR/EA Air Quality Analysis"). See DEIR/EA, Volume 1, at 5-79 to 5-98. The 2009 DEIR/EA Air Quality Analysis was designed to comply with Federal Transit Authority ("FTA") funding requirements.

The third analysis, also completed in 2009 for purposes of the DEIR/EA, was modeled by MassDOT in an attempt to demonstrate SIP consistency ("2009 DEIR/EA SIP Analysis"). See DEIR/EA, Volume 1, at 5-102 to 5-103. The specific goal of the 2009 DEIR/EA SIP Analysis was to demonstrate that the package of transit improvements in the current SIP (as interpreted by MassDOT to include extension of the Green Line only to College Avenue with a spur to Union Square) will accomplish the minimum of 110 percent of the emissions reductions that would have been achieved if the package of projects in the 1991 SIP had been built. To that end, MassDOT modeled the expected air quality benefits of a single project—the Green Line Extension to College Avenue with a spur to Union Square—and then compared the results to the 2006 SIP Analysis modeling results for the *entire* original package of transit commitments (Green Line extension to Ball Square, Arborway restoration, and Red-Blue connector

construction). MassDOT also elected not to remodel the 2006 original package using the new assumptions and inputs included in the 2009 DEIR/EA SIP Analysis, and, as a result, no valid comparison between the emissions reductions associated with the original package of transit commitments and those associated with the total revised package (including the Green line Extension to College Avenue) was presented.

O-009-003 The EENF Certificate requires that the DEIR/EA include an evaluation of regional air quality impacts of ozone precursor emissions (mesoscale analysis) and a calculation of carbon monoxide and particulate matter concentrations at congested intersections near the project corridor (microscale analysis) to describe the air quality benefits associated with the Project. See EENF Certificate at 10. The meso- and microscale analyses included in the 2009 DEIR/EA Air Quality Analysis were designed to comply with this mandate and also with Federal Transit Authority (FTA) funding requirements. According to MassDOT, an unavoidable consequence of this FTA-compliant modeling design, see DEIR/EA, Volume 1, at 5-101, 5-102, is that it does not produce results that can be directly compared to the air quality analysis performed as part of the SIP amendment process in 2006.

O-009-004 The EENF Certificate also requires a description of the Project's "consistency with the [SIP] and MassDEP's Transit Regulations." See EENF Certificate at 10. The DEIR/EA, however, is in fact so opaque with respect to the methodology employed by MassDOT for purposes of the 2009 DEIR/EA SIP Analysis that no member of the public could reasonably be expected to understand and/or discern whether the models represent a valid comparison. For example, it is unclear whether the same transportation model, emissions model, start year, end year, and/or assumptions about future land uses, travel model, roadways and transit networks were applied in the 2006 SIP Analysis and the 2009 DEIR/EA SIP Analysis. This represents, among other issues, a significant impediment to meaningful public participation.

O-009-005 To gain clarity on these points, CLF met with MassDOT and CTPS representatives on January 4, 2010. CLF has learned that the assumptions and data inputs to the 2006 SIP Analysis differed strikingly from those input to the 2009 DEIR/EA SIP Analysis. The analyses applied different inputs to the emissions model (e.g., 0.177 and 0.153 g/mile of nitrogen oxides at 35 mph respectively) and distinct start years (2000 and 2006 respectively) and end years (2025 and 2030 respectively). The analyses also used different assumptions about land uses (e.g., the 2009 SIP Analysis relies heavily on the new MetroFuture progressive regional plan, which was not available in 2006), traffic modeling (986 and 2,727 traffic analysis zones respectively), and roadway and transit networks (e.g., the Urban Ring was only included in the no-build alternative for the 2006 SIP Analysis). At the same time, MassDOT and CTPS also informed CLF that the original package of projects was not evaluated in the 2009 DEIR/EA SIP Analysis thereby making a valid comparison impossible.

O-009-006 Data presented in Table 5.6-11 further highlight the substantial flaws in MassDOT's 2009 DEIR/EA SIP Analysis. The table purports to demonstrate that *the Green Line extension to College Avenue with a spur to Union Square, standing alone, that is without factoring in the air quality benefits of any of the additional transit commitments, achieves greater air quality benefits than the entire package of original transit commitments*. Specifically, MassDOT asserts,

O-009-003

The Green Line Extension will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality. As required by the Secretary's Certificate on the DEIR/EA, the FEIR includes a narrative clarifying the relationships of air quality modeling data to MassDEP and EPA requirements for State Implementation Plan (SIP) consistency.

O-009-004

Please see response to Comment O-009-003.

O-009-005 through O-009-007

The air quality analysis included in the DEIR/EA demonstrates that the Green Line Extension Project meets the Transportation Conformity planning-level requirements and that the emission reductions for the 2009 SIP package, which includes the Green Line Extension Project, exceed the emission reductions for the 2008 Federal Register SIP Approved Projects by more than 10%. The emission reductions were calculated following the same modeling protocol and procedures required for Transportation Conformity and SIP air quality analyses. Transportation Conformity and SIP air quality analyses utilize traffic data from the statewide traffic model and the EPA's emission factor model MOBILE6.2. The statewide traffic model is maintained by the CTPS, the technical staff of the Boston Region MPO, which is responsible for SIP air quality submissions.The statewide traffic model is the basis for determining existing and future traffic data for Clean Air Act Amendments (CAAA) and NEPA submissions.

The EPA requires that statewide traffic models used for SIP submissions be based upon the most recent approved planning level data. As a

O-009-006 without explanation, that the Green Line extension to College Avenue will achieve larger emissions reductions of 151 kg/day for carbon monoxide ("CO"), 0.5 kg/day for nitrogen oxides ("NOx"), and 2 kg/day for volatile organic compounds ("VOC").

O-009-007 The 2009 DEIR/EA SIP analysis also concludes, albeit indirectly, that the Green Line extension to College Avenue with a spur to Union Square as modeled in 2009 would yield considerably greater emissions reductions than the Green Line extension to Medford Hillside with a spur to Union Square as modeled in 2006, although the two analyses assumed the same terminus—College Avenue. See DEIR/EA, Volume 1, at 5-102 and 2006 SIP Analysis at 6.

The egregiousness of these flaws is made even more apparent when one considers that the 2006 SIP Analysis showed that the Red-Blue connection was the greatest contributor to air quality benefits in the original package. See Attachment 1, 2006 SIP Analysis at 10 (Table 1). That project was responsible for a reduction of 400% more NOx and 180% more VOC than the extension of the Green Line to Ball Square proposed at the time and was expected to result in close to the same reduction of CO (94%). Additionally, the emissions reductions from the Arborway restoration were expected to be greater than those associated with the Fairmount improvements.[1] Plainly, the comparison of air quality benefits in Table 5.6-11 of the DEIR/EA is inaccurate. This result is particularly questionable because the proposed alternative for the extension of the Green Line only adds two stations—College Avenue and Union Square.[2]

O-009-008 As a result of these serious modeling errors, the 2009 DEIR/EA SIP Analysis cannot demonstrate SIP consistency. Because, by MassDOT's own admission, the 2009 DEIR/EA Air Quality Analysis cannot be compared to the 2006 SIP Analysis, it also does not provide an alternative set of data against which to assess SIP consistency. To properly respond to the EENF Certificate requirements, an accurate and valid air quality comparison analysis—applying consistent modeling to both the original package of projects and to the revised package, including the Green Line Extension to College Avenue—must be completed. MassDOT's assumptions with respect to this air quality comparison analysis must be made clear to facilitate public participation and ensure a transparent process.

B. Failure to Satisfy EENF Certificate Requirements Concerning Stormwater Analysis

The EENF Certificate requires a careful analysis of impacts to land and stormwater. See EENF Certificate at 9. While the DEIR/EA addresses some of the mandates of the EENF Certificate with regard to stormwater, it does not provide an analysis sufficient to satisfy the EENF Certificate requirement.

---

[1] The emissions reductions for the Arborway restoration and the Fairmount improvements respectively were estimated to be 85 kg/day versus 47kg/day of CO, 7 kg/day versus 5kg/day of VOC, and 1 kg/day of NOx for both.

[2] It is worthwhile noting in this context that the results of the 2006 SIP Analysis also raise some questions. That analysis predicts that the Green Line extension to Union Square and Medford Hillside will have disproportionately greater emissions reductions as compared to the original expansion to Ball Square (227% for CO, 800% for NOx, and 340% for VOC) than one would expect, considering that, as modeled, the new expansion would add only two additional stations (Union Square and College Avenue). See Attachment 1.

result, statewide traffic models are periodically updated to include newly identified background projects, land use, and model enhancements. Statewide traffic models typically include the roadway network that exists at the time it is run and regionally significant projects (background projects) that are reasonably expected to be constructed by the design year (i.e., twenty years into the future). Similarly, the MPOs establish and periodically update the land use for existing and future years. The statewide traffic model that CTPS uses for forecasting travel demand is based on procedures and data that have evolved over many years. It uses the most up to date information, transportation networks, and input data available to CTPS at the time of analysis. The statewide traffic model simulates existing travel modes for transit, auto, and walk/bike and forecasts future year travel on the entire transportation system, spanning, in this instance, the majority of eastern Massachusetts. It uses population, employment, number of households, auto ownership, highway and transit levels of service, as well as downtown parking costs, auto operating costs and transit fares as important inputs in applying the model to the real world condition.

As required by EPA, these inputs are constantly updated so that the model set simulates current travel patterns with as much accuracy as possible. The greatest challenge to the air quality modeling is ensuring consistent results when the statewide traffic and the mobile source emission factor models are periodically updated. For example, the statewide traffic model of 2006 was used to establish the 2008 Federal Register SIP Approved Projects + 10% emissions criteria. This air quality modeling used the best transportation network and input data available at that time. The air quality modeling presented in the DEIR/EA uses an improved statewide traffic model with an updated roadway network, more current land use data, and a newer version of EPA's mobile source emissions factor model. All of these measures result in improved accuracy of the present day and future air quality estimates. This real

O-009-009

For example, the EENF Certificate requires the DEIR/EA to "investigate all feasible measures of reducing impervious surfaces." See EENF Certificate at 9. The DEIR/EA, however, only states that "[t]he existing designs strive to minimize impervious surfaces through the use of existing streets and rail corridor and by reusing existing, developed sites for the stations wherever possible." See DEIR/EA, Volume 1, at 5-134. The DEIR/EA does not consider other beneficial measures to minimize impervious surfaces, such as, vegetated areas, green roofs, and other low-impact development stormwater techniques. By its own admission, MassDOT fails to consider all feasible measures to reduce impervious surfaces stating that "[a]dditional efforts will be taken during preliminary engineering and final design to reduce the net increase in impervious surfaces." See DEIR/EA, Volume 1, at 5-134. Stormwater impacts, however, need to be considered *prior* to selecting a proposed alternative. It is for that reason that the EENF Certificate calls for MassDOT to develop an operations and management plan to mitigate stormwater impacts. See EENF Certificate at 9. The DEIR/EA impermissibly postpones development of such a plan to the final design of the stormwater management system. See DEIR/EA, Volume 1, at 5-138.

O-009-010

The EENF Certificate also requires that MassDOT "demonstrate that source controls, pollution prevention measures, erosion and sediment controls, and the drainage system will comply with" the Massachusetts Stormwater Management Standards for construction and post-construction, and with state water quality standards. See EENF Certificate at 9. The Massachusetts Stormwater Management Standards require specific measures to ensure protection of the Commonwealth's water resources and communities including, but not limited to, the following: no new stormwater outfalls may discharge untreated stormwater (Standard 1), loss of annual recharge to groundwater shall be eliminated or minimized through the use of infiltration measures including environmentally sensitive site design, low impact development techniques, and stormwater best management practices (Standard 3), stormwater management systems shall be designed to remove 80% of the average annual post-construction load of Total Suspended Solids (TSS) (Standard 4). See Massachusetts Stormwater Handbook, Volume 1, Chapter 1, February 2008.[3] The DEIR/EA does not address how the Project will comply with these standards.

O-009-011

Stormwater from the Project would be directed into municipal sewer systems that discharge into the Charles and Mystic Rivers. The Charles River, infamous for its "dirty water," has recently experienced dramatically lower levels of pollutants in part due to a focus on eliminating stormwater runoff. The Mystic River watershed has been long neglected and is surrounded by environmental justice communities that would benefit significantly from access to a clean river. As such, it is necessary for MassDOT to take into account carefully the stormwater impacts of the Project to ensure compliance with all applicable state and federal clean water laws prior to completing the environmental review process. MassDOT therefore should be required to complete and include within the FEIR a detailed stormwater impact analysis that complies with the requirements of the EENF Certificate.

[3] Available at http://www.mass.gov/dep/water/laws/v1c1.doc (last accessed Jan. 8, 2010).

time approach to air quality modeling results in emission values that are considered appropriate for the SIP process. In fact, this air quality modeling approach is required by EPA for evaluating Transportation Plans, Transportation Improvement Programs, and projects for SIPs and NEPA documents.

Please refer to Chapter 3 – Air Quality for a more detailed response concerning the challenges associated with the evolution of modeling programs and input data over time, and how the air quality modeling results presented in the DEIR/EA sufficiently demonstrate consistency with the SIP.

O-009-008

The Green Line Extension will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality. As required by the Secretary's Certificate on the DEIR/EA, the FEIR includes a narrative clarifying the relationships of air quality modeling data to MassDEP and EPA requirements for State Implementation Plan (SIP) consistency.

O-009-009

Proposed stormwater management methods to prevent any increased risk of flooding downstream and to maintain the existing quality of the rivers that receive discharge from the municipal stormwater systems are outlined in Section 6.5.4.6 of the DEIR/EA. The project would be required to comply with federal and state stormwater discharge permit conditions during both the construction and operational phases. Additional design will be advanced during preliminary engineering.

C. Lack of Detailed Analysis of Funding Sources to Support Choice of Proposed Alternative

The EENF Certificate specifically requires a detailed description of funding sources for the Project. See EENF Certificate at 5. The DEIR/EA nowhere provides such a description.

The DEIR/EA states that "EOT expects Project funding will come both from the FTA and from state bonds." See DEIR/EA, Volume 1, at 1-2. Later it provides: "[h]owever, because of the constraints placed on EOT by Federal [sic] funding requirements and the economic crisis facing the Commonwealth, at this time EOT is not able to identify sufficient funding to support construction of the Medford Hillside to Mystic Valley Parkway/Route 16 segment within the 2014 timeframe mandated by the State Implementation Plan." See DEIR/EA, Volume 1, at 1-6 and 3-40. It also states that ". . . EOT plans to seek Federal funding for the project. . . ." see DEIR/EA, Volume 1, at 5-102, and "EOT is working with the FTA to apply for New Starts funds for the project." See DEIR/EA, Volume 3, at 33. Further, responding to a comment, MassDOT represents that "[t]he Project will be funded using a combination of Transportation dollars appropriated by the State and by funds that EOT is seeking through the FTA New Starts program." See DEIR/EA, Volume 3, at 167.

O-009-012

MassDOT's vague discussion of potential project funding is insufficient to satisfy the EENF Certificate requirement. For example, the FTA New Starts program requires a fifty percent state match. The DEIR/EA neither describes the source nor the amounts of the corresponding state funding beyond its general reference to state bonds. It also does not explain how the project will be funded should federal funding, which is not guaranteed, fall through. The EENF Certificate's requirement to provide a detailed description of funding sources is particularly critical since MassDOT's selection of the proposed project, by its own admission, rests on considerations of available sources of project funding. Despite the substantially more significant environmental and environmental justice benefits associated with the so-called "preferred alternative" (Alternative 2, extending the Green Line to Route 16), MassDOT did not choose that alternative and instead selected Alternative 1 (to College Avenue) as its proposed project, solely because of its inability to identify sufficient funding sources to complete Alternative 2 by the SIP deadline. MassDOT concludes without explanation that Alternative 2 could not be financed on time.

MassDOT should therefore be required to present a projected budget for the Green Line Extension with a detailed description of all available funding sources which includes sufficient information to determine whether funding to support construction of the Medford Hillside to Route 16 segment within the 2014 timeframe is available. Such a budget should identify expenditures already incurred, cost estimates for each alternative, plus existing and potential funding sources. The description of the funding sources should be detailed. It should identify their origin (federal, state, local or private), nature (discretionary or non-discretionary), financing mechanism (revenue bonds, grants, grant anticipation notes, pay-as-you-go, state appropriations, etc.), name (e.g., New Starts, flex-funded transit), amount (whether actual or projected), restrictions, if any, and status (received, approved, pending or potential). For funding already received, the budget should include the date it was received, the amount spent, how it was spent, and how the remainder has been allocated. For funding not yet received, the budget should

O-009-010

Please see response to Comment O-009-009.

O-009-011

Please see response to Comment O-009-009.

O-009-012

A detailed project budget, including potential funding sources, will be developed during preliminary engineering. Project cost estimates are based on the current, conceptual level of design. It is anticipated that Green Line Extension construction would be financed with a combination of funds from federal and state sources. In order to fund any state share of the costs of constructing the Green Line Extension project, MassDOT will need to make use of capital funds raised through Commonwealth bonding. Should the existing bond authorization for the State Implementation Plan projects (of which the Green Line Extension project is one) not be sufficient, MassDOT will need to work with the Legislature and the Executive Office of Administration & Finance to provide additional bond authorization to cover those costs of the Green Line Extension project for which the Commonwealth is responsible.

O-009-012 include the actual or expected dates of the application and receipt, the actual sum expected or the range of projected amounts. The budget should also include an estimate of any possible recovery of costs associated with this project, such as from the use or sale of the current Lechmere station property.

D. Incomplete and Segmented Analysis of Maintenance Facility Environmental Impacts

O-009-013 In its "Additional Maintenance Facility Alternatives Analysis" released on December 9, 2009 ("Additional Analysis"), MassDOT states that if it decides to substitute an alternative site to Yard 8 as the preferred maintenance facility location, a full analysis of environmental impacts (to natural resources, air quality, noise and vibration, historic resources, as well as social and economic impacts) will be conducted and documented in a notice of project change. It follows that, if MassDOT decides not to choose a different site for the maintenance facility, its choice will have been made without full consideration of the environmental impacts. This approach negates the purpose of the NEPA/MEPA processes.

O-009-014 Based on the fact that the DEIR/EA itself did not include an analysis of all the maintenance facility locations under consideration, it appears that MassDOT may have impermissibly attempted to segment its review. See, e.g., *Northwest Bypass Group v. U.S. Army Corps of Engineers*, 552 F.Supp.2d 97, 125 (D.N.H., 2008) ("Connected and cumulative actions are considered in the EA 'to assure that decisionmakers, as well as the public, are aware of the environmental impacts of the entire project, as an interconnected whole, so as to avoid irreversible commitment to an entire project on the strength of a segmented analysis of the impacts associated with something less than the entire project.'") (quoting *Sierra Club v. Marsh*, 744 F. Supp. 352, 364 (D. Me. 1990)).

O-009-015 The EENF Certificate clearly states on its first page that "[f]or this project to achieve its potential, [MassDOT] and the MBTA must design the project carefully and coordinate proactively and effectively with state and city agencies, citizens, local businesses and other stakeholders during all aspects of the project—planning, design and construction." While MassDOT has, so far, facilitated a public participation process to address the potential maintenance facility location, it has failed to respond fully to the strong and legitimate concerns of the communities directly affected. To date, no decision on the location of the maintenance facility has been made. Since the Advisory Group meeting on May 5, 2008, when MassDOT first detailed its support facility analysis and findings, the agency has faced widespread opposition to Yard 8 from residents, community groups, city representatives, and members of the state and federal legislative delegations. Through public hearings on November 18, 2009 and December 16, 2009, the Commonwealth has continued to receive thoughtful and, at times impassioned, critiques of the Yard 8 option.

As the EENF Certificate states "[t]he overarching policy goal within MEPA review for the use and reuse of land is to direct public infrastructure investments to spur revitalization of previously developed urban sites over undeveloped Greenfield sites." See EENF Certificate at 5. Further, the EENF Certificate mandates that "[t]his project should be designed to maximize benefits for local residents while preserving the integrity and character of existing

O-009-013

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

O-009-014

Please see response to Comment O-009-013.

O-009-015

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

O-009-016 neighborhoods." See EENF Certificate at 2. Opponents of Yard 8 have argued that the maintenance facility will have a severe impact on the viability of development of the Innerbelt and Brickbottom neighborhoods of Somerville. Combined, these neighborhoods constitute a 225-acre industrial zone, with 145 developable acres remaining, which could be a driver of significant economic development. The existing transportation infrastructure—including the Lowell Line, the freight right of way, the Boston Engine Terminal, McGrath highway and I-93—form a nearly impenetrable barrier around the neighborhoods. The expansion of the Green Line has the potential to help break down the barriers to this area, connect it to other parts of Somerville, Cambridge and Boston and spur economic development. The maintenance facility, depending on its location and the manner in which it is constructed, however, could create another physical barrier and remove land which could otherwise be used for economic development. Neither the DEIR/EA, nor the Additional Analysis, fully considers the relative impacts of the remaining maintenance facility location options on revitalization of the area. Failure to do so not only limits the Project's opportunity to live up to its full potential but also unnecessarily places its timely completion at risk.

O-009-017 The EENF Certificate also requires an analysis of noise and vibration for existing and proposed conditions which includes the identification of sensitive receptors, a detailed noise assessment and vibration analysis, and mitigation measures. See EENF Certificate at 13. Considering the significant community opposition to the siting of the maintenance facility at Yard 8 in large part due to its noise and vibration impacts, it is necessary that a full analysis be completed to help inform the choice of the maintenance facility location.

O-009-018 Likewise, the EENF Certificate requires the proponent to address the stormwater impacts of the project alternatives. See EENF Certificate at 9. While the DEIR/EA includes such an analysis for each of the Green Line Extension alternatives, it fails to consider the stormwater impacts of any of the maintenance facility options other than Yard 8. The Additional Analysis also does not address the stormwater impacts of the additional maintenance facility options reviewed. The largest change in impervious surface area as a result of this project is related to the maintenance facility. Yard 8 would increase the impervious area by 4.8 acres, which is over seventy percent of the total increase in impervious area for the entire proposed project. This is of particular importance because the maintenance facility is most likely also the portion of the project with the greatest potential for release of contaminants into stormwater. Stormwater from the maintenance facility, regardless of which of the options still under consideration MassDOT chooses, would be directed into a municipal sewer system that discharges into the Mystic River. As such, it is necessary for MassDOT to take into account carefully the stormwater impacts of the maintenance facility at all locations under consideration to ensure compliance with all applicable state and federal clean water laws.

O-009-019 To comply with the scope of the EENF Certificate, MassDOT should therefore be required to complete and include within the FEIR a full environmental impact analysis, including, but not limited to, noise, vibration, air emissions, and stormwater impacts, for each of the maintenance facility site alternatives under consideration. MassDOT should also detail specifically how each maintenance facility alternative will impact surrounding neighborhoods and opportunities for revitalization.

O-009-016

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

O-009-017

FEIR Chapter 2 presents an analysis of noise and vibration impacts for each site alternative. The storage and maintenance facility and its rail approaches will be designed to minimize noise and vibration impacts to neighboring properties and stakeholders. Noise and vibration mitigation measures are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

O-009-018

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. FEIR Section 2.3 provides a

II. Limited Extension to College Avenue by December 31, 2014 Violates SIP

The United States Environmental Protection Agency ("EPA") has designated Eastern Massachusetts a nonattainment area for ozone. A purpose of the SIP is to help Massachusetts achieve ozone attainment. Because motor vehicles are the predominant sources of ozone precursor emissions in the area, the SIP relies on strategies to reduce vehicle miles traveled ("VMT"). The extension of the Green Line, an important transportation control measure ("TCM"), is therefore an essential element of the SIP.

The Clean Air Act ("CAA") requires projects receiving federal funding within nonattainment areas to demonstrate compliance with the SIP. Specifically, 42 U.S.C. § 7506(c)(2) mandates that "[n]o Federal agency may approve, accept or fund any transportation plan, program or project unless" the project "has been found to conform to any applicable implementation plan." The Federal Highway Administration Regulations, at 23 CFR §771.133, state that "[t]he final EIS or FONSI should document compliance with requirements of all applicable environmental laws, Executive orders, and other related requirements." Massachusetts Regulations, see 310 CMR § 60.03(13)(a), require "timely implementation" of TCMs included in a SIP and transportation plan, like the Green Line Extension Project. Therefore the environmental review process must document that the Green Line Extension Project, as currently proposed in the DEIR/EA, will comply with the SIP deadline.

O-009-020

O-009-021

The SIP requires an extension of the Green Line from Lechmere Station both to Union Square and Medford Hillside by December 31, 2014. The EENF Certificate provides that "the regulations do not specify the terminus of the line *within* Medford Hillside (emphasis added)." See EENF Certificate at 8. To comply with the SIP, MassDOT must construct, by December 31, 2014, an extension of the Green Line that terminates in Medford Hillside. Medford Hillside's historical boundaries are well documented and do not include the location of the proposed terminus at the intersection of College Avenue and Boston Avenue. Historical and modern maps, as well as published references to the neighborhood, previously provided to MassDOT and included with these comments, see Attachment 2, clearly demonstrate that the proposed project does not reach the Medford Hillside.

The DEIR/EA states, without explanation and contrary to the well-documented definition of Medford Hillside, that the proposed project meets the SIP requirement because the College Avenue terminus reaches Medford Hillside. MassDOT must, pursuant to the EENF Certificate, either demonstrate that the College Avenue terminus lies within the Medford Hillside—which we believe it cannot do—or select an alternative terminus that satisfies the SIP. The MEPA and NEPA processes can only be concluded if the project complies with the SIP, which calls for an extension beyond College Avenue to Medford Hillside. A terminus at Route 16, as considered in four out of six alternatives in the DEIR/EA, would fulfill the SIP requirement to extend the Green Line to Medford Hillside.

In this context, it is useful to note that former Secretary of Transportation James A. Aloisi, Jr. in his close-out report of October 29, 2009 stresses that "[t]he Green Line expansion is a lost opportunity without a clear and unequivocal commitment to extending the line to Route

comparison summary of environmental impacts for the three maintenance facility alternatives. As a result of the evaluation, Option L is identified as the preferred maintenance facility site. Design for the maintenance facility and the entire project alignment will be refined during the Project's preliminary engineering stage.

O-009-019

Please see response to Comment O-009-018.

O-009-020

The Green Line Extension will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality. As required by the Secretary's Certificate on the DEIR/EA, the FEIR includes a narrative clarifying the relationships of air quality modeling data to MassDEP and EPA requirements for State Implementation Plan (SIP) consistency. As described in Section 1.1 of the DEIR/EA, the Proposed Project is anticipated to be completed by December 31, 2014 in compliance with the SIP. MassDOT is continuing to strive to achieve this goal.

O-009-021

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. The Proposed Project, with a terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the

16." See Secretary Aloisi's Letter to Governor Deval Patrick, dated October 29, 2009, at 7. Such a commitment currently does not exist. Compared with terminating the line at College Avenue, the Route 16 terminus would produce an estimated additional reduction in VMT over the Baseline Alternative of more than ten percent. It also would provide fair and equitable access to transit—and thus to increased economic and educational opportunities—to five additional state-defined environmental justice communities (two in Somerville, two in Medford, and one in Arlington). Since the DEIR/EA's environmental justice analysis did not model transit benefits for the proposed project but instead only considered those for alternatives with a Route 16 terminus, it precludes an exact quantification of the potential gain in environmental justice benefits. There can be no doubt, however, that the transit benefits to environmental justice communities would be great.

III. Continued Public Participation

O-009-022

The Green Line Extension has received wide community support and interest. Its supporters not only have strong opinions about important parts of the Project, but also significant knowledge and expertise that bring value to the public process. Citizen involvement is therefore a critical component of moving ahead with the Project.

On December 1, 2009, CLF received a letter from MassDOT seemingly ending the Advisory Group process for the Project and seeking suggestions on the next phase of civic engagement. CLF has welcomed the opportunity to participate in the Advisory Group and therefore urges MassDOT to continue to convene this group regularly as it continues through the MEPA process and beyond. In addition, going forward, we recommend the development of a public participation process to solicit specific, local neighborhood input for each of the new stations and the maintenance facility as the project proceeds to one hundred percent design and through construction.

IV. Conclusion

CLF looks forward to the issuance of the Secretary's DEIR Certificate. Based on conversations with the MEPA Office, it is our understanding that despite MassDOT's announcement on November 17, 2009, that the Secretary's determination on the DEIR/EA will occur by January 22, 2010, the Secretary now intends to issue his Certificate no later than January 15, 2010. Issuance by that day will assure compliance with 301 CMR 11.08(8), the MEPA regulation that requires the Secretary's determination on an EIR to occur within seven days after the close of the public comment period.

Thank you for the opportunity to comment.

Sincerely,

Rafael Mares
Staff Attorney

emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Additionally, FEIR Chapter 4 includes a detailed description of College Avenue Station functioning as a terminal station.

Since the release of the DEIR/EA, a few stakeholders raised concerns that the proposed College Avenue Station, serving as a terminal station for the Proposed Project, would not adequately serve the Medford Hillside neighborhood. Serving this neighborhood was identified as part of the SIP description. To address and resolve these concerns, CTPS prepared a memorandum demonstrating that the College Avenue Station location does adequately serve the walk market area for the Medford Hillside neighborhood. This memorandum is provided in Appendix C of the FEIR.

O-009-022

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

Attachment 2

In Search Of Medford Hillside 1891 – 2008

Pages	Section	Abstract
2-5	*Historical Maps from the Medford Public Library Map Collection.*	Places named Hillside are consistently at Winthrop Street or north of it.
6-7	*Modern Maps from the Medford Public Library Map Collection.*	One map showing Medford Hillside north of North Street; one showing Medford Hillside between College Avenue and Winthrop Street northeast of Boston Avenue.
8-11	*ical Excerpts from the Medford Public Library General Reference Holdings.*	A definition of Medford Hillside as the northwesterly slope of College Hill. Mention of Winthrop Street and North Street as the two "rangeways" through the Hillside territory. Mention of Capen Street, Quincy Street, 286 Boston Avenue (all north of Winthrop) and Harold Street and Pinkham Road (both north of North Street) as Medford Hillside.
12-16	*Germane Content from Various Government Agencies.*	Excerpts and maps from the EOT's Beyond Lechmere Study; data and maps from US Geological Survey (USGS) Geographical Names Information System (GNIS); a map from EPA; all showing Medford Hillside situated north of Winthrop Street and closer to North Street than to Winthrop.
17-19	*Contemporary Photographs of locations with "Hillside" in their names.*	Seven photos of landmarks and businesses, all at, or north of Winthrop Street.
20-34	*Modern Maps from Internet Mapping Web Sites.*	Ten maps, all supporting placement of Medford Hillside north of Winthrop Street. A map showing the locations of 127 Hillside businesses, churches and organizations clustering north of Winthrop Street. A table of those businesses with distances from each to a possible station at Mystic Valley Parkway, Winthrop Street and College Avenue. Average distance to College Avenue is roughly twice either Winthrop Street or Mystic Valley Parkway.
35-44	*Newspaper References (Articles, Obituaries, Real Estate Transactions, Classified Ads) Locating Medford Hillside.*	37 excerpts from newspapers from 1889 to 2006 mentioning neighborhood streets and overwhelmingly placing Winthrop Street as the de facto southern boundary of Medford Hillside.

---

MEDFORD HILLSIDE.

There are many of them, but the term is distinctively applied to but one, the northwestern slope of Walnut, now for half a century called College hill. As a portion of the so-called Hillside district is included in the level plain beside the railway, and its development has been in a way different from the real Hillside, this sketch will deal with that mainly.

...

From early times there had been two "rangeways" through this territory, from Menotomy road to the Mystic, one became Winthrop street in Medford, the other North street. The first proved the most convenient stopping place for the Medford patrons of the railroad, which laid its track between two towns all the way from Boston to Lowell.

Medford Hillside

The Medford Historical Register
Published by Medford Historical Society
(defining Medford Hillside as the northwestern slope of College Hill and traversed by Winthrop and North Streets)

West Medford in 1870
Moses Whitcher Mann

...

Three buildings crowned the top of Walnut Tree Hill, as it was formerly called, the beginning of Tufts College; and the depot across the track, as was also the college site, became known as College Hill.

145

...

Just back from College Hill on the right, sheltered by the trees and hedges, was, and still is, the Stearns residence. With its brick windmill tower it was an attractive sight, to which was added the interest of its connection with another railway, the Underground Railroad of antebellum days.

Passing the old station of Medford Steps with its long stairway—this was on the right hand—and under a bridge now removed, and emerging from the railway cut, the most noticeable object was the First Parish Church, with its several-storied steeple, one of which contained the original town clock presented by Mr. Brooks, while higher up was the bell cast by Paul Revere.

(showing Medford Hillside adjacent to Mystic Valley Parkway,
well north of Winthrop and North Streets and southwest of Boston Avenue)

Medford Hillside is the area extending north from Powderhouse Square through Tufts University and over the Mystic River into West Medford. With its residential, educational and commercial land uses, it is an important center in the study area that could support improved transit service. Boston Avenue is a primary roadway through Medford Hillside that has urban centers and activity centers at the intersection of Winthrop Street and along the section from College Avenue to Arlington Street.

Notes:

The bulk of the newspaper clippings were from ProQuest searches conducted through the Boston Public Library. The searches variously included The Boston Globe and The Boston Herald plus other Massachusetts newspapers. Nearly 800 articles were culled down to thirty-seven that mentioned other streets in the neighborhood. They comprised news articles, real estate transaction records, obituaries, wedding announcements, public process announcements and classified advertisements. The following streets were mentioned:

Number of mentions	Street Name	Notes
7	Winthrop Street	
4	Quincy Street	North of Winthrop Street, closer to North Street
4	Capen Street	North of Winthrop Street
2	Emery Street	North of Winthrop Street
2	Marshall Street	North of Winthrop Street
2	Orchard Street	North of Winthrop Street
2	Boston Avenue	Both addresses north of Winthrop Street
2	Mason Street	North of Winthrop Street
2	Fairmount Street	Closer to Winthrop Street than College Avenue
2	Tesla Avenue	North of Winthrop Street
1	Hillsdale Road	North of Winthrop Street
1	North Street	North of Winthrop Street
1	Harris Road	North of North Street
1	Taylor Street	North of Winthrop Street
1	Sharon Street	North of North Street
1	Greenleaf Avenue	At the corner of Winthrop Street
1	Brookings Street	South of Winthrop Street
1	Hume Avenue	South of Winthrop Street
1	College Avenue	South of Winthrop Street

Mr. Ian Bowles
Secretary of Energy and Environmental Affairs
MEPA Office
100 Cambridge Street, Suite 900
Boston, MA 02114
Attention: Holly Johnson, MEPA Analyst

RE: EEA #13886

Dear Ms Johnson:

O-010-001 The Executive Board of the East Cambridge Planning Team, which represents residents of the Cambridge neighborhood most affected by the move of the Lechmere T station across Msgr. O'Brien Highway, would like to express its support for locating the Maintenance Yard at Option L, rather than any nearer to residential areas in either Cambridge or Somerville. A great deal of development is planned for the Northpoint area, which we would not like to see compromised in any way. O f course, our preference would be to have the maintenance yard and storage facility located at one end of the line or the other, rather than in the middle.

O-010-002 The move of the Lechmere station across a major highway is of particular concern to riders of the Green Line. As designed, the new station seems neither safely accessible without considerable traffic calming, nor a sheltered, pleasant place to wait for a train. All of the other new stations have walls, roofs, etc., and the Charlie Card dispensers are not out on the platform exposed to the elements. This design for Lechmere Station should be revised.

O-010-003 The East Cambridge Planning Team has proposed a use for the old Lechmere T station and property which has been enthusiastically supported by Cambridge City staff and others, and we hope you will consider it as well when making your decisions regarding this area.

With all good wishes,

Barbara Broussard
President, East Cambridge Planning Team
All other eight Board Members

East End House, 105 Spring Street, Cambridge, MA 02141

O-010-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, Option L is identified as the preferred maintenance facility site.

O-010-002

Revised conceptual plans for Lechmere Station, including modifications to the station headhouse and entrances, enclosed automatic fare collection, and other amenities are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

O-010-003

MassDOT has reviewed the suggestions submitted by the East Cambridge Planning Team. Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. These plans, including the pedestrian crossings of O'Brien Highway and associated street, crosswalk, and sidewalk designs will be further refined in the preliminary engineering stage of the Project. As part of the Green Line Extension, MassDOT intends to demolish the existing Lechmere Station and prepare the site for potential future redevelopment. Based on the current requirements of the O'Brien Highway roadway improvements (as shown in FEIR Chapter 5, Lechmere Station), the existing bus shed must be removed.

Subject: Comments: Green Line Extension Draft EIR (EEA #13886) -- Friends of the Belmont Community Path

January 8, 2010

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs MEPA Office
Attn: Holly Johnson (holly.s.johnson@state.ma.us) 100 Cambridge Street, Suite 900 Boston, MA 02114
RE: Green Line Extension Draft EIR (EEA #13885)

Dear Secretary Bowles,

We are writing on behalf of the Friends of the Belmont Community Path (BCP) to express our full support for comments you have received in this docket regarding construction of the Somerville Community Path. Our organization is a grassroots group of local citizens who support the construction of a planned 0.85-mile segment of the Mass Central Rail Trail that would connect Belmont Center to Brighton Street, Belmont.

There are important interdependencies between the Belmont Community Path and the Somerville Community Path, which are both part of the larger Mass Central Rail Trail. Ultimately, the goal of the Mass Central Rail Trail coalition (www.masscentralrailtrail.org) is to complete a 104-mile bicycle and pedestrian park through 24 communities from Northampton to Boston along the route of the former Central Mass Railroad. This cross-State park will become a major tourist attraction and 25 miles are already complete, including in Belmont, Cambridge and Somerville.

We take an interest in the Somerville Community Path because the segments of the MCRT are as interdependent as links in a chain, and the completion of segments outside our community will be of critical importance to the success and usability of the overall pathway network, including the Belmont segment. In this case, for example, the BCP would connect to a segment of approximately one mile, connecting to Alewife Station, that is slated for construction in the near future. From Alewife, there are connections to a broader network of off-road recreational paths including the Minuteman Bikeway and the Somerville Community Path. The successful completion of the Somerville Community Path would provide a key link in a safe, off-road path enabling bicyclists to commute between Belmont and Boston.

The critical eastern section of the Mass Central Rail Trail is the Somerville Community Path that will bring this linear park to Cambridge, the Charles River and into Boston. Clearly, the way to build this last section is with the construction of the Green Line extension from Cambridge to Somerville and Medford.

We join with other advocates for the MCRT project in offering wholehearted support for the design and construction of the Green Line extension but offer the following comments to insure successful extensions of both the Green Line and the Somerville Community Path.

O-011-001

The DEIR should clearly state that the extension of the Community Path will be designed y MassDOT's contractors as agreed to in a February 24, 2009 letter from the EOT. We understand that this design will be for the section from Lowell St. to Lechmere.

1

O-011-001

MassDOT is committed to completing all planning, design, and engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community Path between Lowell Street and Inner Belt Road. MassDOT is not able at this point to commit to funding the construction of the Community Path. The limits of the path were predicated on the connections to Lechmere being made through the Inner Belt area via Inner Belt Road and the proposed Urban Ring Bridge into the Lechmere area. However, the cessation of planning for the Urban Ring Project has changed the timing of this anticipated connection. MassDOT is unable to assume responsibility for designing the Urban Ring Bridge as part of the Green Line Extension Project. That being said, MassDOT is committed to working with the City of Somerville, residents and businesses in the Brickbottom and Inner Belt neighborhoods, and Community Path advocates to design the Path to create improved connectivity within the Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension.

O-011-001

- The only way the Path can realistically and cost effectively be constructed is together with the Green Line construction. Therefore the Green Line and Community Path extensions will be designed and constructed as one project and described as such in the DEIR and Green Line planning documents.

- MassDOT should commit to working with the City and other State and Federal agencies to obtain the necessary funding for the construction of the Community Path extensions, including applying for Federal New Starts funding for applicable costs (The FTA has recently proposed a policy that "pedestrian improvements located within one-half mile and all bicycle improvements located within three miles of a public transportation stop â€¦ may be eligible for FTA funding: http://edocket.access.gpo.gov/2009/E9-27240.htm)

There are many other reasons why these requests are reasonable and appropriate in addition to completing the Mass Central Rail Trail:

- The Somerville Community Path will provide desirable off-road bicycle and pedestrian access to the stations, offering superior connections to the neighborhoods (like in Davis Sq.), thereby attracting more riders in a very cost-effective manner.

- In the vicinity of Lowell St., Gilman Sq. and Washington St. stations, the Community Path is in integral part of the station access.

There are at least 2 precedents in the Boston area for community paths constructed and paid for by transit projects:

- The Linear Path over the Red Line Paths with the Red and Orange line extensions that were part of the overall transit construction project

- The Southwest Corridor Path alongside and over the Orange Line

Thank you very much for considering these comments for the extension of the Green Line relative to the Somerville Community Path.

Sincerely,

John B. Howe

RE: Green Line Extension Draft EIR (EEA #13886)

Dear Secretary Bowles:

O-012-001 I am writing on behalf of the Friends of the Community Path, a local community group with over 2,000 supporters of the existing and proposed Somerville Community Path. We strongly support the construction of the Green Line Extension to Route 16 on the Medford/Somerville line and to Union Square in Somerville and believe in its positive economic and environmental impacts.

O-012-002 However, because of shortcomings and omissions in the design, we cannot support this Massachusetts Department of Transportation (MassDOT) Draft Environmental Impact Statement (DEIR) becoming the Final EIR, unless a Supplemental EIR or Addendum is performed to correct the deficiencies.

We urge you to:

1) Request that MassDOT incorporate the revisions outlined below into the EIR and the subsequent final design
2) Request that MassDOT seek state and federal funding for the Community Path extension as an integral part of the Green Line Extension
3) ensure that a Citizens Advisory Committee public process be instituted to help guide these necessary design improvements.

O-012-003

O-012-004

Although a 10% design stage cannot contain all the details everyone would like, now is the time to ensure that the Community Path extension is incorporated into the final EIR and the subsequent final design. Notably, the Community Path is good for the Green Line, and the Green Line is good for the Community Path. There are many local and national examples of

O-012-001

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

O-012-002

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

O-012-003

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

O-012-004

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

successful rail-and-path projects (a few are cited near the end of this letter), and now is the right time to garner state and federal funding for such projects.

The Somerville Community Path (also known regionally as an extension of the Minuteman Trail) provides the logical connection to the City's neighbors to the east and west. Every improvement to the Community Path extension in its co-design with the Green Line extension maximizes the potential of our regional transportation resources.

We appreciate your consideration of these revisions to both the EIR and the subsequent final design:

REVISIONS TO FUNDING AND CONSTRUCTION (followed by details):

O-012-005

- The DEIR should clearly state that the extension of the Community Path will be designed by MassDOT's contractors *as agreed to in a February 24, 2009 letter from the EOT.*
- That to take full advantage of cost efficiencies and technical necessities, *the Green Line and Community Path extensions will be funded and constructed together as a single project and must clearly be described as such by MassDOT.*
- MassDOT should commit to work with the City of Somerville and other State and Federal agencies to obtain the necessary funding to build the Community Path extension as an integral part of the Green Line extensions - as was done with Boston's 4.7mile long Southwest Corridor path as part of the Orange Line, and with the mile-long Linear Park as part of the Red Line from Davis Square to Alewife. (By comparison, the Community Path extension is about 2.5 miles.) Applications for funding should include Federal New Starts funding for allowed bicycle and pedestrian access costs
- *As the location of the support facility is finalized, the route of the Community Path from Washington St. to Lechmere in Cambridge should be re-evaluated.*

Details

Funding and the Importance of the Community Path extension – By acquiring federal funding for the Community Path in conjunction with the Green Line extension, both transit projects will benefit tremendously, with the added perk of creating additional design and construction jobs in the Commonwealth. By contrast, if funding for both transit projects is not sought concurrently, it will cost many times more to construct the Community Path as a separate project, in turn yielding the grim possibility that the Community Path extension may never get built. We understand that the City of Somerville has about $3 million of the reportedly $15 - $20 million Community Path extension estimated cost.

The request for State and Federal transit funding is reasonable and appropriate, as follows:

- The Federal Transportation Act (FTA) has recently proposed a policy that "pedestrian improvements located within 1/2 mile and all bicycle improvements located 3 miles of a

O-012-005

MassDOT is committed to completing all planning, design, and engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community Path between Lowell Street and Inner Belt Road. MassDOT is not able at this point to commit to funding the construction of the Community Path. The limits of the path were predicated on the connections to Lechmere being made through the Inner Belt area via Inner Belt Road and the proposed Urban Ring Bridge into the Lechmere area. However, the cessation of planning for the Urban Ring Project has changed the timing of this anticipated connection. MassDOT is unable to assume responsibility for designing the Urban Ring Bridge as part of the Green Line Extension Project. That being said, MassDOT is committed to working with the City of Somerville, residents and businesses in the Brickbottom and Inner Belt neighborhoods, and Community Path advocates to design the Path to create improved connectivity within the Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension.

public transportation stop … may be eligible for FTA funding"
http://edocket.access.gpo.gov/2009/E9-27240.htm

- The Community Path - a mere 2 miles from Boston at it's current Cedar Street terminus - will provide desirable off-road bicycle and pedestrian access to the T stations, offering superior connections to the surround neighborhoods, especially in East Somerville - as in Davis Square, where 60% of the residents use public transportation and thousands walk and bike to the station each day. *The Community Path will attract more T-riders in a very cost-effective manner. More T-riders means enhanced opportunities for getting federal New Starts and other federal funding.*
- In the vicinity of Lowell St., Gilman Sq. and Washington St. stations, the Community Path is designed as an integral part of the station access. This will allow the public transportation success of the Davis Square station to be repeated in parts of Somerville that really need it.

REVISIONS TO DESIGN

Community Path from Lowell St. to Route 16: The MEPA certificate said that the environmental review would include evaluation of continuing the Community Path west of the Lowell St. station to Medford. The study results that were presented (Appendix E of the DEIR) concluded that the width of certain sections right-of-way was insufficient to provide such a continuous Path. However, since there are some sections where there is enough width, a route, path connections to local streets, can be studied further.

O-012-006

Community Path from Route 16 to West Medford: Section 3.2.3 of the RFP said that Vanasse Hangen Brustlin, Inc. (MassDOT / EOT's consultant) should study "*Using the bikeway/pathway guidelines, consider options for providing pedestrian connections to the West Medford commuter rail station and evaluate the viability and potential impacts of including a community path in this section of the project area.*" This seems not to have been done but should be. Such a Path would make a transfer connection from Route 16 to West Medford. Therefore MassDOT should plan for a community path to connect the Route 16 terminus to West Medford via an overpass of Route 16, a bridge over the Mystic River and a route along the Lowell commuter rail tracks.

O-012-007

Access to Route 16 Station - The plans in the DEIR document do not show how Green Line riders will safely access the Route 16 station from Arlington and Medford and from the Alewife Brook paths that are being improved as part of a $3.6 million ARRA stimulus project. A multi-use path for pedestrians and bicyclists to the station should be included in the design from the Alewife paths to the station. Please request that MassDOT perform this design.

O-012-008

Community Path Route from Washington St. to Lechmere - the Somerville Community Path route should connect the Washington St./Brickbottom station, the Brickbottom community and Inner Belt to Lechmere. The present plans do not make these connections. If the proposed Yard 8 location for maintenance and storage facility is "dropped", better routes for the Community Path (such as along the Green Line to Brickbottom and over the former Red Bridge location) that do make these connections are possible. The Green Line extension plans should state that this re-evaluation will be done.

Page 3 of 6

O-012-006

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16 and related station access issues. Connections to West Medford and the existing commuter rail station can be specifically evaluated at that time. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

O-012-007

Please see response to Comment O-012-006.

O-012-008

MassDOT is committed to completing all planning, design, and engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community Path between Lowell Street and Inner Belt Road. MassDOT is not able at this point to commit to funding the construction of the Community Path. The limits of the path were predicated on the connections to Lechmere being made through the Inner Belt area via Inner Belt Road and the proposed Urban Ring Bridge into the Lechmere area. However, the cessation of planning for the Urban Ring Project has changed the timing of this anticipated connection. MassDOT is unable to assume responsibility for designing the Urban Ring Bridge as part of the Green Line Extension Project. That being said, MassDOT is committed to working with the City of Somerville, residents and businesses in the Brickbottom and Inner Belt neighborhoods, and Community Path advocates to design the Path to create improved connectivity within the

Bicycle Parking

O-012-009

- The amount of bicycle parking presently described in the plans (270 spaces) is welcome but will be insufficient for the expected number of bicyclist coming to the stations. 270 spaces is only about 1% of the expected ridership. Based on the present parking at Red line stations, bike parking at 3-5% of ridership will soon be needed. Therefore, we request that the amount of bike parking be increased to approximately 5% at the Union Square, Route 16 and Lowell St. (major intersection with Community Path) stations and 3% at the remainder.
- Also, the location of the bicycle parking (where specifically shown in the plans) are good at some locations but not at others. The bicycle parking locations should be as close to as possible to the entrance and in well lit and safe locations.
- Lastly, bicycle parking should be covered parking if at possible.

O-012-010

Improved pedestrian and bicycle access

Pedestrian connections to some of the stations could be better designed. Access to some of the stations could be vastly improved by having *more than one entrance or access point* such as:

- a direct connection from the Gilman Square station to the Somerville High School/Library/City Hall complex)
- the Washington St. station design which seems particularly poor in this regard for riders coming from the west and north. This could be greatly improved by locating the station directly above Washington St. where direct access via elevator would be possible (earlier designs included such a layout).
- In general, pedestrian and bicycle access should be given higher priority in these "community-based" station designs that motor vehicles connections.
- station designs (specifically College Ave and also Washington St.), where drop-off stops ("kiss and ride"), directly blocks the front of the T-station entrance and will congest entrance to the station. Paradoxically, pedestrian access to the station entails a long, complicated route.
- Lowell St. station, where a direct connection to the platform from the Path coming from Cedar St. would be possible via a safe pedestrian crossing of one track. MassDOT has said this would not be allowed because of safety concerns even though every light rail system in the US (including in Boston: Longwood stop on the Green Line and Milton and Butler stops on the Mattapan line) allows crossing of tracks for access. Even if MassDOT will not allow this access point at this time, the Lowell St. station platform should be designed for such future access.

Page 4 of 6

Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension.

O-012-009

The amount of bicycle storage at each station is based on ridership projections developed by CTPS. DEIR/EA Appendix D includes the methods CTPS used to analyze demand for bicycle parking. Detailed bicycle parking designs will be further developed during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

O-012-010

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

We look forward to seeing these revisions incorporated into the EIR and the subsequent final design.

Here are just a few local and national precedents for successful rail-with path projects:

PRECEDENTS FOR RAIL-WITH-PATH PROJECTS

There are at least two precedents in the Boston area for rail transit with community paths with both constructed by MBTA and funded with state and federal funding:

- The Linear Path over the Red Line Paths with the Red and Orange line extensions that were part of the overall transit construction project
- The Southwest Corridor Path in Boston alongside and over the Orange Line

Additionally, there are many recent examples of paths being built together with mass transit expansions around the nation:

- The Capital Crescent trail alongside the planned light-rail Purple Line in suburban Washington DC includes trail construction is part of the project and the cost estimates that will be submitted for New Starts funding from the federal government.

  http://purplelinemd.com/images/stories/purpleline_documents/deis/deis/10_chapter5.pdf
  http://purplelinemd.com/images/stories/purpleline_documents/deis/Conceptual%20Plans_%2009%202008.pdf

- Bicycle and pedestrian path alongside the light-rail Expo line in Los Angeles:
  http://buildexpo.org/gallery.php
  http://metro.net/projects_programs/exposition/feis.htm

- A world-class bikeway was built alongside and integrated with stations on the 14-mile Orange Line BRT corridor in LA:

  http://www.streetfilms.org/las-orange-line-bus-rapid-transit-plus-bike-path/

The Somerville Community Path is a critical piece of the following regional and State-wide bicycle and greenway plans.

- The Massachusetts Bicycle Transportation Plan (page 30 and 45 and Figure 4): http://www.massbikeplan.org/_docs/Massachusetts%20Bicycle%20Plan%20with%20Links%20to%20Graphics.pdf
- The Somerville Community Path as part of the critical 104-mile east-west Mass Central Rail Trail (Figures 4.1 and 4.2): http://www.masscentralrailtrail.org/
- The City of Somerville's Open Space and Recreation plans list the Community Path
- The Mystic Valley Case Statement for Active Transportation for the Mystic River Communities:

http://www.railstotrails.org/resources/documents/whatwedo/case_statements/Vision%20for%20July%2010th%20draft.pdf

- The 2007 MAPC Regional Bicycle Plan - http://www.mapc.org/transportation/trans_alternatives/Bike_plan_PDFs/Bike_Plan_FINAL_version_3-14-07.pdf

In summary, we encourage you to: *1)* request that MassDOT incorporate these revisions into the EIR and the subsequent final design, 2) request that MassDOT seek federal funding for the Community Path extension as an integral part of the Green Line Extension, and 3) ensure that Citizens a Advisory Committee public process be instituted to help guide these necessary design improvements. These crucial revisions relating to the Community Path as it is co-designed with the Green Line extension will help bring our regional transportation resources closer to their full potential.

Thank you.

Sincerely,

Joel Bennett

Email: Holly.S.Johnson@state.ma.us

Secretary Bowles,

The Glass Factory Condominium Trust would like to submit this independently commissioned critique performed by Cavanaugh Tocci Associates regarding the sound and vibration analyses presented in the Draft Environmental Impact Report and MBTA Green Line Extension, Noise and Vibration Technical Report. It is clear from this analysis that these two reports are severely lacking in multiple areas, which are summarized below.

O-013-001

1) Although the DEIR provides a recommendation for a maximum of 65 dBA for interior train pass-by sound levels, actual measurements or data are not presented in the report. Interior noise is probably the most important issue facing a building that is situated next to transit lines, and yet the report fails to address this critical aspect. The Glass Factory respectfully requests that the MBTA commission work to assess interior train pass-by sound levels before making any decisions regarding mediation.

O-013-002

2) Neither report reveals the assumptions made in estimating sound levels from passing trains, specifically whether an elevated track structure was taken into consideration. An elevated track structure will produce more noise than tracks along the ground and this would add to the noise impact being experienced by residents at the Glass Factory. The Glass Factory respectfully requests that the MBTA disclose whether sound estimates were based on ground-level tracks or elevated tracks in the DEIR, and if it was the former, that the impact assessments be re-run with the elevated track configuration assumption.

O-013-003

3) The DEIR does not specifically address remediation approaches for sound mitigation at the Glass Factory. This is an unacceptable gap that needs to be addressed specifically, especially given the fact that the Glass Factory was assigned the most severe impact from a noise perspective and that the DEIR has

O-013-001

The outdoor-to-indoor noise level reduction of the existing Glass Factory building façade has been measured and future projected interior noise levels have been assessed against appropriate criteria. These findings have been reported in FEIR Chapter 5, *Lechmere Station*. Mitigation commitments are reported in FEIR Chapter 8, *Draft Section 61 Findings and Mitigation Commitments*. The stakeholder coordination process for project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

O-013-002

The presence of an elevated track was taken into account in projecting noise levels at adjacent abutters, such as the Glass Factory Condominiums. In accordance with FTA guidelines, an increase in noise of four decibels was included in projecting noise levels. This increase is due to the potential for noise to be radiated from the vibration of the elevated structure. Reference noise measurements of the Green Line trains operating on the existing elevated guideway south of the existing Lechmere Station confirm that this four decibel increase is appropriate for the existing guideway. FEIR Section 5.4 includes updated noise and vibration modeling assumptions for the vicinity of the Glass Factory Condominiums.

O-013-003

As reported in FEIR Section 5.4, the existing outdoor-to-indoor noise reduction of the Glass Factory Condominiums has been measured and the resulting interior noise level projections have been assessed against appropriate interior noise criteria and mitigation has been discussed in Chapter 5, Lechmere Station. Proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation.

Glass Factory Condominium Trust
169 Monsignor O'Brien Highway
Cambridge, MA 02141

O-013-003

already deemed the Glass Factory location unsuitable for a wall. The Glass Factory respectfully requests that more specific sound mitigation methods are both proposed and budgeted for the Glass Factory in the DEIR.

O-013-004

4) Despite the Glass Factory and Brickbottom having similar proximity to an elevated track, no vibration impact is projected for the Glass Factory. Cavanaugh & Tocci clearly believe that based on the available data, vibration impacts on Glass Factory due to the Greenline Extension would be unacceptable. The Glass Factory Condominium Trust respectfully requests that a vibration impact analysis be conducted or re-run with special consideration for the Glass Factory Condominium.

We appreciate the opportunity to comment on the DEIR and re-affirm our requests for more clarification and analysis specifically with regard to the Glass Factory Condominium due to its close proximity to the proposed Greenline Extension.

Thank you for your consideration.

Enc. Analysis from Cavanaugh & Tocci Associates, Inc.

O-013-004

Potential vibration impact prior to mitigation has been assessed for all sensitive receptors including the Glass Factory Condominiums. Unlike the Brickbottom Artists Building which is approximately 18 feet away from the proposed elevated guideway, the Glass Factory Condominium building is approximately 43 feet away from the proposed elevated guideway at its closest point. Trains will be traveling at a lower speed than near the Brickbottom Artists Building as they approach and depart the new Lechmere Station. Chapter 5 (Lechmere Station) and Chapter 8 of the FEIR describes the process for developing and implementing mitigation measures at the Glass Factory Condominiums.

Cambridge, MA 02141

Subject: Review of MBTA Green Line/Lechmere Extension
Review of Sound and Vibration Impacts
Glass Factory Condominiums

Dear Messrs. Huang and Donahue,

As requested, we have reviewed documents concerning sound and vibration impact of proposed alternatives for the Green Line Lechmere Extension to Somerville/Medford. All alternatives involve the same elevated rail alignment proposed to be adjacent to the Glass Factory building. The following are documents reviewed concerning the project:

MBTA Green Line Extension, Noise and Vibration Technical Report DEIR (HMMH Report Number 302580.000 dated August 2009) posted to the MBTA Green Line Extension website on December 24, 2009.

Draft Environmental Impact Report/Environmental Assessment and Section 4(f) Statement, Green Line Extension Project, Volume 1, Chapter 4 Affected Environment and Chapter 5 Environmental Consequences, dated October 2009 and posted to the MBTA Green Line Extension website on October 16, 2009.

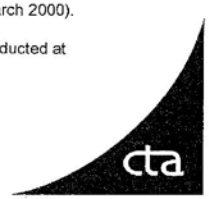
Various other figures and information on the Green Line website.

Transit Noise and Vibration Impact Assessment, Federal Transit Administration, Report FTA-VA-90-1003-06 May 2006.

In addition, we have reviewed information for the MBTA Greenbush Commuter Rail Line. This other MBTA project is not related to the Green Line Extension project; however, methods used to predict sound and vibration impacts along the Greenbush Line are similar to those used to predict impacts along the Green Line Extension. The Greenbush information has the advantage of comparing sound and vibration impacts predicted prior to construction and measured after the Greenbush Line began revenue service. Among reports reviewed for the Greenbush Line are the following:

Draft FEIR dated March 2000 for the MBTA Greenbush Line Corridor (FEIR, March 2000).

HMMH project memo dated April 21, 2000 outlining noise measurements to conducted at Glastonbury Abbey (HMMH April 2000).



HMMH project memo dated May 16, 2000 indicating monitors to be located in spaces of Glastonbury Abbey for our comment (HMMH May 2000).

MBTA Greenbush Commuter Rail Line, Operational Noise and Vibration Measurement Results-Draft, February 2009, KM Chng Environmental Inc. DRAFT REPORT

Summary Chart of Sound Measurements Conducted March 10, 2008 by Cavanaugh Tocci Associates, Inc. (not prepared for written report).

We also visited the Glass Factory for purposes of examining the windows to investigate the potential for upgrading them or replacing them to provide the required noise reduction to maintain pass-by sound levels to within 65 dBA as recommended in the DEIR (page 45). During the visit, I also inspected the two garage levels for evidence of foundation settling and foundation walls cracking.

Sound Impacts

DEIR Determination

The DEIR estimates day-night average sound levels (L_{dn}) at the Glass Factory façade of 70.2 dB. A severe impact in accordance with FTA guidelines was determined to be a day-night average sound level exceeding 63.5 dB, thus they have determined that a severe impact will occur at the Glass Factory, and that sound barriers will not be effective in mitigating sound levels at upper stories overlooking any barrier constructed. In estimating sound levels, it was not indicated whether or how sound radiated from the proposed elevated structure was considered in the estimated sound level.

Additional Noise Impact Considerations Required

The DEIR does not indicate what maximum sound levels will occur outside and inside the building. Anticipated to be of most significance are maximum train pass-by sound levels inside the building; however, there is a small outdoor garden area worthy of consideration as well. The building is outfitted with tandem horizontal slider windows, each set glazed with single pane glass. The DEIR recommends that train pass-by sound levels not exceed 65 dBA inside residential units. They suggest that airport noise control programs typically obtain 5-10 dBA reductions through window improvements; however, no mention was made as to what improvements in Glass Factory windows would be required.

Existing Windows and the Potential for Improving Them

The tandem window glass spacing between sashes is approximately 2.25". The interior and exterior frames appear to be connected. Exterior and interior sash seals, though appearing to be thin, also appear subjectively to be in good condition providing a fair to good window seal.

The DEIR did not evaluate building façade sound isolation. The existing isolation appears to be appropriate for the high levels of traffic noise exposure on the west side. The same tandem window arrangement is used on both sides of the building. Despite the good sound isolation provided by the existing windows, enhancement or replacement with higher performing windows would be required to maintain maximum train pass-by sound levels to 65 dBA. The sound isolation enhancement normally implemented with existing windows is to space an interior sash of compatible operability on the interior, spacing it 3 to 6 inches from the prime glazing. In the case of the Glass Factory, this would be a third operable sash and would probably not be practical from the standpoint of a unit owner. Hence, the existing tandem windows would likely need to be replaced by acoustical windows having the required sound isolation performance.

cta

Accuracy of Estimated Sound Levels

In order to evaluate the accuracy of estimated sound levels, we considered DEIR estimates of sound levels produced by commuter trains on the MBTA Greenbush Line at a wayside location. Commuter train sound levels and their frequency spectra differ from those of Green Line trains, however the methods employed to evaluate pass-by sound levels is similar. For the one abutter for whom we conducted commuter rail pass-by sound measurements, actual measured sound levels ranged between 5 and 11 dBA higher (averaging 7 to 8 dBA higher) than estimated during the DEIR phase. In a wider evaluation of operational sound levels by KM Chng Environmental, Inc. (Draft report dated February 2009), much better agreement was found between predicted and measured train pass-by sound levels. They determined that DEIR estimated sound levels were within 1 to 2 dBA of actual measured sound levels with one location having measured sound levels only 3 dBA higher than estimated during the DEIR phase.

Conclusions

The following are concluded regarding sound impacts:

1. A severe exterior noise impact is anticipated. Noise barriers will not reduce sound levels at upper stories of the Glass Factory exterior façade.
2. DEIR estimated sound levels are expected to be acceptably accurate, although in our previous work for an abutter along the Greenbush Line, DEIR estimates of future train pass-by sound were lower than later measured.
3. The DEIR recommends that interior train pass-by sound levels not exceed a maximum of 65 dBA. Interior sound levels were not addressed in the DEIR.
4. The DEIR does not explore specific remediation measures to limit train pass-by sound levels inside the Glass Factory building. The existing windows may need to be replaced by acoustical windows that provide a larger noise reduction.
5. The added impact of sound radiated from the elevated track structure is not discussed, and having not been considered, may result in sound levels higher than estimated in the DEIR.
6. Other train pass-by mitigation methods such as covering the elevated structure or tunneling were not discussed.

Vibration Impacts

DEIR Determination

Unlike sound impacts, vibration impacts at the Glass Factory building are not directly addressed or stated. However, vibration levels at Brickbottom Lofts are estimated to be about 77 dBA exceeding the applicable criterion of 72 VdB resulting in a vibration impact requiring consideration of mitigation. Note that the track adjacent to Brickbottom Lofts is also to be elevated, though elevated structures adjacent to the Glass Factory and Brickbottom Lofts were not described or noted as being equivalent in design.

Criteria

The criteria recommended for use by the FTA do not require vibration levels to be below the "threshold of feelable" vibration as described in *ANSI S2.71 Guide to the Evaluation of Human Exposure to Vibration in*

cta

Buildings. The perceptibility of vibration in building depends on building structural response characteristics. With the alignment being so close to the building, special evaluation of building response to train pass-by vibration should be given. This is especially required owing to the variability in vibration level prediction noted in transfer mobility measurements conducted. This further evaluation might begin as simply measuring vibration in a similarly constructed building adjacent to a similarly supported track structure.

Visual Inspection Lower and Upper Garage Levels

On the upper garage floor, some cracking was noted, but in only one case was the crack raised one side. This crack transmitted into the adjacent wall and up a short distance. On the lower garage floor, presumed to have the original concrete at-grade floor, only very minor cracking was noted. However, the west side wall (side of the building away from the proposed rail alignment) showed minor cracking and water leakage at the center of most structural bays. As the grade level is lower on the east side of the building, little cracking and water leakage was observed. Though it is not this firm's expertise, during design, attention should be made in the design of elevated structure footings not to unduly increase ground loads on walls that could result in cracking and water leakage.

Accuracy of Estimated Vibration Levels

The DEIR discusses a comprehensive vibration propagation technique applicable to grade-mounted track. The transfer mobility data exhibited about a 10 VdB variation from one location to another where this testing was performed. This variation suggests that estimated vibration levels might vary by +/- 5 VdB.

In the KM Chng draft report comparing measured and predicted sound and vibration levels along the MBTA Greenbush Line, measured vibration levels were noted to be higher and lower than predicted by 12 to 14 VdB.

Conclusions

The following are concluded regarding vibration impacts:

1. Green Line Extension train pass-by vibration has not been evaluated at the Glass Factory, but on the basis of information provided for Brickbottom Lofts, vibration impact at the Glass Factory is expected to be unacceptable.

2. Estimated vibration levels can vary from location to location because of variations in ground propagation characteristics. This variation may be somewhat larger than garnered from transfer mobility measurements on the basis of a comparison between predicted and actual vibration measurements along the MBTA Greenbush Line.

3. Special consideration of Green Line Extension vibration transmitted to Glass Factory should be considered because of its close proximity to the proposed alignment.

cta

If we can provide any further information, please do not hesitate to contact us. Thank you.

Yours sincerely,

December 30, 2009

Overview:

The Green Line Advisory Group for Medford, better known in the City of Medford as GLAM, is a grassroots group consisting of members of the disability and environmental justice community along with abutters and other concerned citizens whose mission is the education of the Medford public about the proposed Green Line project. We are providing public comments within the time frame allowed on the DEIR on the EEA # 13886 regarding the proposed Green Line Extension.

When speaking about the proposed Green Line Extension, the Commonwealth of Massachusetts and the special interest advocacy groups need to get real. The DEIR submitted by the Executive Office of Transportation (EOT- now known as MassDOT) to the Executive Office of Energy and Environmental Affairs (EOEEA) from our perspective is riddled with abstract theory. We will continue to call MassDOT EOT for the purpose of clarification as it was known during the process of this period.

The DEIR makes ambiguous statements with vague conclusions versus presenting practical application on the reality of the true impacts of this project that are both short term and far reaching. Some of these ambiguous statements and conclusions often contradict themselves in other parts of the DEIR. While stating they are looking at other maintenance sites, they recommend the Yard Eight location as their recommendation. While EOT states they don't plan a 300 car parking garage at Route 16 MVP, they encourage a garage at Route 16 MVP. The DEIR is like an open ended environmental contract whereas citizens' voices and concerns are not being heard.

The DEIR is a document based more in political expediency and public relations hype by the EOT and special interest advocacy groups than based in the stark realities of our times. As our environmental advisor, Dr. Marlene Warner,[1] points out to us in her review of EOT's past studies, the use of numbers, lots of numbers within EOT studies have a ". . . striking absence of meaning, which is statistics applied to those numbers in a relevant way . . . "The public should expect to see statistics that represent processed data with degrees of probable outcomes before planning or speculating. The question, is this project the best the state can do for its citizens? We think not, which is why we will be

[1] Dr. Warner is a retired professor of Cell Biology and Obstetrics/ Gynecology and Interdisciplinary studies. Dr. Warner is a former Dean of Baylor College and also has taught at Union Institute in Cincinnati. She has served on the Houston Galveston Area Council, a 17-member county planning commission for over ten years. In particular she serves on the Environmental Health committee and its Air Quality subdivision. Her background and interest is in health as a faculty member of both the Cell Biology and Obstetrics/Gynecology Departments and in research in the Realties of Cancer in Minority Communities, and chemical and environmental basis for cancer causation. She was the first woman to participate with NASA in putting a biological project in space.

recommending that the state break this project down into further phases with additional study needed.

This transit project's vision is limited in imagination with proposals, regulations and environmental standards that will likely be outdated by the time this project is even ready for construction. On November 17, 2009 it was announced that President Barack Obama is pushing to impact federal safety controls on state transit. (Metro Newspaper, "Will Obama set riders at ease?") What does this mean to backlogged maintenance issues that the MBTA is currently experiencing?

As another example, The Mount Sinai School of Medicine recently announced in its November 2009 newsletter Focus on Healthy Aging in its News Briefs column:

"Carbon monoxide in air pollution, even at levels well below national standards, is associated with an increased risk of emergency hospitalizations for cardiovascular disease in older adults, according to a study published September 15 in Circulation . . . Currently the EPA is evaluating the scientific evidence on the link between carbon monoxide and health to determine whether the health-based standard should be modified."

There is mounting research evidence we can site concerning the negative impact of diesel particulates on health. There have been numerous public comments requesting a health study to determine the impact of moving diesel commuter trains closer to local residential homes. This is especially true when pinpointing the impact on the disability and environmental justice populations living in the HUD elderly housing program known as Walkling Court in Medford. EOEEA will find no such study in the DEIR. In fact, we have written responses from EOT playing the coy game that they are only responsible for the proposed Green Line Extension, not the impact of the commuter rail. This is like a bank robber telling you they are only responsible for the intent of stealing money from the bank while any collateral damage is not their responsibility. Let' get real.

The proposed Green Line extension project is not based in the financial realities of today. Day after day we are confronted with news articles and reports concerning the MBTA's high operating deficit, public safety issues that put the public at risk due to deferred maintenance, compounded by mounting debt service. Despite these issues, EOT is recommending that the MBTA take on expansion of its operation and maintenance by extending the proposed Green Line. This expansion does not fly in the face of fundamental financial common sense.

In an August 16, 2009 editorial called "On the slow train to financial reality" even the Boston Globe speaks to the need for restraint in expanding projects that further burden the MBTA under its current weight of issues. The Globe rightfully asks the question about the proposed Green Line, ". . . Are there cheaper ways

to achieve the same transportation and environmental goals?" As we know, the Commonwealth is allowed under the federally approved State Implementation Plan to propose substitutions that provide equal or better environmental benefits. In speaking about the proposed Green Line Extension and financial realities, the Globe states in the same editorial ". . . that project must be scrutinized more closely for affordability." We believe that the EOT should add within the DEIR an alternative choice that addresses a substitution for the proposed Green Line that would address financial practicalities while achieving the same transportation and environmental goals.

In the same train of thought, the November 2009 MBTA report commissioned by Governor Deval Patrick on a review of the MBTA's conditions recommends, "It makes little sense to continue expanding the system when the MBTA cannot maintain the existing one. Slow expansion until the safety and maintenance priorities can be addressed."

As many citizens recently have learned through unfortunate circumstances, you cannot continue to pile up debt or defer debt you cannot afford. At some point you have to pay the piper so to speak. There are negative consequences to this lack of common sense or delusional approach by the state, especially when we are putting the transit public in unsafe and at risk detriment. This public safety issue is a concrete issue as many learned who rode the Red Line a few weeks ago.

In the Boston Globe on Saturday, November 14, 2009, on page A6 in an article entitled "Obama pushes domestic spending cuts" this article articulates the fact that the Obama administration is shifting gears to address mounting debt by freezing or reducing domestic spending in the upcoming federal budget. This action is being taken in the face of mounting public anxiety over growing deficits that have become both an economic and political liability.

Two days before in the Boston Globe on the opinion page in the article, "Red ink is staining more than the MBTA," a public policy and advocacy firm points out that the Commonwealth of Massachusetts isn't much better off than the MBTA when it comes to incurring debt. This year taxpayers will be paying $1.8 billion in debt service while needed social services and other public services endure the brunt of cuts. The article points out the need for citizens to make the hard choices for what we want to pay. Cut needed services or pay higher taxes?

EOT has decided within the DEIR to impose that choice for Medford by recommending a phase II alternative that eliminates close to $300k in assessed property tax value according to the assessor records of Medford by taking down commercial property between North Street and Route 16 MVP. GLAM contests EOT's figures in the DEIR that are based on estimates as opposed to the actual

numbers at the assessor's office. [2] This phase II adds $160 million in construction costs to this project and would lose Medford revenue that we estimate is equivalent to 9-10 police, fire fighter or teachers jobs lost. How did EOT arrive at that decision for Medford? Why wasn't the city of Medford involved in that decision?

What is their answer to that tax loss? The hypothetical potential of urban development, assuming that Medford the lowest density of the three cities wants to become a high-density location. The oxymoron of the proposed Green Line extension, developing transit to deal with high-density impacts while creating more high density impacts.

As the Globe opinion columns above so aptly states and we quote, "Of course, hard choices run directly counter to the political process. Few leaders get elected by telling voters they can't have what they want . . . The result is a culture of immediate gratification – photo opportunities and ribbon cuttings, while debt piles up and maintenance is deferred."

We believe that it is time that the State Representatives and State Senators, along with EOT officials who have pushed the Green Line project, get out from under the above- mentioned political hackery trend and get real. Here are facts they need to confront:

No money for this project for several years: More objective sources at the State House inform us that funding for the first phase of this project will not be available until the year 2016 due to recession conditions. Before we move to a new endeavor, we must address a plan for the financial and public safety issues at the MBTA. It is projected in the recent MBTA D'Alessandro report that by 2014 the MBTA without additional sales tax revenue will be at a $1.19 billion cumulative deficit. We must deal head on with this problem and make hard decisions before we set the proposed Green Line Extension in play. Otherwise we doom the MBTA to failure in being able to afford or maintain an expansion project as currently proposed by the EOT.

Therefore there is time to ensure that this project's environmental and socioeconomic benefits are articulated in a more concrete fashion that proves out hypotheticals now proposed and addresses residents' and community concerns. Federal funding for the Route 16 MVP phase of this project may not occur until 2020, if at all, due to scarcity of available funds. By that time, there may be other progressive techniques available that would make this current plan moot.

---

2 In our research at the Medford Assessor's office, it was found that the 200 Boston Avenue property was assessed at $13,016,400. At a commercial tax rate of $20.36 per thousand, the property tax on this commercial building alone represents $265,000. This figure does not include the Elizabeth Grady building proposed to be taken as listed in the DEIR.

This means the state needs to bite the bullet and be honest with special interest groups, such as the Conservation Law Foundation (CLF), that this project has to be scaled down and slowed down to allow the MBTA to address critical public safety issues. We all ready know of civil rights violations within seventeen years of this process where there has been no participation by the disability or environmental justice community from Medford. This has been documented in a civil rights complaint/report to the FTA. We are all ready aware that the FTA and the federal environmental protection agency are studying particulates to likely recommend a change to standards since there is a great deal of evidence regarding the negative health effects of these particulates. (See mitigation comments for reference to these studies in this paper.) And if the CLF refuses to listen, the state needs to take their case back into the courts based upon extraordinary financial burden.

Immediate gratification without benefit of studies: Activists practice doctrine that emphasizes direct action in support or in opposition to one side of a controversial issue. Activists do not always mirror the desire of the grassroots community. If their activism is not based in heuristic research or what also is known as political ethnographic inquiry in understanding human conditions, they can create a polarization and anti-dialogical action within a community as has been seen in the case of the proposed Green Line Extension process with groups such as STEP and MGNA.

As the progressive educationalist, Paulo Freire, has stated in his book, "The Pedagogy of the Oppressed", the one last fundamental characteristic of anti-dialogical action is cultural invasion of a community. Activists, not based in authentic diverse grassroots understanding, become cultural invaders who create divisive tactics and manipulation for their own special interest and gratification. In this case pushing the theories of material gain based in highest and best use, the promise of increased property values, and high density urban development that can open communities to speculation and destabilization resulting in moving moderate to low income populations out. And because of their own special interest, advocates who use anti-dialogical action most times do not represent the will of their community. Activist groups, not based in the grassroots, often disrespect the potential of the community in which they invade and impose their own view upon a community, inhibiting the ability to bring consensus on an issue within the community. We believe this happened in the Green Line process in Medford. This cultural process is what educationalist Paulo Freire is articulating in his book.

We believe that EOT and the State Representative who represents the district impacted by the Green Line in Medford allowed special interest advocacy groups such as STEP and MGNA to have undue lobbying influence over the proposed Green Line process by the unlimited access they were provided. This process was supported by the unusual tactic of the CLF, a legal body that knew that the disability community was not being represented in this project. This tactic could

be construed as doing an end run around the Americans for Disabilities Act and we believe should be investigated as civil rights violations as we point out in our FTA case.

GLAM, a disability and environmental justice group, came together because of these issues with the belief these special interest groups misrepresented the diversity of our community. The EOT process has now put local neighborhoods such as Brickbottom in Somerville and Medford businesses and residents abutting this project in environmental harms way. This process became based in advocacy groups' own naiveté and elitist attitudes in understanding how citizens participation and the public choice theory works versus the mechanism theory in building community consensus. Therefore there became a collaborative process between the legislator and the special interest groups that drove the process to become less transparent and less objective resulting in the individual citizen's voice being shut out.

To show their arrogance with only 10% of studies being done, the CLF came out in favor of the project going to Route 16 MVP. When these 10% of studies came out and the numbers of TAZs were not providing the ridership numbers to justify this terminus, the CLF came out in support of unscientific literature that said 10,000 people would be riding at Route 16 MVP just because they lived within the surrounding area. Not only did EOT's modeling not bear this number out, but we brought studies forward from the CTPS that showed this theory was irresponsible and ridiculous in comparison to practical application which through traffic studies showed commuters driving to their jobs in the suburbs as opposed to downtown Boston.

When special interest groups like MGNA started to present station designs without evidence of disability access and then promoted them with EOT, we in GLAM felt this symbiotic relationship was going too far. In other words none of the stations were designed in a fashion that allowed full accessibility or was the disability community allowed to participate in those designs.

As Katherine Fichter, planner for EOT, stated in a recent Tufts Daily newspaper article on the proposed Green Line, the cost of the Green Line expansion increased because EOT was not fully complying with the ADA. GLAM had already brought these compliance issues out at an EOT public advisory meeting based upon information we received from sources at the MBTA. Our source informed GLAM that EOT was trying to cut the costs of this project by reducing ADA compliance since EOT had originally put forth bogus project cost numbers in their EENF. EOT did not feel the public would accept the full cost of this project. EOT denied our claim at the time. But the proof is in the pudding.

The current design for stations in the DEIR, which GLAM helped advocate for the disability community, shows how inept the special interest groups were in their designs. But the station design process also proved a pattern of excluding

authentic citizen participation. This was the same pattern GLAM encountered regarding shared community paths. We do appreciate that EOT actually has mentioned in the DEIR the ADA enhancements to community paths that are required by the FTA in the design process. These were the guidelines we provided to them at the Community Path workshops. We do expect MassDOT (EOT) to continue on designing stations. But we must wonder if the disability and environmental justice community will be left out of these designs as well, especially those who live in Medford. The DEIR process should recognize that a spokesperson for EOT stated in response to public comments on the SIP annual report that the disability community would have to wait decades for their rights. And the disability community felt that was the attitude EOT had. The DEIR process owes a responsibility to the disability community to ensure that the federal government is informed if the disabled and environmental justice community rights are violated.

As pointed out in the report called "Power and Interest Groups in City Politics", a report written by Tufts researchers for the Rappaport Institute for Greater Boston at Harvard University, the interests of the disability and environmental justice communities remain seriously under represented when it comes to government and that special interest groups tend to represent the more affluent and highly educated. Therefore, when EOT points out the negative impacts to the environmental justice population in Union Square area or leaves out mention of the mitigation impact to Walkling Court where the elderly disability and environmental populations reside, GLAM knows that these populations were left out of the EOT process. This claim is based upon our own experiences and observations. Hence, GLAM has filed a civil rights report/complaint to the FTA regarding what we saw as civil rights violations within the process.

Based upon the undue influence of special interests, the State Representative for this district took an advocacy position to support the proposed Green Line extension based upon theory without benefit of any studies. A supposedly, highly educated person who could not wait for studies before taking an advocacy position that did not necessarily represent the entire community. Therefore he now stands stark naked intellectually before the Medford community having advocated a project that incorporates residential and commercial land taking, the code name for eminent domain by the state, with the resulting impact of tax dollars projected to be lost to the city of Medford's tax base. And as we have recently seen in the Rivers Edge project, those faced with land acquisition are often low-balled in the process and have to go to court to fight for the rightful value of their property.

As businessman David D'Alessandro wrote in the MBTA review, plans and theories by state government and legislators are often". . . well intentioned, but founded upon a combination of optimistic, unrealistic and untested assumptions."

Hence we have a pattern with the proposed Green Line project. Promoted by the same state legislator, who listened to special interests that said there would be no land taking and who promoted station designs that did not meet the Americans with Disabilities Act requirements. Even now claims of better air quality are based in regional measurements while the DEIR admits on page 6-8 in the detail assessment of this project that we could see localized decreases or increases in carbon monoxide and particulate matter in our area. Hence, the fallacy of theory meets reality.

The DEIR is a contradiction in terms and we would conclude it is like buying a pig in a poke. EOT leaves open doors for inference of further mitigation issues upon the Medford community than currently articulated in the DEIR. Thus the DEIR should not become the final environmental report until these issues are further studied and quantified.

The DEIR should be turned down by MEPA until the FTA makes a decision on the alleged discrimination in the process or mediation takes place. If not, MEPA opens itself up to charges of discrimination on its own part by knowing that a complaint is there and that is being judicated by the FTA and no decision has been reached by the FTA at this writing.

The DEIR leaves our small business community vulnerable with unrealistic statements made by state bureaucrats who do not know how business runs. In fact, as one of our Executive Committee members pointed out, the EOT appears to see "Medford as being the environmental toilet for Winchester, Arlington and Somerville."

Therefore, we believe this project requires further studies in specific areas before this project can be environmentally approved in a final FEIR. We believe for financial considerations this project should be broken down in to further phases. Phase I should be the build to Lowell Street with the spur to Union Square. Phase Ii should include the maintenance facility center. Phase III should be Lowell Street to Ball Square. In each of these phases the project should be analyzed and assessed for its actual impact upon parking, land acquisition, and socioeconomic impact before the next phase begins. In essence, theories need to be proved and we have the opportunity at this juncture to require a test of these hypothetical theories as we see impact unfold.

Doing this project in phases is not unusual and is similar to what occurred in the Orange Line build out process. As people became accustomed to living with this project, it became more and more acceptable to extend deeper into neighborhoods. The reason we would recommend stopping at Ball Square, where intended in the original SIP plan, is a financial one.

We have read reports by ReConnecting America, who documented for the city of Somerville the dramatic changing socio-economic demographics of Porter and

Davis Squares after initiating the operation of the Red Line. Their report documents that middle to low income people were pushed out of these areas. The phasing in of the Green Line project will educate us if successful housing strategies actually can be implemented to prevent further displacement and pushing out of populations with this proposed expansion.

It should be assessed if the environmental justice and disability community actually gain jobs from this transit project, not only in downtown Boston but also within the 128 belt. We cannot just claim in theory that a project will provide jobs, we need to see concrete evidence in how it will create jobs. It is a fact that the working disability community approaches over 20% in unemployment levels within its community. And there is no doubt for those who study this community that it is a community that wants to work.

Yet EOT in its opaque claim shows no tangible evidence by the Commonwealth of Massachusetts to assist this community in job seeking within this project's intent. There is no reference to labor research pertaining to this community to prove EOT's claims that this project benefits both the environmental justice and disability community in finding jobs. What type of jobs and where? Yet, the Dept. of Labor's Office of Disability Employment Policy has issued recent research reports in how to advance employment for people with disabilities. But without groups like GLAM advancing these types of reports and advocating their use within project studies, they never see the light of day.

As it has been stated in the Rappaporte Institute's report, the jobs are moving out to the suburbs while Boston is being dominated by university expansion. A CTPS traffic study on the Alewife Brook Parkway correlates this information when it also determined the majority of traffic to be moving to the suburbs as opposed to downtown Boston.

The Rapporte Institute's report has all ready stated that the jobs downtown will be for educationalist, which brings us to the point of Tufts University and its tentacles within the community. Though Tufts has gotten a free hand to develop in Somerville, it has had a great resistance in Medford. MGNA, a Tufts favored group, has stated many times publicly that bike paths and community walk ways will benefit Tufts University students and is the way to go for station access. For financial reasons we may want to agree with them and give them the ability to walk and take bicycles by stopping at Ball Square, thereby, saving the Commonwealth millions of dollars of mitigation, particularly in rehabbing Tufts' buildings. It is obvious Tufts own shuttle transportation costs will be reduced when and if the proposed Green Line extends to Ball Square or College Avenue. We suggest that if Tufts wants the proposed Green Line Extension built to College Ave than the state should do as Reno, Nevada did with their transit project and require those who benefit to contribute a large donation to this project for financial reasons.

DEIR/Mitigation Review:

Our DEIR/mitigation comments will focus on what we believe to be significant issues. This does not mean that GLAM does not have other concerns with the DEIR report that should be addressed.

Land Taking in Medford

GLAM stated from the beginning of the EOT process that our public position is that we are against any kind of land taking. We believe that property rights for both abutters and small businesses are paramount especially in an area where affordable housing and jobs for working people are essential in sustaining socioeconomic diversity. Property rights should not outweigh property benefits.

In the current DEIR, EOT has identified major and minor land taking in Medford and the loss of jobs in Medford due to this land taking. With unemployment in Massachusetts over 9%, EOT has cavalierly stated that the loss of jobs they estimate in Medford is insignificant. Let's step out from under the public relations hype and step into reality. EOT states ". . . the jobs at stake represent at most a minor economic impact." With food pantries at capacity in Medford, foreclosures still occurring and unemployment in the country at a 26-year high and expected to climb, any job loss is a significant loss and a significant socioeconomic impact to our community. We are offended by the Commonwealth's disconnect to the realities that their citizens face.

EOT makes conclusive, undocumented statements that "Many of the jobs displaced would likely be relocated or replaced within the affected cities." (Executive Summary, page ES-33) They go on to state that there is an inherent economic advantage to having the Green Line close to Tufts University inferring that Tufts University would hire these lost job positions. Is Tufts University who lost 25% of its endowment over the last year guaranteeing they are picking up these lost jobs in Medford? If so, let's get that in writing. How does EOT come to the following conclusion? "Therefore, many of the jobs affected – particularly the office positions displaced in Medford – would not actually be eliminated but only relocated locally." There is no concrete evidence to this statement only assumption.

O-014-001

We actually contest the estimated 224 job loss number listed for Medford and believe it to be much higher than EOT is indicating. The Cummings Property representative at the public hearing in March 2009 at the Brooks School in Medford mentioned at least 700 jobs in just the 200 Boston Avenue building. This also does not take into account anticipation of impact on job loss due to traffic mitigation proposals EOT has for the Medford Hillside businesses. They

O-014-001

Socioeconomic impacts, including projected effects on businesses, jobs, tax revenues, and community disruptions, are described in DEIR/EA Section 5.3, Socioeconomic Impacts. Effects on land use and transit access are discussed in DEIR/EA Section 5.2, Land Use, and Section 5.15, Indirect and Cumulative Effects. As required by the Secretary's Certificate on the DEIR/EA, additional analysis of the socioeconomic effects of the maintenance facility alternatives are described in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project. A series of Project workshops will provide opportunities to discuss broader impacts of the Project on job creation, economic development, housing affordability, and other community impacts.

O-014-002

plan to eliminate parking spaces by reducing current parking inventory and turning it into turning lanes at the intersection of Winthrop St. and Boston Ave. This removal of parking spaces impacts businesses that depend not only upon walk in business but drive up business. And who can anticipate the number of businesses that may go out of business when construction of this project impacts customer's ability to access local business? There has been no articulation of how EOT plans to address these economic issues in the construction phase.

In fact, the proposed land taking in Medford especially of the Elizabeth Grady Building and the 200 Cummings Property building actually stymie economic development in our community. Recently Mayor McGlynn negotiated the addition of an Italian bioscience firm at the 200 Cummings property location. This firm is gearing up to bring jobs and revenue to our community. Why would Medford want to jeopardize this expansion opportunity for speculative theories from EOT?

The property tax values listed on page 5-16 of the detail DEIR assessment also appear to be understated. In visiting the Medford assessor's office this summer, GLAM representatives found the 200 Boston Avenue building to be actually worth $265,000 in property tax value and not the $122,000 that EOT is claiming based upon their estimates. This discrepancy makes EOT's numbers very suspect for other properties listed such as the Elizabeth Grady building.

O-014-003

We also believe based upon the maps provided in the DEIR that not all land acquisition has been identified. For example, the project juts into property at the Winthrop Street bridge headed down the hill toward George Street. Are we to assume they will not be some land acquisition at this bridge reconstruction area? Also, the 196 Boston Avenue property is sited with land acquisition and is not mentioned on the list even though EOT maps show land acquisition graphs cutting off portions of this property for the drop off area.

O-014-004

Piggot Road is targeted with noise, vibration and land acquisition. The land acquisition grid actually shows a house close to the track being severely impacted by land acquisition right up to its back door. EOT on the other hand expects us to believe that this is not an impact. The quality of life for this particular residential street is so severely impacted that it makes living within this street intolerable. As health professionals understand, destroying a neighborhood's culture, restricting its green and open space and abruptly invading its private space has resulting impacts to mental and emotional health as Dr. Marlene Warner has pointed out to us a scientist.

O-014-005

We anticipate that if this project goes to Route 16 that these residents will be targeted by speculators who will take advantage of the situation and low-ball the real estate values. We believe this situation will also occur for those homes that will be isolated by a Route 16 station as they will be surrounded by the MBTA

12

O-014-002

Construction impacts of the Project are described in each environmental resource section in DEIR/EA Chapter 5, Environmental Consequences. Pedestrian and vehicular access to abutting businesses and properties will be maintained at all times. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during design and construction.

O-014-003

DEIR/EA Section 5.2 describes the Project's potential temporary and permanent acquisitions. MassDOT will continue to evaluate opportunities to minimize these property impacts. Properties referenced on this page of the comment letter are not impacted by the Proposed Project to College Avenue and are not included in the proposed acquisitions and relocations.

O-014-004

As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds. FEIR Chapter 8 describes specific proposed mitigation measures, plans for monitoring after construction, and next steps pertaining to mitigation. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

O-014-005

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the

O-014-005

and the constant in and out of drop off, bus traffic and poor maintenance of surrounding MBTA property as seen in the maintenance today.

For these mitigation reasons alone, GLAM cannot support this transit project beyond College and Boston Avenue. We in fact would encourage the city of Medford to deny all permitting beyond this area.

It is clear to GLAM in reviewing this DEIR and in contacting abutters mentioned in land acquisition that they have not all been notified by EOT of this project despite EOT's contentions to the contrary.

Transit impact on abutters by moving commuter rail closer to homes

O-014-006

EOT has proposed in the DEIR moving the commuter rail closer to abutters' properties without mitigation of the diesel pollution that currently exists. Abutters all ready experience environmental pollution from diesel particles on their homes, cars and land. By moving the commuter rail closer to their homes, this problem will only exasperate these environmental issues. GLAM and abutters have called several times for a health study on the affect of diesel particulates on this area and particularly in the area of the Walkling Court elderly HUD housing program where there is a vulnerable population of disability and environmental justice community.

We base our request upon considerations that other environmentalist groups were projecting, in which later a California Environmental Protection Air Resource Board study of December 2008 verified their findings. That environmental study has found diesel particulate matter contributes to premature death, lung cancer and increased respiratory and cardiovascular hospitalizations. The study results point out that those most vulnerable are children whose lungs are still developing and the elderly who may have other serious health problems. We believe that the Walkling Court housing program fits into the latter population. These conclusions correlate with a recent study done in New York City where similar health impacts were found upon those living near subway stops, bus depots and areas of traffic congestion. We requested health studies such as this prior to these findings and continue to request health studies to the date of this report with no studies being done.

EOT has not met our request to separate out diesel particulate matter impacts from ambient particulate matter pollution studies despite this recommendation by the California EPA Air Resource Board and supported by other environmental scientists. Nor have they met our request for health studies upon the Route 16 MVP area. Our environmental advisor, Dr. Marlene Warner, states diesel exhaust does not equal auto exhaust. Diesel effects must be separated out in air quality studies. She also states it is essential to locate or create a cancer incidence and type survey for this particular area of Medford both over time and separate for age and race. This is a basic and fundamental need. Though we

13

Commonwealth from extending the Green Line beyond College Avenue at this time.

O-014-006

The Green Line Extension will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the air quality impacts from relocating commuter rail lines closer to homes and the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality. As required by the Secretary's Certificate on the DEIR/EA, the FEIR includes a narrative clarifying the relationships of air quality modeling data to MassDEP and EPA requirements for State Implementation Plan (SIP) consistency. The preparation of a health study is beyond the scope of the Green Line Extension Project.

provided Dr. Warner's comments to EOT, they did not comply with our request for these baseline air and health studies even after they were made aware of the California study and the New York subsequent study.

We believe these health studies are warranted based upon a report entitled "Environmental Justice Inventory for Ten Communities in the Greater Boston Area" researched and written by Tufts University's Urban and Environmental Policy and Planning Dept. This 2005 report was commissioned by MEPA itself. The City of Medford is specifically highlighted in this report in regards to chronic disease indicators. Medford was noted to have 44 lung cancer deaths at an age-adjusted rate of 61.8, which was higher than the state age adjusted rate. As we noted above, lung cancer has been identified as an issue of exposure to diesel particulate matter. There were 201 cardiovascular disease deaths at an area age adjusted rate of 253.6, slightly below the state age adjusted rate. These numbers need to be updated to create a baseline health impact from this transit project.

We believe this DEIR should not be approved until such health studies are first conducted.

Ridership in Medford

O-014-007

O-014-008

Most of the ridership numbers in the DEIR are based on riders diverting from other forms of public transportation, in particular other light rail systems. Based upon the financial issues the MBTA faces now and in the future, these ridership numbers appear to be just rearranging the deck chairs on the Titanic. The new ridership numbers appear weak. Yet, the DEIR does not address a study of comparable cost/benefits if the state was to address more efficient, enhanced services on existing lines. The EOT is proposing to invest $1 billion dollars in this project while adding $21 million of annual operational costs to the MBTA, an agency all ready suffering from operating deficits and deferred maintenance issues. If we, the taxpayers, were to invest in this project as EOT estimates, which do not appear to include mitigation costs, we would think the public should deserve this cost benefit/analysis to say we are putting tax dollars in the most beneficial way.

Special interests groups told citizens in Medford that people in the neighborhood would walk to stations to use the proposed Green Line Extension as opposed to drive. Advocates have told residents that stations would not cause parking or traffic problems because local residents would be walking to the proposed Green Line. This is unrealistic. But in the DEIR we are told that ridership will increase over the years due to high-density growth. Medford's character is not one of high density as the DEIR points out and to force this change upon our community is to create a quality of life issue.

O-014-007

No other light rail services, or other rail transit services for that matter, service the Green Line Extension Study Area. Therefore few Green Line Extension riders are expected to be former riders of other rail transit services. The projected riders identified in DEIR/EA Section 3.7 are anticipated to come from local corridor communities.

O-014-008

The 2005 *Beyond Lechmere* study and subsequent consideration of Green Line Extension alternatives have considered enhancements to existing MBTA rail and bus services.

Despite recommending no parking garage at this time, EOT coyly leaves the door open to put a 300 car-parking garage at the Cummings Property site. As Mr. Woelfel was quoted as saying in a local access show out of Arlington over a year ago that he anticipated putting an "Alewife" type garage at Route 16. We believe that EOT actually intends to build this facility to divert traffic to our area from the Alewife facility and are only waiting for the public's eye to wane on this project in the future. After all, the DEIR is an open contract as it now exists.

O-014-009

With the amount of property EOT plans to take at 200 Boston Avenue, we can only surmise that EOT will use this facility to put up this garage and possibly put a car barn at this location for bus layovers. We based our statements on EOT's stated intent at a Winchester public meeting to bring buses from Winchester, Woburn, Burlington and Arlington to this drop off area to boost weak ridership numbers. Buses through this area would have to go through the West Medford community, a historic African American community. We believe that either scenario would cause an undue environmental burden upon this environmental justice community. As we have stated previously, we would be opposed to bringing this project forward from College and Boston Avenue based upon these quality of life and mitigation issues.

Traffic Congestion in Medford

O-014-010

It is unclear in the DEIR as to when EOT took its traffic measurements. If for example, EOT took vehicle traffic counts at Winthrop Street and Boston Ave or at Route 16/MVP in the late spring/ summer, than they have under estimated the impact of traffic in the area. It is well known that when Tufts University reconvenes in the fall, traffic impact increases in these areas as students arrive back in the area.

O-014-011

EOT's mitigation proposals around traffic control have impact to Medford parking inventory. They propose elimination of parking spaces at Route 16/MVP and at the intersection of Winthrop Street and Boston Avenue, impacting upon the small businesses in that area that depend upon car traffic as well as walk in business. These measures would have a negative impact upon revenue generation for these businesses. EOT also proposed elimination of parking spaces in Ball Square, which could impact upon the South Medford area in terms of park and hide, an area all ready experiencing traffic and parking problems. There are no real concrete solution to these problems from EOT other than it is the city's problem. EOT needs to come back with stated corrective action measures that articulate any further mitigation and who will be picking up the cost.

It appears that if EOT's inferred traffic mitigation measures do not work EOT can actually drop the responsibility for this condition back into the hands of the cities by stating that these conditions are not attributable to the proposed Green Line Extension project. For example, EOT is proposing a turning lane on the bridge at College and Boston Avenue as a mitigation measure. Yet we can envision

15

O-014-009

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

O-014-010

Page 4-42 of the DEIR/EA identifies the dates traffic volumes were collected, which were available on November 7th and 8th, 2007. Volumes account for Tufts University-related traffic and were recorded when all schools were in session.

O-014-011

DEIR/EA Chapter 6 and FEIR Chapter 8 list the traffic and parking measures to which MassDOT has committed to mitigate impacts. These mitigation measures address pedestrian and roadway traffic signal improvement needs, impacts during construction, and parking enforcement coordination. These measures will be further advanced during preliminary engineering.

drivers using this lane to drop off riders to the MBTA station instead of the designated drop off area. We can also envision these drivers impeding traffic as they try to use this lane to head down College Ave toward Somerville or down Boston Avenue toward Ball Square as opposed to turning toward Route 16/MVP.

As Mayor McGlynn stated in the city's public comments to the EENF released in 2006 he states his concerns for the unique challenges this intersection creates that are exacerbated by the College Avenue bridge feeding into this intersection. As he notes this intersection has a high traffic count, irregular turning movements with a significant number of university students walking through this campus area. We do not believe that EOT has addressed in their mitigation the Mayor's assessment of this intersection as a dangerous area. This issue needs to be addressed.

To understand traffic mitigation, one must understand human behavior. We believe the measure that EOT has proposed for this bridge will only enhance the danger of this intersection and its impact upon public safety. In fact, we cannot envision how people with disabilities would be able to navigate this hectic situation as they try to access elevator and escalator entrances on the opposite side of the drop off area.

O-014-012

O-014-013

Based upon EOT's mitigation proposal cities would have no recourse in obtaining EOT's project funds for corrective action if future traffic congestion actually is not solved by EOT's measures. We recommend then that EOT work to determine within the DEIR appropriate traffic controls. It is not apparent that they have done so prior to this DEIR report. We propose that it should be required in the DEIR that all parking and traffic controls be monitored during the first five years after the system opens for operation. If EOT's implemented controls are found to be insufficient EOT will be required to provide all funds for all corrective action as determined as needed by the cities impacted by this project.

As Wendell Cox, a Senior Fellow at the Texas Public Policy Foundation, writes in his article, "The Illusion of Transit Choice" found in the Quarterly Journal of Public Policy in Texas, rail does not reduce traffic congestion. He points out traffic congestion is getting worse everywhere – in urban areas with new rail systems, and in areas without them. In looking at transit choices as alternatives that bring drivers out of their cars, one must consider whether these choices are auto competitive. As he states, the minimum requirement for auto competitiveness is transit service that is fast or nearly as fast, from origin to destination, as the automobile. This means taking public transfers into consideration as well when speaking of origin to destination. Although the proposed Green Line may get you to Boston, what is the time to destination when taking into consideration transfers to other lines to get to your final destination? And since the trend in the country has been decades of suburbanization, hence there has been significant growth of jobs out in the suburban areas. As has been already been proven and pointed out in our comments, cars are going to jobs in the suburbs. Therefore the

16

O-014-012

The Project is intended, in part, to relieve traffic congestion, as described in DEIR/EA Chapter 2, Purpose and Need. Some station access points for parking or passenger drop-off/pick-up are likely to impact local traffic flow, as outlined in DEIR/EA Section 5.5, Traffic. As described in DEIR/EA Chapter 6, these impacts will be minimized to the extent practical.

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes how MassDOT will coordinate with municipalities and stakeholders to address traffic and parking concerns.

O-014-013

DEIR/EA Chapter 6 and FEIR Chapter 8 list the traffic and parking measures to which MassDOT has committed to mitigate impacts. These mitigation measures address pedestrian and roadway traffic signal improvement needs, impacts during construction, and parking enforcement coordination. These measures will be further advanced during preliminary engineering.

flexibility the car brings to convenience of reaching a job in the suburbs versus a fixed rail system that limits destination to downtown does not point to the conclusion that there will be reduction of traffic congestion to the Medford area.

Recently Parade Magazine highlighted a poll in its Oct. 18, 2009 issue that asked the question, Should America cut funding for roads in favor of public transit? The results showed the following, 51% of the public said no. Their reason was the following, "Mass transit doesn't go to enough locations on a frequent enough schedule to make it worthwhile. Driving is a better alternative." This poll correlates with Mr. Cox's study conclusion that for transit to have any hope of attracting people out of cars, it must be available in a form that is auto competitive. Although EOT has shown the proposed Green Line's extension's competitiveness with current bus service, it has not shown it to be auto competitiveness. Therefore its conclusions that traffic congestion will be reduced are again theory without practical application based upon other transit studies on traffic congestion. This issue raises the question as to whether the proposed Green Line Extension is going in the areas of best benefit.

O-014-014

Parking

O-014-015

- ✓ Hide-and-ride impacts may occur in station areas. To identify appropriate parking controls, EOT should be required to conduct on-street parking inventory surveys now around each proposed station area up to one year prior to the possibility of station openings to document existing on-street parking supply within a half mile radius of the proposed station areas. We believe they have not identified this inventory within the DEIR. Based upon surveys, we recommend that EOT work with affected neighborhoods to identify and implement appropriate mitigation elements within studies prior to any proposed station openings.

O-014-016

- ✓ Mitigation issues should include time-limit signs, parking meters where appropriate, passenger drop-off/pick up zones, truck and load/unload zones, and residential parking zones (RPZs) within a half a mile radius of each station. We do not see proposed mitigation within the DEIR that expands beyond the immediate station areas. EOT should be required to provide funding for implementing appropriate parking controls, labor and all other related installation costs for these mitigation issues and we believe the cities should insist that these measures extend to within a half-mile radius.
- ✓ EOT staff should be required to monitor all parking controls during the first five years after the system opens and determines if RPZs boundaries or other parking controls are insufficient. EOT should be required to fund any expansion of existing or newly created RPZs or other parking controls during the first five years following any proposed station openings.

17

O-014-014

Reductions in regional traffic volumes and vehicle miles traveled (VMT) indicate that the Green Line Extension is competitive with automobile travel within the Somerville and Medford communities.

O-014-015

An on-street parking inventory within 500 feet of each proposed station was conducted in the DEIR/EA as specified in the Secretary's Certificate on the EENF.

DEIR/EA Table 6-1, Project Mitigation Commitments, lists the traffic and parking measures to which MassDOT has committed to mitigate impacts. These mitigation measures address pedestrian and roadway traffic signal improvement needs, impacts during construction, and parking enforcement coordination.

O-014-016

DEIR/EA Chapter 6 and FEIR Chapter 8 list the traffic and parking measures to which MassDOT has committed to mitigate impacts. These mitigation measures address pedestrian and roadway traffic signal improvement needs, impacts during construction, and parking enforcement coordination. These measures will be further advanced during preliminary engineering. MassDOT will work with the local municipalities to develop a parking enforcement program.

Visual Resources and Aesthetics

The Hillside area has many trees, vegetation and animal and bird habitats along the commuter rail. This woodland habitat is an appealing, valuable environmental, and neighborhood characteristic for those abutters who live along that area. This woodland barrier also acts as a natural sound and diesel particle emission barrier for the commuter rail and traffic and buses on Boston Avenue. It also acts as a light barrier for the railroad and Boston Avenue and provides shade in the summer. We believe the State Shade Tree Law should be investigated as to its pertinence to this area and should be an included requirement within the DEIR. We have not seen such consideration of this law within the DEIR. In fact we are greatly concerned and opposed to the number of trees that EOT has proposed to cut down such as oak and maples.

Many of our membership who lives near the commuter rail have had negative experience with the MBTA and its vegetation replacement program. Once the MBTA puts in place its replacement vegetation program it rarely revisits the program to measure it success or to maintain the area.

O-014-017

We are aware that many abutters in that area are concerned with the destruction of this area by EOT's proposal to move the commuter rail closer to their homes, the construction to accommodate the proposed Green Line tracks and the impact on the wildlife in that area. EOT within the DEIR seems to treat this concern with little veracity. MEPA should require further studies on this mitigation issue and should demand that EOT come back with a further demonstration of how they will protect this woodland area without removing trees and vegetation and disturbing animal and bird habitats.

The proposal of any retaining walls by EOT in their studies that does not disturb the woodland area should incorporate aesthetic retaining wall design measures, such as steps, patterning, texture, and vegetative planting that blends into the scale and character of the neighborhood all paid for by EOT funds. In other words, any retaining wall should enhance the character of what is all ready there, not replace it.

Air Quality

O-014-018

EOT has all ready admitted in the DEIR on page 6-8 of the detail assessment that this project would cause some localized decreases or increases in carbon monoxide and particulate matter. These areas have not been pinpointed within the DEIR and MEPA should require that this information be held transparent to the communities involved and that mitigation measures be identified.

O-014-019

MEPA should require that EOT provide a stand-alone study of Medford's current air quality especially in light of the health study we are demanding for our community. EOT needs to guarantee that Medford's air quality is not going to be

18

O-014-017

DEIR/EA Section 5.10 addresses Project impacts to wildlife and plantlife. The Massachusetts Shade Tree Law (MGL Ch. 87) defines public trees as those within a state highway, not a railroad right-of-way, and does not apply to the Green Line Extension. In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project. Public input on mitigating impacts to vegetation and landscaping will be sought.

O-014-018

The Green Line Extension will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality. As required by the Secretary's Certificate on the DEIR/EA, the FEIR includes a narrative clarifying the relationships of air quality modeling data to MassDEP and EPA requirements for State Implementation Plan (SIP) consistency.

O-014-019

The preparation of a health study is beyond the scope of the Green Line Extension Project. However, the Project will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality. As required by the Secretary's Certificate on the DEIR/EA, the FEIR includes a narrative clarifying the relationships of air quality modeling data to MassDEP and EPA requirements for State Implementation Plan (SIP) consistency.

O-014-019

negatively impacted by additional traffic congestion and or the movement of commuter rail tracks closer to abutters' homes. We, as citizens, need to be guaranteed through scientific studies that our air quality is not being negatively impacted by additional traffic congestion as we have seen in the Wellington Circle area with the TOD development there.

As we understand it from EOT advisory committee meetings, the DEIR air quality projections are founded in part on projections of high rates of alternative fuel/electric car ownership over time as non residents increase their use of the proposed area. As Dr. Warner advised GLAM, it makes more sense in these economic times to project the numbers for 15-20 year old high polluting cars and trucks that private, business, taxi and city users will be desperately sustaining during these economic times and into any recovery. Therefore, we believe that air quality studies should be done based upon current car and truck air quality usage.

Noise and Vibration

In regards to EOT's claims regarding mitigation for noise and vibration, we can only refer to the recent article in the Boston Globe, dated November 1, 2009, titled "Too Close for Comfort." This article articulates that many of the proposals in the current DEIR, such as insulating windows, do not address noise and vibration in the long term. Too much of the mitigation proposed by EOT regarding noise and vibration depend upon the ability of the MBTA to maintain tracks and keeping tracks lubricated over the years.

Based upon the current maintenance conditions at the MBTA, it is self evident that this simple plan does not work. And anyone who has ever ridden the Green Line knows that is one of the most troubled of transit lines within the system. We cannot think about what a project reveals when first brand new; we must anticipate the issues of 10-20 years down the road when maintenance schedules break down. In the October 20, 2009 MetroBoston newspaper, there is an article entitled "Outrage outpaces problems for now". This article mentions the issue transit riders have concerning the $2.7 billion maintenance backlog on the Green line. During the period of September 1 – October 9, 2009 the MBTA reported Green Line service failures due to the following causes, 36% was caused by brake issues, 15% by door problems, 15% due to propulsion problems and 15% due to electrical issues with 19% of problems accounted for other problems not specifically identified.

Much of noise and vibration depend upon driver operation and good maintenance. There are no proposals within the DEIR to slow down transit traffic and no evidence that noise levels were tested with consideration of both the commuter rail and transit trains running at the same time. We caution MEPA and abutters that mitigation as proposed by EOT is dependent upon MBTA maintenance. This proposal is unrealistic and can negatively impact upon the

quality of life. This is evident whether it is issues pointed out on the Green Line or in the above-mentioned article we have found on abutters fighting the MBTA on the Orange Line mitigation issues that have grown over the years.

It has also been identified in the Consumers Reports on Health publication that noise pollution is correlated to high blood pressure problems, especially in populations under 60. Therefore full mitigation in this area is important to the quality of life for our residents.

O-014-020 The EOT/MBTA should be required to develop a vibration and noise-monitoring system with agreed upon thresholds of vibration based upon residential neighborhoods. The EOT should be required to perform these analyses on a regular basis if the proposed Green Line extension is implemented. Failure to do so should subject EOT to monetary penalties that would go to the cities impacted to institute future mitigation fund recourse for residents and local businesses. As we read in the above-mentioned Globe article on mitigation, the MBTA and state are rarely willing to correct problems that arise over the years from poor maintenance on transit systems.

Water Resource Impact at the Mystic River:

O-014-021 We are greatly concerned that the DEIR has identified wastewater discharge from Ball Square up into the Mystic River from this project. We would be seriously opposed to this environmental impact on the Mystic River. Best management practices around water quality resources should be incorporated in the DEIR as required to meet applicable city, state and federal standards and requirements.

Electromagnetic Fields due to light rail consumption:

O-014-022 Light rail, when electricity generated, uses electromagnetic fields. In fact, the MBTA is the greatest consumer of electricity usage in the state according to records we have read. In fact, there is no comparative study to determine if the energy usage of expanding this system actually negates any energy benefit identified. EOT has actually given short shrift to the impact of substations and electromagnetic fields in the expansion of the proposed Green Line. The MEPA should require that the EOT's DEIR identify if there will be any adverse impacts to human health due to electromagnetic fields.

Recently the city of Medford experienced electrical supply problems in South Medford over a two-day period where residents were left without light and heat. How does this additional demand on electrical systems affect an all ready over burdened problem? This question has not been identified or addressed in the DEIR.

O-014-023 In fact, we have researched that DC rectifiers primarily power light rail systems. If left uncontrolled, stray currents originating from light rails and substations can cause corrosion of buried structures and piping. Light rails systems in close proximity to many underground utilities such as water, gas or sewer pipelines may be affected by stray current corrosion. Repair of these kinds of problems can be difficult because light rail systems have to be shut down prior to excavation. EOT has not demonstrated in the DEIR what steps they propose to take to ensure that stray current has been addressed in its plans and construction.

O-014-024 Also, the DEIR appears to only mention a substation in Somerville. We cannot believe that the electricity demand of this project would not require other substations in other areas. Substations need to be clearly identified.

Public Service Safety and Security Plan:

O-014-025 The MEPA should require that EOT in its studies determine a safety and security maintenance plan for policing of stations and neighborhoods. This plan would include developing procedures throughout proposed project design, construction and operation. Although EOT identifies that the MBTA will be responsible for emergencies and security issues, it is unrealistic to think that the city's first responders will not be first on the scene to protect citizens. Who will pick up this cost? This is a cost issues that needs to be identified within a cost analysis.

Walking Court Housing:

We cannot express more than we have all ready our concern on the environmental impact on this elderly disabled and environmental justice population who live at Walkling Court.

EOT has claimed there would be no impact on this housing program and also claimed that this housing was not in an environmental impact area. Yet we find this housing program under the noise mitigation map but not mentioned
O-014-026 specifically in the DEIR. We oppose any extension beyond College Ave and Boston Ave due to these numerous mitigation issues that have not been addressed specifically regarding this home to elders.

O-014-027 ♦ Noise and vibration impacts both in operation and construction of this potential project must meet HUD thresholds. EOT has not documented this project's impact or that it meets the HUD vibration or noise thresholds.

O-014-028 ♦ What is the potential of increased hide and ride parking in this area? This has not been addressed in the DEIR.

O-014-029 ♦ Disturbances by Pedestrians using the Walking Court site to cut through to station locations will be a problem that has not been addressed in this DEIR.

21

O-014-020

As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds. FEIR Chapter 8 describes specific proposed mitigation measures, plans for monitoring after construction, and next steps pertaining to mitigation. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

O-014-021

As described in DEIR/EA Section 5.9, the Project would be required to comply with federal and state stormwater discharge permit requirements during both the construction and operational phases. Compliance with these standards would include using Best Management Practices to prevent contamination of stormwater and control erosion and accretion (sedimentation) from stormwater runoff from the railroad alignment, stations, and maintenance facility. There would not be any wastewater discharges to the Mystic River.

O-014-022

MEPA did not require that the DEIR/EA address this issue. Present understanding of the health effects of long term exposure to electromagnetic fields is incomplete, but shows that risks to the health of children and adults are either low or nonexistent.

Bus Routes in Medford:

O-014-030 It is unreasonable to believe from a financial perspective that EOT would continue to run a bus route that mirrors the route of the proposed Green Line Extension. We would like to see an alternative that demonstrates air quality benefit if hybrid buses are used on this route instead of extending the proposed Green Line extension.

O-014-031 EOT states light rail to be faster in accessing Lechmere station. But citizens who currently ride the bus to Lechmere tell us that when you take into consideration the ability to transfer to get to areas such as Longwood Medical area, the bus actually takes less time because it provides more flexibility in transfer connections than transferring downtown at Park Street on the Green Line.

O-014-032 Also, EOT has stated at its November 2009 hearing in Somerville that they will be reassessing the use of these bus routes as implementation of the proposed Green Line plays out over the next few years. We believe the discontinuance of any bus routes currently in Medford will cause increased traffic congestion as people resort to driving to work or resort to kiss and ride drop off. The reduction of any bus routes actually diminishes transit and choice of transit for those who reside in West Medford. The discontinuance of these bus routes we believe will have impact on the planned development of Medford Square since the 326 Haymarket express, the 94 bus to Davis Square and 95 bus to Sullivan Square stop in Medford Square for pick up of passengers.

MBTA Assessment fees and other costs:

O-014-033 The DEIR does not address cost in any fashion that specifically shows a cost breakdown for this project. We recommend that any cost analysis of this project must identify potential increased MBTA assessment fees to the city of Medford, identify any electrical cost increases to its citizens and any additional public service fees upon the city of Medford.

Smart Growth versus Fair and Sustainable Growth:

As GLAM has stated in prior public comments, we support community development projects only when they instill the stability, affordability and quality of life of neighborhoods so that deep bonds of commitment to the community can be developed through family and social organizational ties. We believe the public should be cautious concerning the proposed Green Line Extension project and EOT's encouragement for Smart Growth. We make these comments upon the findings of the Reconnecting America report, which focused on the changes in Porter and Davis Square that ended up excluding middle to low income populations.

22

O-014-023

MassDOT is aware of common issues related to stray current. As part of the design scope, solutions will be proposed to address stray current throughout the corridor. Related issues are typically not addressed in conceptual design.

O-014-024

The DEIR/EA and FEIR include conceptual Project designs. Traction power designs will be refined during the Project's preliminary engineering stage. The process for coordinating with local communities during Project design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

O-014-025

During preliminary engineering, system safety and security plans will be developed to address stations and emergency response personnel during construction and operational phases. MassDOT will specifically coordinate with emergency response providers to plan for appropriate site and community access during and after the construction phase.

O-014-026

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time.

O-014-027

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension

O-014-034

As part of GLAM's principles and objectives, we challenge EOT's conventional wisdom around the economic theories that EOT is promoting called university expansionism. As we have stated before in comments, many abutters to this project are moderate income residents who fear of being displaced or priced out of their neighborhood as advocates push the concept of higher property values with the proposed Green Line. Affordable housing is not just a city issue; it is a state issue especially when the state is promoting forced changes in the DEIR upon a community as opposed to natural change.

O-014-035

As pointed out through Census Bureau 2000-2008 estimates of population, North Reading and Middleton's population has seen fast growth increases while Somerville's population was down 2.5% during this same time period. Even when looking at the 2007-2008 time period, Medford and Somerville both only had slight increases in population. These figures are collaborated by the weekly real estate transaction reports where Somerville has seen decreased sales in condominiums and single family home sales. These population trends show folks moving to suburbs such as North Reading and Middleton for better quality of life and education issues as well as lower property taxes. Therefore that is also why we feel riderships numbers should be reviewed within the contexts of loss population trends.

Americans with Disabilities Act

O-014-036

Although EOT has spoken of stations being in compliance with the ADA, we do not see enough specifics mentioned in the DEIR to ensure this compliance has been fully accounted within the DEIR. Therefore, we are providing some questions/comments regarding ADA that we do not see addressed in the DEIR. These questions/comments are not meant to be construed as fully addressing all ADA concerns. It is not the job of GLAM to develop an accessibility design review checklist for EOT. But we do believe that there should be an extensive accessibility design review provided within the DEIR to ensure compliance for the disability and elderly community.

O-014-037

(a) Are curb ramps provided at all sidewalk and drop off areas? And are all disability access modes near the main circulation route?
(b) Are all accessible gates and turnstiles located in an accessible path?
(c) Are all walkway surfaces paved, uniformed and surfaces slip-resistant?
(d) Are all sites graded to direct flow of water away from walkways?
(e) What is the measure of slopes and are they in compliance with ADA access board architectural standards?
(f) Do all detectable warning surfaces have raised, truncated areas and in color designation?
(g) Are handrails and guard rails included at proper height?
(h) Within parking and drop off areas, have the required number of accessible parking spaces been designated or considered in the design of drop off areas? Are the accessible parking spaces located

23

Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. No impacts are anticipated at Walking Court Housing.

O-014-028

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout and access at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

O-014-029

Please see response to Comment O-014-027.

O-014-030

Bus alternatives were evaluated for the Project, as presented in DEIR/EA Chapter 3. These alternatives assume the use of vehicles with similar emissions characteristics to hybrid electric transit buses.

O-014-031

Both the Green Line Extension College Avenue and Union Square branches would provide a direct light rail transit connection to the Longwood Medical Area without transferring.

O-014-032

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work

O-014-037

on the shortest possible accessible route of travel from adjacent parking to the accessible station building entrance? Have these issues been considered when looking at drop off areas such as College Avenue?

(i) Will there be posted warning signs with the international symbol of accessibility at each accessible drop off area with penalties mentioned for violators?

(j) Does each passenger-loading zone have an access aisle at least 60 inches wide and extend the full length of the vehicle pull-up space they serve? For example, is there room for The Ride to drop off people with disabilities? And have these plans been incorporated in station designs at areas such as College Avenue when considering reconstruction of this bridge area?

(k) Wherever practical do exterior ramps or waiting areas have roofs or protective coverage for people with disabilities?

(l) Do all elevator cars have slip resistant surfaces? Do elevators have handrails at appropriate height and control panel buttons within appropriate height? Do all elevators have a self-leveling device to bring the car to floor landing?

(m) Are all elevator car alarm and emergency stop buttons and emergency communication grouped at the bottom of the control panel, with their centerlines no lower than 35 inches above the car floor? Will control panels have accompanying Braille designation?

O-014-038

(n) Will all Green Line cars have similar floor leveling capability to bring a wheel chair on board? Will there be attendants at each station for passengers with disability access needs?

O-014-039

(o) Will the proposed Green Line station have audible signals to announce cars arriving and departing? Will these audible signals as well be in elevators? Will there be visual signs for those who are hearing impaired for the same designations?

(p) Is weather protection planned for the outside elevator entrances?

(q) How will the disability community access trains inbound and outbound?

These items listed are not to be considered inclusive of our ADA concerns. We suggest that EOT access the Puget Sound Transportation Accessibility checklist. This checklist is extremely comprehensive regarding ADA requirements in all aspects of providing public transportation.

O-014-040

In a letter provided many months ago to a past EOT Secretary, we had surveyed a disability program to find their concerns about public transit regarding the disability community they served. Two major concerns arose. The first is the fact that the Charlie card system was often difficult in access for those with physical disabilities. For those with developmental disabilities, literacy can be an issue when using the Charlie Card. Both these populations suggested that there should be an MBTA customer service staff available to assist with these issues. The second concern was those with disabilities are often preyed upon by other

24

with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

O-014-033

Project cost estimates are based on the current, conceptual level of design, and will be further refined as the Project progresses through preliminary engineering. It is anticipated that Green Line Extension construction would be financed with a combination of funds from federal and state sources. Efforts to engage a developer for the North Point development will continue as this Project moves into the next phases of design.

O-014-034

Socioeconomic impacts, including projected effects on businesses, jobs, tax revenues, and community disruptions, are described in DEIR/EA Section 5.3, Socioeconomic Impacts. Effects on land use and transit access are discussed in DEIR/EA Section 5.2, Land Use, and Section 5.15, Indirect and Cumulative Effects. As required by the Secretary's Certificate on the DEIR/EA, additional analysis of the socioeconomic effects of the maintenance facility alternatives are described in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. A series of Project workshops will provide opportunities to discuss broader impacts of the Project on job creation, economic development, housing affordability, and other community impacts.

O-014-035

Ridership projections presented in DEIR/EA Section 3.7 were developed by CTPS and include estimates for various access modes, including walking, biking, bus and car. Methods for developing the ridership

riding populations. For example, there were those in the survey who had been robbed on light rail and when riding a bus. Others experience verbal and physical abuse and harassment at MBTA stations. Their recommendation was that there should be more security available and more trained MBTA staff available at station sites.

Unlike EOT, we believe that the MBTA settlement with the disability community does require that there be manned stations to address these types of issues.

O-014-041

We also have raised the question with FTA in our report/complaint as to whether the state can expend billions of dollars on a new project without first bringing all, older stations into ADA compliance, such as Boylston Street station and Symphony Hall station as examples. This question should be answered before there is approval of the proposed Green Line project.

Environmental Justice and the Disability Community

GLAM's purpose is to give authentic voice to those segments of the population who are being excluded from the EOT process. GLAM's credibility in the community of Medford is unique in that it is neither an advocacy nor an opponent group. GLAM is an educational group that has tried to force transparency in this project, posed the hard questions to EOT for those citizens who have felt disenfranchised by the EOT process. We have submitted public comments throughout the process, pointed out the need for additional environmental study considerations and provided research on the disability community to EOT to enhance their knowledge of the American with Disabilities Act (ADA) and its long reaching impact in this project. It is well known that consideration of the disability community is often omitted from many governmental studies such as found in the DEIR preparation work. In fact, the Dept. of Labor has just begun this year to track unemployment statistics of the disability community.

O-014-042

We believe EOT and special interest advocacy groups have demonstrated legal and cultural incompetence [2] when dealing with the disability community and its civil rights laws. Therefore, we cannot believe that they have the best interest of these populations within the project. This cultural incompetence has lead GLAM to support a civil rights report/complaint to the Federal Transportation Administration submitted by its individual members. This report/complaint is now under review by the FTA with an assigned case number.

Cultural incompetence is the lack of awareness about cultural difference and this lack of knowledge can result in an inability to step out of one's position to recognize the difference. Despite a community population's similarities, fundamental differences among people arise from nationality, ethnicity and culture as well as from family background and individual experiences. We define these differences to include race, ethnicity, disability, class, religion, gender, sexual orientation and educational position.

estimate are described in DEIR/EA Section 3.4, Ridership Methodology. Additional details required by the Secretary's Certificate on the DEIR/EA are provided in FEIR Chapter 3, Air Quality.

O-014-036

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. Designs for each station will be further developed during the Project's preliminary engineering stage. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. Specific design details and station elements will be further developed during preliminary engineering. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access. The process for stakeholder coordination during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

O-014-037

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. Designs for each station will be further developed during the Project's preliminary engineering stage. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. Specific design details and station elements will be further developed during preliminary engineering. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access. The process for stakeholder coordination during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

The federal EPA recognized GLAM in 2008 as a public transit group based upon an alternative proposal we submitted to both EOT and the federal EPA regarding the proposed Green Line extension. The federal EPA termed this alternative proposal an enhancement worthy of discussion at the state level. This alternative enhancement was posed to the EOT in anticipation of the mitigation issues we foresaw at the proposed Route 16/MVP site. Our alternative enhancement can be found on EOT's current document site from October 2007.

O-014-043

We had proposed that EOT do an alternative analysis study on taking the proposed Green Line from Ball Square, Somerville by tunnel to Route 16 Clarendon Hill Somerville where it could then connect to the Alewife Red Line station to meet the Urban Ring concept. We proposed that a maintenance facility could be constructed at Route 2 behind Alewife to meet EOT's needs. We provided EOT evidence developed by the city of Somerville that shows there is more ridership at Route 16 Somerville than at Route 16 MVP.

EOT turned down this alternative enhancement and has denied us public access to their quantitative and qualitative data that arrived at this decision. For example, EOT claimed our enhancement did not meet the environmental justice criteria for a transit project area even though the information provided to HUD by the city of Somerville demonstrates a large environmental justice population at Route 16 Somerville than at Route 16 MVP. Although we were told by EOT after several months of asking for this material, that the qualitative and quantitative data would be provided in the DEIR. No such information has been provided and we are asking that this information be put in the DEIR.

As you can see with the maintenance facility issue, when Somerville asks for mitigation consideration, they are provided options that EOT states will cost the state millions of additional dollars. But when GLAM at the beginning of the EOT Advisory process, asked that studies (not the project) be completed on our alternative enhancement to determine its feasibility, EOT gave us little attention and failed to bring our alternative enhancement forward in a transparent fashion. We have found the EOT process discriminatory when considerations were brought forward by the disability and environmental justice populations.

Tunnel Alignment Analysis

O-014-044

During the EOT Advisory committee meeting process, GLAM asked that a tunnel be considered between College Avenue and Route 16 MVP. A tunnel was proposed to alleviate what we saw as severe mitigation issues coming forward if EOT proposed going above ground to this area.

Although EOT prepared a tunnel alignment analysis, they turned down a tunnel as too costly based on numbers they proposed in their tunnel alignment analysis. But this cost analysis did not include the savings to be achieved in mitigation costs if EOT was to do a tunnel in this area. Therefore, the possible savings of

26

O-014-038

While the Green Line Extension Project is being design for fully accessible stations in compliance with ADA requirements, the issue of system-wide level boarding on the Green Line and modifications to existing vehicles is beyond the scope of this project.

O-014-039

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. Designs for each station will be further developed during the Project's preliminary engineering stage. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. Specific design details and station elements will be further developed during preliminary engineering. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access. The process for stakeholder coordination during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

O-014-040

Staffing at Green Line Extension stations will be overseen by the MBTA. Convenience for all customers is a top priority for MassDOT and will be given further consideration during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

O-014-041

The MBTA has made significant progress in retrofitting its rail transit stations to meet ADA accessibility guidelines. Symphony Hall Station accessibility construction is scheduled for completion in 2012. Full

O-014-044

not having to replace bridges or not having to do some or all mitigation to surrounding buildings was not addressed. We believe that the cost analysis prepared by EOT was not complete without addressing these mitigation cost savings. We believe that had EOT truly explored this tunnel alignment that they might have achieved consensus in the city of Medford on the Route 16 area as the idea took a positive hold among many residents.

This summer members of GLAM explored a capped, depressed tunnel that was created in Reno, Nevada that took Amtrak passenger and freight trains below the city's surface. This train system addressed the pollution problem and inconvenience of a train that passed through the middle of the city, causing both diesel pollution from the trains passing through and the idling of trucks, buses and cars as they often waited for long freight trains to complete their trip and business through the city. This city was much improved by a depressed tunnel that was then capped to provide a community shared path with proper landscaping, ADA accessibility and Western artistry on display throughout the shared path. The shared community path was used as an asset to expand community events near the Truckee River, which flows next to the train tracks.

Portions of this tunnel were hand dug to preserve historic artifacts and buildings and had to accommodate a water way as mentioned above. Therefore, you would think that the cost of the Re-Trac project as is it is best known would be very costly. But we found through discussions with Reno municipal staff involved in the capital project that this 2 ½ mile structure actually cost much less than what EOT was proposing for a similar stretch of tunnel we had requested they explore from College Avenue to Route 16.

Therefore, you must imagine GLAM's surprise when the tunnel idea was turned down by EOT due to cost, while the options proposed on the maintenance facility center for Somerville adds millions of dollars. It seems that Somerville was provided all consideration while GLAM was considered a second class citizen.

O-014-045

We believe that MEPA should require that EOT explore the tunnel option with a full cost analysis that includes mitigation savings, presented to the public in a transparent fashion.

Verbal Comments

O-014-046

GLAM is protesting the fact that the Executive Office of Energy and Environmental Affairs (EOEEA) is not accepting verbal comments for public record on the Draft Environmental Impact Review (herein called the DEIR report), EEA number 13886. In attending the public hearing on November 18, 2009 in Somerville on the DEIR, where EOEEA did not appear to be in official attendance, it was not clear that EOT would be transcribing the verbal comments made at those meetings to EOEEA for their review process. Our understanding is that the Federal Transit Administration (FTA) is asking for transcripts of these verbal public comments. We believe that verbal and written comments should be

27

accessibility at Boylston Station is not yet programmed. As presented in DEIR/EA Appendix G, the Green Line Extension offers substantial mobility enhancements for disability populations.

O-014-042

Impacts to environmental justice populations resulting from the Proposed Project are described in DEIR/EA Section 5.4, Environmental Justice. During the DEIR/EA phase, outreach to both disability and environmental justice populations occurred. Additionally, the Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes specific outreach efforts to the environmental justice and disability communities that will be made as the Project progresses through its next phases. Additionally, the Project is being designed to comply with all requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), and the MBTA.

O-014-043

As directed by the Secretary's Certificate on the DEIR/EA, the FEIR includes a limited scope of issues related to the Green Line Extension Project. The Proposed Project, with a Medford Branch terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (MassDEP DEIR/EA comment letter, January 8, 2010). Although an extension to Mystic Valley Parkway/Route 16 is MassDOT's Preferred Alternative, financial constraints prohibit the State from progressing the Project beyond College Avenue at this time. The Green Line Extension Project does not include further extension to Alewife.

O-014-046 included in all Commonwealth public reporting for the purpose of a diverse inclusive process that includes comments from all, not just those skilled in written communication.

We have made our complaint known to Mr. Donald Gomes, affirmative action officer for the Mass environmental agency in November as we believe EOEEA's process in excluding verbal comments violates the Americans for Disabilities Act (ADA). Mr. Gomes as of this date has failed to respond to our letter of complaint. This protest letter was copied to the Federal Transit Administration for inclusion in our civil rights report/complaint filed with the FTA regarding what we believe to be public processes used by the EOT that have excluded citizen participation by the disability community and environmental justice populations within this project.

O-014-047 As an organization with representation of the environmental justice and disability communities, we believe that this process is becoming an elitist one as opposed to a process of plurality, especially when you consider that EOEEA will be making a decision within seven days after the January 8, 2009 extended deadline. Denial of putting transcripts of verbal comments in public record for review solidifies this elitist process. The Commonwealth imposes cultural incompetence upon its citizens by denying those with second language issues and those whose culture may be more comfortable in verbal communication the right to have their comments put in public record. The federal government on the other hand demonstrates its progressive stance by asking for the transcript of those verbal public comments. GLAM has notified both the Commonwealth and the FTA that we consider the policies of EOEEA to be discriminatory to various cultures, including the disability community and environmental justice communities. This EOEEA process should be nullified until proper public participation processes are put in place to allow meaningful scrutiny.

O-014-044

As stated on page 9 of the DEIR/EA Executive Summary, several members of the public suggested constructing tunnels for segments of the Green Line Extension. Based upon this interest, MassDOT and the Project team performed an analysis of tunneling as an alternative to at-grade construction. This analysis is available on the Project website at http://www.greenlineextension.org/currentmaterials.asp?area=mls. The report found tunneling to be cost-prohibitive for this Project, especially considering that an at-grade right-of-way is available. Even with mitigation costs included in the comparison, the cost to tunnel from College Avenue to Mystic Valley Parkway/Route 16 would be substantially higher than an at-grade rail alignment.

O-014-045

The Secretary's Certificate on the DEIR/EA did not require further evaluation of the tunneling alternative.

O-014-046

As indicated at the November 18, 2009 Public Hearing, A transcript of the November 18, 2009 Public Hearing was presented to EOEEA as public comment. That transcript is also included and responded to in this volume; please see comment letter I-001. The hearing was recorded by a professional stenographer as an opportunity for individuals to set their opinions on the official record.

Conclusion and Recommendations

If one wants to believe that theoretically the state and its forces have correctly analyzed and standardized what is going to happen in this project, then one needs to review the financial conditions of the state. They will recognize there is limited amount of money for cities and towns and that President Obama has announced he will be decreasing domestic spending to bring debt under control. Based upon the financial picture, we believe it brings the opportunity to require that more concrete studies come forward with conclusive evidence.

This theoretically, abstract DEIR report bases everything on standards that have not been proven accurate. We, as responsible citizens need to see reports with more empirical data. We do not feel that empirical data is in the current DEIR.

Therefore we recommend the following.

O-014-048
- ✓ That the DEIR be forced back for further study to address omissions and errors in the current report that weakens the credibility of this proposed project. For example, there is no presentation of College Avenue as a terminus for Phase I of the proposed Green Line. Therefore, mitigation impacts are not articulated.

O-014-049
- ✓ We believe that Route 16 should be eliminated from the current DEIR due to the severe mitigation it proposes to the city of Medford as currently proposed.

O-014-050
- ✓ This project should be broken down into additional phases that allow the public to see at each phase the actual impact of this project upon communities. This process would allow further studies to determine better mitigation measures and gives cities like Medford the ability to absorb current economic development plans with affordable housing strategies.

O-014-051
- ✓ Although GLAM is not unsupportive of the effort to build to College Ave and Boston Ave, we just do not believe that the theoretical evidence proves the need there since the stations are so close to each other. Using MGNA and STEP's own statements that people will only want to walk or bike to a station, why not walk to or bike to Ball Square in an effort to save money for the Commonwealth? This is of course assumes that Tufts does not wish to contribute to this project, taking a financial burden off the state.

O-014-052
- ✓ Due to severe mitigation and financial impacts upon Medford, we cannot support the proposed Green Line beyond College Ave. In fact, we question the financial viability in doing this project at all, but do realize that transportation is the future growth of our communities. But we want to grow with a population that includes the Disability and Environmental Justice

O-014-047

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

O-014-052 populations who are currently a part of our community unlike Davis Square and Porter Square where these populations were partly eradicated from this area.

O-014-053 ✓ If the state ever gets the money for this project, we would suggest EOT instead revisit GLAM's alternative/enhancement to Route 16/West Somerville where the largest population in that part of the city is where the disability and environmental justice populations live. But we are willing to recognize that the financial constraint of the state hampers this progress at this time. Or so we thought until EOT was willing to ante up additional millions of dollars for the Option L maintenance facility site as proposed at their December 2009 public hearing in Cambridge. Although we support Brickbottom in its compromise with the state to meet mitigation issues, we also are concerned that this compromise was won at the expense of the disability and environmental justice communities.

Unfortunately if the state takes this financial burden on at this time as it is proposed, we will probably find ourselves in another Big Dig capital project with very little reality coming out of promises made and a great deal of debt burdening the next two generations.

These comments are respectfully submitted by Executive Committee of The Green Line Advisory Group for Medford and other concerned citizens.

Sincerely yours,

Carolyn Rosen
Chairperson
Green Line Advisory Group for Medford (GLAM)

30

O-014-048

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA. FEIR Chapter 3 summarizes the impacts of College Avenue as a terminus.

O-014-049

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. The Proposed Project, with a terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Additionally, FEIR Chapter 4 includes a detailed description of College Avenue Station functioning as a terminal station.

O-014-050

The Proposed Project consists of two phases- the extension to Medford Hillside (College Avenue) and the extension to Union Square.

O-014-051

The Proposed Project includes the College Avenue Station and the Ball Square Station. DEIR/EA Section 3.7.3 includes ridership estimates at these stations in the year 2030. Based on the estimates, 2,420 people would board each day at College Avenue Station and 1,890 people

RE: Green Line Extension Draft EIR (EEA #13886)

Dear Secretary Ian Bowles:

First, we would like to thank you for all of the time and energy that has gone into the Green Line Extension to Somerville and Medford up to this point. Being able to go to so many public meetings and here from officials on this topic has been incredibly important not only to our organization, but also to the Somerville community at large. Thank you again for these efforts. I am writing today to recommend that the Draft EIR be approved, with a few modifications.

Groundwork Somerville is committed to seeing this project completed on time by December 31, 2014 and does not want to stand in the way of that completion. In order for this to happen, design and construction must proceed, but in a thoughtful manner to ensure that full benefits occur from the extension. It is our belief that in order to ensure that this happens, a few critical factors must be noted.

O-015-001

First, Groundwork Somerville, along with our partners at the Community Corridor Planning Project, strongly urges a meaningful public input process. We believe that community involvement is the only way to ensure a successful Green Line extension project. A project-wide Citizens Advisory Group should be maintained throughout the entire project, including detailed design, engineering, construction and start-up phases. Smaller local advisory groups should be established to work with the MBTA and consultants to address specific station design, land use, connectivity, and construction and mitigation issues. Additionally, MEPA should require collaborative planning, with meaningful community involvement and public coordination that should intensify immediately, before this project progresses and require that senior project staff work out of a centrally located field office to maximize access.

O-015-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project. As stated in Section 6.4, MassDOT and the MBTA will convene a Green Line Extension Design Working Group. This group will advise the agencies on design workshops, participate in the workshops and serve as a corridor advisory group during design.

O-015-001 Community Corridor Planning is willing to work with state staff to assist with the creation of such advisory groups.

O-015-002 Additionally, Community Corridor Planning has a strong group of engaged residents and business owners, with our numbers soaring recently to 700. Our Advisory Team recently led an interactive community meeting where 11 Core Principles to land use planning regarding the Green Line Extension were ratified by over 300 residents. We strongly encourage MassDOT and MEPA to examine and utilize these principles in all development.

O-015-003 Groundwork Somerville is in strong opposition to the Maintenance Facility site at Yard 8. We strongly urge you to eliminate this Option and to require Mass DOT to carry out a full analysis of the Option L alternatives and Option H for siting the Maintenance Facility. While not perfect, these other two options have much more support in the Somerville and Cambridge communities. Yard 8 is opposed by the cities of Somerville and Cambridge and has been vocally rebuked by community residents and business owners at numerous public meetings. It would impose an onerous transportation infrastructure burden on the city that would negatively impact quality of life and preclude economic development of Brick Bottom/Inner Belt. Placing such a structure in Yard 8 would not only negatively impact current residents and businesses, but it would put Somerville at a significant disadvantage for future economic development in this optimal area.

O-015-004 The Community Path must be fully integrated into the design, planning, and construction of the Green Line extension. The Path exemplifies the Federal Transit Administration's new policy on bicycle/pedestrian access to public transportation recognizing the importance of maximizing multi-modal access. The DEIR should state specifically that the extension of the path will be designed by MassDOT as agreed to in February of 2009. It is also essential that the Community Path and the Green Line extensions be built as one project.

O-015-005 The Mystic Valley Parkway / Route 16 terminus should be designed and constructed at the same time as the rest of the project.

O-015-006 Track design and construction should enable adding future stations – between Lechmere and Washington Street/Union Square, between College Avenue and Route 16, and along a future Green Line extension from Union Square to Porter Square that could serve both Cambridge and Somerville neighborhoods.

O-015-007 Green Line station designs should effectively accommodate bus drop off and pick-up with much attention given to the ease of intermodal connections. Bus routes in Somerville must be aligned to optimize connections to Green Line stations simultaneous to the start of Green Line service. Community input must be gathered regarding the re-routing of bus lines and bus stops before this can happen.

O-015-008 The number of bike racks currently proposed does not meet the needs of the community. The number of riders in and around Somerville, and the increase in riders due to closer proximity to the new T stops, will increase necessitate even more bike racks than we are utilizing in Davis (which, even with their large numbers, are not sufficient). Additionally, all

O-015-002

MassDOT has reviewed and considered the "Core Community Principles" for station area land use, presented by Community Corridor Planning. As described in the FEIR, Section 6.2 of the Public Involvement Plan, MassDOT will hold land use workshops to discuss related issues with the community.

O-015-003

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

O-015-004

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the

O-015-008 stations should be designed so as to encourage walking and should not impede pedestrian access. An important pedestrian access way will be the Community Path, and thus this infrastructure should be planned for well.

O-015-009 Lastly, it is imperative that the DEIR state clearly how the Maintenance Facility, Storage areas and stations will be sustainable structures. It is our belief that the environmental impact of extending the Green Line should also encompass the use of "green" technology that can be included in the construction of these new structures. This should include creating green roofs on all storage facilities, and utilizing renewable energy technology to power the buildings. Such technology, especially green roofs, will add insulation, sound proofing, mitigate stormwater issues and decrease the urban heat island effect, not to mention add to the asthetics of the area. One final note on creating green structures, the act of jumping on the "green revolution" bandwagon will also allow for a certain degree of bragging rights by the state and the MBTA. Let us be leaders for the Commonwealth, and maybe even the country in this regard.

Thank you for taking the time to listen to the concerns of Groundwork Somerville.

Sincerely,

Nancy E Bernhard

Nancy Bernhard
President, Board of Directors
Groundwork Somerville

City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

O-015-005

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

O-015-006

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

O-015-007

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

O-015-008

The amount of bicycle storage at each station is based on ridership projections developed by CTPS. DEIR/EA Appendix D includes the methods CTPS used to analyze demand for bicycle parking. Detailed bicycle parking designs will be further developed during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

O-015-009

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual designs. Detailed designs for each station, the maintenance facility, and the entire Project will be refined during the preliminary engineering phase. As stated in DEIR/EA Section 3.7, the Project will emphasize low-energy, low-impact, "green" design. The process for coordinating with the local communities during Project design is described in the Public Involvement Plan, Chapter 6 of the FEIR.

info@HumanCenteredDesign.org

The Institute for Human Centered Design, founded 32 years ago has worked extensively throughout the world on matters pertaining to transportation and urban planning. For that reason as well as the fact that four of our staff reside in Somerville and Medford, we are writing today to urge the approval, with a number of caveats, of the Green Line Extension through Somerville to West Medford – Rt. 16 as well as to Union Square. We fully appreciate the fact that Somerville and Medford's lack of connectivity has hindered their growth and served as an injustice to the residents. It is therefore a relief that there is transit within sight, albeit still over 5 years away. Below we have outlined a number of points that we believe need to incorporated into the Secretary's decision:

Vehicles:

- The decision should state unequivocally that the MBTA/MassDOT must purchase ***100% ultra low floor*** light rail vehicles rather than the proposed order of vehicles similar to the current fleet of 70% low floor Breda LRVs. These vehicles do not allow people with disabilities to board independently because they are not level with the platform and require driver interaction. Further, the vehicles are far noisier, both externally and internally, than modern trams used in Asia, Australia, and Europe and have interior designs that are poorly designed for riders and their ergonomics. At least 5 LRV manufacturers including Bombardier, Alstom, Siemens, Kawasaki, and Zed have made and put into service over 1,000 such vehicles for nearly 10 years on 6 continents but one wouldn't know it here in Boston. In Vancouver B.C. for the 2010 Winter Olympics, Bombardier is operating their latest Flexity tram, providing an opportunity for all to experience a modern tram or light rail vehicle.
- A new line such as the Green Line Extension should utilize the latest technology and deliver a 1st Class transit experience for all. Utilizing 1990's vehicle designs and engineering won't deliver that experience.

Board of Directors

George Terrien, AIA
Marie Trottier
Renae Wells
Eugene Williams

Executive Director
Valerie Fletcher

O-016-001

MBTA will procure new light rail vehicles as part of the Green Line Extension. These vehicles are anticipated to be 70% low floor, similar to the existing Type 8 vehicles. Renderings for these vehicles are available on the Project website at http://www.greenlineextension.org/currentmaterials.asp?area=mls.

O-016-002

MBTA will procure new light rail vehicles to operate as part of the Green Line Extension Project. Renderings for these vehicles are available on the Project website at http://www.greenlineextension.org/currentmaterials.asp?area=mls.

01/11/10 MON 11:37 FAX

Institute for Human Centered Design

For an example of how modern ultra low floor light rail vehicles and excellent station design can facilitate a comfortable experience for all riders, please see our case study at www.universaldesigncasestudies.org/ and take a look at the Bordeaux case study.

Stations:

O-016-003

- Each Green Line Extension station should first and foremost be designed to serve and encourage riders who come by foot, bicycle, and bus. Car access should be secondary in consideration.
- Stations should be accessed at both ends, provide redundant elevators if elevators are required, clearly defined and sheltered waiting areas (ideally enclosed with heat) and ample perches and benches for people to rest upon.
- At street and platform levels, riders should be provided both audio and visual messages about the real time status of the next train: e.g. 2 minutes away.
- Transfers to buses should occur as close to the station entrance as possible.
- Sheltered bicycle parking should be provided at each station.
- Public art should be incorporated into the station designs, not only at the entrances but also at the platforms.

Connectivity:

O-016-004

- First and foremost, the location of the line termini at West Medford and Union Square should not in anyway inhibit future extensions of these lines. It is critical that the Commonwealth choose locations and designs that eliminate potential roadblocks to expansion because it is far cheaper to be proactive now rather than relocate infrastructure later.
- In the case of Union Square, the Secretary's decision should specifically require that the Project relocate part of the station or the NStar substation that effectively blocks future extension to Porter Square. Further, the decision should require MassDOT to commence a feasibility analysis for the extension to Porter and study both a Somerville Ave alignment as well as within the existing MBTA ROW.
- The project should include a transfer station to enable residents who want to go from Union Sq to Medford Hillside without having to go all the way to Lechmere. Third, the project should be required to analyze and propose improvements as well as consolidations to existing bus routes within both Somerville and Medford.

O-016-005

O-016-006

- Fourth, as part of the decision, MassDOT should be required to commence planning and design for the dismantling of the McGrath highway and its transformation into a boulevard that re-knits Somerville by encouraging pedestrians and bicycling along and across it.

O-016-007

- Finally, the Community Path project should be fully integrated within the design of the Green Line Extension and built by the project, preferably during initial construction phases.

[positive environments]

O-016-003

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

O-016-004

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

O-016-005

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the

Institute for Human Centered Design

O-016-008

Maintenance Yard:
In keeping with a long-term vision of not only this project but also supporting future Green Line extensions both to the north such as Porter & Arlington and southwest to Mattapan/Roxbury, it is critical that the Maintenance Yard have ample space to grow without consuming precious commuter rail yard space. As such, the negotiations and ultimate decision about its location and size should address the need for long-term expansion rather than just meet the needs of this project. All too often the Commonwealth and its municipalities plans, negotiates and makes decisions in terms of 5-20 years, rather than 50-100 years which is what is needed with infrastructure such as the Green Line extension.

Thank you for your time and consideration of our comments.

Sincerely,

Valerie Fletcher

[aptive Environments]

FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

O-016-006

DEIR/EA Section 3.9 describes the compatibility of the Green Line Extension with other regional projects, such as the conceptual reconstruction of McGrath Highway and the Urban Ring transit corridor initiative. MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses to ensure, to the extent feasible, consistency with planning and other projects.

O-016-007

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

O-016-008

The Green Line Extension storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the Project. Chapter 2 of the FEIR fully describes the environmental impacts of the proposed storage and maintenance facility. In order to maximize operating efficiencies, the facility must be constructed within the same timeframe as the Green Line Extension Project, in the vicinity of the Green Line Extension right-of-way, and north of downtown Boston.

The storage and maintenance facility alternatives include storage for

Green Line Extension vehicles and replacement of the existing Lechmere Station vehicle storage. Storage capacity is also provided for vehicles currently stored in trackways between Lechmere Station and Government Center; this storage will be lost due to the Green Line Extension.

RE: Green Line Extension Draft EIR (EEA #13886)

Dear Secretary Bowles,

LivableStreets Alliance strongly supports the extension of the Green Line, applauds all the effort made by MassDOT and their consultants and appreciates being able to submit these comments to EOEA as part of the MEPA process.

Overall, we are very excited about the Green Line Extension for the many benefits it will bring to the residents and visitors of Somerville, Cambridge, Medford and surrounding towns. High-quality rapid transit will give people a more frequent and more dependable transit option, which we expect will reduce the amount of automobile usage and automobile ownership in the area, as well as reduce congestion and bring about cleaner air.

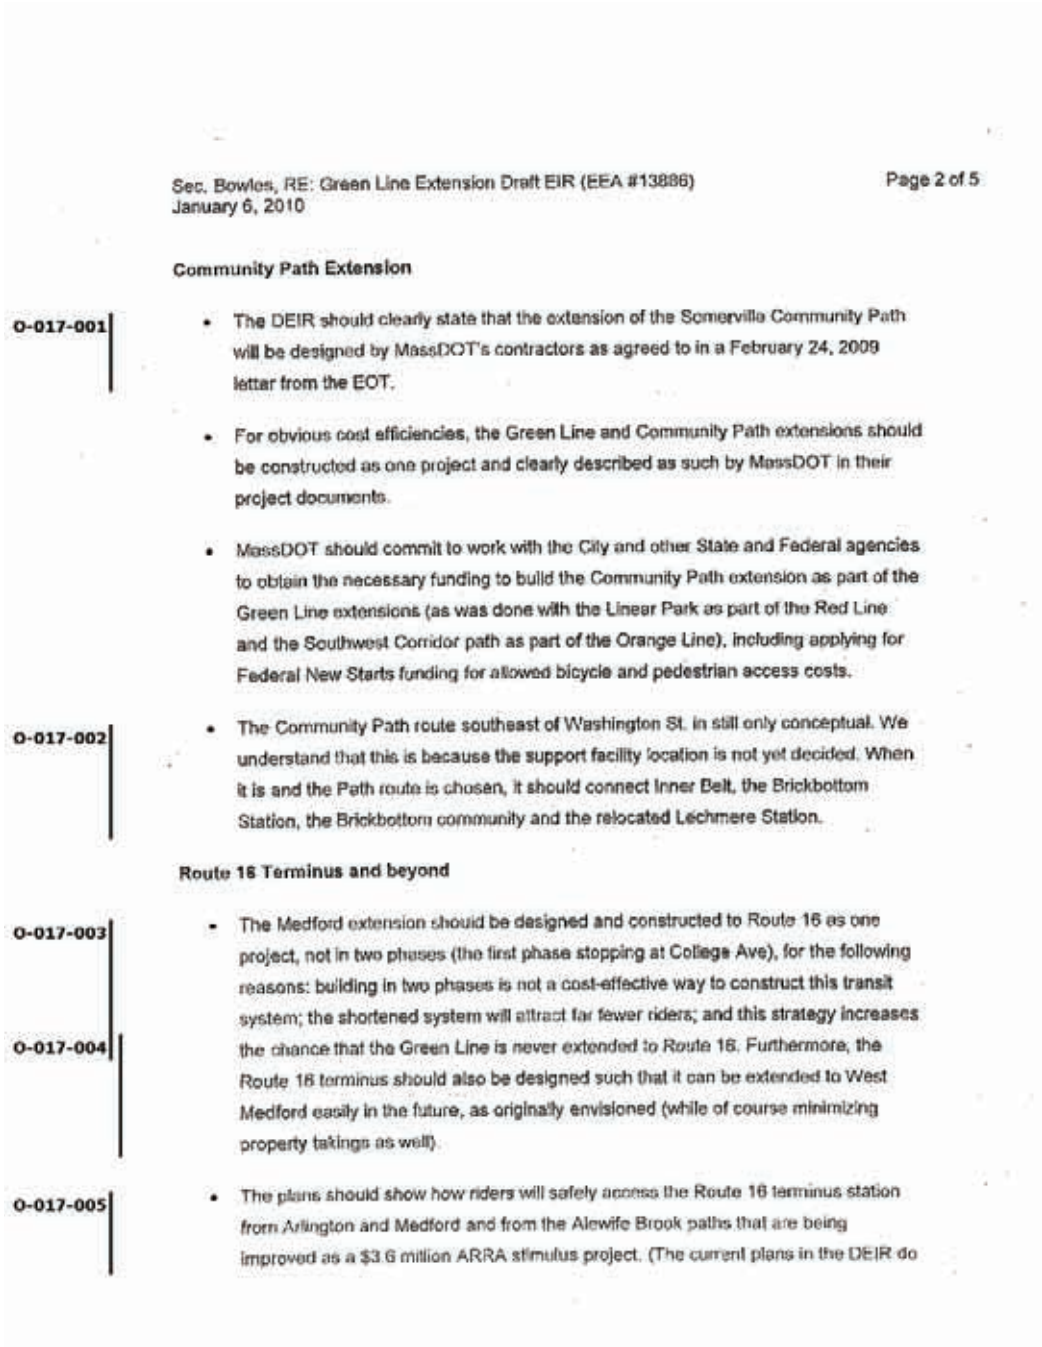
The DEIR very clearly outlines the general design of the Green Line Extension, which as currently designed we feel is on the right track to fulfilling its true potential. However, as with most projects, the devil is in the details.

While we realize that a 10% design stage cannot contain all the details everyone would like, we feel that there are many improvements that will be necessary in the final EIR and subsequent designs to achieve a first class transit system. Therefore we think it's critical that the following issues be included as requirements in the MEPA Certificate:

LivableStreets Alliance

Livable**Streets** Rethinking urban transportation

LivableStreets Alliance 70 Pacific St. / 3rd Sidney Cambridge MA 02139 T: 617.621.1745 F: 617.864.2085 info@livablestreets.com



Sec. Bowles, RE: Green Line Extension Draft EIR (EEA #13886) Page 2 of 5
January 6, 2010

Community Path Extension

O-017-001
- The DEIR should clearly state that the extension of the Somerville Community Path will be designed by MassDOT's contractors as agreed to in a February 24, 2009 letter from the EOT.
- For obvious cost efficiencies, the Green Line and Community Path extensions should be constructed as one project and clearly described as such by MassDOT in their project documents.
- MassDOT should commit to work with the City and other State and Federal agencies to obtain the necessary funding to build the Community Path extension as part of the Green Line extensions (as was done with the Linear Park as part of the Red Line and the Southwest Corridor path as part of the Orange Line), including applying for Federal New Starts funding for allowed bicycle and pedestrian access costs.

O-017-002
- The Community Path route southeast of Washington St. is still only conceptual. We understand that this is because the support facility location is not yet decided. When it is and the Path route is chosen, it should connect Inner Belt, the Brickbottom Station, the Brickbottom community and the relocated Lechmere Station.

Route 16 Terminus and beyond

O-017-003
- The Medford extension should be designed and constructed to Route 16 as one project, not in two phases (the first phase stopping at College Ave), for the following reasons: building in two phases is not a cost-effective way to construct this transit system; the shortened system will attract far fewer riders; and this strategy increases

O-017-004
the chance that the Green Line is never extended to Route 16. Furthermore, the Route 16 terminus should also be designed such that it can be extended to West Medford easily in the future, as originally envisioned (while of course minimizing property takings as well).

O-017-005
- The plans should show how riders will safely access the Route 16 terminus station from Arlington and Medford and from the Alewife Brook paths that are being improved as a $3.6 million ARRA stimulus project. (The current plans in the DEIR do

O-017-001

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

O-017-002

MassDOT is committed to completing all planning, design, and engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community Path between Lowell Street and Inner Belt Road. MassDOT is not able at this point to commit to funding the construction of the Community Path. The limits of the path were predicated on the connections to Lechmere being made through the Inner Belt area via Inner Belt Road and the proposed Urban Ring Bridge into the Lechmere area. However, the cessation of planning for the Urban Ring Project has changed the timing of this anticipated connection. MassDOT is unable to assume responsibility for designing the Urban Ring Bridge as part of the Green Line Extension Project. That being said, MassDOT is committed to working with the City of Somerville, residents and businesses in the Brickbottom and Inner Belt neighborhoods, and Community Path advocates to design the Path to create improved connectivity within the Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension.

O-017-003

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will

O-017-005 not show this.) Safe routes for pedestrians and bicyclists should be shown from the west side of Route 16.

O-017-006
- A multi-use path should be designed and constructed as part of or parallel with the Green Line Extension project from the Route 16 Station to the West Medford Commuter Rail Station. This is a distance that is easily walkable in 5-10 minutes if there was a direct connection between the two stations, and would allow for commuter rail to rapid transit transfer, and vice versa, boosting the ridership of both transit lines.

Union Square Terminus and beyond

O-017-007
- The Union Square terminus should be designed such that it can be extended to Porter Square easily in the future.

Pedestrian Access

O-017-008
- Pedestrian access could be improved at some of the stations by having more than one entrance or access point (such as a direct connection from the Gilman Square station to the Somerville High School/Library/City Hall complex). The Brickbottom Station design seems particularly poor in this regard for riders coming from the west and north.
- The location of drop-offs (kiss and rides), in particular at College Ave. and Brickbottom stations are directly in front of the entrance where pedestrian access is most important and requires vehicles to cross over the sidewalk at two locations. Pedestrian (and bicycle) access should be given higher priority than these motor vehicles connections. A drop-off zone along the street itself would be more appropriate and would not invade on the pedestrian space.

O-017-009
- Improvements for pedestrian access in general should be further studied, particularly the placement of crosswalks at the most desirable crossing points as well as the widening of sidewalks and addition of traffic calming measures such as curb extensions and raised crosswalks where possible. In particular, the crossing of McGrath Highway to reach the relocated Lechmere Station is an area of particular

require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

O-017-004

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

O-017-005

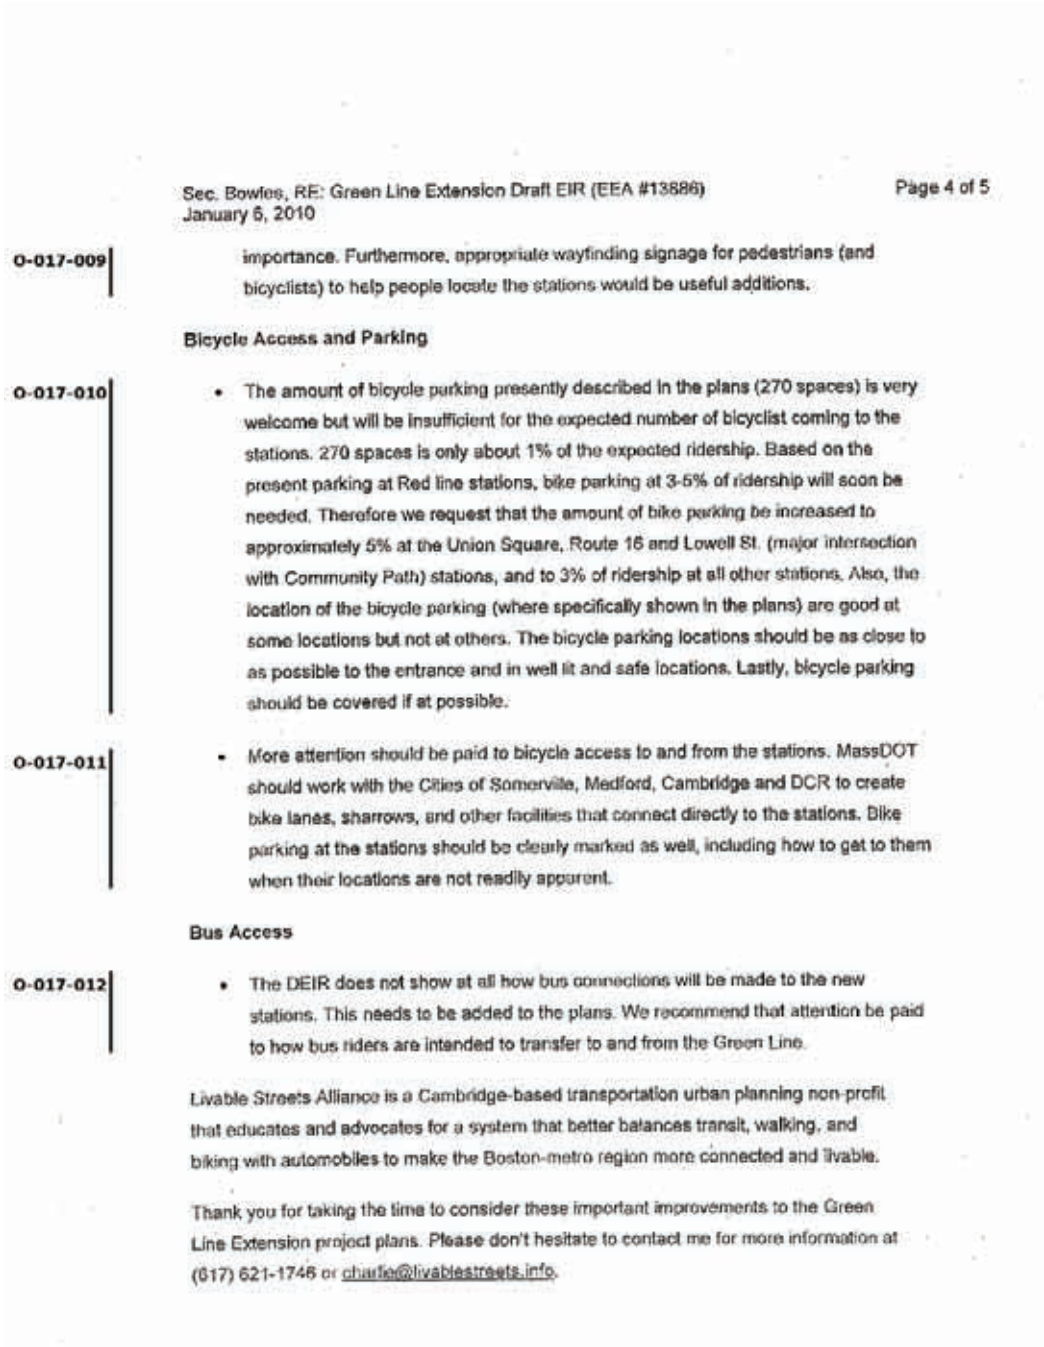
A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

O-017-006

Please see response to Comment O-017-005.

O-017-007

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.



Sec. Bowles, RE: Green Line Extension Draft EIR (EEA #13886) Page 4 of 5
January 6, 2010

O-017-009 importance. Furthermore, appropriate wayfinding signage for pedestrians (and bicyclists) to help people locate the stations would be useful additions.

Bicycle Access and Parking

O-017-010
- The amount of bicycle parking presently described in the plans (270 spaces) is very welcome but will be insufficient for the expected number of bicyclist coming to the stations. 270 spaces is only about 1% of the expected ridership. Based on the present parking at Red line stations, bike parking at 3-5% of ridership will soon be needed. Therefore we request that the amount of bike parking be increased to approximately 5% at the Union Square, Route 16 and Lowell St. (major intersection with Community Path) stations, and to 3% of ridership at all other stations. Also, the location of the bicycle parking (where specifically shown in the plans) are good at some locations but not at others. The bicycle parking locations should be as close to as possible to the entrance and in well lit and safe locations. Lastly, bicycle parking should be covered if at possible.

O-017-011
- More attention should be paid to bicycle access to and from the stations. MassDOT should work with the Cities of Somerville, Medford, Cambridge and DCR to create bike lanes, sharrows, and other facilities that connect directly to the stations. Bike parking at the stations should be clearly marked as well, including how to get to them when their locations are not readily apparent.

Bus Access

O-017-012
- The DEIR does not show at all how bus connections will be made to the new stations. This needs to be added to the plans. We recommend that attention be paid to how bus riders are intended to transfer to and from the Green Line.

Livable Streets Alliance is a Cambridge-based transportation urban planning non-profit that educates and advocates for a system that better balances transit, walking, and biking with automobiles to make the Boston-metro region more connected and livable.

Thank you for taking the time to consider these important improvements to the Green Line Extension project plans. Please don't hesitate to contact me for more information at (617) 621-1746 or charlie@livablestreets.info.

O-017-008

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

O-017-009

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. The chapter presents a traffic analysis, a detailed description of pedestrian crossings of O'Brien Highway, and proposed roadway, crosswalk, and sidewalk improvements that are consistent with the NorthPoint development plans. These station and street plans will be further refined in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

O-017-010

The amount of bicycle storage at each station is based on ridership projections developed by CTPS. DEIR/EA Appendix D includes the

RE: Green Line Extension Draft EIR (EEA #13886)

Dear Secretary Bowles,

The goal of the Mass Central Rail Trail Coalition (www.masscentralrailtrail.org) is to complete a 104-mile bicycle and pedestrian greenway through 25 communities stretching from Northampton to Boston along the route of the former Boston & Maine Railroad's Mass Central Branch. This cross-state greenway will become a major tourist attraction. In fact, 25 miles are already complete, including in Belmont, Cambridge and Somerville (i.e., the Linear Park above the Red Line subway and its extensions into Somerville and Belmont). The critical eastern section of the Mass Central Rail Trail is the Somerville Community Path that will bring this linear park to Cambridge, the Charles River and into Boston, mostly along the route of the planned Green Line extension. Clearly, the way to build this last section is together with the construction of the Green Line extension from Lechmere station in Cambridge to Somerville and Medford.

We have reviewed the Draft EIR for the Green Line extension. The MCRT Coalition wholeheartedly supports the design and construction of the Green Line extension but offer the following comments to insure successful extensions of both the Green Line and the Somerville Community Path.

O-018-001 • The DEIR should clearly state that the extension of the Community Path will be designed by MassDOT's contractors as agreed to in a February 24, 2009 letter from the EOT. We understand that this design will be for the section from Lowell St. to Lechmere.

O-018-002 • The only way the Path can realistically and cost effectively be constructed is together with the Green Line construction. Therefore the Green Line and Community Path extensions will be designed and constructed as one project and described as such in the DEIR and Green Line planning documents.

O-018-003 • MassDOT should commit to working with the City and other State and Federal agencies to obtain the necessary funding for the construction of the Community Path extensions, including applying for Federal New

Mass Central Rail Trail *104 miles* *connecting 25 communities*

O-018-001

MassDOT is committed to completing all planning, design, and engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community Path between Lowell Street and Inner Belt Road. MassDOT is not able at this point to commit to funding the construction of the Community Path. The limits of the path were predicated on the connections to Lechmere being made through the Inner Belt area via Inner Belt Road and the proposed Urban Ring Bridge into the Lechmere area. However, the cessation of planning for the Urban Ring Project has changed the timing of this anticipated connection. MassDOT is unable to assume responsibility for designing the Urban Ring Bridge as part of the Green Line Extension Project. That being said, MassDOT is committed to working with the City of Somerville, residents and businesses in the Brickbottom and Inner Belt neighborhoods, and Community Path advocates to design the Path to create improved connectivity within the Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension.

O-018-002

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

O-018-003

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the

O-018-003

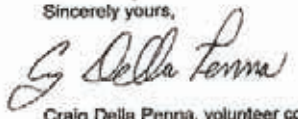
- Starts funding for applicable costs (The FTA has recently proposed a policy that "pedestrian improvements located within one-half mile and all bicycle improvements located within three miles of a public transportation stop ... may be eligible for FTA funding: http://edocket.access.gpo.gov/2009/E8-27240.htm)

There are many other reasons why these requests are reasonable and appropriate in addition to the goal of completing the eastern end of the Mass Central Rail Trail:

- The Somerville Community Path will provide desirable off-road bicycle and pedestrian access to the stations, offering superior connections to the neighborhoods (like in Davis Sq.), thereby attracting more riders in a very cost-effective manner.
- In the vicinity of Lowell St., Gilman Sq. and Washington St. stations, the Community Path is in integral part of the station access.
- There are at least 2 precedents in the Boston area for community paths constructed and paid for by transit projects:
  - The Linear Path over the Red Line Paths with the Red and Orange line extensions that were part of the overall transit construction project
  - The Southwest Corridor Path alongside and over the Orange Line

Thank you very much for considering these comments for the extension of the Green Line relative to the Somerville Community Path.

Sincerely yours,



Craig Della Penna, volunteer coordinator
Mass Central Rail Trail Coalition

City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

RECEIVED
JAN 8 2010
MEPA

January 8, 2010

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles,

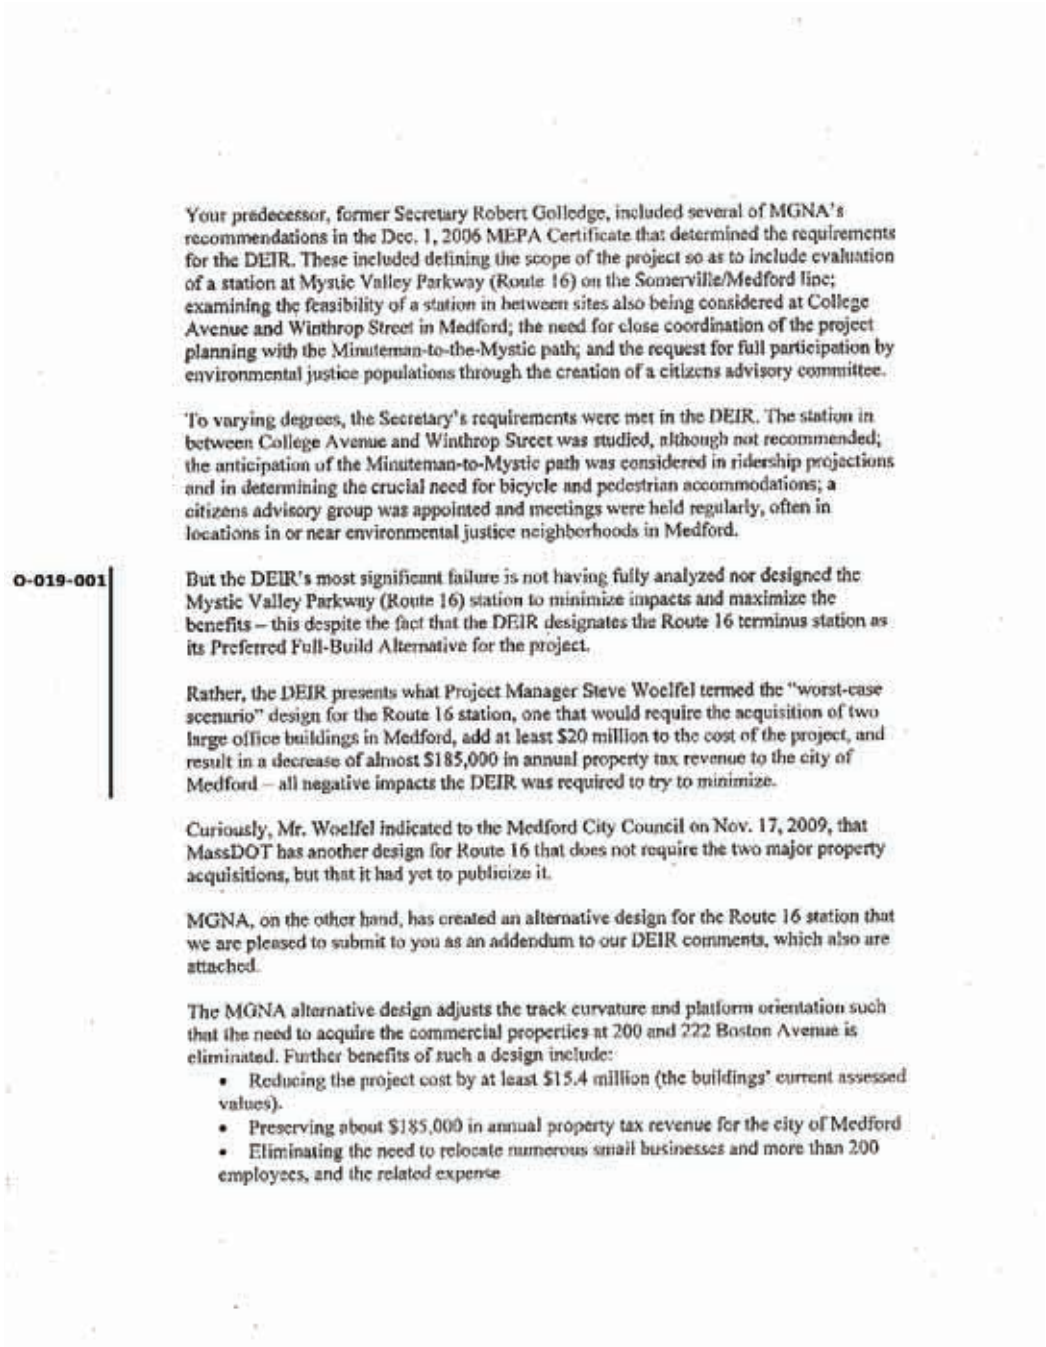
The Medford Green Line Neighborhood Alliance (MGNA) once again welcomes the opportunity present comments on the Green Line extension project, in this case regarding the Draft Environmental Impact Report (EEA #138860).

The MGNA is a group of citizens who support the proposed Green Line extension to Medford, and who advocate for proactive involvement from the city, its residents and all stakeholders to ensure that the extension is completed in a manner that is most beneficial to the community.

MGNA views the Green Line extension as a historic opportunity for Medford residents, businesses and institutions to gain a major improvement to the region's transportation infrastructure that will serve the community well for decades. Executed properly and carefully, the Green Line will provide thousands of Medford residents with an efficient, environmentally friendly alternative to automobile use; provide better access to employment, cultural, educational and health care opportunities; improve air quality; and make Medford overall a better place to live, work and visit.

For the past four years, MGNA has been actively reaching out to all segments of the community to encourage active participation in the planning process – whether individually, as part of a neighborhood or constituency group, or as part of our alliance – and also striving to become more informed itself about the many complex issues that this project comprises.

We have conducted dozens of meetings and workshops; conducted outreach inviting civic participation; distributed informational material; and prepared two Station Study reports assessing all factors related to the Green Line extension in Medford.



Your predecessor, former Secretary Robert Golledge, included several of MGNA's recommendations in the Dec. 1, 2006 MEPA Certificate that determined the requirements for the DEIR. These included defining the scope of the project so as to include evaluation of a station at Mystic Valley Parkway (Route 16) on the Somerville/Medford line; examining the feasibility of a station in between sites also being considered at College Avenue and Winthrop Street in Medford; the need for close coordination of the project planning with the Minuteman-to-the-Mystic path; and the request for full participation by environmental justice populations through the creation of a citizens advisory committee.

To varying degrees, the Secretary's requirements were met in the DEIR. The station in between College Avenue and Winthrop Street was studied, although not recommended; the anticipation of the Minuteman-to-Mystic path was considered in ridership projections and in determining the crucial need for bicycle and pedestrian accommodations; a citizens advisory group was appointed and meetings were held regularly, often in locations in or near environmental justice neighborhoods in Medford.

O-019-001

But the DEIR's most significant failure is not having fully analyzed nor designed the Mystic Valley Parkway (Route 16) station to minimize impacts and maximize the benefits – this despite the fact that the DEIR designates the Route 16 terminus station as its Preferred Full-Build Alternative for the project.

Rather, the DEIR presents what Project Manager Steve Woelfel termed the "worst-case scenario" design for the Route 16 station, one that would require the acquisition of two large office buildings in Medford, add at least $20 million to the cost of the project, and result in a decrease of almost $185,000 in annual property tax revenue to the city of Medford – all negative impacts the DEIR was required to try to minimize.

Curiously, Mr. Woelfel indicated to the Medford City Council on Nov. 17, 2009, that MassDOT has another design for Route 16 that does not require the two major property acquisitions, but that it had yet to publicize it.

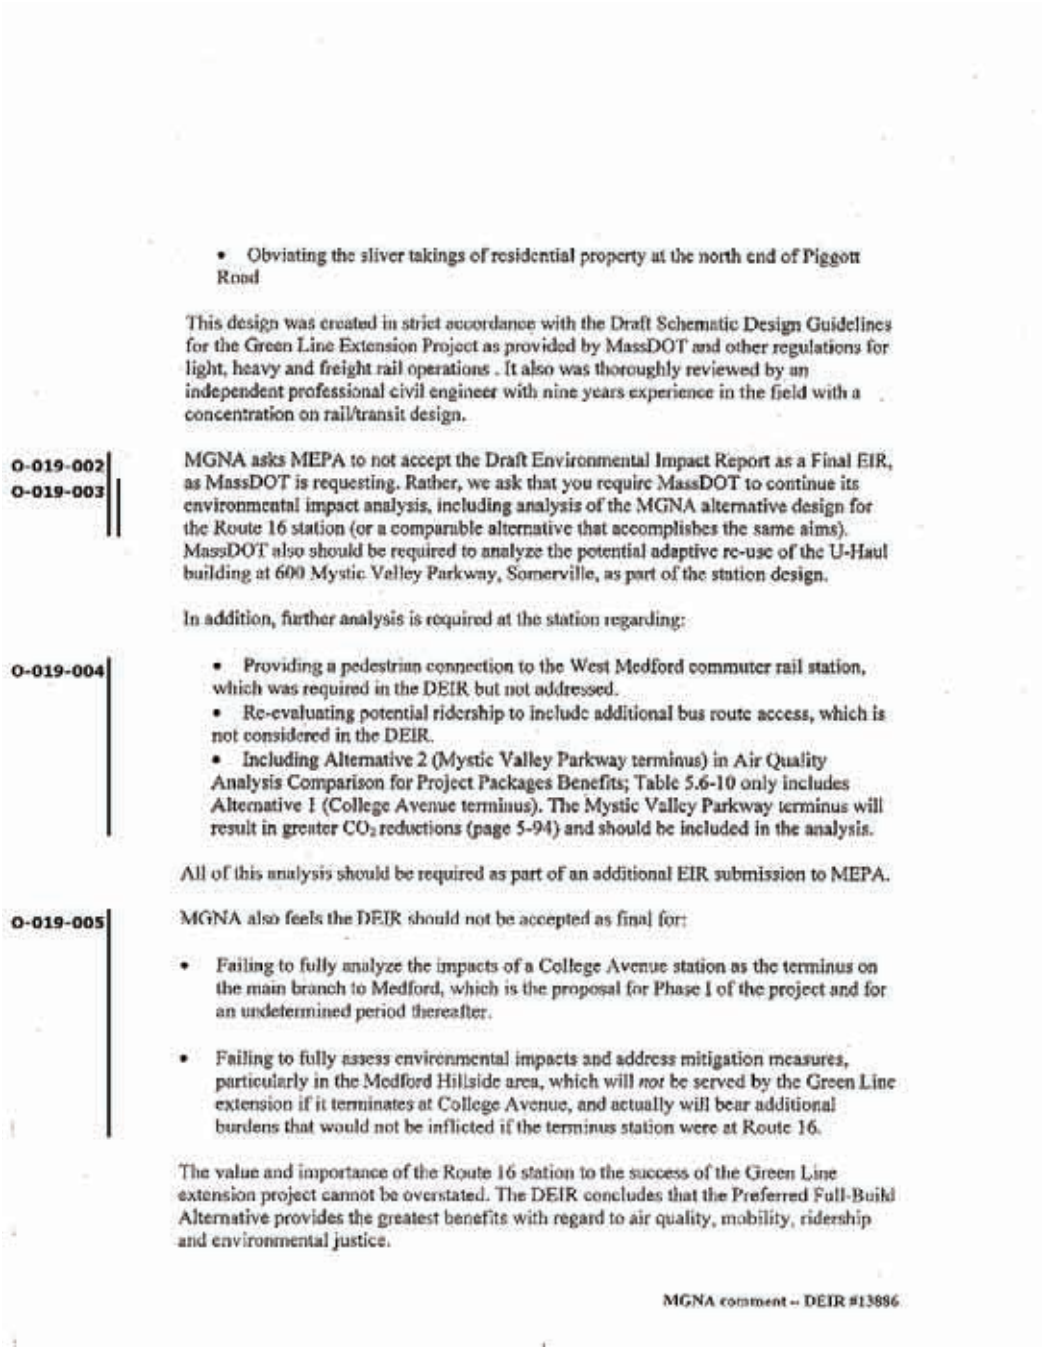
MGNA, on the other hand, has created an alternative design for the Route 16 station that we are pleased to submit to you as an addendum to our DEIR comments, which also are attached.

The MGNA alternative design adjusts the track curvature and platform orientation such that the need to acquire the commercial properties at 200 and 222 Boston Avenue is eliminated. Further benefits of such a design include:

- Reducing the project cost by at least $15.4 million (the buildings' current assessed values).
- Preserving about $185,000 in annual property tax revenue for the city of Medford
- Eliminating the need to relocate numerous small businesses and more than 200 employees, and the related expense

O-019-001

All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.



• Obviating the sliver takings of residential property at the north end of Piggott Road

This design was created in strict accordance with the Draft Schematic Design Guidelines for the Green Line Extension Project as provided by MassDOT and other regulations for light, heavy and freight rail operations . It also was thoroughly reviewed by an independent professional civil engineer with nine years experience in the field with a concentration on rail/transit design.

O-019-002
O-019-003

MGNA asks MEPA to not accept the Draft Environmental Impact Report as a Final EIR, as MassDOT is requesting. Rather, we ask that you require MassDOT to continue its environmental impact analysis, including analysis of the MGNA alternative design for the Route 16 station (or a comparable alternative that accomplishes the same aims). MassDOT also should be required to analyze the potential adaptive re-use of the U-Haul building at 600 Mystic Valley Parkway, Somerville, as part of the station design.

In addition, further analysis is required at the station regarding:

O-019-004

- Providing a pedestrian connection to the West Medford commuter rail station, which was required in the DEIR but not addressed.
- Re-evaluating potential ridership to include additional bus route access, which is not considered in the DEIR.
- Including Alternative 2 (Mystic Valley Parkway terminus) in Air Quality Analysis Comparison for Project Packages Benefits; Table 5.6-10 only includes Alternative 1 (College Avenue terminus). The Mystic Valley Parkway terminus will result in greater CO_2 reductions (page 5-94) and should be included in the analysis.

All of this analysis should be required as part of an additional EIR submission to MEPA.

O-019-005

MGNA also feels the DEIR should not be accepted as final for:

- Failing to fully analyze the impacts of a College Avenue station as the terminus on the main branch to Medford, which is the proposal for Phase I of the project and for an undetermined period thereafter.

- Failing to fully assess environmental impacts and address mitigation measures, particularly in the Medford Hillside area, which will *not* be served by the Green Line extension if it terminates at College Avenue, and actually will bear additional burdens that would not be inflicted if the terminus station were at Route 16.

The value and importance of the Route 16 station to the success of the Green Line extension project cannot be overstated. The DEIR concludes that the Preferred Full-Build Alternative provides the greatest benefits with regard to air quality, mobility, ridership and environmental justice.

MGNA comment – DEIR #13886

O-019-002

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

O-019-003

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

O-019-004

At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

O-019-005

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch.

Last November, outgoing Secretary of Transportation James A. Aloisi reiterated his strong support for the Route 16 terminus station:

"The Green Line extension is a lost opportunity without the clear and unequivocal commitment of extending the line to Route 16," Aloisi wrote to Governor Deval Patrick.

Speaking at a sendoff event that same week, Aloisi said, "'I'm very clear that the Green Line extension really doesn't make any sense unless it goes to Route 16. I think it has to go to Route 16 and we've got to find a way to make it go to Route 16."

O-019-006 Fully evaluating a "best case" scenario station design during additional environmental analysis would be a great place to start.

Thank you.

Ken Krause

Attachments:
MGNA DEIR Analysis
MGNA Track Alignment Alternative

Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

O-019-006

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

Since the release of the DEIR/EA, a few stakeholders raised concerns that the proposed College Avenue Station, serving as a terminal station for the Proposed Project, would not adequately serve the Medford Hillside neighborhood. Serving this neighborhood was identified as part of the SIP description. To address and resolve these concerns, CTPS prepared a memorandum demonstrating that the College Avenue Station location does adequately serve the walk market area for the Medford Hillside neighborhood. This memorandum is provided in Appendix C of the FEIR.

info@medfordgreenline®.org

MGNA Green Line DEIR Analysis

MAIN POINTS

O-019-007 The Draft Environmental Impact Report (DEIR) should NOT be accepted as the Final Environmental Impact Report (FEIR), because the DEIR fails to fulfill the requirements set forth by the Executive Office of Environmental Affairs in its Dec. 1, 2006 MEPA Certificate on the Expanded Environmental Notification Form.

According to the Certificate, in order to be accepted as an FEIR, the DEIR must provide a "reasonably complete and stand-alone description and analysis of the project, project alternatives and environmental impacts, and adequately address mitigation." Further, the Certificate states that the DEIR should "investigate all feasible methods of avoiding, reducing or minimizing impacts to land."

The DEIR fails to meet these requirements in numerous ways, most significantly by:

O-019-008 • **Failing to analyze and design the Mystic Valley Parkway (Route 16) station to minimize impacts and maximize the benefits**. In fact, the DEIR presenting what MassDOT describes as a "worst-case scenario" for the station – the only element of the project treated in such a fashion.

O-019-009 • **Failing to fully analyze the impacts of a College Avenue station as the terminus** on the main branch to Medford, which it is proposed to be in Phase I of the project construction.

O-019-010 • **Failing to fully address mitigation** measures, particularly in the Medford Hillside area, which will NOT be served by the Green Line extension if it terminates at College Avenue, but will bear additional burdens of increased vehicular traffic through the neighborhood, as well as construction impacts and effects of a terminus station that would not be felt if Route 16 were the terminus.

Despite being filed 10.5 months after the Dec. 1, 2008 deadline, the DEIR is materially deficient in almost every category.

Therefore, the Secretary of Environmental Affairs should require MassDOT to continue the Environmental Impact analysis in the form of a Final Environmental Impact Report that addresses the many outstanding issues, most importantly the complete analysis of the Mystic Valley Parkway (Route 16) station.

O-019-011 Further, MassDOT should be required to re-evaluate a schedule in which it will construct what the DEIR describes as the Preferred, Full-Build Alternative -- that is, a terminus station at Route 16 with no parking – in one phase by Dec. 31, 2014, in order to achieve the maximum environmental benefits of the project without delay and within the commonwealth's legal deadline.

MGNA DEIR Analysis – December 30, 2009

O-019-007

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

O-019-008

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

O-019-009

All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

SPECIFIC POINTS

SUPPORT FOR MYSTIC VALLEY PARKWAY TERMINUS AND ONE-PHASE CONSTRUCTION BY DEC. 31, 2014

We support the Mystic Valley Parkway (Route 16) terminus station, with no parking, as the Preferred Alternative. The DEIR clearly demonstrates that this alternative provides the maximum benefits from the project in regard to:

- Ridership (70% switching from auto travel)
- Reduction of vehicle miles traveled in the service region
- Air quality improvements
- Service to environmental justice communities.

It also demonstrates the acute need for better transit service in this neighborhood, as the intersection of Route 16 and Boston Avenue, had the second highest daily traffic volume (29,000 vehicles) in the entire project area.

O-019-012 *HOWEVER*, the station analysis is incomplete and its design is inadequate and inflicts unnecessary environmental impacts. MassDOT officials have publicly acknowledged putting forth the "worst case scenario" for the Route 16 station; this is not acceptable in a document that is required to minimize all negative impacts.

O-019-013 In addition, the Mystic Valley Parkway Station should be built as part of a single phase, otherwise the environmental benefits will be delayed or possibly never realized, as construction of Phase 2 is unlikely, at best.

A one-phase project build to Route 16 also is preferable because:

- By providing the greatest benefits with regard to air quality, mobility, ridership and environmental justice, the Preferred Alternative is the strongest regional project and would be most competitive in vying for federal funding.
- By MassDOT's own estimate, the cost of constructing the final leg of the extension, from College Avenue to Mystic Valley Parkway, would increase by $50 million by undertaking it in a second phase between 2016-2020.
- Delaying the completion of the project into a second phase would push it outside the scope of the current MEPA and NEPA review process, requiring another complete review, additional costs and further delays. These are unlikely to be undertaken for the benefit of a single station.

SUPPORT FOR ALTERNATIVE DESIGN FOR MYSTIC VALLEY PARKWAY TERMINUS STATION

We applaud MassDOT for designing the stations in a manner that minimizes residential property takings and for not displacing any Medford residents. *HOWEVER*, the same effort has not been made for minimizing commercial property takings, particularly at the Mystic Valley Parkway Station.

O-019-014 We strongly advocate analysis of the Medford Green Line Neighborhood Alliance's alternative design for the Route 16 station, which demonstrates that adjusting the track curvature and platform

O-019-010

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

O-019-011

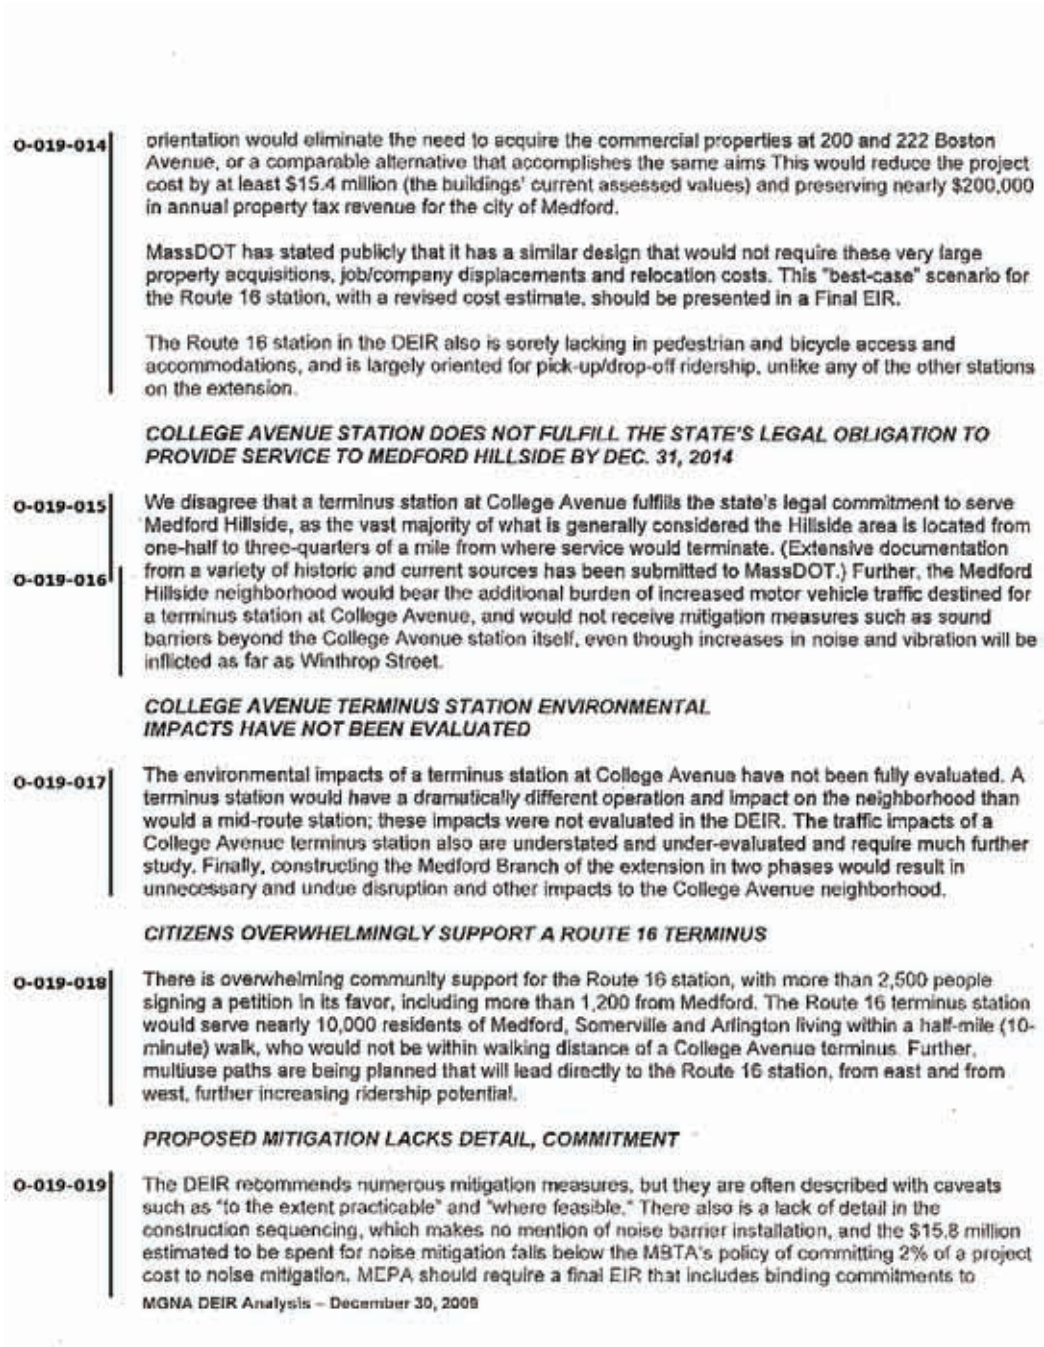
The Proposed Project, with a terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), “Determination of Air Quality Emission Reductions.” These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Additionally, FEIR Chapter 4 includes a detailed description of College Avenue Station functioning as a terminal station. MassDOT is anticipating to strive to achieve the goal of 12/31/2014.

O-019-012

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

O-019-013

All stations for the Green Line Extension project were designed to



O-019-014 orientation would eliminate the need to acquire the commercial properties at 200 and 222 Boston Avenue, or a comparable alternative that accomplishes the same aims This would reduce the project cost by at least $15.4 million (the buildings' current assessed values) and preserving nearly $200,000 in annual property tax revenue for the city of Medford.

MassDOT has stated publicly that it has a similar design that would not require these very large property acquisitions, job/company displacements and relocation costs. This "best-case" scenario for the Route 16 station, with a revised cost estimate, should be presented in a Final EIR.

The Route 16 station in the DEIR also is sorely lacking in pedestrian and bicycle access and accommodations, and is largely oriented for pick-up/drop-off ridership, unlike any of the other stations on the extension.

COLLEGE AVENUE STATION DOES NOT FULFILL THE STATE'S LEGAL OBLIGATION TO PROVIDE SERVICE TO MEDFORD HILLSIDE BY DEC. 31, 2014

O-019-015 We disagree that a terminus station at College Avenue fulfills the state's legal commitment to serve Medford Hillside, as the vast majority of what is generally considered the Hillside area is located from one-half to three-quarters of a mile from where service would terminate. (Extensive documentation

O-019-016 from a variety of historic and current sources has been submitted to MassDOT.) Further, the Medford Hillside neighborhood would bear the additional burden of increased motor vehicle traffic destined for a terminus station at College Avenue, and would not receive mitigation measures such as sound barriers beyond the College Avenue station itself, even though increases in noise and vibration will be inflicted as far as Winthrop Street.

COLLEGE AVENUE TERMINUS STATION ENVIRONMENTAL IMPACTS HAVE NOT BEEN EVALUATED

O-019-017 The environmental impacts of a terminus station at College Avenue have not been fully evaluated. A terminus station would have a dramatically different operation and impact on the neighborhood than would a mid-route station; these impacts were not evaluated in the DEIR. The traffic impacts of a College Avenue terminus station also are understated and under-evaluated and require much further study. Finally, constructing the Medford Branch of the extension in two phases would result in unnecessary and undue disruption and other impacts to the College Avenue neighborhood.

CITIZENS OVERWHELMINGLY SUPPORT A ROUTE 16 TERMINUS

O-019-018 There is overwhelming community support for the Route 16 station, with more than 2,500 people signing a petition in its favor, including more than 1,200 from Medford. The Route 16 terminus station would serve nearly 10,000 residents of Medford, Somerville and Arlington living within a half-mile (10-minute) walk, who would not be within walking distance of a College Avenue terminus. Further, multiuse paths are being planned that will lead directly to the Route 16 station, from east and from west, further increasing ridership potential.

PROPOSED MITIGATION LACKS DETAIL, COMMITMENT

O-019-019 The DEIR recommends numerous mitigation measures, but they are often described with caveats such as "to the extent practicable" and "where feasible." There also is a lack of detail in the construction sequencing, which makes no mention of noise barrier installation, and the $15.8 million estimated to be spent for noise mitigation falls below the MBTA's policy of committing 2% of a project cost to noise mitigation. MEPA should require a final EIR that includes binding commitments to

MGNA DEIR Analysis – December 30, 2009

comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16.

O-019-014

The Proposed Project, with a terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP, MassDEP DEIR/EA comment letter, January 8, 2010).

Various community groups have suggested modified concepts for the Mystic Valley Parkway/Route 16 Station. Preliminary evaluation of these concepts showed that the cost of constructing the Green Line Extension to Mystic Valley Parkway/Route 16 would not be reduced sufficiently to be able to be funded at this time. Additional evaluation of the concept as

O-019-019 mitigation as well as additional mitigation measures such as cash payments to affected abutters, and retrofitting the existing commuter rail diesel locomotives with emission-reduction devices. It should commit to providing mitigation such as noise barriers *prior to* construction wherever possible.

MASSDOT HAS FAILED TO TAKE PUBLIC COMMENT AND OPINION INTO ACCOUNT

While MassDOT went through the motions of conducting public outreach and graciously honored meeting requests from citizen interest groups, there is precious little evidence that input from the public was taken to heart, except to support conclusions that they had already reached. In particular,

1) Comprehensive research to establish the extent of the area called "Medford Hillside" was neither accepted or rebutted.
2) Repeated questions about how the Winthrop Street station stop was dropped from consideration have been met with repeated unsubstantiated claims that community opposition prevented it from being seriously considered. MassDOT needs to document the objections that it considered when making this decision.
3) A June 11, 2008 letter to EOT from the State Legislative Delegation (Jehlen, Sciortino, Garballey, Donato) representing Medford and areas adjacent to the Route 16 station seeking analysis of alternative track configurations in the area of a Route 16 terminus went unanswered.
4) In May 2009, requests of EOT to participate in an attempt to redesign the trackwork around a Route 16 terminus in a way that reduced land takings were declined by EOT, in particular citing "limited staff availability."

O-019-020 MassDOT needs an opportunity to complete an FEIR in order to incorporate these public concerns into its plans.

LECHMERE STATION RELOCATION IMPACTS

Midway through the DEIR process, MassDOT was forced to assume the redesign and cost of the relocation of Lechmere Station as part of the Green Line extension project, because a developer was unable to fulfill its commitment to pay for the station relocation into the failed North Point project.

This has added approximately $111 million to the cost of the project, or roughly the estimated cost of the College Avenue to Route 16 section of the extension. More than anything, this circumstance has forced MassDOT to relegate this final portion of the Green Line extension to Medford into a second phase, to be built sometime between 2016 and 2020, even though the DEIR demonstrates that the Full Build Alternative to Route 16 provides the greatest air quality benefits.

O-019-021 MEPA should require MassDOT to seek alternative funding the for Lechmere Station relocation, as well as redesigning major project elements such as the Route 16 station, to reduce costs in order for the entire project to be built in one phase by Dec. 31, 2014.

CONCLUSION

The new Massachusetts Department of Transportation is committed to make "investments and decisions that strengthen communities, support economic growth and improve public health." The Green Line extension is the perfect example of a project that will fulfill that mission, but only if it is built in the most environmentally beneficial and cost-effective manner, which is to continue the Environmental Impact Report in a manner that will enable the Commonwealth to construct the main branch to Route 16 in Medford in one phase by Dec. 31, 2014.

MGNA DEIR Analysis – December 30, 2009

it relates to the MBTA's design standards, operations and other requirements would be necessary in order to determine the full cost savings of a redesigned station. While MassDOT has not been required to revisit the design of this station as part of the FEIR document, further evaluations may consider the redesign options presented by the MGNA in future analyses.

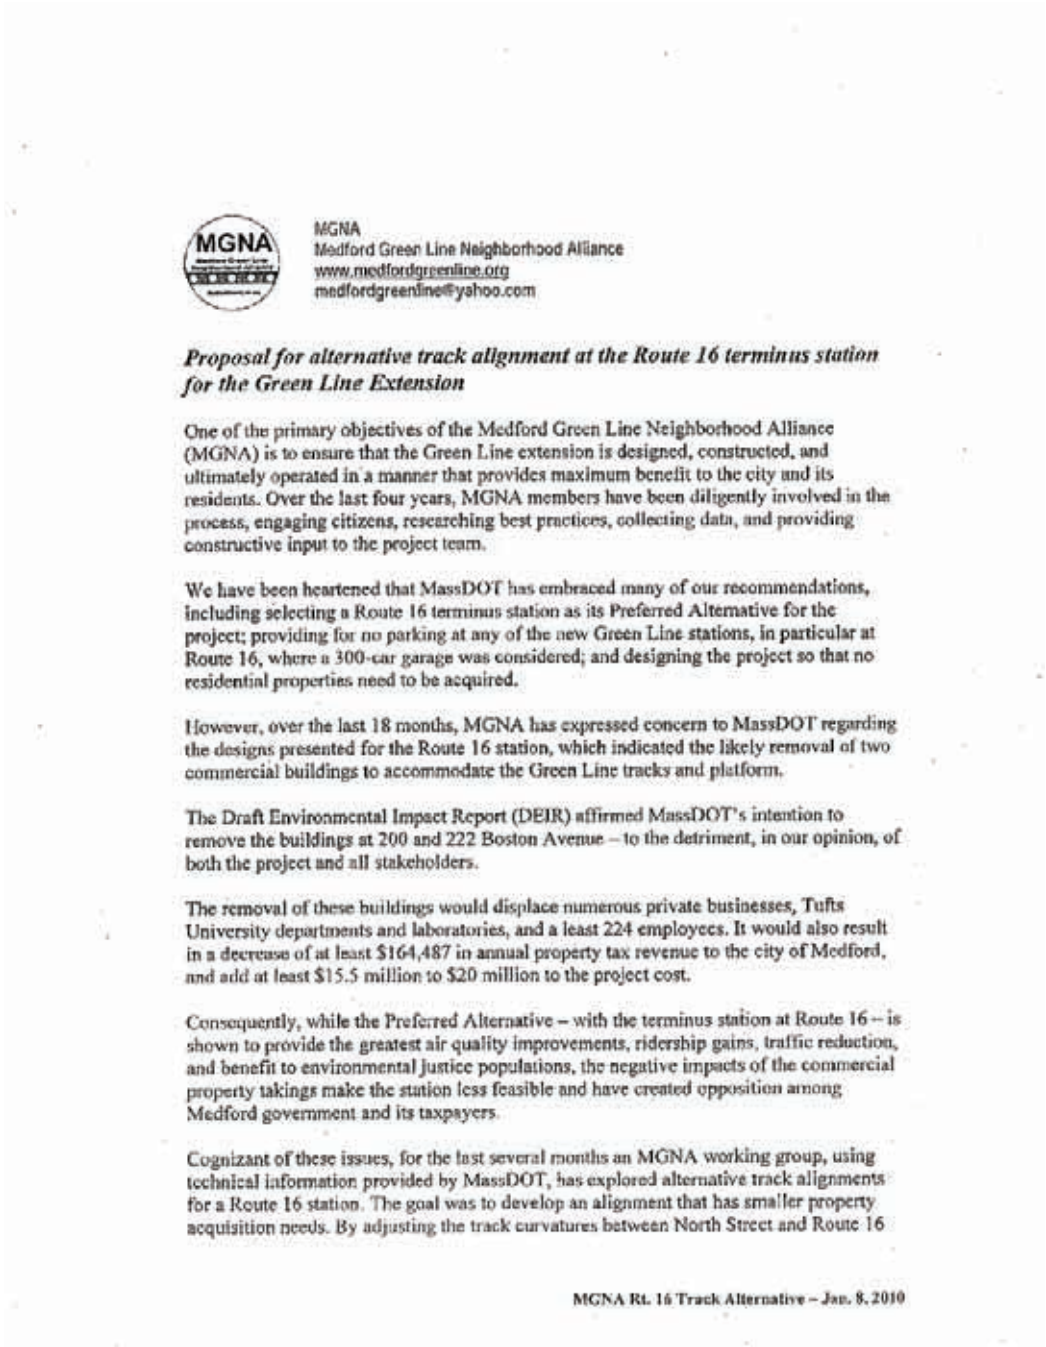
O-019-015

As directed by the Secretary's Certificate on the DEIR/EA, the FEIR includes a limited scope of issues related to the Green Line Extension Project. The Proposed Project, with a Medford Branch terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Although an extension to Mystic Valley Parkway/Route 16 is MassDOT's Preferred Alternative, financial constraints prohibit the Commonwealth from progressing the Project beyond College Avenue at this time.

Since the release of the DEIR/EA, a few stakeholders raised concerns that the proposed College Avenue Station, serving as a terminal station for the Proposed Project, would not adequately serve the Medford Hillside neighborhood. Serving this neighborhood was identified as part of the SIP description. To address and resolve these concerns, CTPS prepared a memorandum demonstrating that the College Avenue Station location does adequately serve the walk market area for the Medford Hillside neighborhood. This memorandum is provided in Appendix C of the FEIR.

O-019-016

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has



MGNA
Medford Green Line Neighborhood Alliance
www.medfordgreenline.org
medfordgreenline@yahoo.com

Proposal for alternative track alignment at the Route 16 terminus station for the Green Line Extension

One of the primary objectives of the Medford Green Line Neighborhood Alliance (MGNA) is to ensure that the Green Line extension is designed, constructed, and ultimately operated in a manner that provides maximum benefit to the city and its residents. Over the last four years, MGNA members have been diligently involved in the process, engaging citizens, researching best practices, collecting data, and providing constructive input to the project team.

We have been heartened that MassDOT has embraced many of our recommendations, including selecting a Route 16 terminus station as its Preferred Alternative for the project; providing for no parking at any of the new Green Line stations, in particular at Route 16, where a 300-car garage was considered; and designing the project so that no residential properties need to be acquired.

However, over the last 18 months, MGNA has expressed concern to MassDOT regarding the designs presented for the Route 16 station, which indicated the likely removal of two commercial buildings to accommodate the Green Line tracks and platform.

The Draft Environmental Impact Report (DEIR) affirmed MassDOT's intention to remove the buildings at 200 and 222 Boston Avenue – to the detriment, in our opinion, of both the project and all stakeholders.

The removal of these buildings would displace numerous private businesses, Tufts University departments and laboratories, and a least 224 employees. It would also result in a decrease of at least $164,487 in annual property tax revenue to the city of Medford, and add at least $15.5 million to $20 million to the project cost.

Consequently, while the Preferred Alternative – with the terminus station at Route 16 – is shown to provide the greatest air quality improvements, ridership gains, traffic reduction, and benefit to environmental justice populations, the negative impacts of the commercial property takings make the station less feasible and have created opposition among Medford government and its taxpayers.

Cognizant of these issues, for the last several months an MGNA working group, using technical information provided by MassDOT, has explored alternative track alignments for a Route 16 station. The goal was to develop an alignment that has smaller property acquisition needs. By adjusting the track curvatures between North Street and Route 16

MGNA Rt. 16 Track Alternative – Jan. 8, 2010

complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Chapter 4 of the FEIR describes the noise impacts and mitigation measures for the College Avenue Station. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

O-019-017

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

O-019-018

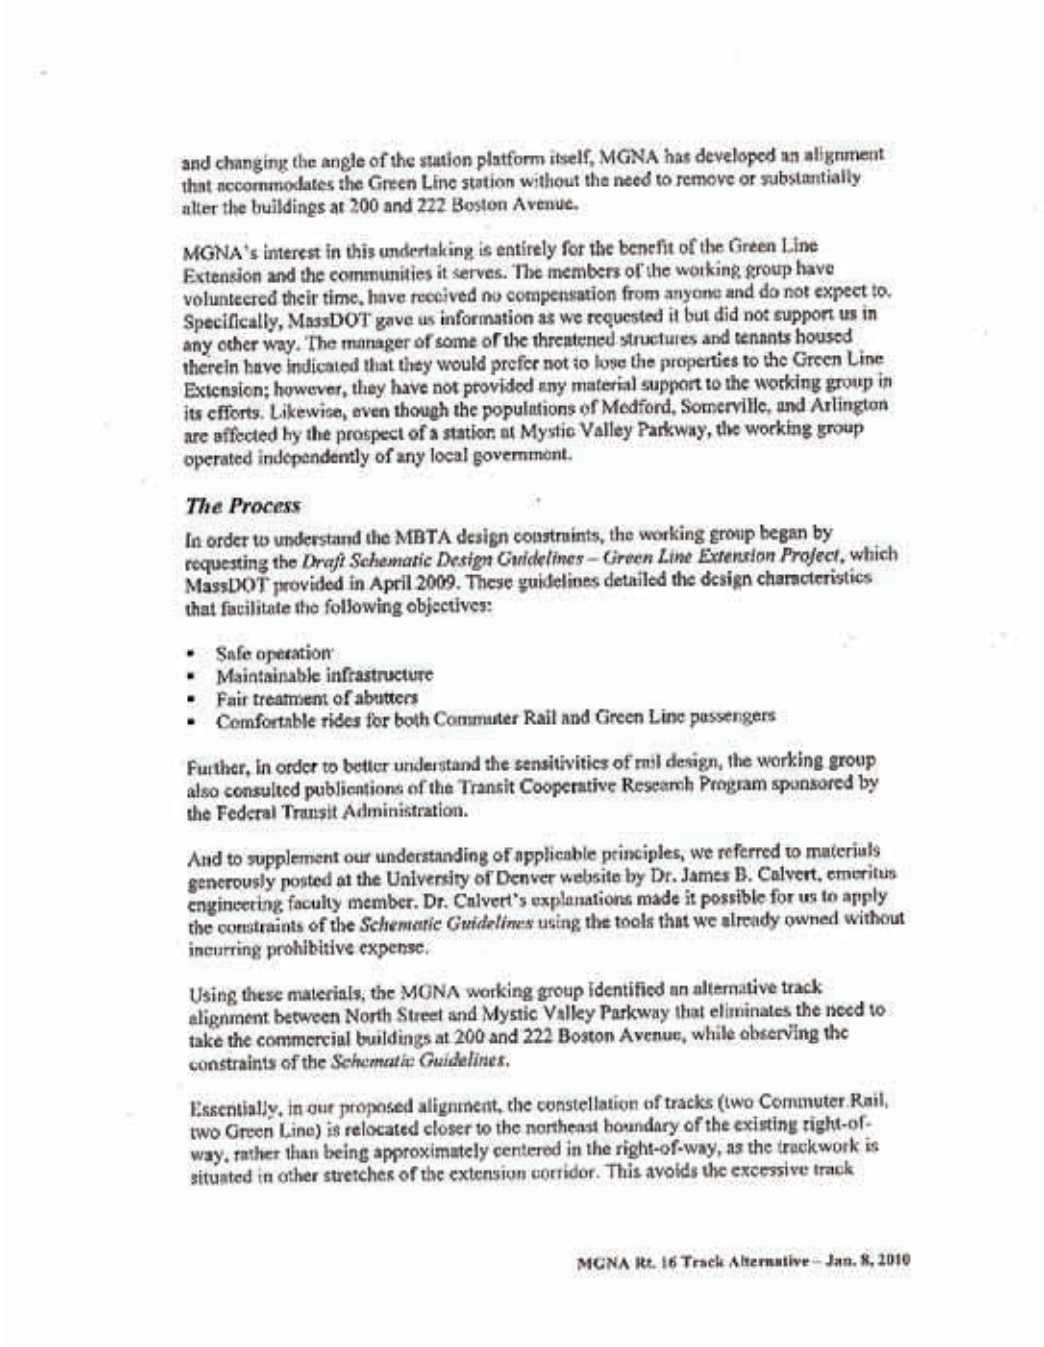
Limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time.

O-019-019

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8. During preliminary engineering, detailed designs related to mitigation will be developed.

O-019-020

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project.



and changing the angle of the station platform itself, MGNA has developed an alignment that accommodates the Green Line station without the need to remove or substantially alter the buildings at 200 and 222 Boston Avenue.

MGNA's interest in this undertaking is entirely for the benefit of the Green Line Extension and the communities it serves. The members of the working group have volunteered their time, have received no compensation from anyone and do not expect to. Specifically, MassDOT gave us information as we requested it but did not support us in any other way. The manager of some of the threatened structures and tenants housed therein have indicated that they would prefer not to lose the properties to the Green Line Extension; however, they have not provided any material support to the working group in its efforts. Likewise, even though the populations of Medford, Somerville, and Arlington are affected by the prospect of a station at Mystic Valley Parkway, the working group operated independently of any local government.

The Process

In order to understand the MBTA design constraints, the working group began by requesting the *Draft Schematic Design Guidelines – Green Line Extension Project*, which MassDOT provided in April 2009. These guidelines detailed the design characteristics that facilitate the following objectives:

- Safe operation
- Maintainable infrastructure
- Fair treatment of abutters
- Comfortable rides for both Commuter Rail and Green Line passengers

Further, in order to better understand the sensitivities of rail design, the working group also consulted publications of the Transit Cooperative Research Program sponsored by the Federal Transit Administration.

And to supplement our understanding of applicable principles, we referred to materials generously posted at the University of Denver website by Dr. James B. Calvert, emeritus engineering faculty member. Dr. Calvert's explanations made it possible for us to apply the constraints of the *Schematic Guidelines* using the tools that we already owned without incurring prohibitive expense.

Using these materials, the MGNA working group identified an alternative track alignment between North Street and Mystic Valley Parkway that eliminates the need to take the commercial buildings at 200 and 222 Boston Avenue, while observing the constraints of the *Schematic Guidelines*.

Essentially, in our proposed alignment, the constellation of tracks (two Commuter Rail, two Green Line) is relocated closer to the northeast boundary of the existing right-of-way, rather than being approximately centered in the right-of-way, as the trackwork is situated in other stretches of the extension corridor. This avoids the excessive track

MGNA Rt. 16 Track Alternative – Jan. 8, 2010

This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA, and provides responses to all comments on the DEIR.

O-019-021

MassDOT will continue to work with MAPC and the Legislature to identify funding opportunities for the extension to Mystic Valley Parkway/Route 16.

proximity to the east corner of 200 Boston Avenue and to the northeast walls of 200 Boston Avenue and 222 Boston Avenue.

More specifically, our alternative has these characteristics:

1. It is wholly confined within the existing railroad right-of-way except for a sliver taking from a commercial parking lot (Medford), one vacant commercial lot (Somerville) and one commercial building and lot (Somerville).
2. It uses curve radii well within the *Schematic Guidelines'* specifications, typically double the minimum and sometimes triple the minimum, thereby improving passenger comfort, reducing risk of excessive noise and decreasing the torque on rolling stock that arises in approaches to banked trackwork.
3. Where conflicting constraints appear, it uses the more stringent specification, taking a conservative approach.
4. It achieves all spiral and tangent track goals including a tangent 450-foot platform and tangent platform approach, in order to avoid wheel squeal.
5. It eliminates the need to place trackwork on the very locations where the northeast walls of 200 and 222 Boston Avenue stand today.

A fully detailed description of the alignment is provided below, and conceptual drawings are attached.

Conclusion

O-019-022

MGNA put forward our alternative alignment for the tracks between North Street and Mystic Valley Parkway, and the reorientation of the station platform, in hopes that it can contribute to a design for the Route 16 terminus that does not necessitate taking the commercial properties at 200 and 222 Boston Avenue in Medford. There are doubtless other solutions that qualified engineering personnel could discover to achieve the same objectives, and we ask that one of these be included in the Final EIR/EA for the Green Line extension project, rather than the worst-case scenario that is presented in the DEIR/EA.

O-019-022

Various community groups have suggested modified concepts for the Mystic Valley Parkway/Route 16 Station. Preliminary evaluation of these concepts showed that the cost of constructing the Green Line Extension to Mystic Valley Parkway/Route 16 would not be reduced sufficiently to be able to be funded at this time. Additional evaluation of the concept as it relates to the MBTA's design standards, operations and other requirements would be necessary in order to determine the full cost savings of a redesigned station. While MassDOT has not been required to revisit the design of this station as part of the FEIR document, further evaluations may consider the redesign options presented by the MGNA in future analyses.

Details

Relocation of Commuter Rail tracks to shift them away from the threatened properties:

- 900-foot compound curve ("S" curve) comprising two 200-foot circular curves with spiral transitions separated in the center with a 100-foot tangent.
- Heading south, the compound curve begins at the south bridgehead of the Mystic Valley Parkway Bridge and completes approximately even with the east corner of 200 Boston Avenue.
- Shifts tracks 22 feet to the north-east (away from 200 Boston Avenue and 222 Boston Avenue) instead 13 feet, which the DEIR alignment achieves.
- Conforms to design standards as follows:
  - Limits circular radius to 7640 feet (corresponding to 0°45'00" degree of curvature) compared to a preferred minimum of 4297 feet (corresponding to 1°20'00" degree of curvature) – [1] § *1.2.9.1 Commuter Rail Geometric Design*
  - With 0°45'00" curves, meets 60 miles per hour design speed with <½ inch superelevation – [2] extrapolation from *Table 3.2.2b Desired Superelevation and Minimum Spiral Curve Length (English Units)*
  - Includes four 100-foot spiral transitions (into and out of each of the two opposed circular curves) – [1] § *1.2.9.1 Commuter Rail Geometric Design*
  - Includes 100 foot tangent track at spiral reversal – [1] § *1.2.9.1 Commuter Rail Geometric Design*
  - Minimum clearance from right-of-way property line to centerline of closest track is 12½ feet *vs. Guidelines'* 8½ feet minimum and 10 feet preferred clearance to retaining wall – [1] *Figure 1-8 Typical Section*
  - Centerline clearances between adjacent tracks on tangents is 13 feet (greater on curves) as per *Guidelines* – [1] *Figure 1-8 Typical Section*
- Not shown in this drawing, between North Street and Winthrop Street, additional curved trackwork returns the track constellation to an alignment roughly centered in the railroad right-of-way, the position it occupies for most of the extension corridor.

Placement of Green Line tracks to clear the affected preexisting structures:

- 400-foot simple curve comprising one circular curve with spiral transitions
- Heading north, the outbound track curve begins 125 feet north of North Street bridge; inbound track curve begins just south of North Street bridge
- Adheres to design standards as follows:
  - Minimum clearance from adjacent pre-existing structures at 200 Boston Avenue and 222 Boston Avenue to centerline of closest track is 13½ feet vs. *Guidelines'* 8 feet preferred and 6½ feet allowed with niches – [1] § *1.2.9.2 Light Rail Geometric Design*, [1] *Figure 1-8 Typical Section*
  - Includes a single 200-foot circular curve with minimum radius of 3274.3 feet (corresponding to 1°45'00" degree of curvature) compared to minimum preferred 1000 feet (corresponding to 5°43'00" degree of curvature) – [1] § *1.2.9.2 Light Rail Geometric Design*

- Includes two 100-foot spiral transitions (into and out of circular curve) – [1] § *1.2.9.2 Light Rail Geometric Design*
- Includes the 450-foot platform required for terminal stations – [1] § *1.2.11 Table 1-5 Station Requirements*
- Provides a 20 foot wide platform, consistent with the DEIR (this dimension is unspecified in [1] without ridership forecasts – see [1] § *1.2.11.3 Access*)
- An Area of Refuge (point of safety) is located at the south end of the platform – [1] § *1.2.11.3 Access*
- Provides a tangent-track (0°00'00") platform even though curves as tight as 2°00'00" are allowed – [1] § *1.2.9.2 Light Rail Stations*
- Includes 100-foot tangent track approaching platform – [1] § *1.2.9.2 Light Rail Stations*
- Centerline clearances between adjacent Green Line tracks on tangents is 13 feet, consistent with preferred spacing (although 12-foot spacing is allowed) – [1] § *1.2.9.2 Light Rail Geometric Design Minimum distance between centerline of tracks*

- Not shown in this drawing, between North Street and Winthrop Street, additional curved trackwork returns the track constellation to an alignment roughly centered in the railroad right-of-way, the position it occupies for most of the extension corridor.

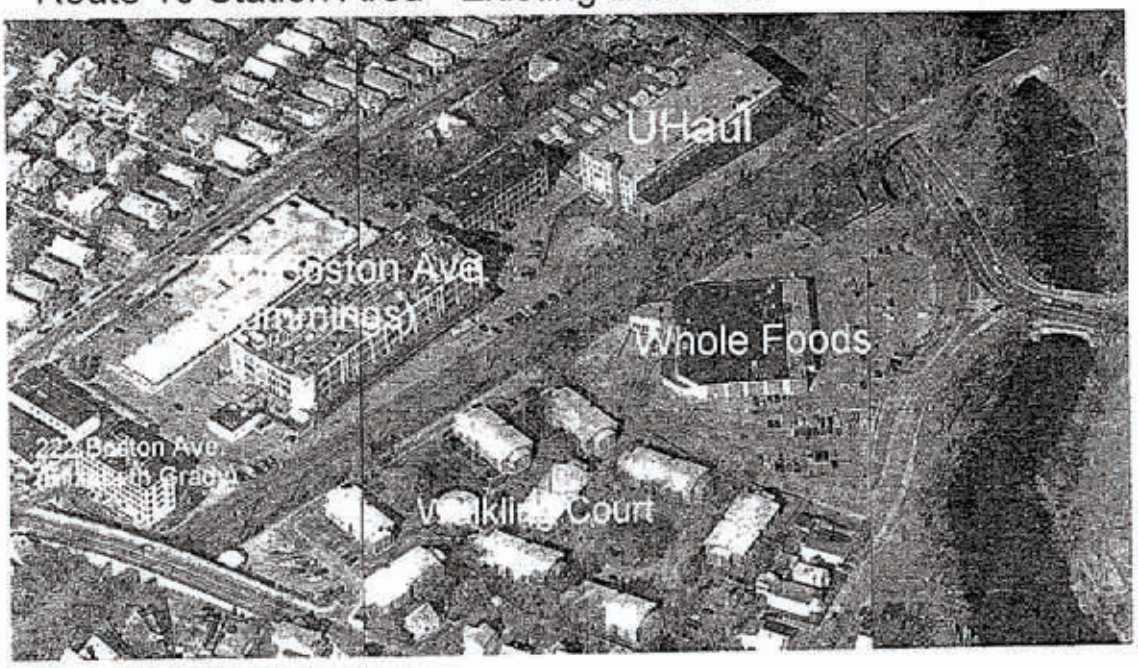
DEIR: Analysis and Response

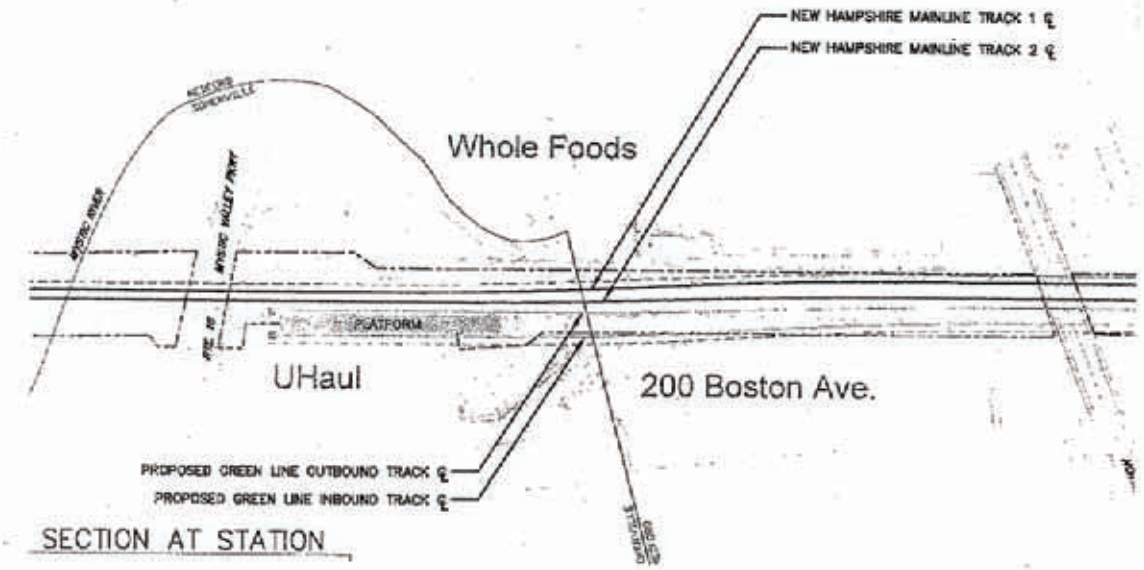
Route 16 Station Area - Existing Land Use



DEIR: Analysis and Response

EOT Design 1, Feb. 2008

- No conflict with office buildings or North Street bridge
- Commuter rail tracks shown shifted east; 225-foot platform



DEIR: Environmental Impact

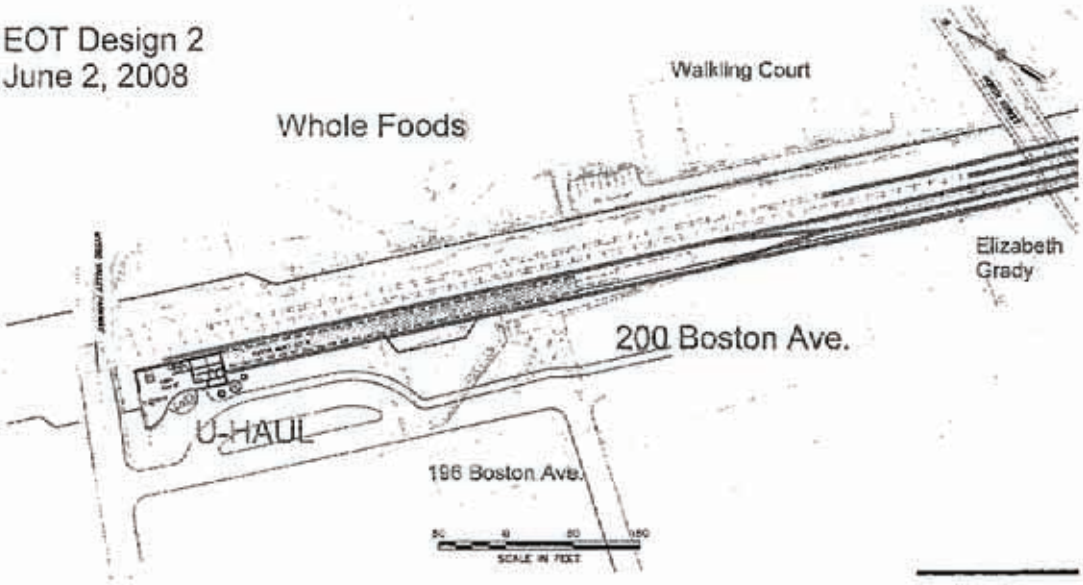
In Appendix B of the DEIR, the EOT states:

"In February of 2008, a series of public workshops were conducted in the neighborhoods to discuss the proposed station areas and to obtain feedback from stakeholders on the various concepts developed.

"Based on previous work and the feedback obtained at these workshops, the **station concepts for** Gilman Square and **Mystic Valley Parkway / Route 16 were generally accepted by the public and local officials and did not require additional evaluation."**

DEIR: Analysis and Response

EOT Design 2
June 2, 2008

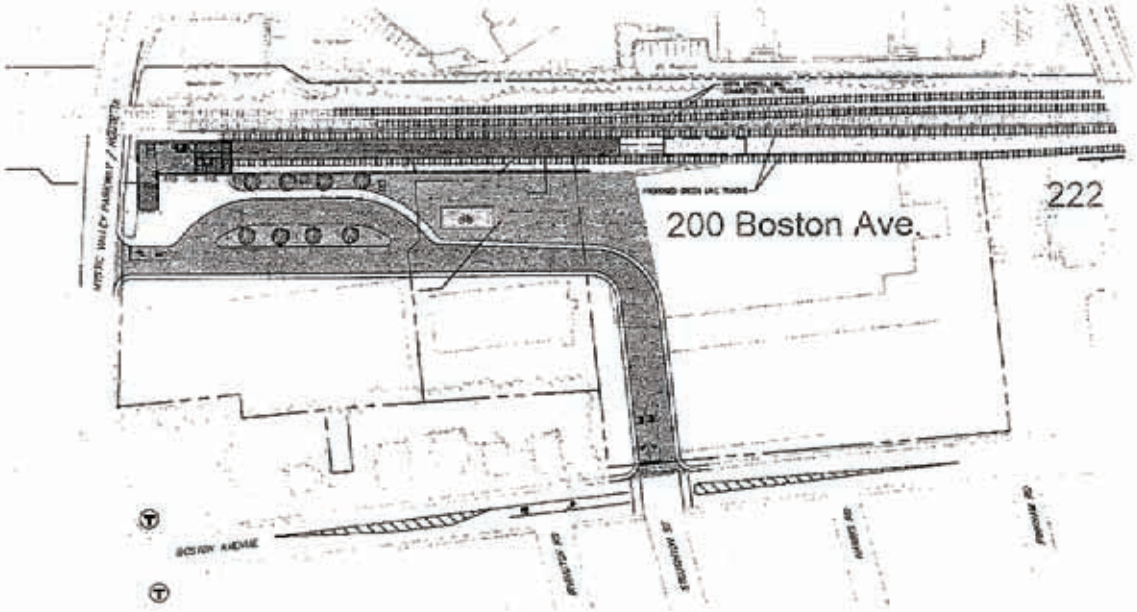


- Third Green Line track added; conflicts shown with office buildings and bridge
- Commuter rail tracks returned to existing position, platform lengthened to 450 ft.

DEIR: Analysis and Response

EOT Design 3
March/Oct. 2009

- Third Green Line track removed
- Commuter rail tracks again shifted east, but not Green Line tracks, which also have excessive spacing in between them



DEIR: Analysis and Response

MGNA Design Alternative November 2009

- Commuter rail tracks shifted east, within right-of-way
- Green Line tracks gently curved, within EOT/FTA guidelines
- Platform orientation changed; no conflicts with office buildings or need to acquire them to accommodate station

DEIR: Analysis and Response

MGNA Route 16 Alternative Station Design Advantages

- Eliminates need to acquire 200 and 222 Boston Avenue properties, preserving businesses
- Preserves $182,000 in annual property tax revenue to Medford, which is likely to greatly increase with the advent of Green Line service, which will raise the buildings' asessed values
- Reduces project cost by at least $15.4 million (buildings' current assessed values)
- Saves cost of relocating displaced companies and employees

RECEIVED
JAN 11 2010
MEPA

January 8, 2010

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
100 Cambridge Street, Suite 900
Boston, MA 02114
Attn: Holly Johnson (holly.s.johnson@state.ma.us)

Dear Secretary Bowles,

I am writing to express the continued support of the Mystic River Watershed Association for the Green Line extension to Somerville and Medford and for completion of the design and implementation of the Somerville Community Path.

This project, including the construction of the Somerville Community Path, will provide an essential extension of public transportation and vital expansion of pedestrian and bicycle ways available to residents of the Mystic River Watershed. As a result, we are certain that this project will have a very positive impact on water quality and environmental conditions in the Mystic River and its tributaries.

In order to insure that the Somerville Community Path can effectively move forward we request that the following be considered during your deliberations.

O-020-001

- We request that the DEIR clearly state that the extension of the Community Path will be designed by MassDOT's contractors as agreed to in a February 24, 2009 letter from the former EOT.
- That, in order to obtain the best economies of scale and out of technical necessity, plans are made to insure that the Green Line and Community Path extensions are constructed as one project. We also request that this intention be clearly described as such by MassDOT.
- We request that MassDOT be required to commit to work with the City and other State and Federal agencies to obtain the necessary funding to build the Community Path extension as part of the Green Line extension. This was the case when the Linear Park was constructed as part of the Red Line and the Southwest Corridor path was completed as part of the Orange Line extensions.
- We also recommend that application be made for Federal New Starts funding that allows bicycle and pedestrian access costs be covered.

Thank you sincerely for considering these comments.

Very Truly Yours,

EkOngKar Singh Khalsa, Executive Director
Mystic River Watershed Association

O-020-001

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

Re: Comments on Green Line Extension DEIR

Dear Secretary Bowles:

The Massachusetts Chapter of the Sierra Club strongly supports the proposed extension of the Green Line from its current terminus at Lechmere Square in East Cambridge, to Somerville and Medford. This project would entail the relocation of Lechmere station across Monsignor O'Brien Highway from its present site, and the expansion of two MBTA commuter rail corridors to accommodate light rail as well—the Fitchburg Line as far as Union Square, and the Lowell Line initially to Medford Hillside and eventually to Mystic Valley Parkway. As both branches will utilize wide rights of way that formerly included more than the currently existing two tracks, commuter rail and Amtrak service will be retained and the new Green Line will include seven new stations beyond Lechmere. In addition, both commuter lines currently run much of their length through the project area in depressed rights of way, necessitating the construction of retaining walls in various locations to accommodate the four tracks and the new stations.

The project is one of several outstanding Air Quality Mitigation Transit Commitments the Commonwealth had agreed to in 1991 as a condition for building the Central Artery/Tunnel Project. The idea of extending the Green Line beyond Lechmere is not new, however. It dates back at least to 1962, when the North Area Terminal Study was commissioned to "design a new transit alignment" along the Lowell Line. Both Somerville and Medford are crisscrossed by highways and rail lines that provide residents with limited benefits while constantly fouling the air they must breathe. Like several other underutilized rail corridors bisecting large swaths of Greater Boston, there are at present no stops located in the project area, but its residents must endure frequent noise, vibration and diesel exhaust from the trains passing through their neighborhoods. There is *no* excuse why such a high-density, transit-dependent slice of the urban core should not enjoy rapid first class rail service directly into downtown Boston—but is instead forced to rely on slow, jerky buses to reach a distant transfer to the subway.

Three decades ago I witnessed the planning and construction of the new Orange Line through the Southwest Corridor adjacent to my home on Roxbury's Fort Hill. It is incumbent on the Commonwealth and the community to examine what went right with this earlier project, as well as what did not go so well, as guideposts for the new Green Line in Somerville and Medford:

O-021-001

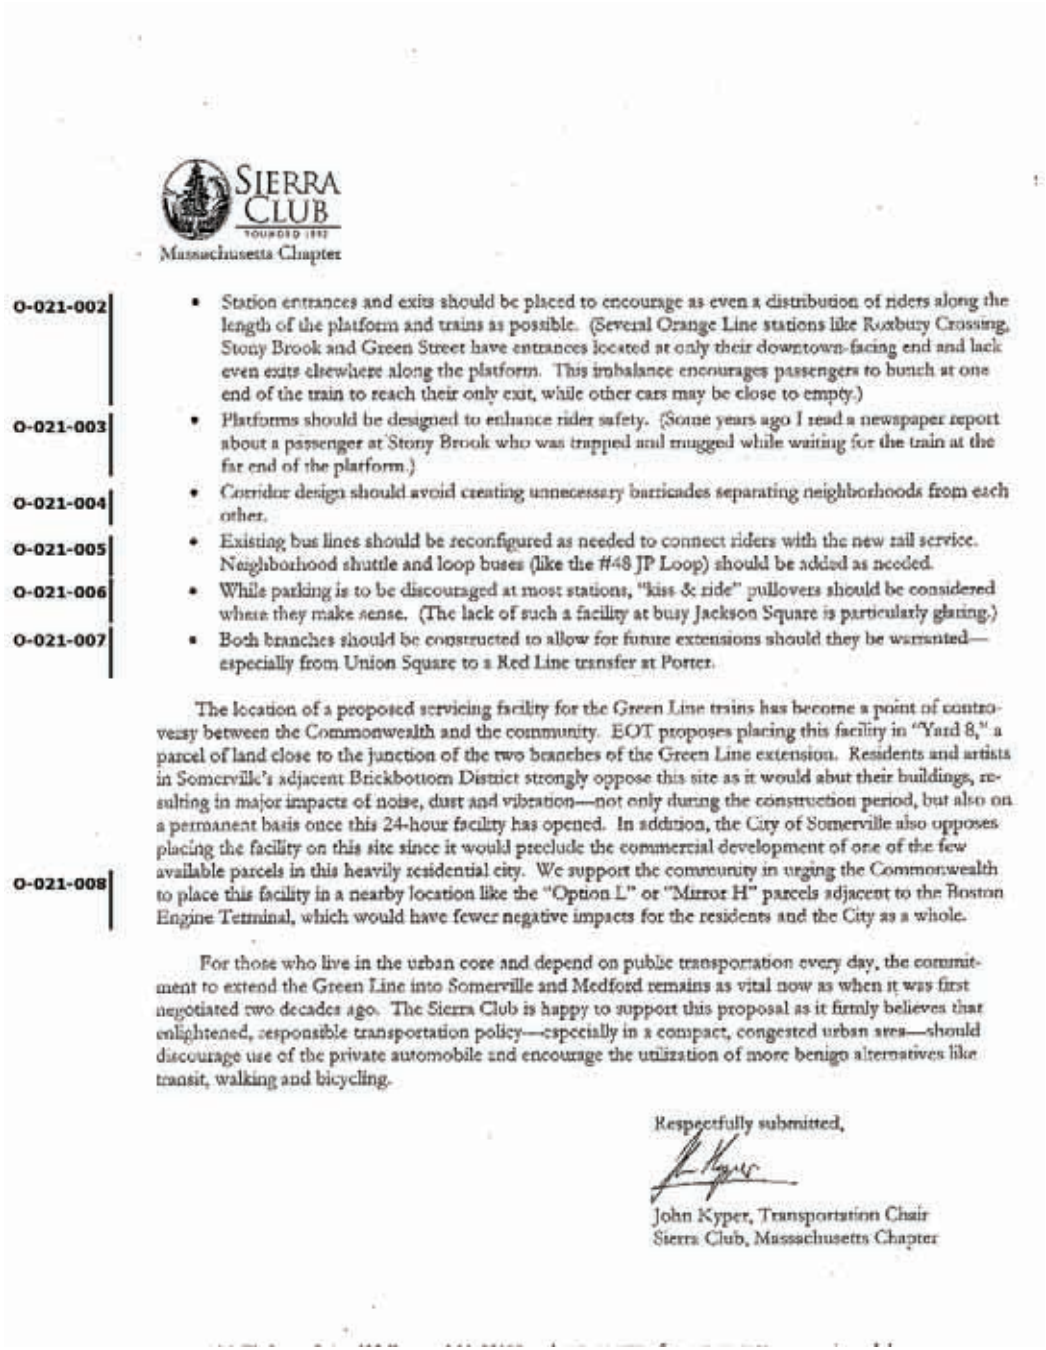
- Stations should be located and configured to maximize pedestrian, bicycle and wheelchair access to and from the adjacent neighborhoods. Riders should not have to do unnecessary walking to reach the train.

10 Milk Street Suite 632 Boston MA 02108 tel: 617.423.5775 fax: 617.423.3658 www.sierraclubmass.org

O-021-001

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.



SIERRA CLUB
FOUNDED 1892
Massachusetts Chapter

O-021-002
- Station entrances and exits should be placed to encourage as even a distribution of riders along the length of the platform and trains as possible. (Several Orange Line stations like Roxbury Crossing, Stony Brook and Green Street have entrances located at only their downtown-facing end and lack even exits elsewhere along the platform. This imbalance encourages passengers to bunch at one end of the train to reach their only exit, while other cars may be close to empty.)

O-021-003
- Platforms should be designed to enhance rider safety. (Some years ago I read a newspaper report about a passenger at Stony Brook who was trapped and mugged while waiting for the train at the far end of the platform.)

O-021-004
- Corridor design should avoid creating unnecessary barricades separating neighborhoods from each other.

O-021-005
- Existing bus lines should be reconfigured as needed to connect riders with the new rail service. Neighborhood shuttle and loop buses (like the #48 JP Loop) should be added as needed.

O-021-006
- While parking is to be discouraged at most stations, "kiss & ride" pullovers should be considered where they make sense. (The lack of such a facility at busy Jackson Square is particularly glaring.)

O-021-007
- Both branches should be constructed to allow for future extensions should they be warranted—especially from Union Square to a Red Line transfer at Porter.

The location of a proposed servicing facility for the Green Line trains has become a point of controversy between the Commonwealth and the community. EOT proposes placing this facility in "Yard 8," a parcel of land close to the junction of the two branches of the Green Line extension. Residents and artists in Somerville's adjacent Brickbottom District strongly oppose this site as it would abut their buildings, resulting in major impacts of noise, dust and vibration—not only during the construction period, but also on a permanent basis once this 24-hour facility has opened. In addition, the City of Somerville also opposes placing the facility on this site since it would preclude the commercial development of one of the few available parcels in this heavily residential city. We support the community in urging the Commonwealth

O-021-008

to place this facility in a nearby location like the "Option L" or "Mirror H" parcels adjacent to the Boston Engine Terminal, which would have fewer negative impacts for the residents and the City as a whole.

For those who live in the urban core and depend on public transportation every day, the commitment to extend the Green Line into Somerville and Medford remains as vital now as when it was first negotiated two decades ago. The Sierra Club is happy to support this proposal as it firmly believes that enlightened, responsible transportation policy—especially in a compact, congested urban area—should discourage use of the private automobile and encourage the utilization of more benign alternatives like transit, walking and bicycling.

Respectfully submitted,

John Kyper, Transportation Chair
Sierra Club, Massachusetts Chapter

O-021-002

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. These stations are designed to be consistent with MBTA standards and compliant with ADA. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

O-021-003

The DEIR/EA and FEIR are based on conceptual station designs. Designs for each station, including safety features, will be refined during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan, Chapter 6 of the FEIR.

O-021-004

MassDOT seeks to maximize community connectivity with the Green Line Extension Project. The DEIR/EA and FEIR include conceptual Project designs. Designs for each station, the storage and maintenance facility, and the entire project alignment will be refined during the Project's preliminary engineering stage. The process for coordinating with local communities during Project design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

O-021-005

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the

FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

O-021-006

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

The only Green Line Extension station that will provide parking is Lechmere Station. Drop-off and pick-up areas will be provided at at several stations. These will accommodate expected kiss-and-ride activity.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

O-021-007

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and

infrastructure design with conceptual future Green Line additions and extensions.

O-021-008

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Mirror H location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

RE: Green Line Extension Draft EIR (EEA #13886)

Dear Secretary Bowles:

On behalf of the Somerville Chamber of Commerce, thank you for the opportunity to submit comments on this project which is so vital to Somerville and the Commonwealth. We very much appreciate MassDOT's effort to move the project forward with the release of the Draft EIR. However, there are a number of key issues that should be addressed.

General Support & Overarching Issue

O-022-001

Generally, the Chamber supports the first phase integration of the Community Path and the Mystic Valley Parkway / Route 16 terminus as well as coordinated planning with the McGrath/O'Brien Highway project. From the business community's perspective the overarching economic issue is the location of the Green Line support facility and the fact that this is a $1B project without an economic development plan.

Brief Background of Federal, State, Local Relevance

As the most densely populated city in New England with the least urban commercial tax base in Boston's urban core, Somerville is inordinately dependent on state aid and structurally challenged to deliver public works, public safety, and public education – cornerstones of the urban quality of life. U.S. Secretary of Transportation Ray LaHood recently framed a strategy for this challenge.

> We see transportation ...as a gateway to economic development and a better quality of life... To put that into action, DOT will listen more carefully to state, regional, and community priorities, the kinds of priorities that small businesses help shape.

With Somerville's Innerbelt Brickbottom area as close to Boston's City Hall as the Prudential Center is, the Metropolitan Planning Organization has articulated the area's importance to the development of the Boston metropolitan region.

> The corridor is very attractive for economic development and presents a unique opportunity to transform the existing postindustrial landscape into a visual and functional continuum of urban space with human scale.

Telephone 617-776-4100 • Fax 617-776-1157 • Email: info@somervillechamber.org • Web: www.somervillechamber.org

O-022-001

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

In order to fund any state share of the costs of constructing the Green Line Extension project, MassDOT will need to make use of capital funds raised through Commonwealth bonding. Should the existing bond authorization for the State Implementation Plan projects (of which the Green Line Extension project is one) not be sufficient, MassDOT will need to work with the Legislature and the Executive Office of Administration & Finance to provide additional bond authorization to cover those costs of the Green Line Extension project for which the Commonwealth is responsible.

The EENF further refined the opportunity.

> This project is a hallmark of the Commonwealth's commitment to the principles and practice of smart growth… New public and private investments can revitalize the social and environmental fabric of the corridor.

In November 2009, under the new aegis of the Massachusetts Department of Transportation, MassDOT's opening presentation on the project said "we view this as an economic development project."

Request for Detailed Analysis of Three Options

O-022-002

The one characteristic that all maintenance and storage options (Yard 8, Mirror H, Option L, and Option L-BET) have in common is that they are in Somerville – with Mirror H encroaching slightly on Cambridge. In light of the fact that Somerville already suffers "a disproportionate burden" as the sole host of the 43 acre, non-taxable, Commuter Rail Maintenance Facility complex (a.k.a. BET) and in light of Executive Order 385 Sections 5-7, the Chamber requests the elimination of a Yard 8 from consideration and requests full analysis of Mirror H, Option L, and Mr. Alan Moore's recommended Option L-BET.

Request for Smart Growth Focus by Key Agencies

O-022-003

We believe that a more detailed analysis of Mirror H, Option L, and Option L-BET is completely consistent with U.S.DOT, the MPO, and MassDOT and that such analysis would indicate a sincere government effort to effectively apply "the principles and practices of smart growth" to minimize Somerville's disproportionate burden and maximize its economic potential in the Innerbelt Brickbottom area. As we have through much of this project, we strongly recommend that the Executive Office of Housing and Economic Development participate in such analysis. By developing "a more detailed corridor study to examine zoning, development opportunities," MassDOT's combined 50 acres of maintenance and storage needs may be fully accommodated in Somerville and the Commonwealth may begin to realize the economic fruit of a $1B project.

Sincerely,

Stephen V. Mackey
President / CEO

O-022-002

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

O-022-003

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. The evaluation considers land use and connectivity impacts and opportunities associated with each maintenance facility site alternative.

RE: Green Line Extension Draft EIR (EEA #13886)

Dear Secretary Bowles,

Somerville Climate Action is extremely supportive of the completion of the green line extension in a timely matter as we believe this project is an integral part of reducing carbon emissions for Somerville and for the Commonwealth as a whole.

The climate science is clear: we need to urgently and significantly reduce carbon emissions to avoid catastrophic climate change. Climate change and increasingly expensive and scarce oil resources will require that we have the most extensive and comprehensive public transportation infrastructure possible to maintain quality of life and economic stability in the near and long term. A comprehensive inter-modal public transportation system should be an integral part of the Commonwealth's strategy to become a leader in climate friendly policies and practices. We ask that the extension of the Green Line be planned, designed, and build with this in mind.

We recommend that the Draft EIR be approved, with the following modifications.

Effective and Comprehensive Public Participation

O-023-001

- We strongly support an engaging and effective public process and ask that a Citizen Advisory Group be maintained through the completion of the project and be involved in early on and in all aspects of the process.

O-023-002

- We support the Community Corridor Planning process and urge you to follow the 11 Core Principles identified and ratified by Somerville residents.

Environmentally, socially, and economically just siting of the Maintenance Facility

O-023-003

- We strongly oppose to the Maintenance Facility site at Yard 8. This option has widely been rejected by Cambridge and Somerville stakeholders at public meetings. Somerville has already suffered economically, socially, and environmentally from poor public transportation infrastructure. Placing the Maintenance Facility at Yard 8 would squander many of the

O-023-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

O-023-002

MassDOT has reviewed and considered the "Core Community Principles" for station area land use, presented by Community Corridor Planning. As described in the FEIR, Section 6.2 of the Public Involvement Plan, MassDOT will hold land use workshops to discuss related issues with the community.

O-023-003

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

SOMERVILLE CLIMATE ACTION

O-023-003 opportunities offered by the green line extension for economic, social, and environmental improvements.

A comprehensive inter-modal system that significantly decreases reliance on fossil fuels

O-023-004 ➢ An effective inter-modal transportation system should make it easy for riders to get to stations by bike or foot and will yield many other benefits such as health improvements for area residents. We are strong supportive of integrating the extension of the Community Path into the Green Line extension planning, design, and building process.

O-023-005 ➢ We believe there is not time to waste in extending the Green Line to Mystic Valley Parkway/Route 16 and should be designed and build at the same time as the rest of the Extension and that the system should be designed to accommodate future stations in underserved areas easily.

Green infrastructure

O-023-006 ➢ All buildings materials, technologies, and practices used in the construction of the Maintenance Facility and Rail extension should use materials and technologies that have the least detrimental ecological impact and mimic natural systems as much as possible. These include green building materials, green roofs, energy-efficient and renewable technology, and zero-waste practices. The use of these materials and technologies should be incorporated in the early in the planning phase of the project to insure a comprehensive process that all parties involved are aware of and can agree to.

Thank you for your consideration and for the work you are investing to create a sustainable future for Somerville and the rest of the Commonwealth.

Sincerely,

Vanessa Rule
Chair
Somerville Climate Action
somervilleclimateaction@gmail.com

O-023-004

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

O-023-005

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

O-023-006

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual designs. Detailed designs for each station, the maintenance facility, and the entire Project will be refined during the preliminary engineering phase. As stated in DEIR/EA Section 3.7, the Project will emphasize low-energy, low-impact, "green" design. The process for coordinating with the local communities during Project design is described in the Public Involvement Plan, Chapter 6 of the FEIR.

RE: EEA #13886

Dear Secretary Bowles:

We are writing on behalf of the Somerville Community Corporation (SCC) to express our support for the Green Line Project and to recommend approval of the Draft Environmental Impact Report contingent on consideration and incorporation of proposed recommendations into the Final EIR. Because time is an important factor, we encourage you to pass the Final EIR with the allowance for supplemental addendums to this report that respond to and address community recommendations in a time appropriate manner.

O-024-001

SCC is most interested in making sure that final plans for Green Line construction reflect the needs and wants of the community. During the summer and fall of 2009, SCC worked in coalition with Groundwork Somerville, Somerville Transportation Equity Partnership, and the Somerville Community Health Agenda as part of CCP (Community Corridor Planning) to engage hundreds of residents to participate in identifying principles for land use and quality of life in Somerville along the proposed Green Line corridor. Many of these principles are directly relevant to the plans put forward by MA DOT. Below, please find the list of recommendations matched with the principles we feel are most relevant to the DEIR.

O-024-002

In addition, we would like to see MA DOT abandon proposals to locate the Maintenance Facility in Yard 8, and to develop full feasibility studies for Option L and Option H as alternative locations for the Maintenance Facility.

O-024-003

We would also like to see MA DOT develop and implement a plan to reconstruct the section of McGrath Highway that passes through Somerville in coordination with construction of the Green Line. We have worked with community members in East Somerville, an Environmental Justice community, who have fought hard to change this roadway to make it more pedestrian friendly, safe, and better integrated into the community. To this end, we would like to see the McGrath Obrien Highway converted into a Boulevard, with the elimination of the Washington Street overpass.

O-024-004

Finally, as a community based organization, we feel strongly that MA DOT should establish a participatory community process for the design-build phase of the Green Line project. We recommend MA DOT establish a community advisory committee, with broad

O-024-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

O-024-002

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

O-024-003

DEIR/EA Section 3.9 describes the compatibility of the Green Line Extension with other regional projects, such as the conceptual reconstruction of McGrath Highway and the Urban Ring transit corridor initiative. MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses to

O-024-004

representation of the demographic spectrum of residents making up the communities along the corridor. We encourage the establishment of a field office in Somerville to facilitate ongoing communication between residents and project staff.

O-024-005

The following Principles were established and endorsed by a diverse body of Somerville residents as part of Community Corridor Planning. The highlighted principles are those that are most directly related to recommendations included in the DEIR, each followed by specific recommendations for the final EIR.

Core Community Principles for
Neighborhood Development Along the Green Line Corridor

Community Involvement: We want to make sure residents are included on an ongoing basis in the planning, design, and zoning changes to the stations and areas around them. Youth, artists, and others should help design stations, with attention to amenities. We need an easy and clear process for residents to address problems as they come up, with ways of immediately resolving unseen impacts.

- Ensure community participation in the next phase (presumed to be done as a design/build project)
- Public involvement will help to keep decision-making public (transparency)
- Need to have a field office that residents can go to with concerns on an ongoing basis
- Need neighborhood based community groups to be involved in planning around each station.

Increase Commercial and Economic Development: We want to see the creation of squares as destinations, with careful attention to mixed use of commercial/residential reuse of buildings, and economic development to increase the tax base.

- Environmental Impact Report should address Department of Transportation (DOT) commitment to economic development
- New MA DOT should fulfill its obligation to work with Secretary of Economic Affairs to promote station location and design that promotes economic development

Improve the Green Environment: We want a safe, environmentally friendly neighborhood with more green space, trees, and gardens, reduction of noise, avoidance of light pollution, and prevention of toxic chemicals in the air.

- Minimize noise of operations
- Mitigate during construction for noise, vibration, etc.
- Involve neighborhoods affected regarding noise and vibration
- Testing should be done immediately after project begins to determine if estimates for vibration and noise done for the DEIR are accurate.
- Only permit stops of commuter trains if converted to electric
- Consider dual-mode conversion of existing commuter trains
- Encourage Walking and Biking through safe, bike/pedestrian friendly design of streets and paths around and between stations.
- Improve plans for pedestrian and bike access, as well as parking for bicycles.

ensure, to the extent feasible, consistency with planning and other projects.

O-024-004

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

O-024-005

MassDOT has reviewed and considered the "Core Community Principles" for station area land use, presented by Community Corridor Planning. As described in the FEIR, Section 6.2 of the Public Involvement Plan, MassDOT will hold land use workshops to discuss related issues with the community.

- New Light Rail Vehicles (LRVs) should be designed to accommodate bicycles (like Portland LRVs)
- The Community Path and its important station connections must be designed and constructed simultaneously with the Green Line extension in order to facilitate direct pedestrian and bicycle access to the stations and to ensure a safe, attractive, and highly-functional Community Path.

Improve Access: We want above standard, safe access to and between stations for people with disabilities, strollers, and pedestrians in general.

Connecting Buses and Trains: We want to ensure inter-modal access between neighborhoods and stations, for new train service to be adequate and speedy, and for existing bus lines to continue to serve areas not connected by train.

- Need opportunity for future connection with other lines, such as Red Line at Porter Square.
- Several stations do not show bus stops, or nearest bus stop is located outside of station. Would be helpful to design station and alter bus route to allow for stops at the stations.

More Local Jobs: We want a fixed percentage of respectable jobs of all types with good wages and benefits for Somerville residents, from construction to permanent.

Keep and Add Local Businesses: We want locally owned, culturally diverse, clean businesses in commercial areas with employees who live in Somerville.

Keep Somerville Affordable: We want to make sure people of all economic means have the ability to afford housing and living costs, so that Somerville residents, such as child care workers, cab drivers, local business employees and others can stay here affordably.

Maintain Our Diversity: Preserve and encourage economic and ethnic diversity of residents and businesses.

We encourage MA DOT to plan all transportation projects on the basis of guiding principles for Transit Oriented Development (TOD), smart growth and quality of live impacts.

Thanks you for your hard work and attention to community input. We appreciate your careful review.

Sincerely,

Danny LeBlanc

MEPA

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson (holly.s.johnson@state.ma.us)
100 Cambridge Street, Suite 900
Boston , MA 02114
Reference: Green Line Extension Draft EIR (EEA #13886)

Dear Secretary Bowles,
I would like to thank the state for considering public comments on the DEIR, as we move into yet another critical phase of this project. Though there are clearly issues to be resolved, it is also clear that the Green Line Extension needs to move forward with caution with this document as the guide, though amendments or supplements to the DEIR should be required to address considerable issues such as the Maintenance Facility size and location in order to avoid delays that would make the project financially unviable.

O-025-001

The Somerville Community Health Agenda (SCHA) supports the Green Line extension and Community Path extensions into Somerville and Medford and applaud the state on securing for these to progress as integral projects which is crucial to long range healthy transportation planning for the region. SCHA has been an active partner in the Community Corridor Planning (CCP) project, related to the Green Line extension's impact in our city. A partnership of Groundwork Somerville, The Somerville Transportation Equity Partnership, the Somerville Community Corporation, and the Somerville Community Health Agenda, CCP is a grassroots, non-profit coalition committed to resident participating in planning for a livable, equitable Somerville. You will have received petitions and letters supporting the Core Community Principles for Neighborhood Development Along the Green Line, which was the product of multiple community neighborhood and city-wide meetings to determine these 11 key issues most important to residents which need to be considered in future planning. SCHA is also active in the Mystic Valley Active and Safe Transportation Network (M-VAST), which has been advocating for Safe Routes to Transit as part of the planning for the Mystic Valley area, in keeping with federal efforts to improve multi-modal connections in transportation planning

O-025-002

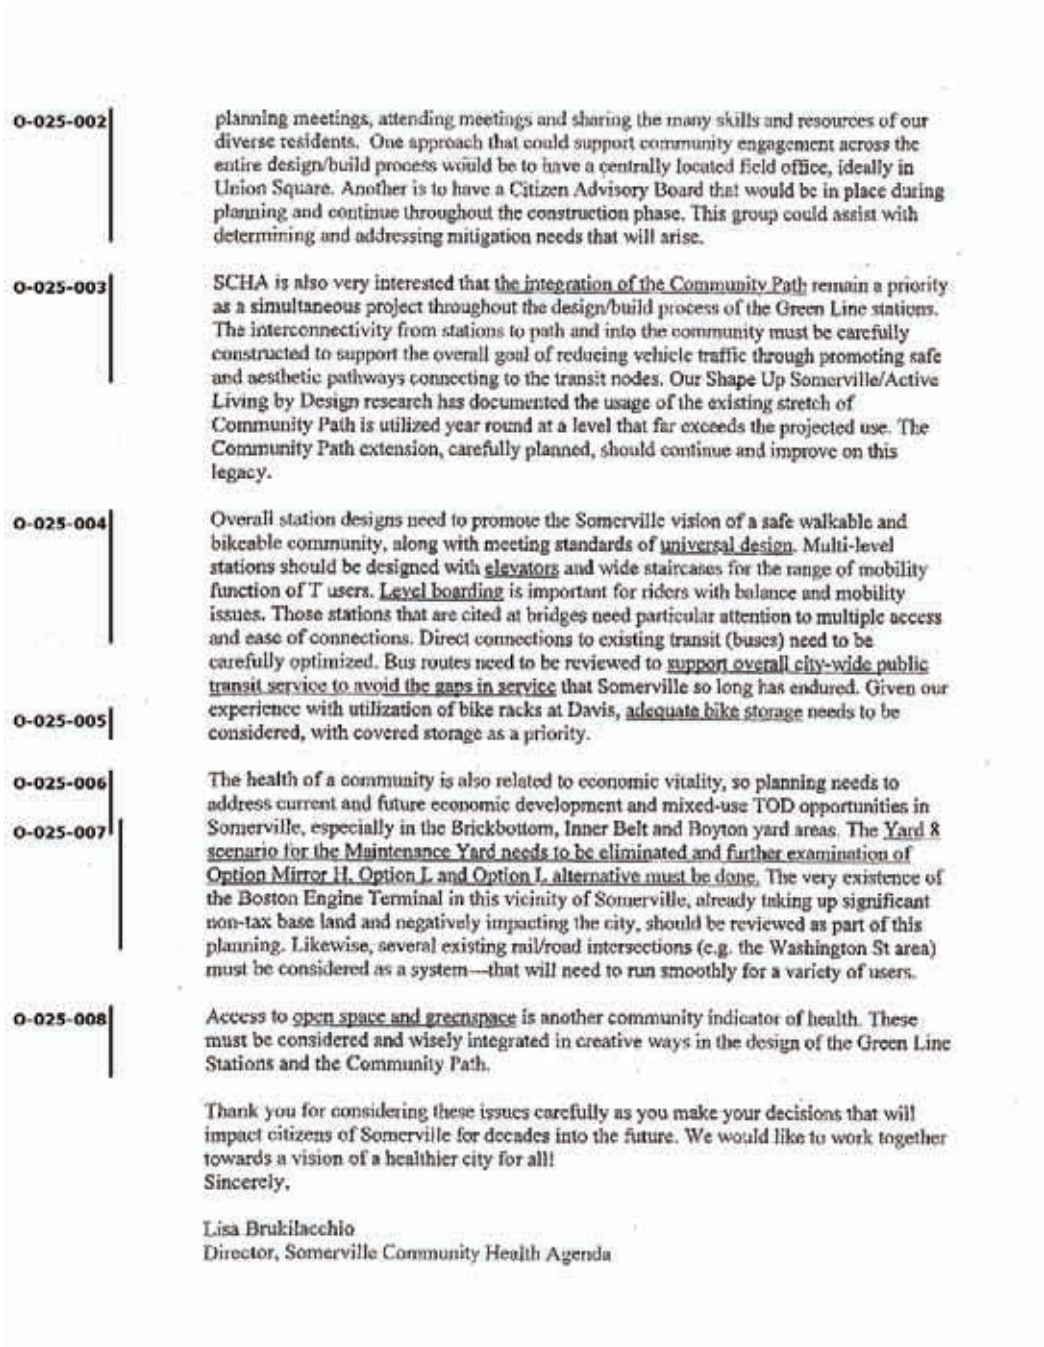
As a public health representative in the community and as a partner of the CCP, I feel compelled to plead that genuine community processes need to be integrated into the design/build phase of the Green Line and Community Path extensions. The CCP work, in tandem with municipal efforts, has proven that average citizens are committed to being part of determining the character of our community. Somerville people will participate in

O-025-001

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

O-025-002

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.



O-025-002 planning meetings, attending meetings and sharing the many skills and resources of our diverse residents. One approach that could support community engagement across the entire design/build process would be to have a centrally located field office, ideally in Union Square. Another is to have a Citizen Advisory Board that would be in place during planning and continue throughout the construction phase. This group could assist with determining and addressing mitigation needs that will arise.

O-025-003 SCHA is also very interested that the integration of the Community Path remain a priority as a simultaneous project throughout the design/build process of the Green Line stations. The interconnectivity from stations to path and into the community must be carefully constructed to support the overall goal of reducing vehicle traffic through promoting safe and aesthetic pathways connecting to the transit nodes. Our Shape Up Somerville/Active Living by Design research has documented the usage of the existing stretch of Community Path is utilized year round at a level that far exceeds the projected use. The Community Path extension, carefully planned, should continue and improve on this legacy.

O-025-004 Overall station designs need to promote the Somerville vision of a safe walkable and bikeable community, along with meeting standards of universal design. Multi-level stations should be designed with elevators and wide staircases for the range of mobility function of T users. Level boarding is important for riders with balance and mobility issues. Those stations that are cited at bridges need particular attention to multiple access and ease of connections. Direct connections to existing transit (buses) need to be carefully optimized. Bus routes need to be reviewed to support overall city-wide public transit service to avoid the gaps in service that Somerville so long has endured. Given our

O-025-005 experience with utilization of bike racks at Davis, adequate bike storage needs to be considered, with covered storage as a priority.

O-025-006 The health of a community is also related to economic vitality, so planning needs to address current and future economic development and mixed-use TOD opportunities in

O-025-007 Somerville, especially in the Brickbottom, Inner Belt and Boyton yard areas. The Yard 8 scenario for the Maintenance Yard needs to be eliminated and further examination of Option Mirror H, Option J, and Option L alternative must be done. The very existence of the Boston Engine Terminal in this vicinity of Somerville, already taking up significant non-tax base land and negatively impacting the city, should be reviewed as part of this planning. Likewise, several existing rail/road intersections (e.g. the Washington St area) must be considered as a system—that will need to run smoothly for a variety of users.

O-025-008 Access to open space and greenspace is another community indicator of health. These must be considered and wisely integrated in creative ways in the design of the Green Line Stations and the Community Path.

Thank you for considering these issues carefully as you make your decisions that will impact citizens of Somerville for decades into the future. We would like to work together towards a vision of a healthier city for all!
Sincerely,

Lisa Brukilacchio
Director, Somerville Community Health Agenda

O-025-003

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

O-025-004

The DEIR/EA and FEIR include conceptual station designs. Designs for each station will be refined during the Project's preliminary engineering stage. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), and the MBTA. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement as the station designs are refined.

O-025-005

The amount of bicycle storage at each station is based on ridership projections developed by CTPS. DEIR/EA Appendix D includes the methods CTPS used to analyze demand for bicycle parking. Detailed bicycle parking designs will be further developed during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

O-025-006

Direct and indirect impacts to land use are described in DEIR/EA Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the

presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for sustainable land use, which could further reduce automobile traffic congestion and improve air quality.

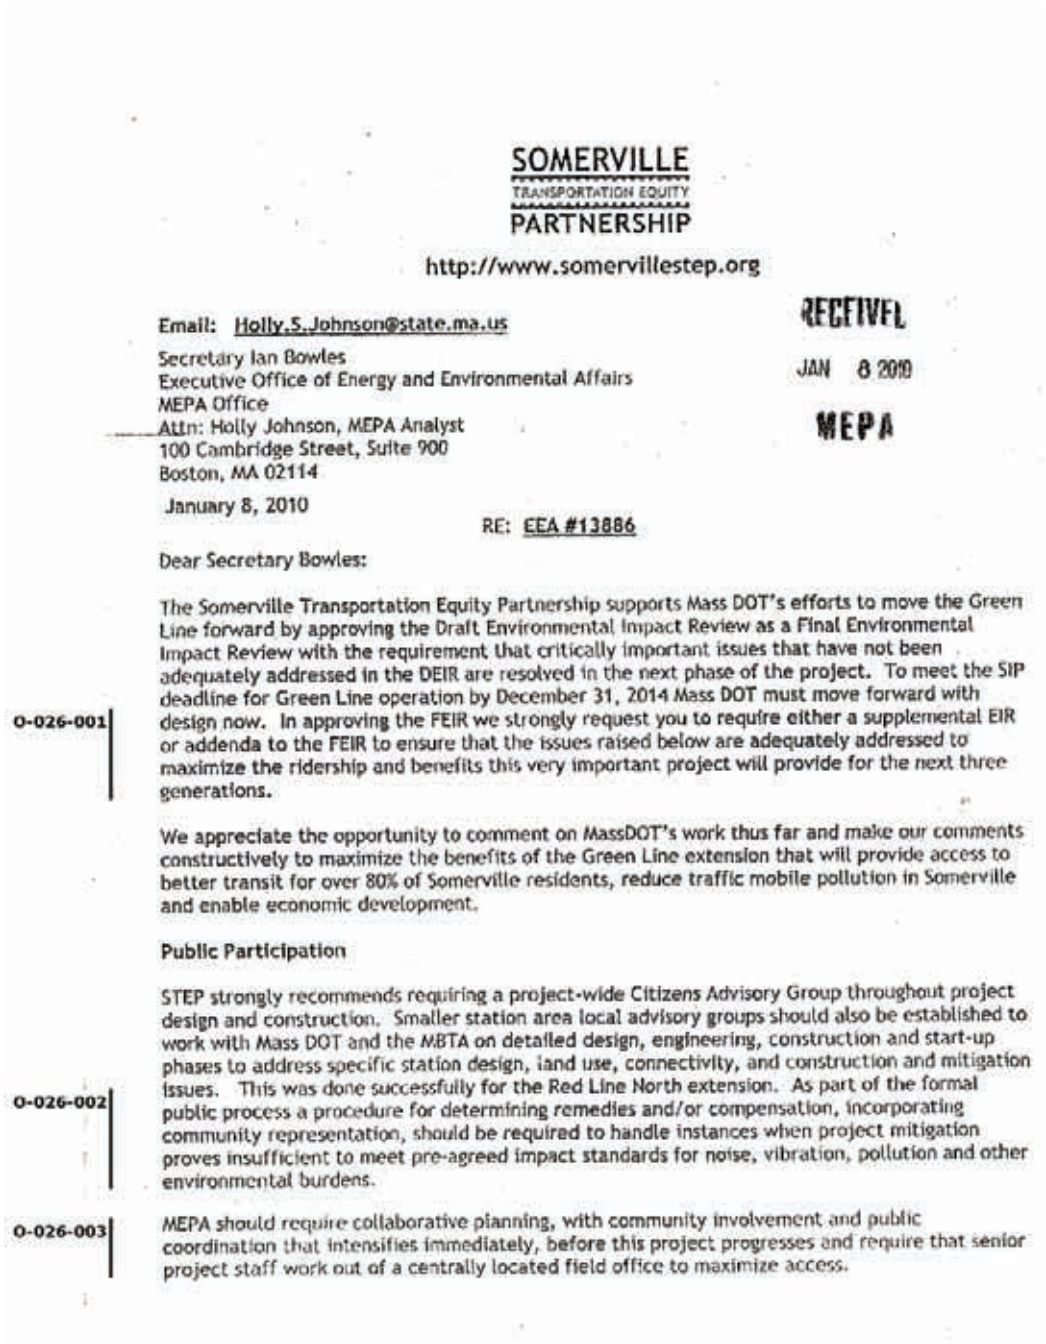
O-025-007

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

O-025-008

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area, which can facilitate access to open space and recreational areas.



SOMERVILLE
TRANSPORTATION EQUITY
PARTNERSHIP

Boston, MA 02114

January 8, 2010

RE: EEA #13886

Dear Secretary Bowles:

The Somerville Transportation Equity Partnership supports Mass DOT's efforts to move the Green Line forward by approving the Draft Environmental Impact Review as a Final Environmental Impact Review with the requirement that critically important issues that have not been adequately addressed in the DEIR are resolved in the next phase of the project. To meet the SIP deadline for Green Line operation by December 31, 2014 Mass DOT must move forward with design now. In approving the FEIR we strongly request you to require either a supplemental EIR or addenda to the FEIR to ensure that the issues raised below are adequately addressed to maximize the ridership and benefits this very important project will provide for the next three generations.

O-026-001

We appreciate the opportunity to comment on MassDOT's work thus far and make our comments constructively to maximize the benefits of the Green Line extension that will provide access to better transit for over 80% of Somerville residents, reduce traffic mobile pollution in Somerville and enable economic development.

Public Participation

STEP strongly recommends requiring a project-wide Citizens Advisory Group throughout project design and construction. Smaller station area local advisory groups should also be established to work with Mass DOT and the MBTA on detailed design, engineering, construction and start-up phases to address specific station design, land use, connectivity, and construction and mitigation issues. This was done successfully for the Red Line North extension. As part of the formal public process a procedure for determining remedies and/or compensation, incorporating community representation, should be required to handle instances when project mitigation proves insufficient to meet pre-agreed impact standards for noise, vibration, pollution and other environmental burdens.

O-026-002

MEPA should require collaborative planning, with community involvement and public coordination that intensifies immediately, before this project progresses and require that senior project staff work out of a centrally located field office to maximize access.

O-026-003

O-026-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

O-026-002

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

O-026-003

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project. As stated in Section 6.4, MassDOT and the MBTA will convene a Green Line Extension Design Working Group. This group will advise the agencies on design workshops, participate in the workshops and serve as a corridor advisory group during design.

Maintenance Facility & Regional Environmental Justice

O-026-004 The Yard 8 Option for the Maintenance Facility should be completely eliminated from consideration. There is unanimous opposition by the cities of Somerville and Cambridge and residents of both cities to use of Yard 8 for the Maintenance Facility. This location would increase Somerville's transportation infrastructure burden, negatively impact quality of life and obstruct needed economic development of Brick Bottom/Inner Belt. Avoidance of increasing such burdens in Somerville was clearly stated in the Secretary's Certificate to conduct the DEIR but ignored by Mass DOT in advancing this location as their preferred alternative without adequately considering other locations that lessen the impact of the facility and storage tracks on the city and residents

O-026-005 We ask that you require Mass DOT to carry out **full analysis of the Option L alternatives and Option H for siting the Maintenance Facility.** Fully considering these sites can result in a solution that minimizes land-takings and the impact on residents and future economic development. As part of this analysis we ask consideration from Mass DOT to minimize the number of cars stored near the Maintenance Facility and consider covering some of the storage tracks with a green roof that will increase open space in the city and enable possible air rights development in the future. This would reduce the negative impact of the storage tracks. While initially adding cost to the storage tracks construction, covered trains are easier to maintain, reduces noise for abutters, improves the condition of vehicles and turns a burden into an amenity_.

Station Design & Siting

O-026-006 Designing and constructing the Mystic Valley Parkway / Route 16 terminus should be carried out at the same time as the rest of the project to serve the large number of riders from Medford, Somerville and East Arlington who would board the Green Line at the Route 16 station.

O-026-007 Design of the Green Line stations should seamlessly connect all modes of transportation, including current and re-routed buses. Station designs should accommodate bus drop off and pick-up (for example, using bus pull-out pockets or curb extensions) with maximum integration of transit modes and minimal street disruption. Mass DOT should work with the communities to align bus routes and connect to Green Line stations at the start of Green Line service, as was done for the Red Line northwest extension.

O-026-008 Where possible station headhouses should be located on major streets and provide easy access for pedestrians and bicyclists. Design should enable access from both sides of the street and in all directions of travel. No parking should be provided at stations, but the design should permit car drop off. Working with the communities it is recommended to widen sidewalks leading to stations and provide safe cross walks where needed.

STEP agrees with the general locations selected for the stations in the DEIR, but we believe that the preliminary station designs do not maximize ease of access particularly where riders will access stations at overpass bridges. Mass DOT should work with community representatives to reconsider station designs to maximize ease of access, efficiency and lower construction costs. We believe that pedestrian and bus access to stations and high station visibility from major streets should be prioritized.

O-026-004

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

O-026-005

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

O-026-006

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension

O-026-009 Stations should provide adequate bicycle storage calculated based on a percentage of boardings at the stations. Bicycle storage should be sheltered from the elements, especially at Route 16, Lowell Street, and Union Square stations, to enable all-weather access.

O-026-010 We urge you to require that that Mass DOT follow the Federal Transit Administration's proposed policy change to bicycle/pedestrian access to public transportation recognizing the importance of maximizing multi-modal access. [Federal Register: November 13, 2009 (Volume 74, Number 218), http://edocket.access.gpo.gov/2009/E9-27240.htm.] This will maximize access to the stations and increase ridership. It will also increase the cost effectiveness of the project.

O-026-011 Stations should be constructed to meet ADA-compliant level boarding of low-floor Green Line cars that have sliding rather than accordion doors currently used on Green Line cars.

O-026-012 Station and station area designs must be developed through a formal and interactive community participation process to ensure that they fit into existing neighborhoods and support appropriate future mixed use development. Takings should be minimized to save the state money and to preserve land uses.

O-026-013 Now that construction of the relocated Lechmere Station is included in the project, station design should utilize the East Cambridge Planning Team's pedestrian-friendly design ideas and re-use suggestions for the old Lechmere Station.

O-026-014 The terminus station at Route 16 should incorporate the Medford Green Line Neighborhood Alliance's ideas for minimizing takings.

O-026-015 For the overall project station design and siting should involve active participation of knowledgeable transportation accessibility advocates to ensure accessibility requirements are fully addressed.

Community Path Integration & Preservation of Corridor Transit Potential

O-026-016 It is critical that the Community Path and its important station connections be designed and constructed simultaneously with the Green Line extension to facilitate direct pedestrian and bicycle access to the stations and to ensure a safe, attractive, and highly-functional Community Path. Delaying construction of the path reduces access to stations and increases the cost of construction once the extension is built. It should be noted that boarding estimates in the DEIR do not adequately reflect the extensive use in Somerville of the Community Path in increasing boardings at the Davis Square Red Line station.

O-026-017

O-026-018 It is critically important to require that track design and construction be done to enable adding future stations - between Lechmere and Washington Street / Union Square, between College Avenue and Route 16, and along a future Green Line extension to Porter Square that could serve both Cambridge and Somerville neighborhoods.

Economic Development & Regional Corridor Planning

O-026-019 Track, station and Green Line corridor area designs must provide full roadway and community access to Brickbottom Inner Belt and Lechmere Station through reconstruction of Route 28 as a neighborhood and local business friendly surface boulevard serving pedestrians and bicyclists as well as cars. Improved connectivity between both sides of Route 28 is crucial for economic development, pedestrian station access, and improved quality of life.

Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. The Proposed Project, with a terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Additionally, FEIR Chapter 4 includes a detailed description of College Avenue Station functioning as a terminal station.

O-026-007

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

O-026-008

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for

O-026-019 Coordinate the Green Line extension with calming of the McGrath/O'Brien Highway in Cambridge and Somerville. In Somerville this would involve eliminating the Washington St. Overpass to turn the concrete elevated highway into an at grade boulevard that would connect Union Square to East Somerville and facilitate economic development for the area. The condition of the overpass requires reconstruction and funding has been identified in the Boston MPO RTP. The community does not want this overpass reconstructed. Design of an at grade boulevard should be carried out while the Green Line is being designed. In Cambridge traffic calming will be required along McGrath-O'Brien Highway to accommodate pedestrians going to the relocated Lechmere Station.

O-026-020 The design and siting of the maintenance facility should not prevent development of a street grid in Inner Belt/Brick Bottom that enables access from North Point, McGrath-O'Brian Highway and Washington St.

O-026-021 State and other leading Transit-Oriented Development guidelines should be utilized to promote strategic regional economic development within a mixed use context in the Brickbottom Inner Belt and Union Square Boynton Yard districts. Maintaining diversity in people and businesses while improving the natural environment is critical. Access to open space and greenery promotes health.

The Somerville Transportation Equity Partnership has been strongly committed to making the Green Line extension a reality. We are very pleased to see this project moving forward after years of delay. As the Green Line moves forward we are seeking that the best decisions are made through a collaborative process to maximize the environmental, transportation and economic benefits of the Green Line extensions.

Sincerely,

Ellin Reisner, President
Somerville Transportation Equity Partnership

Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

O-026-009

The amount of bicycle storage at each station is based on ridership projections developed by CTPS. DEIR/EA Appendix D includes the methods CTPS used to analyze demand for bicycle parking. Detailed bicycle parking designs will be further developed during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

O-026-010

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

O-026-011

The Green Line Extension Project is being designed for fully accessible stations in compliance with ADA requirements. However, the issue of systemwide level boarding on the Green Line and modifications to existing vehicles is beyond the scope of this Project.

O-026-012

Direct and indirect impacts to land use are described in DEIR/EA Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for sustainable land use, which could further reduce automobile traffic congestion and improve air quality. DEIR/EA Section 5.3 describes the Project's potential temporary and permanent acquisitions. MassDOT will continue to evaluate opportunities to minimize these property impacts.

O-026-013

MassDOT has reviewed the suggestions submitted by the East Cambridge Planning Team. Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. These plans, including the pedestrian crossings of O'Brien Highway and associated street, crosswalk, and sidewalk designs will be further refined in the

preliminary engineering stage of the Project. As part of the Green Line Extension, MassDOT intends to demolish the existing Lechmere Station and prepare the site for potential future redevelopment. Based on the current requirements of the O'Brien Highway roadway improvements (as shown in FEIR Chapter 5, Lechmere Station), the existing bus shed must be removed.

O-026-014

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time.

O-026-015

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. Designs for each station will be further developed during the Project's preliminary engineering stage. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. Specific design details and station elements will be further developed during preliminary engineering. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access. The process for stakeholder coordination during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

O-026-016

MassDOT has committed to complete the final design of the proposed

Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

O-026-017

The 2008 ridership model was developed to include projects identified in the Regional Transportation Plan at that time.

O-026-018

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

O-026-019

DEIR/EA Section 3.9 describes the compatibility of the Green Line Extension with other regional projects, such as the conceptual reconstruction of McGrath Highway and the Urban Ring transit corridor initiative. MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses to ensure, to the extent feasible, consistency with planning and other projects.

O-026-020

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. The evaluation considers land use and connectivity impacts and opportunities associated with each maintenance facility site alternative. The preferred site, Option L,

does not prevent development of a new street grid in the Inner Belt and Brickbottom communities.

O-026-021

Direct and indirect impacts to land use are described in DEIR/EA Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for sustainable land use, which could further reduce automobile traffic congestion and improve air quality.

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA number #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Re: Green Line Extension Project (EEA # 13886)

Dear Secretary Bowles:

On behalf of Tufts University ("Tufts" or "the University"), I submit the following comments on the Draft Environmental Impact Report/Environmental Assessment (DEIR) for the Green Line Extension Project (the "Project"), EEA Number 13886.

O-027-001 Tufts is a strong supporter of the Project. We believe that the Project will provide an extremely vital transportation link between Medford/Somerville and downtown Boston, as well as the rest of the MBTA system, and will reduce vehicle travel and improve air quality in the region. However, we would like to comment on some details of the Project that, in our opinion, were not adequately addressed by the DEIR, and require further review. We respectfully request that the Secretary require

O-027-002 either a Final Environmental Impact Report (FEIR) or, at a minimum, a Supplemental Environmental Impact Report that addresses these issues.

I. Vehicular and Pedestrian Traffic

In Tufts' view, the major concerns relating to the proposed College Avenue station relate to traffic flow, pedestrian safety and parking in the adjacent area, particularly if the College Avenue station is the terminus of the Green Line.

Vehicular Traffic

O-027-003 Table 4.6-3 of the DEIR identifies the intersection of Boston Avenue at College Avenue as operating at a Level of Service (LOS) D during both the morning and afternoon peaks, and estimates an average delay of 55 seconds per vehicle during the morning rush and 47 seconds per vehicle during the evening rush. We believe that the current vehicle delay estimates for rush hour may well be understated, particularly heading west on College Avenue during the morning rush hour, when vehicles often are backed up for two or three light-cycles.

O-027-004 Table 5.5-5 anticipates only 40 peak hour "pick-up/drop-offs" at the College Avenue Station. The DEIR assumes that (i) each station will only attract riders within a one-mile radius and (ii) only five percent of riders at each station will arrive via drop-off/pick-up (as opposed to

Ballou Hall, Medford, MA 02155 | TEL: 617.627.4350 | FAX: 617.627.4350

O-027-001
MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

O-027-002
In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

O-027-003
DEIR/EA Table 4.6-3 presents a summary of overall intersection results for each study area intersection and accurately depict overall traffic operations at the intersection. Results by intersection movement are provided in Appendix F to the DEIR/EA. The results by movement match the commenter's observations regarding long delays heading west on College Avenue during the morning. These delays are included in the calculation of the overall intersection operations.

O-027-004
The assumption that each station will only attract riders within a one-mile radius is related only to the catchment area for pedestrians. For those that can arrive by other means (including parking as appropriate by alternative) the catchment area includes the 164 communities within the CTPS regional travel demand model. This also includes anyone currently using another MBTA service who might be better served by the green line.

The assumption related to pick-up/drop-off activity is based on a spring 2007 passenger survey conducted by CTPS. The intent of the survey was to understand the use by station and mode of the drop-offs at transit stations across Eastern Massachusetts. Within the urban core, the

O-027-004

walking, cycling or bus). We are concerned that these assumptions may not apply to a terminus station, and that the impact of pick-ups and drop-offs on both vehicular and pedestrian traffic is therefore understated. Additional study (including a survey of ridership at other Green Line terminus stations like Boston College and Heath Street) is required.

O-027-005

In particular, we believe that the DEIR does not adequately address the impact of vehicular traffic coming south on Boston Avenue. We are concerned that commuters coming from Medford and the north will drive south on Boston Avenue and be dropped off adjacent to the College Avenue station, and that many vehicles will then return home either by making a U-turn on Boston Avenue or by turning left onto College Avenue. This will have a significant adverse effect on both pedestrian and vehicular traffic at the Boston Avenue/College Avenue intersection, and will materially increase vehicular traffic in the surrounding area.

O-027-006

The location of drop-off areas needs to be more carefully studied. The traffic plan should provide a drop-off area for southbound vehicles on Boston Avenue. It may be possible to use the bus stops on Boston Avenue as drop-off points. The study should consider moving the bus stops and drop-off points away from the intersection of College and Boston Avenues to ease traffic and pedestrian congestion and provide for greater safety.

O-027-007

The DEIR proposes widening the College Avenue bridge to add a dedicated right-turn lane, but the ability of cars to make right turns onto the northbound lane of Boston Avenue could be significantly hampered by pedestrian traffic accessing the station. In addition, the station headhouse as currently designed may hamper visibility for motorists making right hand turns.

O-027-008

Unless cars are prohibited from making right turns on a red signal, pedestrian safety at the intersection may be significantly affected.

Pedestrian Traffic

The College Avenue bridge is the only pedestrian connection between the main portion of the Tufts campus on the western side of the rail right of way and the University facilities on the eastern side of the right of way, including Halligan Hall, Cousens Gymnasium, the University athletic facilities, Gantcher Sports and Convocation Center, Hamilton Pool, the Eliot-Pearson School and 80 George Street, which is the headquarters of two major administrative departments of the University. A significant proportion of the 7,600 students, faculty and staff at Tufts' Medford/Somerville campus cross the intersection of College Avenue and Boston Avenue daily. The DEIR designates a Pedestrian Level of Service (PLOS) of E for the intersection during both the morning and evening rush hours, although the average delays are between 55 and 59 seconds, which is very close to a PLOS of F (60 seconds or more) (Table 4.6-6). Nevertheless, Table 5.5-19 does not include any proposed pedestrian mitigation measures for the Boston Avenue/College Avenue intersection.

O-027-009

O-027-010

We urge the EOT, in designing the College Avenue Station and adjacent sidewalks and plazas, to take into account the normal movement of Tufts students, staff and visitors between the east and west sides of the rail right of way and across the College Avenue/Boston Avenue intersection. Given the volume of pedestrian traffic at the intersection, a pedestrian bridge should be seriously considered as an option.

survey results indicate surface rail stops have between 3 and 7 percent of their daily boardings originating from drop-offs. The average, 5 percent, was used in the DEIR/EA analysis. Additional information related to the survey can be found in the transportation appendix to the DEIR/EA.

A more detailed description of how College Avenue was modeled as a terminus station is provided in the FEIR.

O-027-005

The analysis assumes that 65 percent of pick-up/drop-off activity arrives via Boston Avenue from the North. This is roughly in line with the existing percentage of southbound versus northbound traffic. For locations that see an adverse impact due to the pick-up/drop off activity, mitigation to offset this impact has been recommended.

O-027-006

The provision and location of designated pick-up/drop-off areas will be further studied as part of the preliminary engineering associated with the stations.

O-027-007

The pedestrian phase at this traffic signal is an exclusive pedestrian phase, where pedestrians are only provided the walk signal when all approaches have a red indication. In this case, right turning traffic would legally have to yield to the pedestrian in a crosswalk. Additional considerations for pedestrians and potential sight distance issues associated with the College Avenue Station are being further evaluated as part of the preliminary engineering phase of the Project.

O-027-008

O-027-010 In light of the foregoing concerns, we believe that the FEIR or Supplemental Report needs to provide for specific measures to ensure pedestrian safety adjacent to the College Avenue Station.

II. Parking

O-027-011 Further study of the current parking conditions and anticipated changes in Medford parking regulations should be done in order to insure optimal operation of the College Avenue Station and its environs. We fully expect the City of Medford to implement a resident parking program before a new transit station opens, limiting the availability of on-street parking to commuters. Spaces in Tufts' parking lots are essential to the parking management program operated by the University in order to comply with applicable zoning agreements and neighborhood concerns. Limiting commuter parking on adjacent streets and in University lots will require administrative action (and enforcement costs) on the part of both the City of Medford and the University.

III. Noise and Vibration

O-027-012 As noted in Section 4.9.5 of the DEIR, there are a number of Tufts buildings adjacent to the rail right of way on Boston Avenue and Colby Street. Many of these buildings house scientific research extremely sensitive to any increase in the amount or frequency of noise or vibration. Some adverse impact can be anticipated because the new tracks will be closer to the adjacent properties than the existing tracks. Figures 5.7-4 and 5.8-4 do not identify all of the University buildings that will be affected by additional noise and vibration, and suggest that no effort is expected to be made as part of the Project to specifically mitigate those effects. For example, research conducted in the Psychology Department building at 490 Boston Avenue and in the Bray Laboratory at 504 Boston Avenue could be significantly impacted by the proposed project. Other University buildings that could be affected by additional noise and vibration include 177 and 179 College Avenue and 474 Boston Avenue (Curtis Hall). In addition, the University's master plan envisions the Boston Avenue corridor as a major research center for the University; for example, the University has developed plans to construct an Integrated Research Laboratory at 550-574 Boston Avenue at some point in the future.

The EOT should more carefully study the effects of noise and vibration on University buildings adjacent to the rail right of way, and should commit to make whatever efforts are reasonably necessary to mitigate adverse impacts on all adjacent University properties, taking into account planned future uses for those properties. Noise and vibration controls at these locations should be appropriate for protecting sensitive research facilities.

IV. Land Acquisitions and Easements

O-027-013 The DEIR does not provide adequate information on whether any takings would be required on the north side of the Harvard Street rail overpass. The University owns property on both the northeast and northwest sides of that overpass, at 4 Colby Street and 574 Boston Avenue.

Changes to the station headhouse are being reviewed as part of the preliminary engineering phase of the Project.

O-027-009

Pedestrian levels of service (PLOS) at the intersection of Boston Avenue and College Avenue are not anticipated to degrade due to the proposed project, therefore no mitigation is recommended. The proposed project includes the provision of a signalized pedestrian crossing on College Avenue northeast of the intersection. If warranted, a signalized crossing at that location would help to shorten the time a pedestrian would have to wait to cross College Avenue, thereby improving overall PLOS at the Boston Avenue/College Avenue intersection.

O-027-010

The conceptual plan for the College Avenue Station will be further developed during the preliminary engineering stage, taking into consideration municipal, neighbor, and other stakeholder concerns to the extent practical. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

O-027-011

DEIR/EA Chapter 6 and FEIR Chapter 8 list the traffic and parking measures to which MassDOT has committed to mitigate impacts. These mitigation measures address pedestrian and roadway traffic signal improvement needs, impacts during construction, and parking enforcement coordination. These measures will be further advanced during preliminary engineering.

O-027-012

As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate,

O-027-013 Figure 5.2-6 identifies takings on the southwest side of the College Avenue overpass (behind Curtis Hall) and on the northeast side of the overpass. More information is needed on the planned extent of these takings, whether they are sufficient to accommodate the planned widening of the College Avenue bridge, and how University operations will be affected by the takings.

V. Design Issues

O-027-014 The proposed College Avenue Station design (Figure 3.7-22) contemplates a station entry area that extends to the College Avenue bridge. We believe that the area would be better served by moving the entry area back approximately 40 feet so that pedestrian traffic can circulate freely through the plaza area. This change would also improve sightlines for vehicles making a right turn from the College Avenue Bridge to the northbound lane of Boston Avenue, but can be implemented in a way that does not require extending the Green Line tracks further to the north.

O-027-015 Section 3.7.3.6 indicates that handicap accessibility (given the eight percent grade along the College Avenue Bridge) was taken into account in designing the station, but does not provide any detail as to how this issue was addressed.

O-027-016 There is currently a 48-inch water main suspended from the north side of the College Avenue bridge. It is not clear from the DEIR whether the MWRA expects to relocate the water main as part of the Project, and if so, where the rerouted water main will be located.

O-027-017 We believe that an effort should be made to integrate the final design of the College Avenue station into the surrounding neighborhood, allowing the station to serve as a gateway to the area.

VI. Construction Mitigation

O-027-018 Section 3.7.6 lists the criteria that will be required for traffic management and construction staging. We agree with these criteria but would like to see more information on how they will be applied to the construction of the College Avenue station. In particular, we would emphasize that, because the College Avenue bridge is the only available means for Tufts students and staff to move between the west and east side of the rail right of way, adequate and safe pedestrian access cannot be interrupted. Plans for vehicular and emergency access to the University buildings adjacent to the College Avenue bridge should also be specifically addressed.

VII. Stormwater Discharge

O-027-019 Section 5.9.4 contemplates that stormwater would be discharged by underdrains installed beneath the rail right of way. The DEIR does not address how existing flooding problems will be mitigated as part of the Project. Two such areas adjacent to the University are beneath the Harvard Street rail overpass and behind 474 Boston Avenue (Curtis Hall). These issues (and similar issues in other parts of the Project) should be specifically addressed.

minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds. FEIR Chapter 8 describes specific proposed mitigation measures, plans for monitoring after construction, and next steps pertaining to mitigation. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

O-027-013

DEIR/EA Section 5.2 describes the Project's potential acquisitions. MassDOT is currently conducting detailed property surveys to obtain more specific data. MassDOT will continue to evaluate opportunities to minimize these property impacts.

O-027-014

The conceptual plan for the College Avenue Station will be further developed during the preliminary engineering stage, taking into consideration municipal, neighbor, and other stakeholder concerns to the extent practical. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

O-027-015

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. Designs for each station will be further developed during the Project's preliminary engineering stage. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. Specific design details and station elements will be further developed during preliminary engineering. In general, current station concepts include two elevators, escalators, and

01/08/2010 14:45 6176274219 TUFTS PAGE 05/1

Secretary Ian Bowles
Page 5 of 5
January 8, 2010

VIII. Selection of a Preferred Alternative

O-027-020 The DEIR identifies as its "proposed project" ending the Green Line at College Avenue, with a possible future extension to Mystic Valley Parkway/Route 16 (the "preferred alternative"). We believe the EOT should more carefully study design alternatives that would allow extending the Green Line to Mystic Valley Parkway/Route 16 that minimize the impact on the surrounding residential neighborhoods and do not require a taking of the buildings at 200 and 222 Boston Avenue. Such an extension will decrease the potential adverse impacts on traffic and pedestrian safety at the College Avenue/Boston Avenue intersection, and will increase ridership and potential environmental benefits.

O-027-021 We are strongly opposed to any taking of 200 Boston Avenue, not only because of the expense of condemnation and loss of tax revenues, but also because of the significant effect such a taking would have on the University. The University already maintains research facilities in the building and plans to acquire substantial additional space there for laboratory use beginning in 2011. Any estimate of the cost of a taking must include payment for substantial leasehold improvements made by the University as well as relocation of our research tenants. We

O-027-022 therefore believe that the Secretary should require additional study on how the noise and vibration impact on 200 Boston Avenue will be mitigated if the Green Line is extended to Route 16, based on a presumption that the building will not be taken.

Tufts University wishes to reiterate its support for the Project. We hope that the issues we have raised can be fully addressed by the EOT in a Final Environmental Impact Report so that the Project may move forward as soon as possible. Thank you for the opportunity to review and comment on this project.

Sincerely,

Mary R. Jeka
Vice President for University Relations
Tufts University

stairs, and meet the MBTA's requirements for access. The process for stakeholder coordination during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

O-027-016

MassDOT will coordinate with utilities providers to minimize impacts to existing utility lines. Utilities on bridges identified for reconstruction would be rebuilt with the bridges.

O-027-017

Please see response to Comment O-027-015.

O-027-018

During preliminary engineering detailed construction management plans will be developed.

O-027-019

Project drainage improvements will address stormwater management within the Project right-of-way, but not adjacent streets and properties. Exceptions may exist where street reconfigurations are required for the Project. These issues will be considered further during preliminary engineering.

O-027-020

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input

on station design and layout, neighborhood impacts, economic development, and other area planning issues.

O-027-021

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. 200 Boston Avenue would not be acquired for the Proposed Project and not building impacts are anticipated. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

RE: Comments on the Green Line Extension Project DEIR, EEA #13886

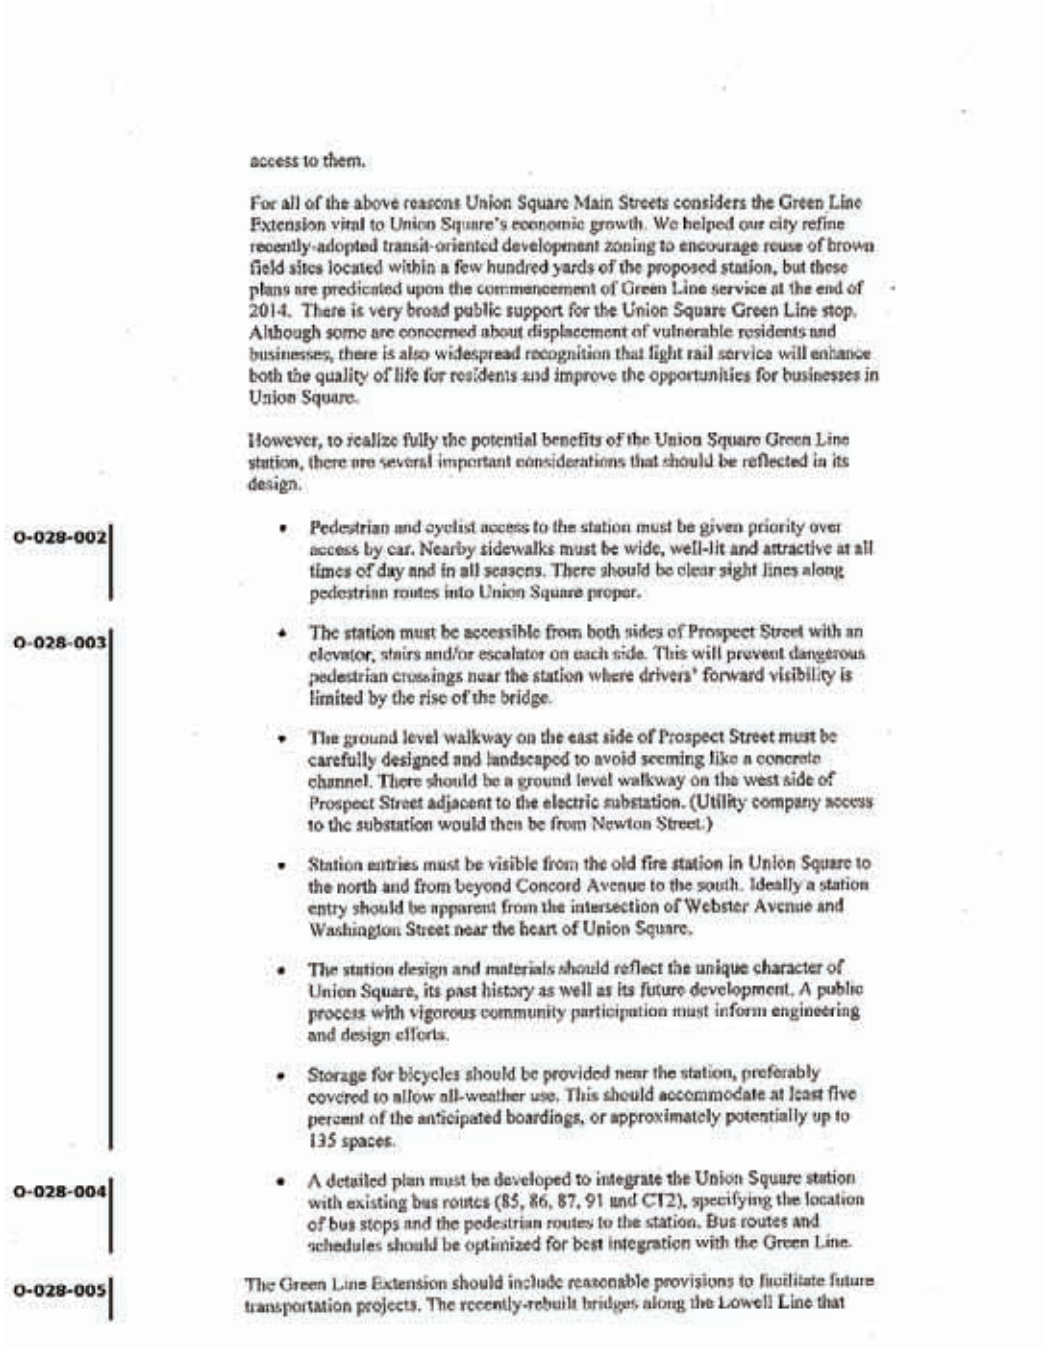
Secretary Bowles and Ms. Johnson,

Union Square Main Streets is pleased to see the Green Line Extension Project reach an important milestone in releasing the DEIR. We strongly support this important expansion of transit services beyond Lechmere Station, and hope to see the Extension in full operation at the end 2014. While the DEIR deals satisfactorily with most of the matters required by the Secretary's EENF Certificate, we feel there are some critical issues where the DEIR must be extended or modified. We trust that EOEEA and MassDOT will be able to determine the best method to achieve such improvements without missing the mandated completion date of December 31, 2014.

Union Square Main Streets is a 501(c)3 organization whose mission is to improve the vitality of Union Square: the oldest, largest and most diverse commercial district in Somerville. Historically Union Square has always been a transportation hub and in the early 20th century was served by several streetcar lines as well as by passenger trains on the nearby Fitchburg Line. But today, in spite of five bus routes that go through it, mobility is limited by roads that are heavily congested at peak times with regional traffic. Much of Union Square is an environmental justice community, and within a few hundred yards of the proposed station there are elderly and disabled housing complexes, pre-K and elementary schools, and affordable housing developments. The Square's transit-dependent population is ready for, and deserving of, better public transportation and its businesses are eager to grow when their customers, employees and supplier have more convenient

O-028-001

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.



access to them.

For all of the above reasons Union Square Main Streets considers the Green Line Extension vital to Union Square's economic growth. We helped our city refine recently-adopted transit-oriented development zoning to encourage reuse of brown field sites located within a few hundred yards of the proposed station, but these plans are predicated upon the commencement of Green Line service at the end of 2014. There is very broad public support for the Union Square Green Line stop. Although some are concerned about displacement of vulnerable residents and businesses, there is also widespread recognition that light rail service will enhance both the quality of life for residents and improve the opportunities for businesses in Union Square.

However, to realize fully the potential benefits of the Union Square Green Line station, there are several important considerations that should be reflected in its design.

O-028-002

- Pedestrian and cyclist access to the station must be given priority over access by car. Nearby sidewalks must be wide, well-lit and attractive at all times of day and in all seasons. There should be clear sight lines along pedestrian routes into Union Square proper.

O-028-003

- The station must be accessible from both sides of Prospect Street with an elevator, stairs and/or escalator on each side. This will prevent dangerous pedestrian crossings near the station where drivers' forward visibility is limited by the rise of the bridge.
- The ground level walkway on the east side of Prospect Street must be carefully designed and landscaped to avoid seeming like a concrete channel. There should be a ground level walkway on the west side of Prospect Street adjacent to the electric substation. (Utility company access to the substation would then be from Newton Street.)
- Station entries must be visible from the old fire station in Union Square to the north and from beyond Concord Avenue to the south. Ideally a station entry should be apparent from the intersection of Webster Avenue and Washington Street near the heart of Union Square.
- The station design and materials should reflect the unique character of Union Square, its past history as well as its future development. A public process with vigorous community participation must inform engineering and design efforts.
- Storage for bicycles should be provided near the station, preferably covered to allow all-weather use. This should accommodate at least five percent of the anticipated boardings, or approximately potentially up to 135 spaces.

O-028-004

- A detailed plan must be developed to integrate the Union Square station with existing bus routes (85, 86, 87, 91 and CT2), specifying the location of bus stops and the pedestrian routes to the station. Bus routes and schedules should be optimized for best integration with the Green Line.

O-028-005

The Green Line Extension should include reasonable provisions to facilitate future transportation projects. The recently-rebuilt bridges along the Lowell Line that

O-028-002

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

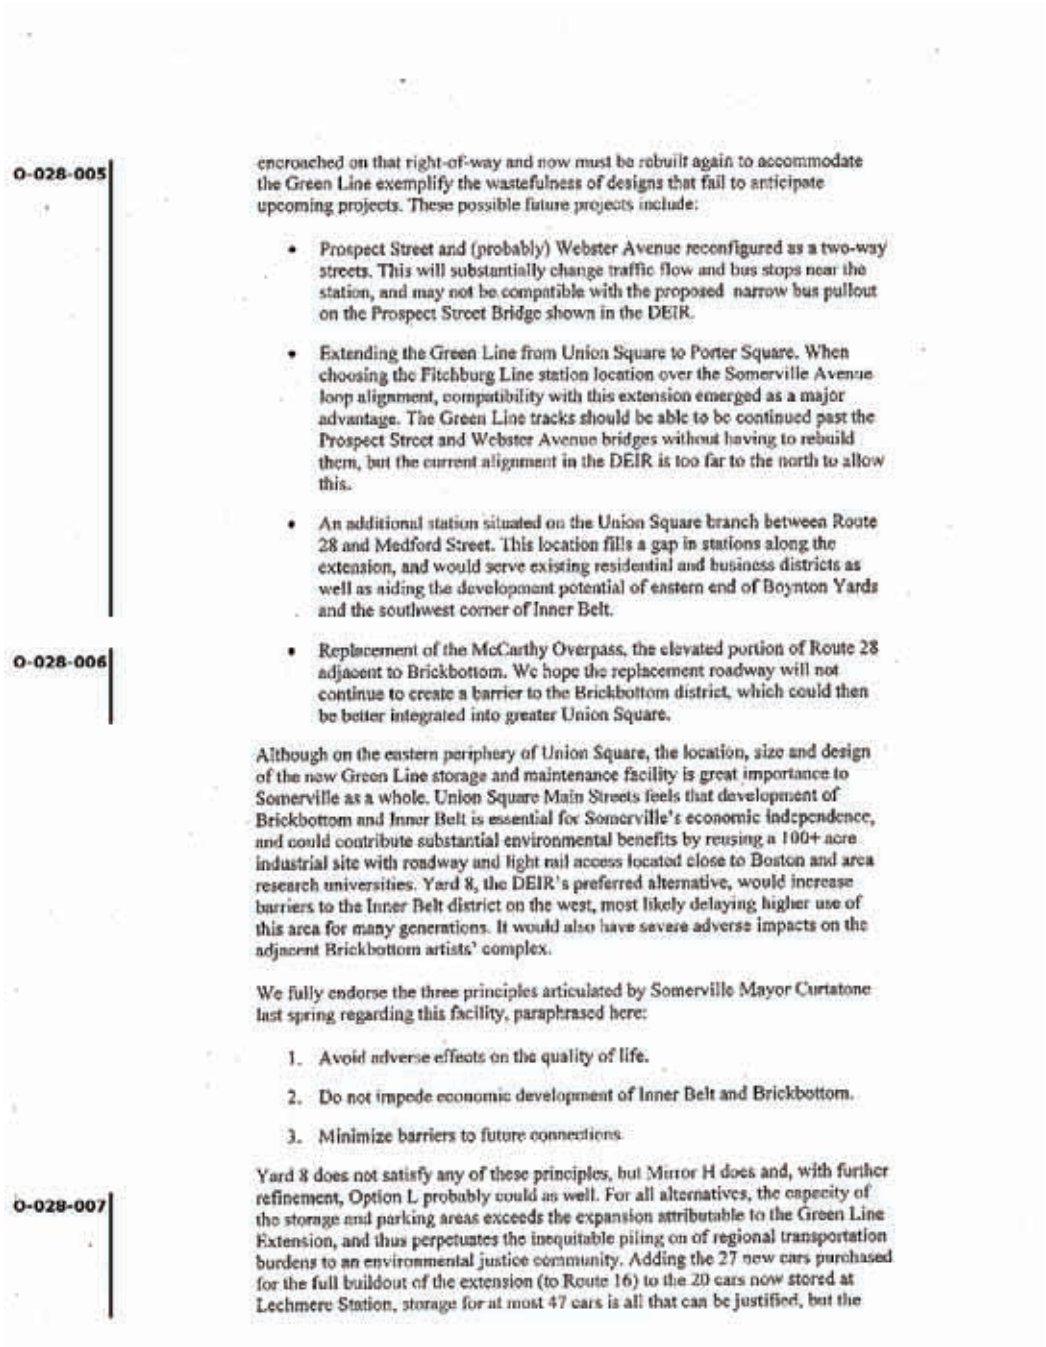
In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

O-028-003

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. These stations are designed to be consistent with MBTA standards and compliant with ADA. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

O-028-004

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work



O-028-005

encroached on that right-of-way and now must be rebuilt again to accommodate the Green Line exemplify the wastefulness of designs that fail to anticipate upcoming projects. These possible future projects include:

- Prospect Street and (probably) Webster Avenue reconfigured as a two-way streets. This will substantially change traffic flow and bus stops near the station, and may not be compatible with the proposed narrow bus pullout on the Prospect Street Bridge shown in the DEIR.
- Extending the Green Line from Union Square to Porter Square. When choosing the Fitchburg Line station location over the Somerville Avenue loop alignment, compatibility with this extension emerged as a major advantage. The Green Line tracks should be able to be continued past the Prospect Street and Webster Avenue bridges without having to rebuild them, but the current alignment in the DEIR is too far to the north to allow this.
- An additional station situated on the Union Square branch between Route 28 and Medford Street. This location fills a gap in stations along the extension, and would serve existing residential and business districts as well as aiding the development potential of eastern end of Boynton Yards and the southwest corner of Inner Belt.

O-028-006

- Replacement of the McCarthy Overpass, the elevated portion of Route 28 adjacent to Brickbottom. We hope the replacement roadway will not continue to create a barrier to the Brickbottom district, which could then be better integrated into greater Union Square.

Although on the eastern periphery of Union Square, the location, size and design of the new Green Line storage and maintenance facility is great importance to Somerville as a whole. Union Square Main Streets feels that development of Brickbottom and Inner Belt is essential for Somerville's economic independence, and could contribute substantial environmental benefits by reusing a 100+ acre industrial site with roadway and light rail access located close to Boston and area research universities. Yard 8, the DEIR's preferred alternative, would increase barriers to the Inner Belt district on the west, most likely delaying higher use of this area for many generations. It would also have severe adverse impacts on the adjacent Brickbottom artists' complex.

We fully endorse the three principles articulated by Somerville Mayor Curtatone last spring regarding this facility, paraphrased here:

1. Avoid adverse effects on the quality of life.
2. Do not impede economic development of Inner Belt and Brickbottom.
3. Minimize barriers to future connections.

O-028-007

Yard 8 does not satisfy any of these principles, but Mirror H does and, with further refinement, Option L probably could as well. For all alternatives, the capacity of the storage and parking areas exceeds the expansion attributable to the Green Line Extension, and thus perpetuates the inequitable piling on of regional transportation burdens to an environmental justice community. Adding the 27 new cars purchased for the full buildout of the extension (to Route 16) to the 20 cars now stored at Lechmere Station, storage for at most 47 cars is all that can be justified, but the

with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

O-028-005

DEIR/EA Section 3.9 describes the compatibility of the Green Line Extension with other regional projects, such as the conceptual reconstruction of McGrath Highway and the Urban Ring transit corridor initiative. MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses to ensure, to the extent feasible, consistency with planning and other projects.

Additionally, as the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

O-028-006

DEIR/EA Section 3.9 describes the compatibility of the Green Line Extension with other regional projects, such as the conceptual reconstruction of McGrath Highway and the Urban Ring transit corridor initiative. MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses to ensure, to the extent feasible, consistency with planning and other projects that are not part of the Green Line Extension Project.

O-028-007

DEIR asks for 72 to 80 cars which does not seem needed and may not be the best use finacial resources. Land within the 43 acre Boston Engine Terminal in Inner Belt should be used first to the fullest extent possible to avoid taking any more Somerville property for additional low-value, tax-exempt maintenance and storage purposes.

O-028-008

There is a great deal of additional study and community input required to finalize the maintenance facility design, and this should be conducted in parallel with preliminary engineering for the rest of the Green Line Extension. However this is done -- via a Supplemental EIR for the maintenance facility, an addendum to the EIR, or using the MEPA Section 11.09 Special Review Procedure -- it should not be an excuse to further delay this project.

O-028-009

Although we recognize the funding challenges facing the Commonwealth, it would truly be a false economy to fail to construct the entire Green Line Extension to Mystic Valley Parkway / Route 16. The eleventh-hour truncation of the Medford branch lessens air quality benefits, and arguably does not meet the SIP requirement to serve Medford Hillside. We also believe the Community Path should be designed and constructed at the same time as the Green Line Extension. As experience at Davis Square has shown, the Path will be a very cost-effective way to increase ridership on the Green Line Extension.

O-028-010

O-028-011

A final but important request is that an effective Citizen Advisory Committee should be created for the project as a whole, and a separate CAC established for the Union Square station and vicinity. While Somerville in general has been interested and engaged by the Green Line Extension, Union Square has been doubly so. The residents and businesses here are eager to help produce the best possible design for our station within project schedule and budget constraints. We look forward to working with the project team to design a Union Square station that exceeds everyone's expectations and provides the highest return on the Commonwealth's investment.

On behalf of the Board of Directors,

Livingston Parsons III
President

O-028-007

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

O-028-008

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

O-028-009

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. The Proposed Project, with a terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Additionally, FEIR Chapter 4 includes a detailed description of College Avenue Station functioning as a terminal station.

O-028-010

MassDOT has committed to complete the final design of the proposed

Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

O-028-011

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project. As stated in Section 6.4, MassDOT and the MBTA will convene a Green Line Extension Design Working Group. This group will advise the agencies on design workshops, participate in the workshops and serve as a corridor advisory group during design.

UNIVERSITY PLACE CONDOMINIUM TRUST
72 - 86 Newbern Avenue, Medford MA 02155

January 7, 2010

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs

Dear Secretary Bowles,

Thank you for the opportunity to provide some comments on the MBTA Green Line Extension Noise and Vibration Technical Report. We are responding on behalf of the residents of University Place Condominiums (UPC) in Medford, MA. We are 48 people living in a block-long brick building at the end of Newbern Avenue, directly next to the commuter rail tracks. We are parallel to, and 3 blocks over from, 7/9 Winchester Place, which is identified as "Long-term noise Site 7" in Figure 27 of Appendix A-4 of the report. Although we have not had an opportunity to discuss the report with the 14 neighbors who live across the street, we anticipate that they would share similar concerns.

We have the following comments:

Noise:

O-029-001 O-029-002
The report indicates UPC will fall into a severe impact area under the current plan, especially with the commuter rail expected to move even closer to our building and neighborhood. The more frequent and additional noise from the Green Line, even at a lower decibel, will further affect the neighborhood because these trains will be running more often. We have lived with the noise and the rumble from the commuter rail and have managed to adapt. But the Green Line will certainly increase the overall noise burden. Finally, the current report does not appear to address constructive noise interference when both the Green Line and commuter rail overlap the neighborhood, which is likely to be louder than any single individual measurement.

O-029-003
We therefore request that noise mitigation walls be required to mitigate noise at or below the current noise levels. A follow up report of the impacts post construction should be completed to prove that mitigation efforts have proven successful. This should guarantee a reasonable quality of life for the residents outside of the building. For those residents who are likely to suffer additional interior burdens, measurements should be made indoors and windows should be offered, at no cost to the residents, to help minimize interior noise, as has been done with airport projects. Ideally the building should be retrofitted with double pain windows to dampen the increased noise.

Vibration:

O-029-004
The report indicates UPC will also fall under a severe impact from vibration. Although advanced (current) rail technology is beyond our understanding at this time, it appears that this is being addressed through various technologies. One of our main concerns is the brick structure of our building and the affect on it from additional Green Line and/or rail traffic. The report does not seem to deal directly with this concern, so we don't understand how it can be addressed or guaranteed. With the significant investments we have made in our housing, we are concerned about potential property devaluation and increased frequency of repairs to the masonry and/or substructure.

We recommend that a 5 to 10 year study be performed to insure that the vibration and noise controls are proving to be effective and maintain levels at or below the original conditions. We also recommend

O-029-001
As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds. FEIR Chapter 8 describes specific proposed mitigation measures, plans for monitoring after construction, and next steps pertaining to mitigation. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

O-029-002
The potential noise and vibration impacts identified in DEIR/EA Chapter 5 account for the collective impacts of rail uses in the area. In other words, simultaneous Green Line and commuter rail movements are included in the analysis.

O-029-003
Please see response to Comment O-029-001.

O-029-004
Please see response to Comment O-029-001.

O-029-004 that the study start a few years before the Green Line begins operation so as to obtain a baseline, which we believe to be of particular importance in the case of the potential vibration damage to the building

Parking:

O-029-005 We already suffer from inadequate parking for residents, which is further strained by out-of-state tenants, commercial parking and neighborhood students. In reviewing the land plot plans, it appears that UPC is likely to lose three or four deeded parking spaces due to the expansion of the right of way for the MBTA/Commuter Rail. Loss of these spaces, combined with more traffic - particularly if the Route 16 station is not built concurrently or with inadequate parking - would prove unsatisfactory and an increased burden to the local residents.

How to adequately determine or reduce this impact is beyond our capabilities, but as local citizenry we would like some reassurance that our overall quality of life will not be negatively affected by the construction and/or operation of the Green Line extension.

Our neighbor Brendan Driscoll, of Driscoll Electric, has stated he would consider selling his property to be turned into the missing piece of a horseshoe road between Newbern Avenue and Morton Avenue, which could potentially address the "taken parking spots" and/or additional residential parking. Although we are not completely certain that we will lose parking spots, we realize it is possible and therefore request clarification of this issue.

Construction:

O-029-006 We do not believe the report fully addresses the disruption that will be caused by construction. We would like further explanation, particularly related to the Broadway commuter rail bridge which most of us use several times a day. We would like to know specifically how the bridge will be affected. Traffic congestion, noise, and disruption to the neighborhood during construction are particular areas of concern.

Traffic:

O-029-007 Failure to build the Route 16 station at all or in a timely manner, or building it without adequate parking is a concern for us. The residents of Medford do not wish to build a "new Alewife" super station. The Green Line extension is likely to attract some additional commuters but less likely from distant communities since it does not offer the same underground and "high speed" efficiencies of a subway line. But we are concerned about the lack of additional parking, particularly in the absence of a terminus parking garage, as well a lack of adequate bicycle parking for those likely to commute from the surrounding communities.

We appreciate the extensive work that has gone into this project and have reviewed this report to the best of our ability. As a group of environmentally responsible citizens we believe strongly in public transportation and ultimately want this project to succeed, even in our own backyard, which we mean *literally*, not just figuratively. But as responsible neighbors, homeowners and community members, we must ensure that the project is undertaken in a way that does not unduly disrupt our lives, our property or our neighborhood.

We hope you will give careful consideration to our concerns and would be happy to provide any further information you require.

Sincerely,

Adam Holland, Leslie Kramer, Daryl Marshall, Ralph Preston, Michael Schwartz
Trustees of University Place Condominiums

O-029-005

The Green Line Extension Project includes no taking on the east side of the tracks near Ball Square Station. Therefore, deeded parking spaces at the University Place Condominiums will not be impacted.

The Project is intended, in part, to relieve traffic congestion, as described in DEIR/EA Chapter 2, Purpose and Need. Some station access points for parking or passenger drop-off/pick-up are likely to impact local traffic flow, as outlined in DEIR/EA Section 5.5, Traffic. As described in DEIR/EA Chapter 6, these impacts will be minimized to the extent practical. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes how MassDOT will coordinate with municipalities and stakeholders to address traffic and parking concerns.

O-029-006

DEIR/EA Chapter 6 and FEIR Chapter 8 list the traffic and parking measures to which MassDOT has committed to mitigate impacts. These mitigation measures address pedestrian and roadway traffic signal improvement needs, impacts during construction, and parking enforcement coordination. These measures, including construction management plans, will be further advanced during preliminary engineering.

O-029-007

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

WACHUSETT GREENWAYS

RECEIVED

JAN 8 2010

MEPA

7 January 2010

Secretary Ian Bowles
Executive Office of Energy & Environmental Affairs
MEPA Office, Attn: Holly Johnson
100 Cambridge Street, Suite 900
Boston, MA 02114

Re: Green Line Extension Draft EIR (EEA #13886)

Dear Secretary Bowles:

Wachusett Greenways is an all-volunteer grassroots group which is building multi-use rail trail in Central Mass. With the help of the Dept. of Conservation & Recreation, the Office of Tourism, the towns, foundations and private donors, we have completed about 14 miles of trail west of the Wachusett Reservoir. The Mass Central Rail Trail has been projected as a key east-west trail by the Dept. of Conservation & Recreation in its publication Commonwealth Connections. We see ourselves as a contributing partner to this 104 mile connection between Northampton and Boston.

O-030-001

The extension of the Green Line provides both challenge and opportunity. If the "T" extension is built through a restricted cut in Somerville without consideration of the multi-use trail alongside, the trail connection will be effectively ruled out. In this era of encouraging alternate means of transportation (especially for the heavily concentrated population of Somerville), and the state's interest in continuous linear connections, this would be a significant loss.

O-030-002

Therefore, Wachusett Greenways urges your consideration of the proposal of the MCRT Coalition in our group letter of 5 January 2010: **To plan and construct simultaneously, both the Green Line extension and the Somerville Community Path between Lowell Street and Lechmere Square.**

We believe that it's a "now or never" opportunity.

Thank you for listening.

Edward P. Yaglou, Director
for Wachusett Greenways, Inc.

P.O. Box 121 • Holden • MA • 01520 • (508) 829-3954

O-030-001

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

O-030-002

MassDOT is committed to completing all planning, design, and engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community Path between Lowell Street and Inner Belt Road. MassDOT is not able at this point to commit to funding the construction of the Community Path. The limits of the path were predicated on the connections to Lechmere being made through the Inner Belt area via Inner Belt Road and the proposed Urban Ring Bridge into the Lechmere area. However, the cessation of planning for the Urban Ring Project has changed the timing of this anticipated connection. MassDOT is unable to assume responsibility for designing the Urban Ring Bridge as part of the Green Line Extension Project. That being said, MassDOT is committed to working with the City of Somerville, residents and businesses in the Brickbottom and Inner Belt neighborhoods, and Community Path advocates to design the Path to create improved connectivity within the Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension.

Boston, MA 02114

Re: MEPA No. 13886
Green Line Extension Project, Cambridge/Somerville/Medford
Draft Environmental Impact Report/Environmental Assessment (DEIR/EA)

Dear Secretary Bowles:

WalkBoston appreciates the opportunity to provide comments on the Draft Environmental Impact Report/Environmental Assessment (DEIR/EA) for the Green Line Extension Project in Cambridge, Somerville and Medford, MA. The plan is an exciting addition to the corridor, as it provides new transit access in a very densely built urban area where transit is likely to quickly become a principal mode of travel for many residents.

Pedestrian access to the transit stations is of great consequence if the project is to prosper and serve its riders well. The need for good walking access is strongly reinforced by the lack of parking at the stations. In addition, the provision of the Community Path along the right-of-way will draw walkers from greater distances than might otherwise be expected. The proposed path is similar to other successful joint transit-walk-bike routes in metro Boston, the Davis-Alewife Linear Path and the Southwest Corridor Path.

A summary of our comments is provided below and followed by detailed station area comments.

O-031-001

1. Integrate the construction of the Community Path with the Green Line Extension project to ensure completion of the Path. The Path will generate a significant number of walk-in transit trips – exactly the outcome that is desired by the community, the MBTA and the FTA.

O-031-002

2. Extend the Green Line to Route 16 because new transit service should be provided to this densely developed portion of the metro area. Additional walking options are needed for access to the station by people walking from nearby portions of West Medford.

O-031-003

3. Provide good pedestrian access from all directions into the stations. (A best-practice example of pedestrian access is Davis Square Station, where access is provided by the east-west Community Path and north-south by the local streets intersecting the Community Path.)
   - East-West access to most of the stations along the Green Line will be served by the east-west Community Path parallel to the tracks.
   - North-South access for most of the stations can only be provided via intersecting streets, and should be maximized to encourage pedestrians.

MAKING OUR COMMUNITIES MORE WALKABLE

[illegible] | 45 School Street | Boston MA 02108 | T: 617.367.9255 | F: 617.367.9285 | info@walkboston.org | www.walkbost

O-031-001

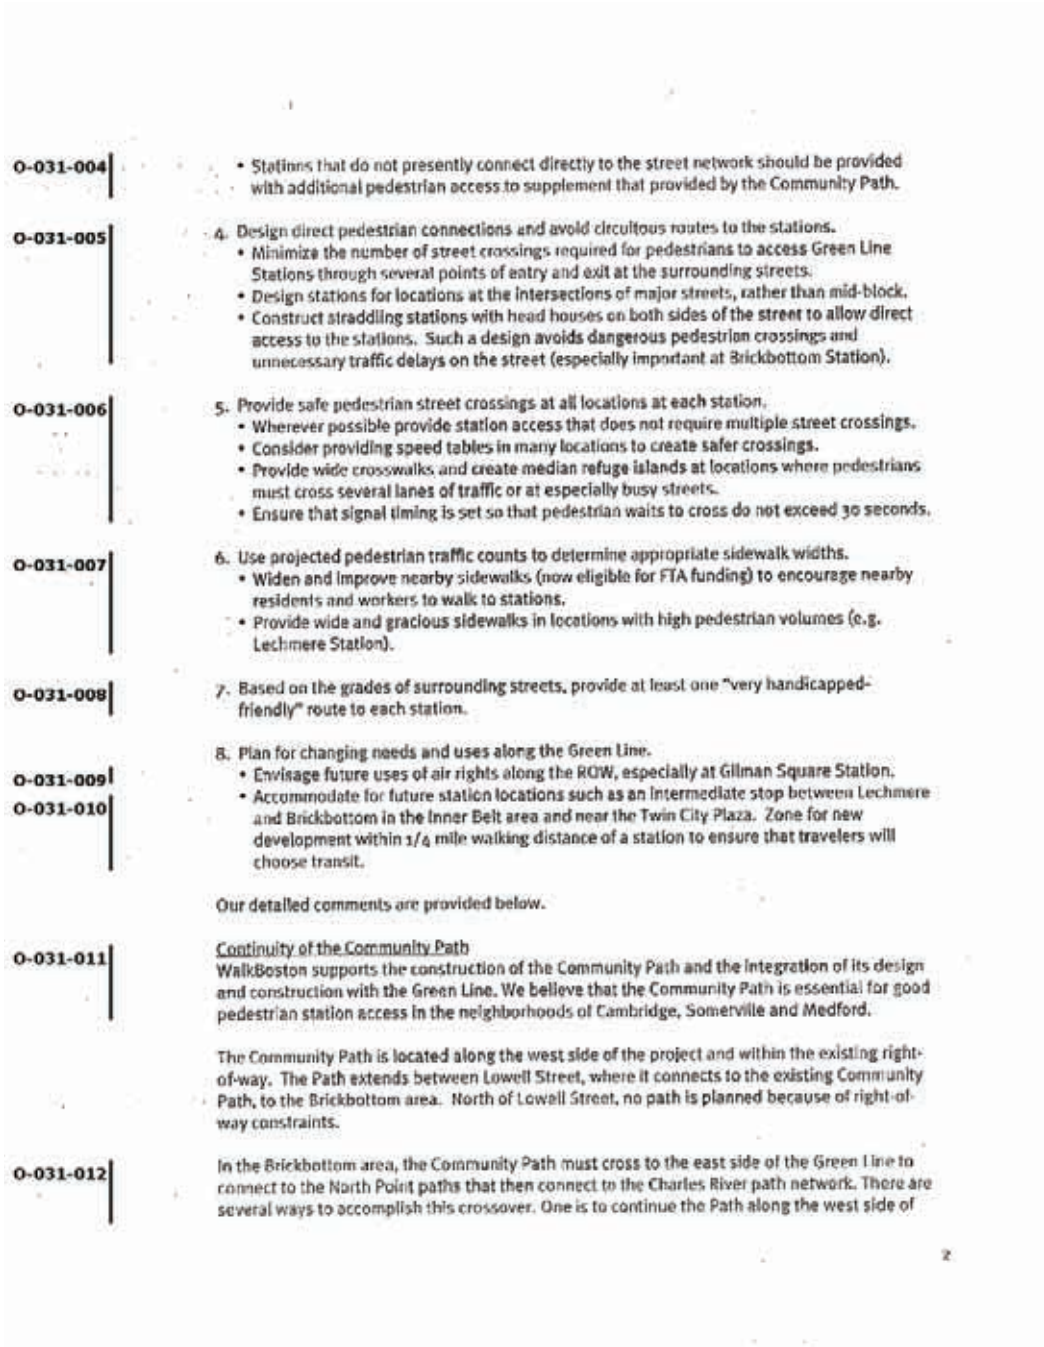
MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

O-031-002

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16 and related station access issues. Connections to West Medford and the existing commuter rail station can be specifically evaluated at that time. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

O-031-003

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.



O-031-004
- Stations that do not presently connect directly to the street network should be provided with additional pedestrian access to supplement that provided by the Community Path.

O-031-005
4. Design direct pedestrian connections and avoid circuitous routes to the stations.
   - Minimize the number of street crossings required for pedestrians to access Green Line Stations through several points of entry and exit at the surrounding streets.
   - Design stations for locations at the intersections of major streets, rather than mid-block.
   - Construct straddling stations with head houses on both sides of the street to allow direct access to the stations. Such a design avoids dangerous pedestrian crossings and unnecessary traffic delays on the street (especially important at Brickbottom Station).

O-031-006
5. Provide safe pedestrian street crossings at all locations at each station.
   - Wherever possible provide station access that does not require multiple street crossings.
   - Consider providing speed tables in many locations to create safer crossings.
   - Provide wide crosswalks and create median refuge islands at locations where pedestrians must cross several lanes of traffic or at especially busy streets.
   - Ensure that signal timing is set so that pedestrian waits to cross do not exceed 30 seconds.

O-031-007
6. Use projected pedestrian traffic counts to determine appropriate sidewalk widths.
   - Widen and improve nearby sidewalks (now eligible for FTA funding) to encourage nearby residents and workers to walk to stations.
   - Provide wide and gracious sidewalks in locations with high pedestrian volumes (e.g. Lechmere Station).

O-031-008
7. Based on the grades of surrounding streets, provide at least one "very handicapped-friendly" route to each station.

8. Plan for changing needs and uses along the Green Line.

O-031-009
   - Envisage future uses of air rights along the ROW, especially at Gilman Square Station.

O-031-010
   - Accommodate for future station locations such as an intermediate stop between Lechmere and Brickbottom in the Inner Belt area and near the Twin City Plaza. Zone for new development within 1/4 mile walking distance of a station to ensure that travelers will choose transit.

Our detailed comments are provided below.

O-031-011
Continuity of the Community Path
WalkBoston supports the construction of the Community Path and the integration of its design and construction with the Green Line. We believe that the Community Path is essential for good pedestrian station access in the neighborhoods of Cambridge, Somerville and Medford.

The Community Path is located along the west side of the project and within the existing right-of-way. The Path extends between Lowell Street, where it connects to the existing Community Path, to the Brickbottom area. North of Lowell Street, no path is planned because of right-of-way constraints.

O-031-012
In the Brickbottom area, the Community Path must cross to the east side of the Green Line to connect to the North Point paths that then connect to the Charles River path network. There are several ways to accomplish this crossover. One is to continue the Path along the west side of

2

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

O-031-004

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. Please see response to Comment O-031-004.

O-031-012

the Green Line, pass over the replacement of the Red Bridge and descend to Water Street, pass under the Green Line viaduct and connect to North Point. A second possibility is to cross the Green Line at the Brickbottom Station, and connect through the Inner Belt area by following the alignment of a new roadway to be constructed over the commuter rail line to connect with Water Street in Cambridge. We think that the most practical solution is to construct the new Path along with the Green Line Extension and to use the Red Bridge replacement as route that connects to Water Street. This route does not depend on the possibility of a bridge that will be built over the Lowell and Fitchburg commuter rail lines at some time in the future. Building the Path along with the Green Line assures that it will be completed, while not precluding a branch of the Path connecting through the Inner Belt area in the future. Keeping the Community Path alignment on the west side of the Green Line in the vicinity of the Red Bridge replacement facility also retains the possibility of a future branch of the Path into Union Square and to the possible Grand Junction Path.

O-031-013

The option of crossing the Community Path to the east side of the tracks at Brickbottom Station should be retained. This routing allows for potential future connections of the Community Path through this area and complements the possibility that Somerville may want to allow more intensive development in this area. The connection beneath Brickbottom Station provides better access in all directions from the station and should be retained as a good investment with significant future development potential.

Lechmere Station – Street-level access for pedestrians

The proposed location for the new Lechmere Station was chosen in part to modernize access to the Green Line and to foster new development in the North Point area. New privately financed buildings around the station include dense residential and employment uses that will house, more riders for the Green Line. As more housing and job sites develop, the new station location may ultimately be more centrally located to walk-in traffic than it would be if it opened today.

The walking barrier created by Monsignor O'Brien Highway/Route 28 means that the new location is less convenient for many existing station users. Although it adds only a few additional feet beyond the location of the existing station, it requires crossing O'Brien Highway which is a very busy arterial street. This adds as much as one minute to the walking time for each Green Line rider coming from existing East Cambridge residential and business areas, and requires using the new First Street Extended intersection with O'Brien Highway. Adding to the traffic at this location is the proposed diversion of vehicles from Cambridge Street which is to be partially abandoned between First Street and O'Brien Highway. This means additional traffic will pass through the intersection with increased and potentially heavy turning movements.

The design of the new roadways in the vicinity of Lechmere Station creates a complex set of intersections where pedestrians must cross the highway. Assuming that current patronage levels are maintained or increased, this will mean that a significant number of pedestrians will pass through these intersections on a daily basis. In the current design, it appears that virtually all walk-in Green Line patrons at the new Lechmere Station will need to cross First Street where it crosses O'Brien Highway. Some additional pedestrian crossings are envisioned for the intersections of O'Brien Highway at Second Street/Water Street and at Third Street.

O-031-014

The heavy traffic along O'Brien Highway suggests that special precautions will be needed for pedestrians going to or from the Lechmere Station. Because of the heavy traffic, protection for pedestrians at all crosswalk locations should include extra-wide crosswalks and pedestrian-

3

O-031-006

Please see response to Comment O-031-004.

O-031-007

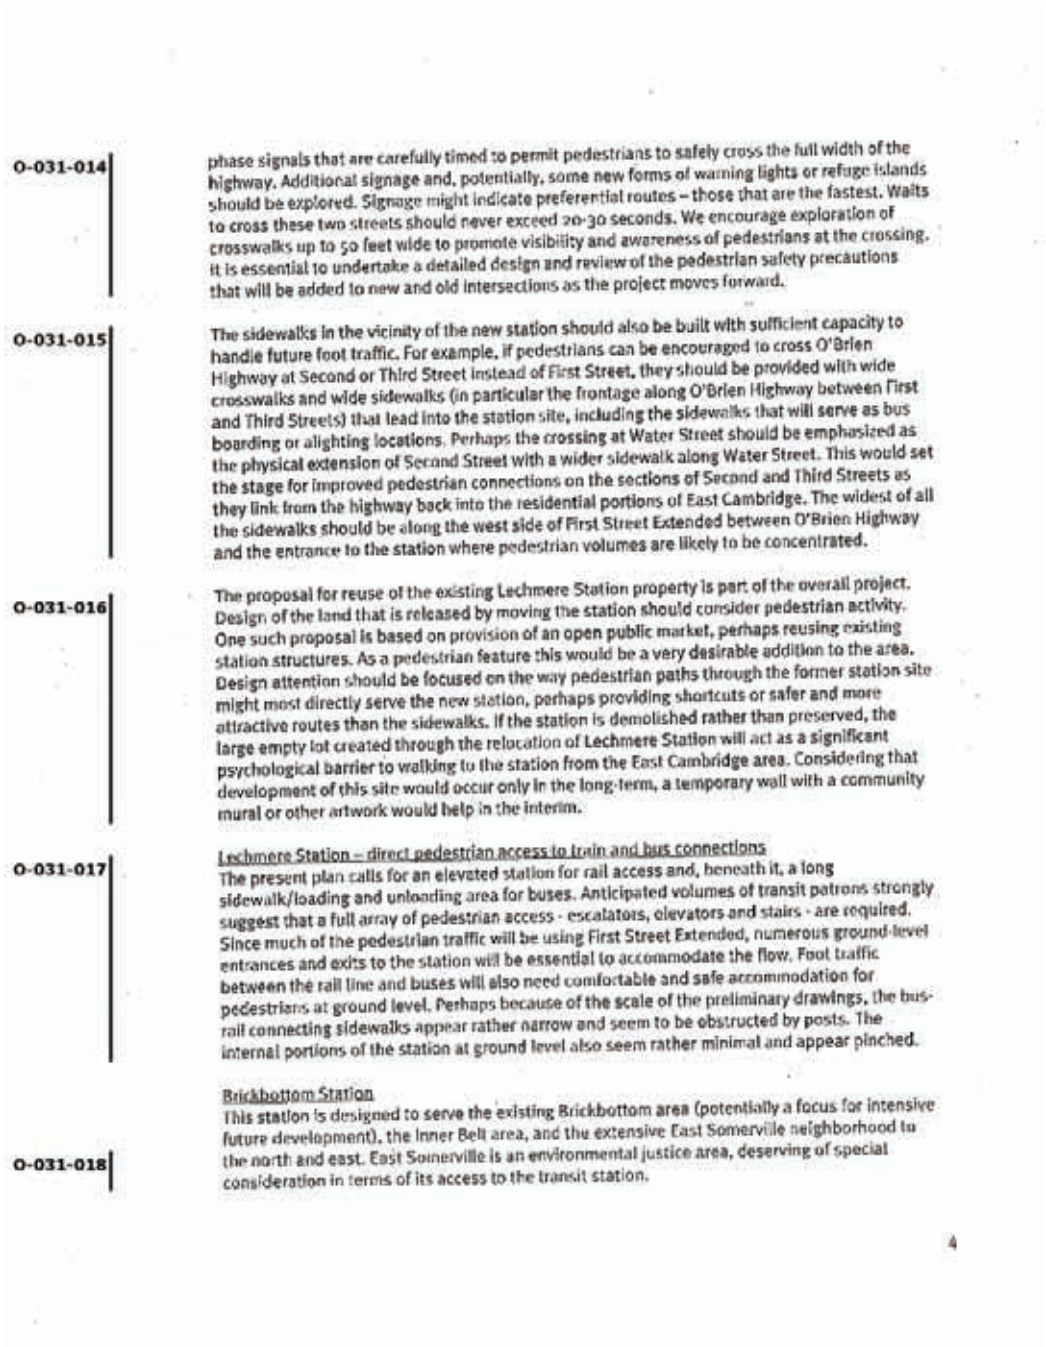
Wider sidewalks will be incorporated into station design in areas immediately surrounding the station to the extent practical. There is no opportunity to widen sidewalks outside of the immediate station area. The neighborhoods which the Green Line would serve are dense, urban neighborhoods that have narrow rights-of-way and buildings located immediately adjacent to the existing back of sidewalk.

O-031-008

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. Designs for each station will be further developed during the Project's preliminary engineering stage. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. Specific design details and station elements will be further developed during preliminary engineering. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access. The process for stakeholder coordination during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

O-031-009

MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for smart growth land use, which



O-031-014

phase signals that are carefully timed to permit pedestrians to safely cross the full width of the highway. Additional signage and, potentially, some new forms of warning lights or refuge islands should be explored. Signage might indicate preferential routes – those that are the fastest. Waits to cross these two streets should never exceed 20-30 seconds. We encourage exploration of crosswalks up to 50 feet wide to promote visibility and awareness of pedestrians at the crossing. It is essential to undertake a detailed design and review of the pedestrian safety precautions that will be added to new and old intersections as the project moves forward.

O-031-015

The sidewalks in the vicinity of the new station should also be built with sufficient capacity to handle future foot traffic. For example, if pedestrians can be encouraged to cross O'Brien Highway at Second or Third Street instead of First Street, they should be provided with wide crosswalks and wide sidewalks (in particular the frontage along O'Brien Highway between First and Third Streets) that lead into the station site, including the sidewalks that will serve as bus boarding or alighting locations. Perhaps the crossing at Water Street should be emphasized as the physical extension of Second Street with a wider sidewalk along Water Street. This would set the stage for improved pedestrian connections on the sections of Second and Third Streets as they link from the highway back into the residential portions of East Cambridge. The widest of all the sidewalks should be along the west side of First Street Extended between O'Brien Highway and the entrance to the station where pedestrian volumes are likely to be concentrated.

O-031-016

The proposal for reuse of the existing Lechmere Station property is part of the overall project. Design of the land that is released by moving the station should consider pedestrian activity. One such proposal is based on provision of an open public market, perhaps reusing existing station structures. As a pedestrian feature this would be a very desirable addition to the area. Design attention should be focused on the way pedestrian paths through the former station site might most directly serve the new station, perhaps providing shortcuts or safer and more attractive routes than the sidewalks. If the station is demolished rather than preserved, the large empty lot created through the relocation of Lechmere Station will act as a significant psychological barrier to walking to the station from the East Cambridge area. Considering that development of this site would occur only in the long-term, a temporary wall with a community mural or other artwork would help in the interim.

O-031-017

Lechmere Station – direct pedestrian access to train and bus connections
The present plan calls for an elevated station for rail access and, beneath it, a long sidewalk/loading and unloading area for buses. Anticipated volumes of transit patrons strongly suggest that a full array of pedestrian access - escalators, elevators and stairs - are required. Since much of the pedestrian traffic will be using First Street Extended, numerous ground-level entrances and exits to the station will be essential to accommodate the flow. Foot traffic between the rail line and buses will also need comfortable and safe accommodation for pedestrians at ground level. Perhaps because of the scale of the preliminary drawings, the bus-rail connecting sidewalks appear rather narrow and seem to be obstructed by posts. The internal portions of the station at ground level also seem rather minimal and appear pinched.

Brickbottom Station
This station is designed to serve the existing Brickbottom area (potentially a focus for intensive future development), the Inner Belt area, and the extensive East Somerville neighborhood to the north and east. East Somerville is an environmental justice area, deserving of special consideration in terms of its access to the transit station.

O-031-018

4

could further reduce automobile traffic congestion and improve air quality.

O-031-010

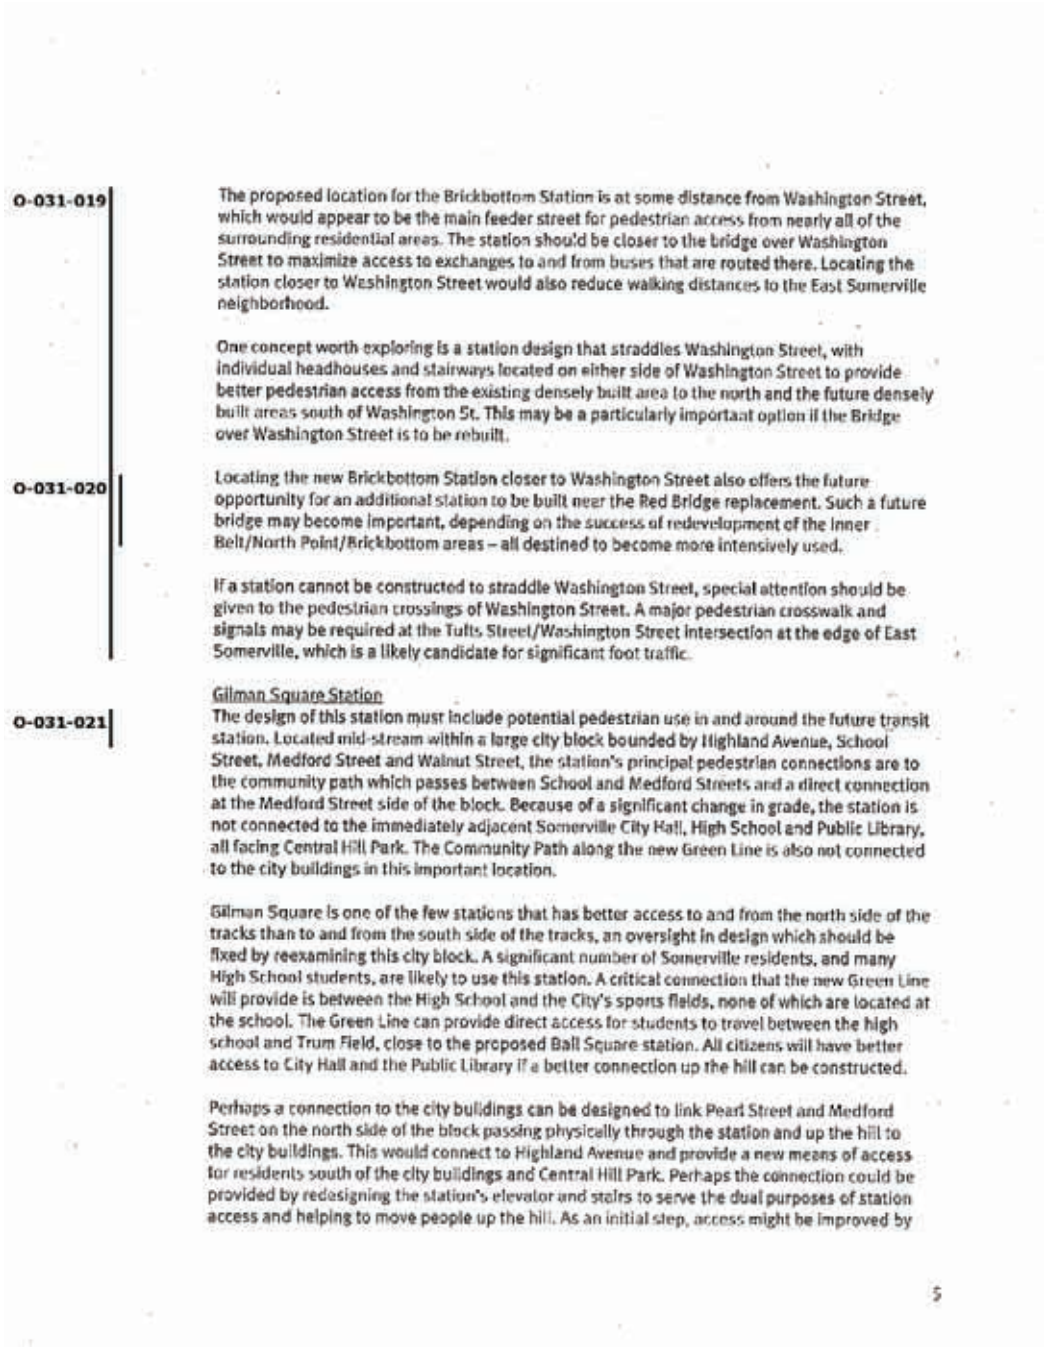
As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

O-031-011

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

O-031-012

MassDOT is committed to completing all planning, design, and engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community Path between Lowell Street and Inner Belt Road. MassDOT is not able at this point to commit to funding the construction of the Community Path. The limits of the path were predicated on the connections to Lechmere being made through the Inner Belt area via Inner Belt Road and the proposed Urban Ring Bridge into the Lechmere area. However, the cessation of planning for the Urban Ring Project has changed the timing of this anticipated connection. MassDOT is unable to assume responsibility for designing the Urban Ring Bridge as part of the Green Line Extension Project. That being said, MassDOT is committed to working with the City of Somerville, residents and businesses in the Brickbottom and Inner Belt neighborhoods, and Community Path



O-031-019

The proposed location for the Brickbottom Station is at some distance from Washington Street, which would appear to be the main feeder street for pedestrian access from nearly all of the surrounding residential areas. The station should be closer to the bridge over Washington Street to maximize access to exchanges to and from buses that are routed there. Locating the station closer to Washington Street would also reduce walking distances to the East Somerville neighborhood.

One concept worth exploring is a station design that straddles Washington Street, with individual headhouses and stairways located on either side of Washington Street to provide better pedestrian access from the existing densely built area to the north and the future densely built areas south of Washington St. This may be a particularly important option if the Bridge over Washington Street is to be rebuilt.

O-031-020

Locating the new Brickbottom Station closer to Washington Street also offers the future opportunity for an additional station to be built near the Red Bridge replacement. Such a future bridge may become important, depending on the success of redevelopment of the Inner Belt/North Point/Brickbottom areas – all destined to become more intensively used.

If a station cannot be constructed to straddle Washington Street, special attention should be given to the pedestrian crossings of Washington Street. A major pedestrian crosswalk and signals may be required at the Tufts Street/Washington Street intersection at the edge of East Somerville, which is a likely candidate for significant foot traffic.

Gilman Square Station

O-031-021

The design of this station must include potential pedestrian use in and around the future transit station. Located mid-stream within a large city block bounded by Highland Avenue, School Street, Medford Street and Walnut Street, the station's principal pedestrian connections are to the community path which passes between School and Medford Streets and a direct connection at the Medford Street side of the block. Because of a significant change in grade, the station is not connected to the immediately adjacent Somerville City Hall, High School and Public Library, all facing Central Hill Park. The Community Path along the new Green Line is also not connected to the city buildings in this important location.

Gilman Square is one of the few stations that has better access to and from the north side of the tracks than to and from the south side of the tracks, an oversight in design which should be fixed by reexamining this city block. A significant number of Somerville residents, and many High School students, are likely to use this station. A critical connection that the new Green Line will provide is between the High School and the City's sports fields, none of which are located at the school. The Green Line can provide direct access for students to travel between the high school and Trum Field, close to the proposed Ball Square station. All citizens will have better access to City Hall and the Public Library if a better connection up the hill can be constructed.

Perhaps a connection to the city buildings can be designed to link Pearl Street and Medford Street on the north side of the block passing physically through the station and up the hill to the city buildings. This would connect to Highland Avenue and provide a new means of access for residents south of the city buildings and Central Hill Park. Perhaps the connection could be provided by redesigning the station's elevator and stairs to serve the dual purposes of station access and helping to move people up the hill. As an initial step, access might be improved by

5

advocates to design the Path to create improved connectivity within the Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension.

O-031-013

Please see response to Comment O-031-012.

O-031-014

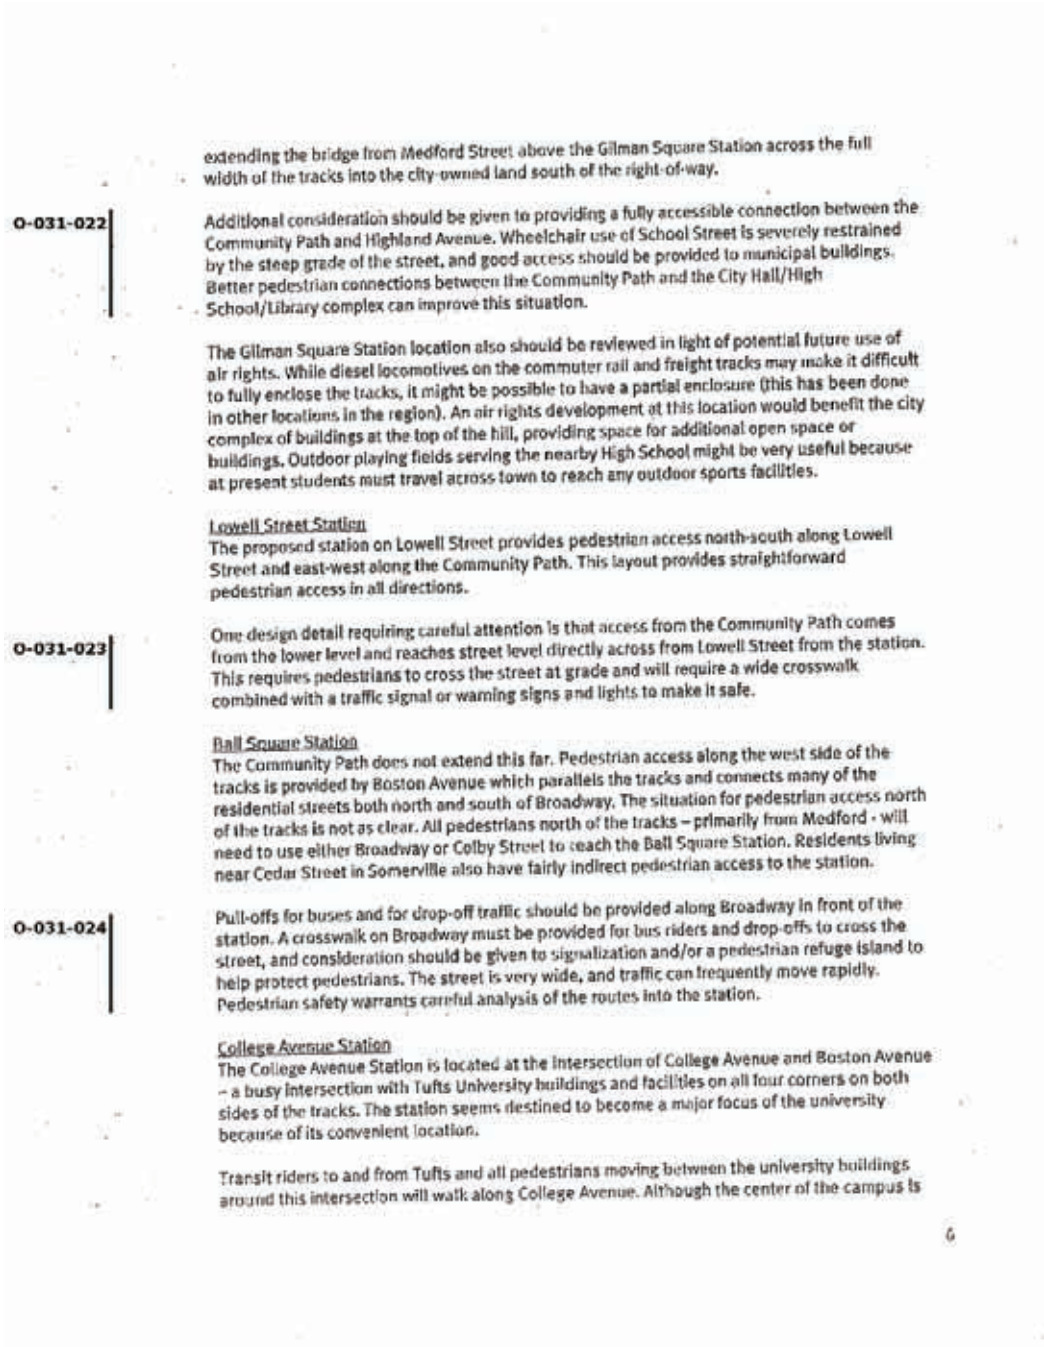
Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. The chapter presents a traffic analysis, a detailed description of pedestrian crossings of O'Brien Highway, and proposed roadway, crosswalk, and sidewalk improvements that are consistent with the NorthPoint development plans. These station and street plans will be further refined in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

O-031-015

Sidewalks in the vicinity of the station will be maximized to the extent practical. The right-of-way along O'Brien Highway can not be increased due to building setbacks in many locations. No opportunities exist to further narrow the roadway (beyond what is currently proposed) and the wide median is necessary to properly channelize traffic and serves as a pedestrian refuge area.

O-031-016

MassDOT has reviewed the suggestions submitted by the East Cambridge Planning Team. Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. These plans, including the pedestrian crossings of O'Brien Highway and associated street, crosswalk, and sidewalk designs will be further refined in the preliminary engineering stage of the Project. As part of the Green Line



extending the bridge from Medford Street above the Gilman Square Station across the full width of the tracks into the city-owned land south of the right-of-way.

O-031-022

Additional consideration should be given to providing a fully accessible connection between the Community Path and Highland Avenue. Wheelchair use of School Street is severely restrained by the steep grade of the street, and good access should be provided to municipal buildings. Better pedestrian connections between the Community Path and the City Hall/High School/Library complex can improve this situation.

The Gilman Square Station location also should be reviewed in light of potential future use of air rights. While diesel locomotives on the commuter rail and freight tracks may make it difficult to fully enclose the tracks, it might be possible to have a partial enclosure (this has been done in other locations in the region). An air rights development at this location would benefit the city complex of buildings at the top of the hill, providing space for additional open space or buildings. Outdoor playing fields serving the nearby High School might be very useful because at present students must travel across town to reach any outdoor sports facilities.

Lowell Street Station

The proposed station on Lowell Street provides pedestrian access north-south along Lowell Street and east-west along the Community Path. This layout provides straightforward pedestrian access in all directions.

O-031-023

One design detail requiring careful attention is that access from the Community Path comes from the lower level and reaches street level directly across from Lowell Street from the station. This requires pedestrians to cross the street at grade and will require a wide crosswalk combined with a traffic signal or warning signs and lights to make it safe.

Ball Square Station

The Community Path does not extend this far. Pedestrian access along the west side of the tracks is provided by Boston Avenue which parallels the tracks and connects many of the residential streets both north and south of Broadway. The situation for pedestrian access north of the tracks is not as clear. All pedestrians north of the tracks – primarily from Medford - will need to use either Broadway or Colby Street to reach the Ball Square Station. Residents living near Cedar Street in Somerville also have fairly indirect pedestrian access to the station.

O-031-024

Pull-offs for buses and for drop-off traffic should be provided along Broadway in front of the station. A crosswalk on Broadway must be provided for bus riders and drop-offs to cross the street, and consideration should be given to signalization and/or a pedestrian refuge island to help protect pedestrians. The street is very wide, and traffic can frequently move rapidly. Pedestrian safety warrants careful analysis of the routes into the station.

College Avenue Station

The College Avenue Station is located at the intersection of College Avenue and Boston Avenue – a busy intersection with Tufts University buildings and facilities on all four corners on both sides of the tracks. The station seems destined to become a major focus of the university because of its convenient location.

Transit riders to and from Tufts and all pedestrians moving between the university buildings around this intersection will walk along College Avenue. Although the center of the campus is

6

Extension, MassDOT intends to demolish the existing Lechmere Station and prepare the site for potential future redevelopment. Based on the current requirements of the O'Brien Highway roadway improvements (as shown in FEIR Chapter 5, Lechmere Station), the existing bus shed must be removed.

O-031-017

Revised conceptual plans for Lechmere Station, including modifications to the station headhouse and entrances, enclosed automatic fare collection, and other amenities are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

O-031-018

The conceptual plan for the Brickbottom Station will be refined during the preliminary engineering stage, taking into consideration municipal, neighbor, and other stakeholder concerns to the extent practical. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process. Based on the analysis conducted during development of the DEIR/EA, it was determined that only one station would be warranted in the vicinity of the Brickbottom neighborhood and Washington Street. This analysis can be found in Appendix A of the DEIR/EA

O-031-019

The conceptual plan for the Brickbottom Station will be refined during the preliminary engineering stage, taking into consideration municipal, neighbor, and other stakeholder concerns to the extent practical. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

not far from College Avenue, it is located atop a hill that requires long paths and/or stairs to reach. Pedestrians walking along College Avenue may encounter some issues because of the relatively narrow sidewalk along this street, hemmed in by a college wrought iron and brick-pillared fence. Although outside the scope of this project, Tufts may want to consider widening this sidewalk or perhaps seeking new means of access between the campus center and Boston Avenue /College Avenue from other directions or with other paths/stairs. The proposed street improvements to be made at the intersection as part of the project should provide for future wider sidewalks along College Avenue.

Bus access to the station is also constrained by the location of the stops on College Avenue south of Boston Avenue. Moving at least one of the stops closer to the intersection, on Boston Avenue just across from the station should be considered because it would shorten the walk from the bus to the station for transit riders and perhaps enhance ridership.

Drop off areas for the station could be improved. The current plan shows a limited space on the north side of Boston Avenue adjacent to the station entrance. A similar drop-off spot on the south side of Boston Avenue traffic would be useful. Two access points for one station would help during inclement weather and provide more convenient transfer between private vehicles and buses.

North of the tracks, the residential area is cut off from direct access to College Avenue by Tufts University buildings. One way to help circulation between the residential district north of the tracks and the Station would be to find a route through Tufts properties from the end of Burget Avenue to College Avenue. Physically the space appears to be available, but it will be up to the University to examine and perhaps institute this improvement.

Route 16/Mystic Valley Parkway Station

The proposed terminus of the Green Line Extension is a station located at one side of a city block bounded by Boston Avenue, Mystic Valley Parkway, Auburn Street and North Street. The proposed station entrance is immediately adjacent to the Parkway on a service road that loops in from Boston Avenue. The station location has limited pedestrian access. The highway is crowded and busy. North of the river residents have access to the commuter rail line at West Medford and may not be a primary market for this station. South of the river, the residences surrounding the station site are provided access only via the Parkway entrance and the access road off Boston Avenue. From a pedestrian point-of-view, North Street is perhaps a preferable walking route. It runs through the residential neighborhood, connecting to many of the likely riders of the new line. However, access from North Street is presently limited to its connection to Boston Avenue and to the access driveway to the station – resulting in a very indirect set of physical connections.

O-031-025

The proposed head house is located directly on Mystic Valley Parkway, a symbolic location which will certainly assist pedestrians in reaching the station from that street. However, access for pedestrians from all other directions is secondary to vehicle access. Boston Avenue, with narrow sidewalks, is not an attractive route to encourage pedestrians. The present crosswalks at Stoughton Street and Boston Avenue are scheduled for replacement to make the route to the station more direct, and will require careful design to assure safe passage for pedestrians across Boston Avenue and the access road into the station. Because so much of the pedestrian access from residential neighborhoods is concentrated on the Boston Avenue entrance, wide crosswalks, signals and signing will be essential to help pedestrians reach the station safely.

7

O-031-020

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

O-031-021

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. These stations are designed to be consistent with MBTA standards and compliant with ADA. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

O-031-022

The DEIR/EA and FEIR include conceptual station designs. Designs for each station will be refined during the Project's preliminary engineering stage. Design and construction of station approach routes beyond the immediate station entrance areas are outside the scope of the Green Line Extension Project.

The preliminary station designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), and the MBTA. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement as the station designs are refined.

O-031-023

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access

O-031-026

Pedestrian routes through the Mystic Valley Park, parallel to the parkway, are not shown as connecting to the headhouse, instead they are truncated, requiring use of the sidewalks along the parkway for the final connection to the proposed station. The Mystic Valley Park pedestrian routes should be upgraded to provide good pedestrian access to the station.

Union Square

From a pedestrian point-of-view, the proposed location for the Union Square station is unfortunate because the site is not located centrally to either the residential or commercial areas. (The city may be able to transform the station area in the future.) Pedestrian connections between the existing uses and the station are very indirect, with the site at the edge of the transit loop that may be significantly changed when or if Prospect Street becomes two-way. The

O-031-027

proposed sidewalk leading into the square is badly conceived – a wide sidewalk heading toward Union Square, but ending just a few feet from the station. Pedestrians, and local businesses would be better served by a station located much closer to the center of the square.

O-031-028

Few existing streets can be used to connect the new Green Line into the Square. One possibility for improving the connection to Union Square would be to route the new light rail line through the salvage yard area directly to Somerville Avenue north to a terminal station at the southeast corner of Prospect Street and Somerville Avenue. A station in this location would be sited at one end of the commercial center and fully accessible to all merchants and significantly closer to existing residential areas. The station would be highly visible as well – an anchor to the business area and a visible sign of its renewal as a dynamic center of urban life in Somerville.

O-031-029

At a later date, it might be possible to extend the Green Line as a streetcar along Somerville Avenue to reach further into the residential areas of the city and serve more riders. A potential benefit of that extension could be the provision of a loop through the square onto Webster Avenue and back to the alignment of the Union Square line at the location where the loop begins going north toward the square. This should not preclude a future extension of the Green Line toward Porter Square.

Thank you for the opportunity to comment on the DEIR/EA for the Green Line Extension. Please contact us for any clarification or additional comments that you may need.

Sincerely,

Wendy Landman
Executive Director

Robert Sloane
Senior Planner

8

and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

O-031-024

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. However, a drop-off/pick-up along Broadway in the vicinity of Ball Square was evaluated. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

O-031-025

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not

included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout and access at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

O-031-026

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

O-031-027

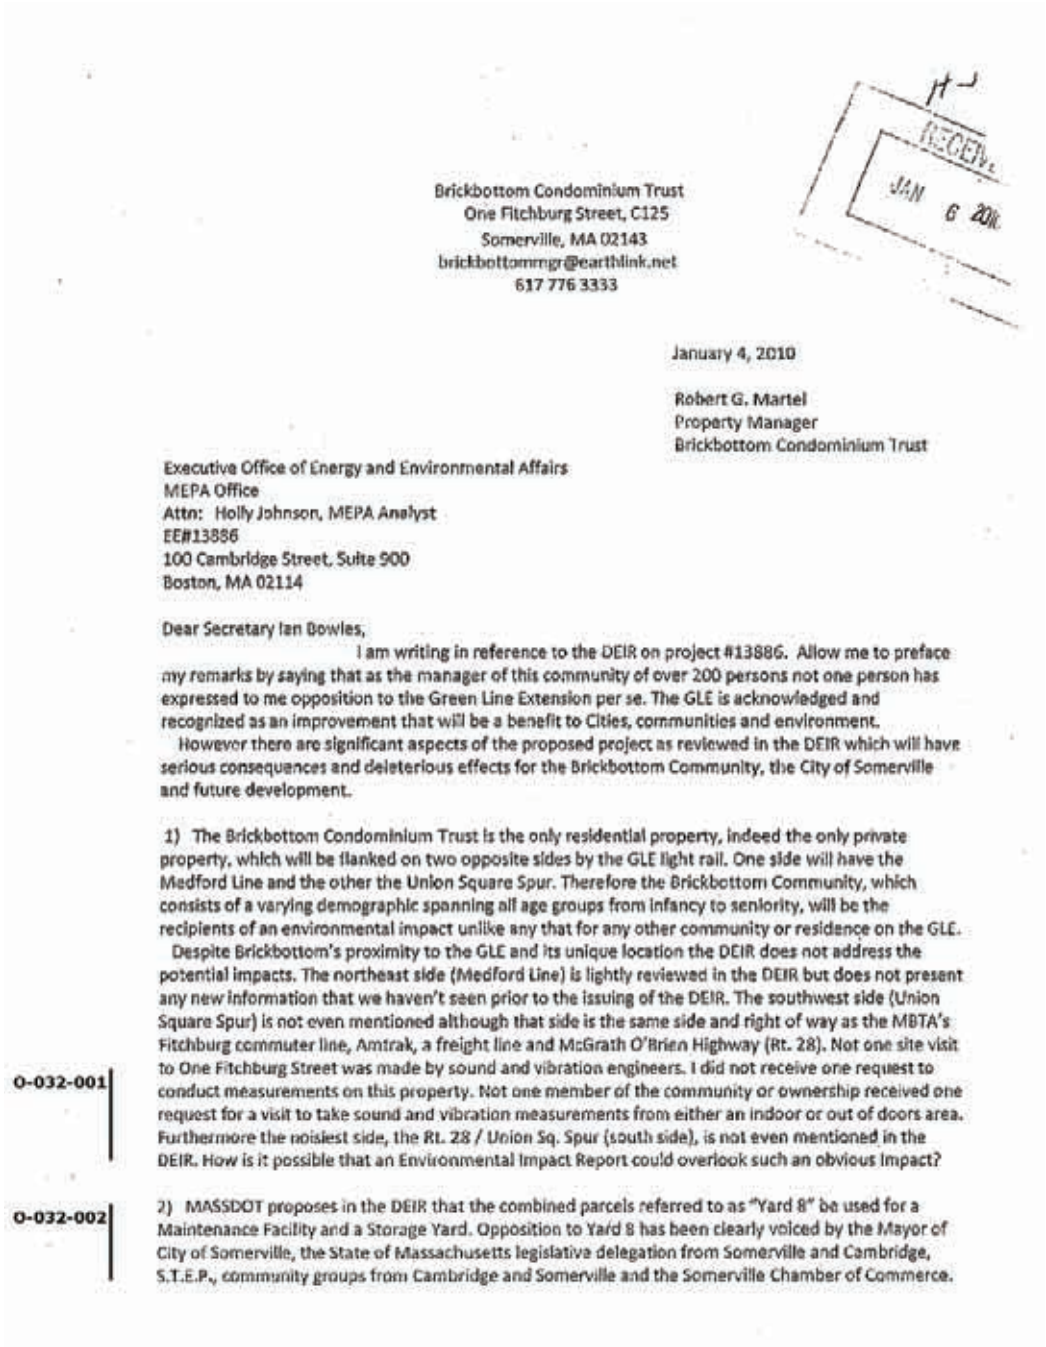
As stated in the Executive Summary of the DEIR/EA, page ES-13, and DEIR/EA Appendix B, other station locations were evaluated for Union Square Station. Locations closer to to the center of Union Square were not selected due to their substantially higher environmental impacts and costs. The DEIR/EA and FEIR include conceptual station designs. Designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

O-031-028

Please see response to Comment O-031-027.

O-031-029

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions. These potential future improvements include an extension of the Union Square Branch to Porter Square.



Brickbottom Condominium Trust

Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EE#13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Ian Bowles,

I am writing in reference to the DEIR on project #13886. Allow me to preface my remarks by saying that as the manager of this community of over 200 persons not one person has expressed to me opposition to the Green Line Extension per se. The GLE is acknowledged and recognized as an improvement that will be a benefit to Cities, communities and environment.

However there are significant aspects of the proposed project as reviewed in the DEIR which will have serious consequences and deleterious effects for the Brickbottom Community, the City of Somerville and future development.

1) The Brickbottom Condominium Trust is the only residential property, indeed the only private property, which will be flanked on two opposite sides by the GLE light rail. One side will have the Medford Line and the other the Union Square Spur. Therefore the Brickbottom Community, which consists of a varying demographic spanning all age groups from infancy to seniority, will be the recipients of an environmental impact unlike any that for any other community or residence on the GLE.

Despite Brickbottom's proximity to the GLE and its unique location the DEIR does not address the potential impacts. The northeast side (Medford Line) is lightly reviewed in the DEIR but does not present any new information that we haven't seen prior to the issuing of the DEIR. The southwest side (Union Square Spur) is not even mentioned although that side is the same side and right of way as the MBTA's Fitchburg commuter line, Amtrak, a freight line and McGrath O'Brien Highway (Rt. 28). Not one site visit to One Fitchburg Street was made by sound and vibration engineers. I did not receive one request to conduct measurements on this property. Not one member of the community or ownership received one request for a visit to take sound and vibration measurements from either an indoor or out of doors area. Furthermore the noisiest side, the Rt. 28 / Union Sq. Spur (south side), is not even mentioned in the DEIR. How is it possible that an Environmental Impact Report could overlook such an obvious impact?

O-032-001

2) MASSDOT proposes in the DEIR that the combined parcels referred to as "Yard 8" be used for a Maintenance Facility and a Storage Yard. Opposition to Yard 8 has been clearly voiced by the Mayor of City of Somerville, the State of Massachusetts legislative delegation from Somerville and Cambridge, S.T.E.P., community groups from Cambridge and Somerville and the Somerville Chamber of Commerce.

O-032-002

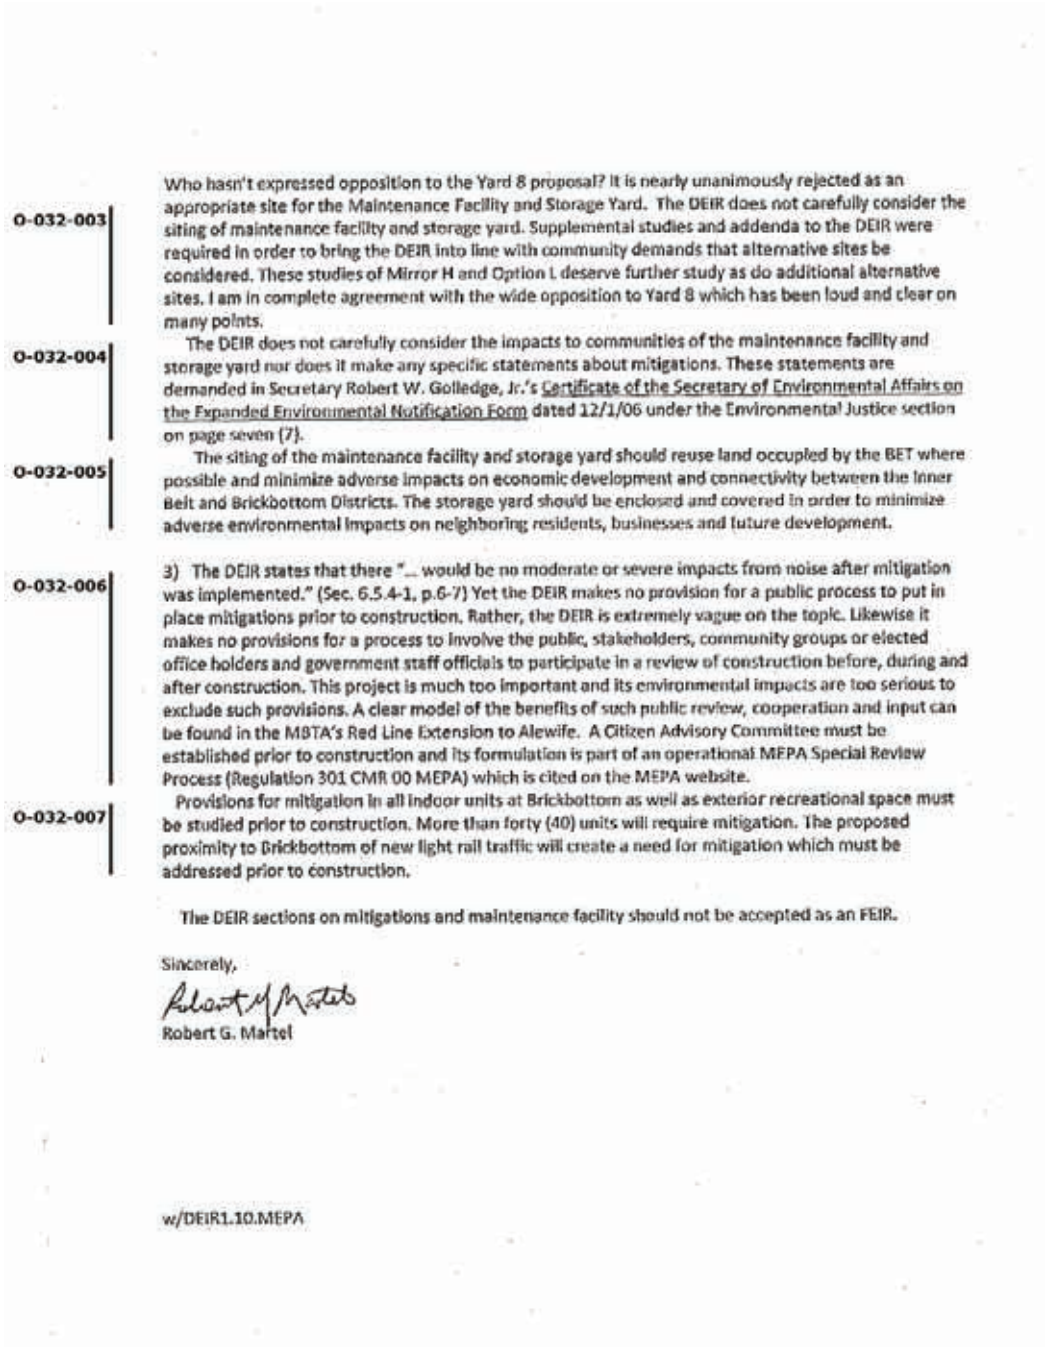
O-032-001

Potential noise and vibration impacts were assessed for the southwest facade of the Brickbottom Artists Building, which abuts the existing MBTA Fitchburg Commuter Rail line. Because the northeast façade represents the location of the building with a potential for more severe noise impact, findings for the southwest façade were not originally reported in the DEIR/EA. These findings have been reported in an expanded analysis of potential noise and vibration impacts at the Brickbottom Artists Buildings, reported in FEIR Chapter 8.

Based on recent site visits to the property, exterior land use with frequent human use has been identified at Brickbottom Artists Building and potential noise impact and mitigation will be assessed accordingly. Findings and associated mitigation commitments will be evaluated during preliminary engineering.

O-032-002

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.



O-032-003

Who hasn't expressed opposition to the Yard 8 proposal? It is nearly unanimously rejected as an appropriate site for the Maintenance Facility and Storage Yard. The DEIR does not carefully consider the siting of maintenance facility and storage yard. Supplemental studies and addenda to the DEIR were required in order to bring the DEIR into line with community demands that alternative sites be considered. These studies of Mirror H and Option L deserve further study as do additional alternative sites. I am in complete agreement with the wide opposition to Yard 8 which has been loud and clear on many points.

O-032-004

The DEIR does not carefully consider the impacts to communities of the maintenance facility and storage yard nor does it make any specific statements about mitigations. These statements are demanded in Secretary Robert W. Golledge, Jr.'s Certificate of the Secretary of Environmental Affairs on the Expanded Environmental Notification Form dated 12/1/06 under the Environmental Justice section on page seven (7).

O-032-005

The siting of the maintenance facility and storage yard should reuse land occupied by the BET where possible and minimize adverse impacts on economic development and connectivity between the Inner Belt and Brickbottom Districts. The storage yard should be enclosed and covered in order to minimize adverse environmental impacts on neighboring residents, businesses and future development.

O-032-006

3) The DEIR states that there "... would be no moderate or severe impacts from noise after mitigation was implemented." (Sec. 6.5.4-1, p.6-7) Yet the DEIR makes no provision for a public process to put in place mitigations prior to construction. Rather, the DEIR is extremely vague on the topic. Likewise it makes no provisions for a process to involve the public, stakeholders, community groups or elected office holders and government staff officials to participate in a review of construction before, during and after construction. This project is much too important and its environmental impacts are too serious to exclude such provisions. A clear model of the benefits of such public review, cooperation and input can be found in the MBTA's Red Line Extension to Alewife. A Citizen Advisory Committee must be established prior to construction and its formulation is part of an operational MEPA Special Review Process (Regulation 301 CMR 00 MEPA) which is cited on the MEPA website.

O-032-007

Provisions for mitigation in all indoor units at Brickbottom as well as exterior recreational space must be studied prior to construction. More than forty (40) units will require mitigation. The proposed proximity to Brickbottom of new light rail traffic will create a need for mitigation which must be addressed prior to construction.

The DEIR sections on mitigations and maintenance facility should not be accepted as an FEIR.

Sincerely,

Robert G. Martel

w/DEIR1.10.MEPA

O-032-003

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

O-032-004

Impacts to environmental justice populations are described in DEIR/EA Section 5.4, Environmental Justice. Additionally, the Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes specific outreach efforts to the environmental justice community that will be made as the Project progresses through its next phases.

O-032-005

As explained in FEIR Chapter 2, MassDOT has explored opportunities for the Green Line Extension storage and maintenance facility to share resources with the Boston Engine Terminal. The independent needs and constraints of these facilities limit opportunities for shared resources.

MassDOT will coordinate with the MBTA during preliminary engineering to maximize efficient land utilization between these storage and maintenance facilities, if possible.

O-032-006

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

O-032-007

As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds. FEIR Chapter 8 describes specific proposed mitigation measures, plans for monitoring after construction, and next steps pertaining to mitigation. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

RE: Project Number EEA #13886

Dear Secretary Bowles,

As a business owner, landlord and also owner-occupant in the Brickbottom Artists Building in Somerville, I have a very vested interest in the long-term financial viability of the building and surrounding community. More than a decade ago I invested in my initial purchase in this building and have added to that investment over time. I chose this location in part due to its proximity to central Boston, the obvious future development potential that affords and the overall quality of life in this residential community. However this is now threatened by the location of the proposed Green Line Extension maintenance and storage facility.

Overall I am extremely pleased that the Green Line Extension project is moving ahead and I feel that the station to be developed within two blocks of this building will significantly increase the community's quality of life and help grow the area. This also recognizes the area's long-term potential as a vibrant center.

B-001-001 The residential environment could be destroyed however by the proposal to locate an 11+ acre heavy maintenance facility on the parcel known as "Yard 8." This is especially true because there is significant evidence that other locations such as the Option L location could also meet the facility's need while having much less environmental impact on the surrounding community.

The "Yard 8" location directly abuts the only residences (200+ occupants) in the surrounding area. Selection of that site would have significant noise and vibration impacts on these residences. Even with significant mitigation such as replacement windows to reduce noise, quality of life will be negatively impacted since those mitigation actions would do nothing for occupants when they would open their windows in the warmer summer months. Selection of the Option L location would not have the same impacts and would require far fewer mitigation steps.

In addition as the Commonwealth moves to being more of a service and "clean" economy, it makes no sense to create a new industrial zone located directly adjacent to an existing residential complex when an alternative site offers largely the same potential without the environmental and community impacts. A quick comparison of the options highlights the negative impacts of selecting Yard 8 for the maintenance and storage facility.

Alden Zacha, Principal

B-001-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

B-001-002

	Yard 8	Option L
Impact to residents	**High** – Site directly abuts the only residences in the surrounding area. Noise and vibration impacts will be significant and even with significant mitigation, quality of life will be negatively impacted	**Low** – Site is reasonably far from any residences. Noise and vibration impacts should be minimal and may require little mitigation
Loss of development potential	**High** – Surrounding properties will likely remain industrial rather than converting to higher value office / commercial	**Low** – Area is bounded by I-93 and proposed large-scale mixed use development
Property tax loss – direct	**High** – Currently zoned commercial	**Low** – Currently owned by government agencies
Property tax loss – indirect	**High** – Surrounding commercial and residential areas will likely face reduced valuations	**None** – Location is already industrial train location bounded by I-93 and large-scale mixed use development

Given these facts, I strongly urge you to support the Option L location for the maintenance facility which minimizes the negative impacts on the community.

Thank you for your consideration and time on this extremely important matter.

Alden Zecha

B-001-002

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

Reference to Project Number EEA #13886

Dear Secretary Ian Bowles,

B-002-001 I am writing to express my opposition to the location of the maintenance yard for the Green Line at Yard 8. While I support the extension of the Green line to Somerville and Medford, which will improve the quality of life in and enhance the economic development of these communities, the Yard 8 location for a maintenance and storage yard impinges strongly on a residential area and blocks the future economic development of the entire Brickbottom and inner belt area. Not only does it irrevocably split apart the development of the area, but it takes 11 acres that is already permitted and zoned for future development that would add to the city's tax base.

I am a Cambridge resident, but I own property at Brickbottom and pay taxes on that property to Somerville. I have a strong interest in the values at Brickbottom and the quality of life available there. The Brickbottom Artists community is a strong vibrant group of producing artists that also serves a community function through its display gallery. Since at the very least, Brickbottom will be exposed to the running of trains during the normal Green Line service, great attention should be paid to issues of mitigation of the noise of the air-conditioners and the wheels of the trains--this issue applies to all the above ground trains throughout Somerville. However, the trains are to pass very close to Brickbottom--any movement of the tracks away from the building would be valuable, as well as other efforts to mitigate the sound level at Brickbottom. I recommend a 20 foot wall separating the tracks and the building--and also that all the units in the building be soundproofed--the 220 people living there on top of the trains deserve at least that.

B-002-002

The Yard 8 site would make living and working in Brickbottom intolerable. The entire storage and maintenance of all the cars for the entire Green line and the extension is made to fall upon the people of Brickbottom in a way that destroys their property values and blocks the future economic development of this area of Somerville.

B-002-003 I strongly support the investigation of alternative sites, and recommend the choice of Mirror H, which puts the maintenance facility near similar functions and out of the path of economic development in Somerville. The alternative Option L--if the yards are moved as far East as possible--still will permit the development of the inner belt.

Yours sincerely,

Walter Gilbert

RE: GREEN LINE EXTENSION AND MAINTENANCE AND STORAGE FACILITY

Dear Secretary Bowles:

I am writing to you regarding the Draft Environmental Impact Report/Environmental Assessment filed on 10/15/2009 with the Massachusetts Environmental Policy Act Office, and the additional analysis (Technical Memorandum entitled Additional Maintenance Facility Alternatives Analysis, dated 12/09/2009) later submitted for proposed locations of the maintenance and storage facility described therein.

We own property located at 22 Water Street, Cambridge, Massachusetts, which abuts MBTA land and is near the proposed maintenance facility. Ours is a 2.4-acre parcel within the North Point zoning district. It is contiguous to the MBTA Green Line extension and across the street from the proposed Lechmere station relocation. The property has been permitted for redevelopment into 392 residential units; 2 levels of parking; retail space; and public open space. Great care was taken to design a structure that was sensitive to the needs of current neighborhood residents and integrates well into the existing and proposed transportation network (foot, bike, car, bus, and train). It is a critical component of the ultimate buildout of the North Point district, which is master-planned for approximately 5.3 million square feet of mixed-use development. Significant effort and expense was also taken in designing our building to abate the noise and vibration effects of the Green Line extension, which runs along the length of our property, both for the residents of our building and those who will live and work throughout North Point and neighboring areas.

We applaud the MBTA's commitment to building a new Lechmere station in North Point and to extending Green Line service into Somerville and Medford. Regarding the location of the maintenance and storage facility location, we feel that the original proposal of Yard 8, while operationally suitable, will impact local residents and businesses and consequently may require extensive mitigation.

B-003-001 On the other hand, the Mirror H location would be exceptionally disruptive to the complete buildout of North Point by taking major portions of six separate parcels that represent nearly 1.6

B-003-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Mirror H location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

B-003-001 million square feet of potential development – 30% of the entire district. A maintenance and storage facility in this location would have material noise and vibration impacts on our development at 22 Water Street, likely requiring it to be redesigned at significant time and expense. More importantly, this location would jeopardize the whole North Point project, which has been over a decade in planning and where hundreds of millions of dollars already have been invested. The value of the existing and planned investment has been completely overlooked in the analysis of the Mirror H location. The $8 million assumed for acquisition cost grossly underestimates the real estate values that would be affected by this proposal. By incorporating this information into the analysis of Mirror H, it will be quite clear that this location will be far more expensive than what was described in the 12/12/2009 Alternatives Analysis, likely multiples higher. We strongly oppose Mirror H and would like to see the plan dropped from consideration.

B-003-002 We feel that the Option L offers benefits over the other two alternatives and would be the most appropriate location for the maintenance and storage facility. Compared to the expense, permitting delays, and ultimate disruption posed by the Yard 8 and Mirror H locations, Option L appears to be the most manageable to develop and operate. Option L also compares favorably to the others regarding demolition, rail service alignment, and potential remediation. We support Option L and encourage you to proceed accordingly.

B-003-003 We also urge the MBTA to continue refining the new Lechmere station design so that it can function at the highest levels of passenger service, access, and safety as well as be aesthetically pleasing. Concurrent with the station design is the need for a safe and well-functioning pedestrian crossing system of the O'Brien Highway for accessing the station. We expect that the final design focuses on landscaping and materials along Water Street, including pedestrian-friendly circulation and a reduction in the width of curb cuts. Finally we hope that all plans are well landscaped and include well detailed parking lots.

We are excited to see the progress of this major regional transportation project and appreciate the chance to provide input. Feel free to contact me if you have any questions or would like additional information.

Sincerely,

Christopher P. Kaneb, Manager

B-003-002

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, Option L is identified as the preferred maintenance facility site.

B-003-003

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. The chapter presents a traffic analysis, a detailed description of pedestrian crossings of O'Brien Highway, and proposed roadway, crosswalk, and sidewalk improvements that are consistent with the NorthPoint development plans. These station and street plans will be further refined in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

Re: EEA# 13886; Green Line Extension Project—DEIR

Dear Secretary Bowles:

Cummings Foundation, Inc. (CFI) is a Massachusetts Not-For-Profit corporation and the effective owner of the properties at 196 and 200 Boston Avenue, Medford. CFI comments on the Green Line Extension project DEIR, filed October 15, 2009, as follows:

1. The DEIR designates the extension of the Green Line to Medford Hillside at College Avenue and to Union Square as the "Proposed Project" and a second-phase .9-mile extension from the College Avenue station to Route 16 as the "Future Full-Build Alternative." The Proposed Project is subject to a completion deadline of December 31, 2014. The Future Full-Build Alternative is to be constructed only as funds become available. The proponent states: "These funds will be available sometime between 2016 and 2020 and may allow this portion of the Green Line extension to be constructed shortly after the 2014 schedule for the Proposed Project has been completed." (DEIR, p. 3-40)
2. The DEIR figures depicting the *lone* design proposal for a Route 16 station show a *very large and likely excessive* driveway passing through the existing parking areas for 196-200 Boston Avenue. (DEIR, Figs. 3.7-27 to 29) In CFI's opinion, this driveway is *very much too large for a neighborhood station* that will be accessed primarily by walking, bicycle and bus, as the project contemplates. (DEIR, p. 3-4) As depicted in Figure 3.7-27, the driveway appears large enough for *dozens* of cars to potentially stand with engines idling while waiting for riders.
3. Figure 3.7-29 shows the projected path of the southbound Green Line track encroaching slightly on the southeast corner of the 200 Boston Avenue office building, appearing to require demolition of a portion of the building, unless the track's path is modified. Reportedly, the Medford Green Line Neighborhood Alliance (MGNA), a Medford citizens' group, appeared before the Medford City Council on November 17 and presented its alternative track layout, demonstrating the feasibility of laying the light rail tracks without interfering at all with this foundation's 200 Boston Avenue building (or the building at 222 Boston Avenue owned by another).
4. It has additionally been reported that MassDOT (through StevenWoelfel) and Vanasse Hangen Brustlin, Inc. (VHB) (through Michael McArdle) also appeared at the November 17 Medford City Council meeting and stated numerous times to the councilors that the Route 16 station design contained in the DEIR was merely a *"worst case scenario for land takings"* at Boston

B-004-001

B-004-002

B-004-003

B-004-001

All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

B-004-002

Please see response to Comment B-004-001

B-004-003

DEIR/EA Section 5.2 describes the Project's potential acquisitions. MassDOT is currently conducting detailed property surveys to obtain more specific data. MassDOT will continue to evaluate opportunities to minimize these property impacts.

B-004-003 Avenue and that MassDOT has already been working on designs that *would eliminate any need* to acquire the office buildings at 200 and 222 Boston Avenue.

B-004-004
5. The December 1, 2006 Certificate of the Secretary of EOEA on the Expanded Environmental Notification Form (EENF Certificate) directs that "[t]he DEIR should identify temporary and permanent land takings." (EENF Certificate, p. 5)
6. Under the heading "Land Acquisitions and Easements," the DEIR states: "For purposes of planning, the ***maximum*** property impacts of the Project have been identified and evaluated in the DEIR. As the Project progresses through preliminary engineering and final design, ***EOT will strive to refine*** the designs in an effort to further minimize property acquisitions and have the least possible impact on local neighborhood and property owners." (Emphasis supplied) (DEIR, p. 3-42). Prior to any future refinement as EOT may determine, the DEIR identifies the 200 Boston Avenue property as subject to a ***maximum whole*** property taking, but with the Future Full-Build Alternative only. (DEIR, p. 3-43)

B-004-005
7. CFI submits the DEIR fails to identify temporary and permanent land takings with the specificity necessary to comply with the Secretary's EENF Certificate. As CFI wrote to public participation coordinator Regina Villa Associates on February 14, 2008, 200 Boston Avenue is a four-story 210,000 sq. ft. office building in which approximately 700 individuals work or visit each regular workday. The city of Medford relies on tax revenues from the building, the individuals who work in the building rely on the businesses located there for their livelihoods, and the businesses that support Medford's and the surrounding municipalities' economies need to be able to plan for their organizations' futures. Given the very vague DEIR statement on a potential for land taking at 200 Boston Avenue, it would be exceptionally unfair to the city of Medford and the businesses and employees in the 200 Boston Avenue building if the proponent were to successfully petition the Secretary for review of this DEIR as a FEIR.

B-004-006 In conclusion, CFI requests the Secretary to direct the proponent to file a FEIR, which identifies ***with reasonable specificity*** any need the project may have for temporary and permanent land takings under the Future Full-Build Alternative. ***Acceptance of the DEIR – which contains proponent's "worst case scenario" for "maximum potential" land takings only -- as a FEIR would potentially irrevocably damage many of the stakeholders interested in the ultimate disposition of the 200 Boston Avenue property, including the property's business occupants, their employees, the property owner, and the city of Medford.***

Thank you for your consideration. Please contact me with any questions regarding these comments.

Sincerely,

CUMMINGS FOUNDATION, INC.

Joel B. Swets
Executive Director

B-004-004

Please see response to Comment B-004-003.

B-004-005

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

B-004-006

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

Re: EEA# 13886; Green Line Extension Project—DEIR

Dear Secretary Bowles:

I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford. My firm, Cummings Properties (CPL), is the developer and operator of office and research buildings at 196-200 Boston Avenue on parcels that adjoin the proposed Route 16 station under the Future Full-Build Alternative.

B-005-001 While CPL has always been a consistent supporter of mass transit and finds much to applaud in this DEIR, CPL nevertheless strongly urges you ***not*** to accept this DEIR as the Final EIR and to require further and more detailed analysis of any land taking needs at Boston Avenue. While according to the DEIR, ***no*** land taking will occur at 200 Boston Avenue if additional separate funding for the .9-mile Phase II extension from the College Avenue station to Route 16 cannot be found, the DEIR asserts that appropriate funding will become available between 2016 and 2020.

B-005-002 Put simply, the Route 16 station design included in the DEIR is inadequate. The current document offers only a "worst case scenario" (reportedly MassDOT's own description) for the Route 16 station design, while offering optimized station designs for all other Green Line extension stations. It is our firm's position that MassDOT should revisit the Route 16 station design.

B-005-003 The Medford Green Line Neighborhood Alliance (MGNA), a Medford citizens' group, has offered an alternative station design that averts ***two*** major commercial property acquisitions (200 and 222 Boston Avenue) thereby greatly reducing project costs, preserving businesses and jobs in Medford, avoiding harmful disruption to dozens of businesses, and preserving substantial property taxes for the city of Medford. This MGNA alternative station design reportedly also optimizes traffic flow and better serves the integrity of the station's surroundings. After filing its DEIR, MassDOT has reportedly been exploring similar improved designs, but no such new and improved MassDOT designs have yet been published and vetted by public comment.

B-005-004 In CPL's judgment, the DEIR filed with the Secretary on October 15 is deficient as a Final EIR, and should not be accepted as such, at least as regards the Future Full-Build Alternative's .9-mile extension to Route 16. MassDOT should consider the MGNA alternative station design for the Route 16 location, and should present its own improved Route 16 design(s) for public comment, before proceeding through preliminary engineering to final project designs and construction.

Thank you for your consideration. Please contact me with questions regarding this comment.

Sincerely,

CUMMINGS PROPERTIES, LLC

Dennis Clarke

Dennis A. Clarke
President and CEO

B-005-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

B-005-002

All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

B-005-003

Various community groups have suggested modified concepts for the Mystic Valley Parkway/Route 16 Station. Preliminary evaluation of these concepts showed that the cost of constructing the Green Line Extension to Mystic Valley Parkway/Route 16 would not be reduced sufficiently to be able to be funded at this time. Additional evaluation of the concept as it relates to the MBTA's design standards, operations and other requirements would be necessary in order to determine the full cost savings of a redesigned station. While MassDOT has not been required to revisit the design of this station as part of the FEIR document, further

evaluations may consider the redesign options presented by the MGNA in future analyses.

B-005-004

Johnson, Holly (EEA)

From: Brendan Driscoll [BDriscoll@DriscollElectric.net]
Sent: Tuesday, December 29, 2009 7:54 AM
To: Johnson, Holly S (ENV); Brendan Driscoll
Subject: Green Line Extension Draft Environmental Impact Report

Good morning,

I am writing to express my concern with the impacts the proposed Green Line Extension project will have on 3 properties I own in Medford.

B-006-001

1. 83 Newbern Avenue, Medford (Direct abutter) My business currently occupies this property. Once completed the relocated commuter rail tracks (outbound) will be located within feet of our building. Existing commuter rail operations currently shake the building and are extremely noisy. I am concerned that relating the tracks closer to the building will logically make things worse. Noise and vibration reports on the project's website confirm that there will be significant impact on my property.
2. 86 Morton Avenue, Medford (Direct abutter) We currently lease this commercial building to a painting/ general contracting firm. Once completed the relocated commuter rail tracks (outbound) will be located within feet of our building. Existing commuter rail operations currently shake the building and are extremely noisy. I am concerned that relating the tracks closer to the building will logically make things worse. Noise and vibration reports on the project's website confirm that there will be significant impact on my property.
3. 82- 84 Morton Ave., Medford (Located adjacent to 86 Morton Ave., Medford) This is a 3 family property that we own which was a gut renovation approximately 4 years ago. Building has been fully rented to professionals since renovation was completed. I am concerned that increase noise and vibration caused by both the Green Line and relocated Commuter Rail will negatively affect rental values and our ability to rent the units.

Regards

driscoll

DEIR/EA Sections 5.7, Noise, and 5.8, Vibration, describe the noise and vibration impacts, respectively, expected from the Project. Pursuant to FTA-established guidelines, these impacts have been identified and evaluated for moderate and severe impacts to sensitive receptors. FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments, describes the mitigation measures that would be implemented to eliminate, minimize, or offset impacts above regulatory thresholds.

Dear Secretary Bowles:

B-007-001 Please do not short-cut the study process by eliminating the requirement of a full EIR in this case.

B-007-002 Please consider seperating the new maintainence facility for independant study including review by a local advisory group. Consider also that the proposed maintainence facility in the size proposed could limit the benefit of the extension. Reduce the size of the facility and incorporate the new facility on DOT land and not on any privately owned land in Somerville that has development potential.

Please do not forget that the extension project is require as a mitigation measure and to burden Somerville with a loss of land that otherwise has remarkable economic development potential will be an unfair burden. The size of the proposed maintainence facility seems greatly out of proportion with the approximately four miles of light rail track that is being added.

Please accept also the following review comments, that you will be familiar with from other sources as my own:

Station Design & Siting

B-007-003
- Green Line stations must connect as seamlessly as possible with all other clean modes of transportation, including current and re-routed buses. Station design should accommodate bus drop off and pick-up with maximum integration of transit modes and minimal street disruption.
- Station designs should allow for car drop off, but not parking, and present ease of pedestrian and bicycle access by location of stations on major streets whenever possible, with station access from both sides of the street and in all direction of travel. This will maximize transit use.
- Station and station area designs must be developed through a formal community participation process to ensure that they fit into existing neighborhoods and support appropriate future mixed use development. Takings should be minimized to save the state money and to preserve land uses.

B-007-004
- Design for the project terminus at Lechmere Square should pay particular attention to the East Cambridge Planning Team's pedestrian friendly area design ideas and old Lechmere Station re-use suggestions. The terminus at Route 16 should incorporate MGNA's ideas for minimizing takings.

Community Path Integration & Preservation of Corridor Transit Potential

B-007-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

B-007-002

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. The evaluation considers land use and connectivity impacts and opportunities associated with each maintenance facility site alternative.

B-007-003

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA to evaluate opportunities to improve connections between existing bus routes and proposed stations. Where appropriate, automobile drop-off / pick-up locations will be provided at Green Line Extension stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

B-007-004

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. In accordance with the Secretary's Certificate on the DEIR/EA, the FEIR (Chapter 5, Lechmere Station) includes only conceptual station designs. Plans for stations, the storage and maintenance facility, and all project elements will be refined during the preliminary engineering stage of the Project. MassDOT intends to demolish the existing Lechmere Station and

B-007-005 • Track design and construction should enable adding future stations - between Lechmere and Washington Street / Union Square, between College Avenue and Route 16, and along a future Green Line extension to Porter Square that could serve both Cambridge and Somerville neighborhoods.

B-007-006 • The Community Path and its important station connections must be designed and constructed simultaneously with the Green Line extension in order to facilitate direct pedestrian and bicycle access to the stations and to ensure a safe, attractive, and highly-functional Community Path.

Economic Development & Regional Corridor Planning

B-007-007 • Track, station and Green Line corridor area designs must provide full roadway and community access to Brickbottom Inner Belt and Lechmere Station through reconstruction of Route 28 as a neighborhood and local business friendly boulevard. Improved connectivity to both sides of Route 28 is crucial.

B-007-008 • State and other leading Transit-Oriented Development guidelines should be utilized to promote strategic regional economic development within a mixed use context in the Brickbottom Inner Belt and Union Square Boynton Yard districts. Maintaining diversity in people and businesses while improving the natural environment is critical. Access to open space and greenery promotes health.

B-007-009

Maintenance Facility & Regional Environmental Justice

B-007-010 • More detailed analysis of Mirror H and Option L is necessary. The siting of the maintenance facility and storage yards should not increase the transportation infrastructure and environmental burdens in Somerville or interfere with proposed economic development in the Brickbottom Inner Belt area.

B-007-011 • Current use of the Boston Engine Terminal for the maintenance of diesel engines serving the commuter rail network south of Boston needs to be phased out and a new facility built south of Boston to eliminate the unsustainable and unjustifiable shuttling of trains through Cambridge.

Public Participation

B-007-012 • MEPA should require collaborative planning, with community involvement and public coordination that should intensify immediately, before this project progresses. A staffed field office should be required, before construction start, to address resident concerns and facilitate involvement.

• A project-wide Citizens Advisory Group should be maintained throughout detailed design, engineering, construction and start-up phases with additional smaller local advisory groups established for specific station design, land use, connectivity, construction and mitigation issues.

B-007-013 • A procedure for determining remedies and/or compensation, incorporating community representation, should be required to handle instances when project mitigation proves insufficient to meet pre-agreed impact standards for noise, vibration, pollution and other environmental burdens.

Sincerely yours,

Richard Nilsson, AIA, LEED AP
President and CEO

Nilsson Associates, Ltd.
Architecture + Planning + Interiors
51 Russell Road, Somerville, MA 02144
P: (617) 623-1266 F: (617) 623-6066 M: (857) 928-6773
W: http://www.NilssonAssociates.US
E: Richard.Nilsson@NilssonAssociates.US

prepare the site for future redevelopment. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during project design.

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

B-007-005

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

B-007-006

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

B-007-007

DEIR/EA Section 3.9 describes the compatibility of the Green Line Extension with other regional projects, such as the conceptual reconstruction of McGrath Highway and the Urban Ring transit corridor

initiative. MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses to ensure, to the extent feasible, consistency with planning and other projects.

B-007-008

Direct and indirect impacts to land use are described in DEIR/EA Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for sustainable land use, which could further reduce automobile traffic congestion and improve air quality.

B-007-009

Socioeconomic impacts, including projected effects on businesses, jobs, tax revenues, and community disruptions, are described in DEIR/EA Section 5.3, Socioeconomic Impacts. Effects on land use and transit access are discussed in DEIR/EA Section 5.2, Land Use, and Section 5.15, Indirect and Cumulative Effects. As required by the Secretary's Certificate on the DEIR/EA, additional analysis of the socioeconomic effects of the maintenance facility alternatives are described in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. A series of Project workshops will provide opportunities to discuss broader impacts of the Project on job creation, economic development, housing affordability, and other community impacts.

B-007-010

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter

2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

B-007-011

Major modifications to operations of the Boston Engine Terminal (BET), MBTA Commuter Rail and other railroads, and railroad vehicles are beyond the scope of the Green Line Extension Project.

B-007-012

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

B-007-013

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

Re: Green Line Extension Project
Draft Environmental Impact Report

Dear Ms. Johnson:

Over the past several years, Pan Am Railways ("PAR") has repeatedly expressed its commitment to the success of the Green Line Extension project (the "Project"), and has worked closely with representatives of several agencies of the Commonwealth and their consultants to assist in the conceptual design of the Project. After reviewing the Draft Environmental Impact Report ("DEIR") for the Project, however, PAR feels compelled to point out certain inaccuracies regarding the impact of the Project on freight rail service as well as the status of Yard 8.

B-008-001

PAR understands that Yard 8 is the preferred alternative for the location of a maintenance facility during construction of the Project, and has had multiple conversations with state officials regarding an acquisition of this parcel by the MBTA. However, at this point no agreement has been reached, and Yard 8 remains an integral part of PAR's freight operations to serve its customers in the Boston area and on the North Shore. Accordingly, while PAR would like to continue to work cooperatively to assist with the Project, it is important to recognize that the Project will adversely affect PAR's ability to provide freight service if alternative arrangements—if any exist—cannot be mutually agreed upon.

B-008-002

Furthermore, the DEIR states that PAR could utilize the Yard 10 lead track to bypass Yard 8 and continue freight operations in much the same manner as it does today, but this is not a correct assumption. To the contrary, this option has never been fully

B-008-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

B-008-002

During preliminary engineering, MassDOT will coordinate with PAR on track rights and PAR service in the Study Area.

B-008-002

investigated and preliminary analysis indicates that development and encroachments along this track would make it extremely difficult to perform freight service, even if the line were rehabilitated to a standard that would permit operations. Moreover, as a result of the unavailability of this connection, the so-called Third and Fourth Irons remain the sole freight only connection to Yard 8 and are critical to the continuation of freight service in this area at present and reasonably foreseeable levels and would have to be replaced if needed to be removed for the Project.

B-008-003

Recently PAR was also informed that its current connection between Yard 8 and the tracks utilized to service customers—commonly known as the "Willey Track"— and possibly other tracks will need to be removed or altered to accommodate the Project. Should this be necessary, the connection to provide freight service to Boston area and North Shore customers would be compromised, again with no presently viable alternatives to adequately mitigate the effects of this lost connection short of replacement. Importantly, the adverse effects on freight service brought about by this change will occur regardless of the status of Yard 8, absent a mutually acceptable agreement on alternative service options, should such options even exist.

In closing, PAR would like to reiterate its support for the Project and its willingness to continue to cooperate with the relevant agencies to resolve these issues. Notwithstanding the challenges presented by existing circumstance, we hope that alternatives can be identified and implemented in a manner that will both speed the progress of the Project and lower its cost. Toward that end, PAR remains willing to meet with the appropriate agencies to explore solutions to these complex problems.

Thank you for your attention to this matter. Please feel free to contact me if you should have any questions or comments.

Sincerely,

Roger D. Bergeron

Roger D. Bergeron

Boston, MA 02114

Dear Secretary Bowles:

We are the owners of units 304 & 307 in the Glass Factory condominiums. We own these as investment properties and have concerns about the Green Line extension impacting the desirability of these as rental properties. We are also concerned about the future value of these properties if the design and location of the new Lechmere Station are not improved.

B-009-001 We are particularly alarmed by the horrendous design of the new station. Building something this unattractive will surely lower our property values. We expected a station more along the lines of the new station at Charles MGH, or the beautifully designed glass station that had been proposed by the North Point developers. We request you substantially improve the design and quality of this station to make it consistent with the upscale neighborhood that is developing in North Point and the surrounding areas.

The station is located too close to the Glass Factory. It looms over our landscaped parking area and reduces our green space. It is uncomfortably close to our building and will certainly lower property values. We suggest putting the station closer to the corner of East Street and Msgr. O'Brien Highway. Here it would give this visible corner a sense of importance. Most of the outdoor parking could then be hidden behind the station.

B-009-002 We are concerned about impacts during construction and hope you will do all you can to minimize noise, provide adequate screening and maintain easy access to the Glass Factory during construction so our tenants will not be disturbed during the construction.

B-009-003 We are concerned that the tracks and busway behind the building will severely reduce the value of the units facing the rear of the building. Many owners would be forced into foreclosure and values throughout the whole building would be affected. We request you position the tracks and busses as far away as possible to protect the value of the 50% the building that faces the rear. We also want the green space to be left as is.

B-009-004 We strongly oppose locating the Mirror H maintenance facility behind the Glass Factory. We purchased our units here with the understanding there would eventually be additional residential development as well as offices and a hotel in the area behind the building. The maintenance facility would make this positive development impossible.

Sincerely yours,

Patricia J. Mason
Administrator and Authorized Agent

B-009-001

Revised conceptual plans for Lechmere Station, including modifications to the station headhouse and entrances, enclosed automatic fare collection, and other amenities are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

B-009-002

Construction impacts of the Project are described in each environmental resource section in DEIR/EA Chapter 5, Environmental Consequences. Pedestrian and vehicular access to abutting properties will be maintained at all times. Construction contractors will be required to comply with relevant federal, state, and local laws, regulations, and codes to eliminate or minimize adverse effects (such as noise and vibration levels, and traffic flow) to environmental and social resources. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the next phases of the Project: design and construction.

B-009-003

FEIR Chapter 5 describes the revised conceptual plans for Lechmere Station, including station design, track alignment, bus routings, and other elements. Changes to the track alignment depicted in the DEIR/EA were evaluated, but could result in additional impacts on area abutters. Proposed mitigation measures for area abutters are also described in FEIR Chapter 5. During preliminary engineering, specific station design elements will be further developed.

B-009-004

An expanded technical and environmental analysis of the light rail

storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Mirror H location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

PROCEEDINGS

MS. KATHERINE FICHTER: I think I'm going to start. We are waiting for the Mayor of Somerville, who is on his way. He is dealing with automobile traffic since we don't have the Green Line Extension yet. But I'm going to start just by explaining a little bit about what we're going to do this evening, and then my colleague Nancy is going to talk a little bit more just about the structure of how we're going run the comments. And by then, hopefully the Mayor will be here to speak to us, and then I'll go into the longer presentation that you see before me -- or behind me.

Welcome, everybody. My name is Kate Fichter. I am the Manager of Long-Range Transportation Planning for the Commonwealth of Massachusetts. I am also the Project --

[Applause]

MS. KATHERINE FICHTER: -- thank you. I am also the Project Manager for the Green Line Extension Project and, for people who are followers of this project, we are three years plus a month since we gathered in this room to kick off this phase of the environmental review process for the Green Line Extension; and I could not be more thrilled than to be here tonight. This is a huge milestone, and a lot of credit is due to the people who are sitting here,

who have worked with us and pushed us and never given up and never gotten bored; and I am just really, really happy to see everybody here tonight.

I'm going to start by defining two acronyms that I'm going to be using a lot tonight. The first is MassDOT, which stands for the Massachusetts Department of Transportation. A lot of people who've come to our meetings have heard me use the term "EOT" a lot in the past, which is the Executive Office of Transportation. On November first, we changed our name. We changed our mission, and we changed our organizational structure. So going forward, unless I slip up -- and please forgive me if I do -- you will hear me use the term "MassDOT."

The other acronym I'm going to use a lot is the DEIR, which is the Draft Environmental Impact Report, which is this document. This is the document that we are here to discuss tonight. This is a major overview study of the environmental impacts of the Green Line Extension Project as we understand them now. I'll talk in more detail about what this document is, but I'm going to be using that term a lot tonight, so is probably everyone who speaks. So I just wanted to be clear that people knew what it was: and if you picked up a copy of the Fact Sheet, which I hope that you did on your way in and -- if you don't, please, on your way out -- that talks more about it as well.

Just a few basics before we get going. For the people who've seen me speak before, who've seen us run public meetings for this project before, we typically have a lot of give and take. People speak, I answer. We have some conversation, some dialogue. Tonight is not really going to be like that. This is a more formal event. I'm going to do my presentation. Then Nancy and I are going to sit. Nancy's going to help run the comments to keep everything going smoothly, but really this is more like a listening session. This is a time for the public to have the floor. We're here to listen to you. Everything that you say is being recorded by a professional stenographer.

We're also encouraging people to separately submit written comments, and there's information on how to do that in the Fact Sheet. It's also on the project website. So it's going to be more formal. I'm not going to be speaking very much until the end. So I just didn't want people to be frustrated when I wasn't responding; and for people who like to hear me talk, this might be disappointing, it might not. We will do responses in writing as we finalize the Environmental Impact Report; but for tonight, it's mainly going to be you having the stage.

So everybody knows, we've got a big crowd here tonight. I know we've got a long list of people who want to speak, and we are asking people to sign up if you want

to speak. We will stay here until every last person who wants to speak has had a chance to speak. If you're the last person, you may be speaking to an empty room, but we will still be here. So I didn't want people to get concerned that we were going to cut you off at some point. We're also being recorded by Somerville Cable. So if you speak tonight, you have a chance of being on TV. And the only other think I wanted to say is my parents are here tonight. So please be gentle and help make me look good. Okay. So I'm going to have Nancy just explain a little a bit about how we're going to go tonight and then, hopefully, the Mayor will speak.

MS. NANCY FARRELL: Thanks, Kate, and welcome to everyone. I'm very happy to see you and to be with you this evening. This is the public hearing on the Green Line Extension DEIREA. The EA part is the Environmental Assessment. As Kate said, the team will not be responding to your questions tonight, and sometimes that can be a little frustrating. Kate will want to respond to your questions, and I will have to do this to her to stop her. So please understand that this is for you to get your opinions on the record, and that's the purpose of the hearing.

Because there are so many people who do want to speak, we are going to ask you to limit your comments to

two minutes. Now, you can say a lot in two minutes, believe me, because I've done a lot of these meetings. I will raise my hand when you reach the end of your two minutes, ask you to wrap up your remarks; and if you go over, then I will have to ask you to be polite and to stop talking.

At the end of the night after everyone's had a chance to speak, if you are burning to have another two minutes, you can approach the microphone. We have a sign-in sheet in the back for speakers, and we have a sign-in sheet for elected official speakers. I am actually going to ask the elected officials to also stay to the two-minute limit, just so you know that. I will recognize them first, however, because they often have to go to another meeting.

So please, if you want to speak, be sure to sign up to be recognized. I already have thirty-three speakers who have signed up. I will read the names three at a time. You don't have to line up at the microphone, but that will let you know that your name is coming up. You'll come to this microphone right here in the front in the center. You can speak to Kate and me. If you'd rather turn around and speak to everyone else, you're welcome to do that as well. I ask you always to be courteous and respectful of everyone else's opinion.

So if the Mayor is here -- ah, here he is. I

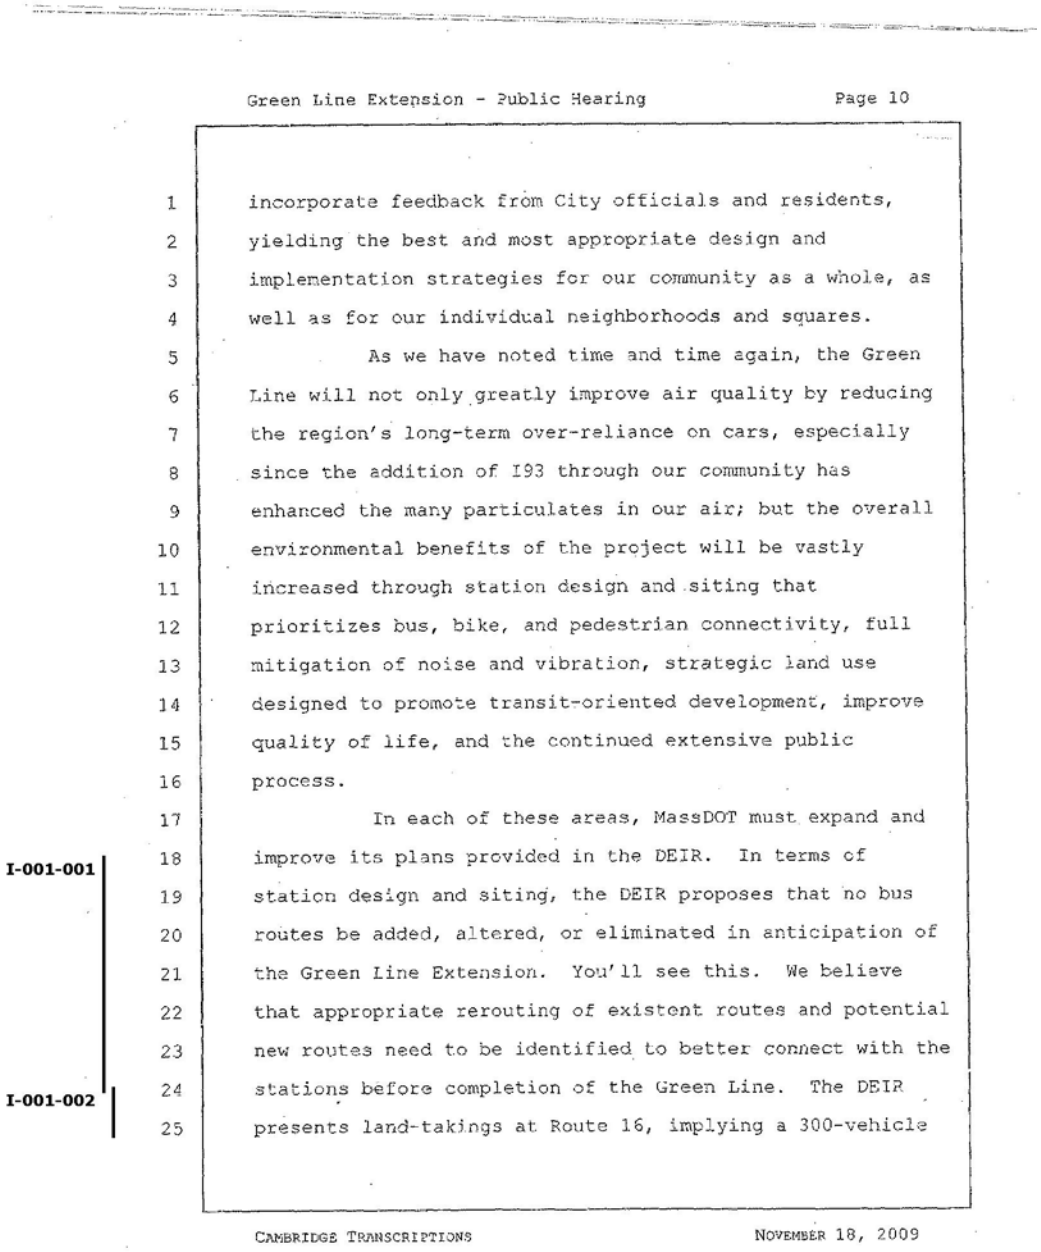
will introduce Mayor Joseph Curtatone to make a few remarks, and then we will start the presentation, which will go pretty briskly, and then we will be very anxious to hear what you have to say.

MAYOR JOSEPH CURTATONE: Thank you, Nancy. To Kate's parents, she's doing a fantastic job. I really love her. How about a round of applause for Kate's parents, right? First, I'm going to be over two minutes. I'm just going to be upfront, and I have to leave early, I apologize. I usually stay for the whole thing. I have a son down at the skating rink at hockey practice. I have to drive him home.

Members of the state delegation could not be here this could not be here this evening. They are in session. Full support of this project, I want to thank them for their help. As well, the members of the Somerville Board of Aldermen may be trickling in. They have community meetings going on tonight. But we want to welcome and thank MassDOT officials and all the elected officials representing this community from the community, including Somerville Transportation Equity Partnership, all the stakeholders in this city, the business community, my staff at the Office of Strategic Planning and Community Development, and Governor Patrick and former Secretary of EOT, James Aloisi, for his hard work.

But on behalf of the City and our residents, businesses, and employees, I applaud the release of the Green Line Extension Draft Environmental Impact Report, and offer sincere thanks, again, to MassDOT for committing to a few things, a Route 16 terminus, full design of the Community Path, and an analysis of alternate locations for the maintenance facility. It's been mentioned, the DEIR does represent a critical phase in the public evaluation process and allows for preliminary engineering to begin, which we've been waiting for for a long time. To that end, the City welcomes the opportunity to comment on MassDOT's work thus far, and I strongly encourage all of you, residents and business owners, to offer written comment prior to January 8, 2010.

In framing those comments and responding to this draft EIR, we need to bear in mind that enhanced transit is not only a worthy goal in its own right, but it is the key to addressing a wide range of urban development goals and complementing the City's overall planning, environmental, and quality of life initiatives. Now, with these goals in mind, we need to be sure that this project is fully integrated into our larger vision for Somerville's future, that it contributes to the solution of existing problems, while anticipating future needs. We will, therefore, continue to work to ensure that the future plans and phases



Green Line Extension - Public Hearing Page 10

incorporate feedback from City officials and residents, yielding the best and most appropriate design and implementation strategies for our community as a whole, as well as for our individual neighborhoods and squares.

As we have noted time and time again, the Green Line will not only greatly improve air quality by reducing the region's long-term over-reliance on cars, especially since the addition of I93 through our community has enhanced the many particulates in our air; but the overall environmental benefits of the project will be vastly increased through station design and siting that prioritizes bus, bike, and pedestrian connectivity, full mitigation of noise and vibration, strategic land use designed to promote transit-oriented development, improve quality of life, and the continued extensive public process.

In each of these areas, MassDOT must expand and improve its plans provided in the DEIR. In terms of station design and siting, the DEIR proposes that no bus routes be added, altered, or eliminated in anticipation of the Green Line Extension. You'll see this. We believe that appropriate rerouting of existent routes and potential new routes need to be identified to better connect with the stations before completion of the Green Line. The DEIR presents land-takings at Route 16, implying a 300-vehicle

I-001-001

I-001-002

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

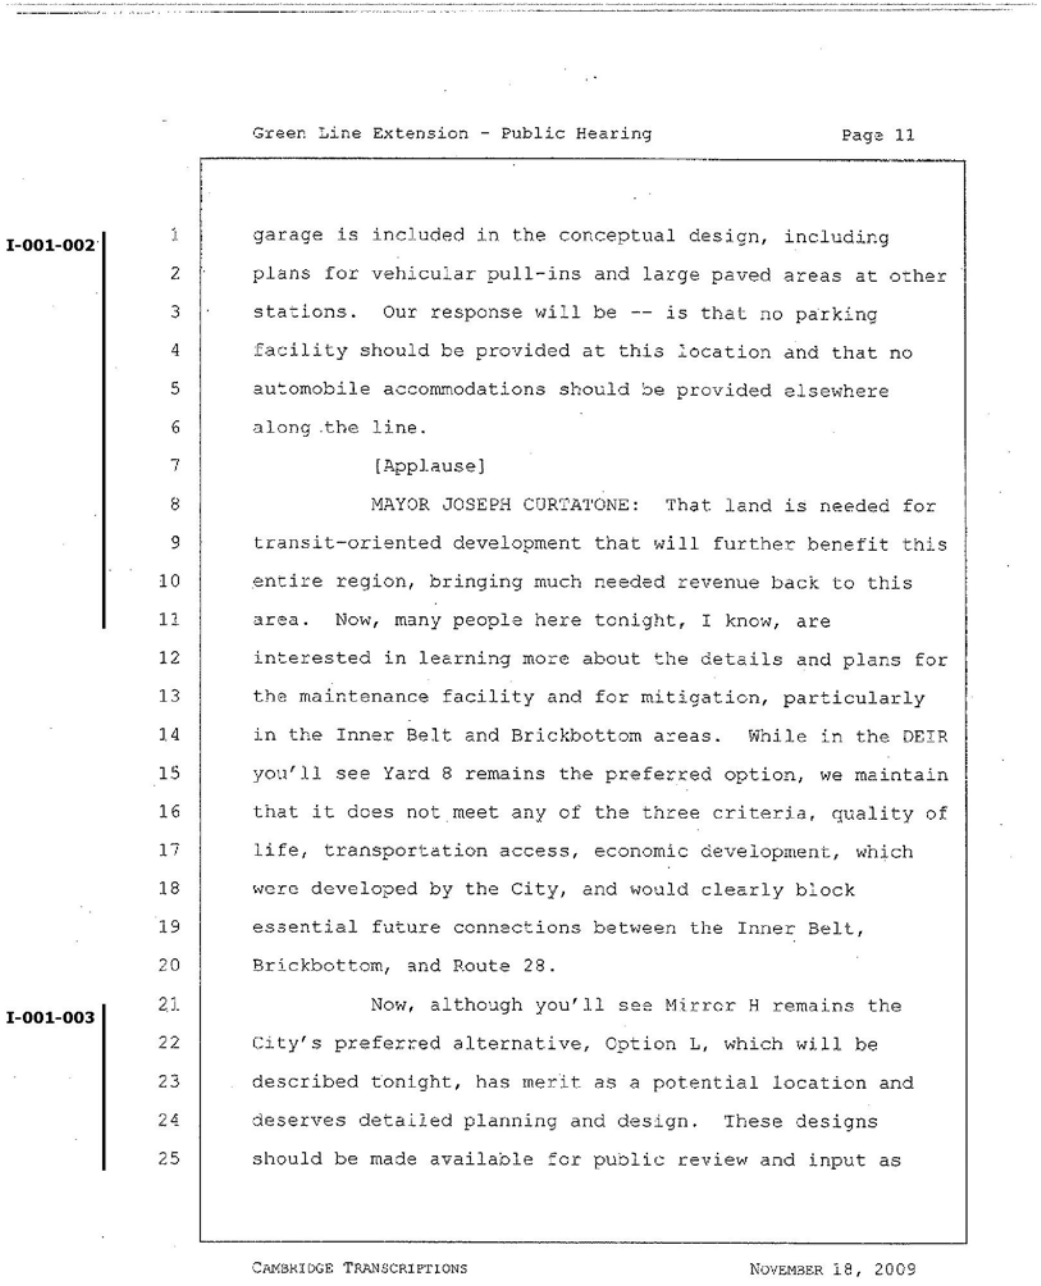
I-001-001

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-001-002

Although the proposed station layout did not include parking, A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are no longer included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.



Green Line Extension - Public Hearing Page 11

garage is included in the conceptual design, including plans for vehicular pull-ins and large paved areas at other stations. Our response will be -- is that no parking facility should be provided at this location and that no automobile accommodations should be provided elsewhere along the line.

[Applause]

MAYOR JOSEPH CURTATONE: That land is needed for transit-oriented development that will further benefit this entire region, bringing much needed revenue back to this area. Now, many people here tonight, I know, are interested in learning more about the details and plans for the maintenance facility and for mitigation, particularly in the Inner Belt and Brickbottom areas. While in the DEIR you'll see Yard 8 remains the preferred option, we maintain that it does not meet any of the three criteria, quality of life, transportation access, economic development, which were developed by the City, and would clearly block essential future connections between the Inner Belt, Brickbottom, and Route 28.

Now, although you'll see Mirror H remains the City's preferred alternative, Option L, which will be described tonight, has merit as a potential location and deserves detailed planning and design. These designs should be made available for public review and input as

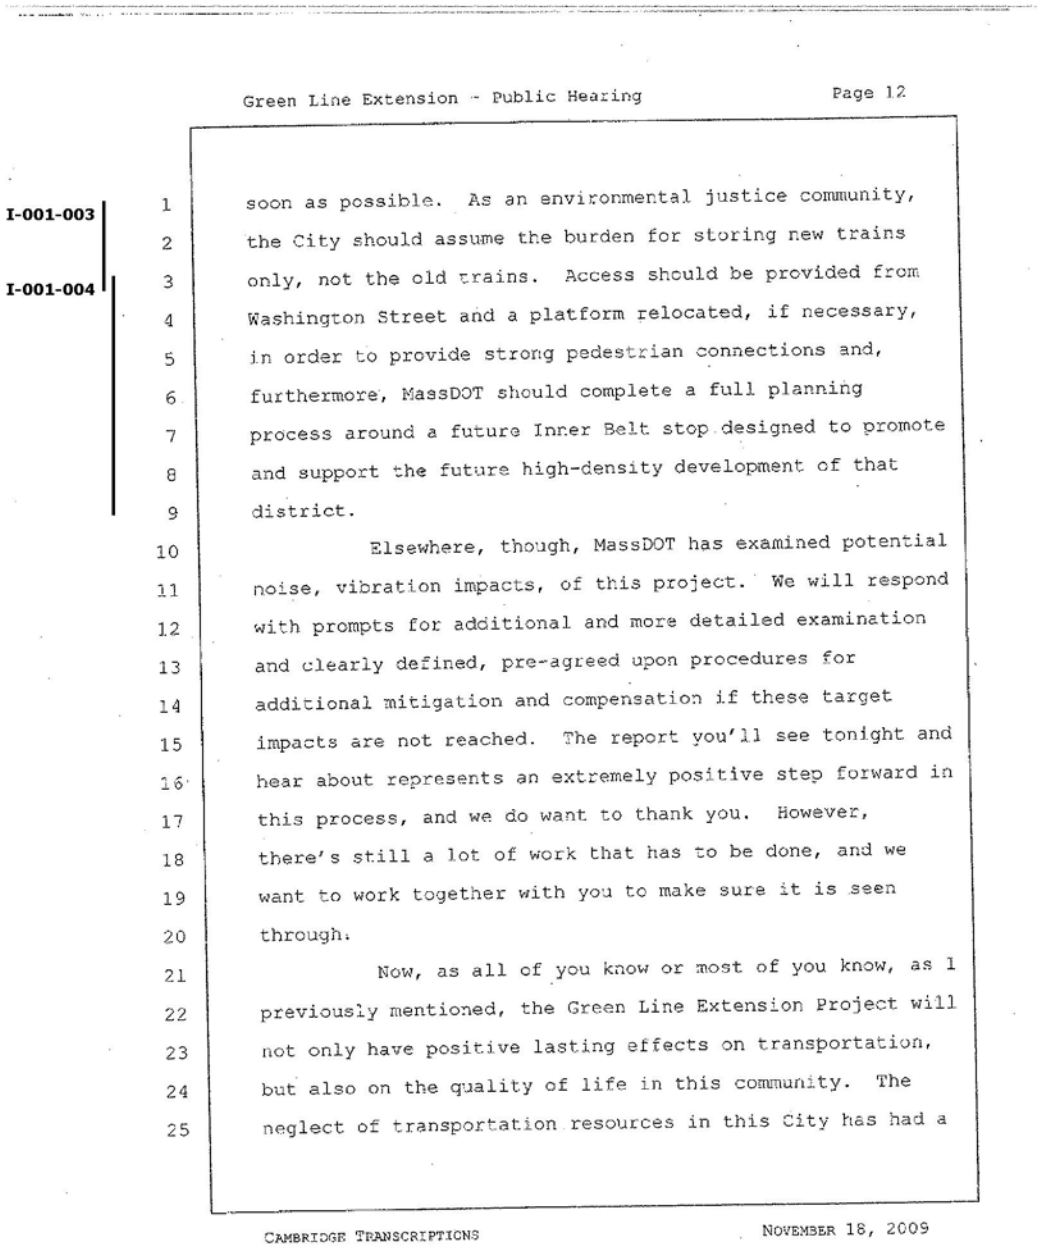
CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-002

I-001-003

I-001-003

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Mirror H location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.



Green Line Extension - Public Hearing Page 12

I-001-003

I-001-004

soon as possible. As an environmental justice community, the City should assume the burden for storing new trains only, not the old trains. Access should be provided from Washington Street and a platform relocated, if necessary, in order to provide strong pedestrian connections and, furthermore, MassDOT should complete a full planning process around a future Inner Belt stop designed to promote and support the future high-density development of that district.

Elsewhere, though, MassDOT has examined potential noise, vibration impacts, of this project. We will respond with prompts for additional and more detailed examination and clearly defined, pre-agreed upon procedures for additional mitigation and compensation if these target impacts are not reached. The report you'll see tonight and hear about represents an extremely positive step forward in this process, and we do want to thank you. However, there's still a lot of work that has to be done, and we want to work together with you to make sure it is seen through.

Now, as all of you know or most of you know, as I previously mentioned, the Green Line Extension Project will not only have positive lasting effects on transportation, but also on the quality of life in this community. The neglect of transportation resources in this City has had a

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-004

The conceptual plan for the Brickbottom Station will be refined during the preliminary engineering stage, taking into consideration municipal, neighbor, and other stakeholder concerns to the extent practical. The Public Involvement Plan, Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station location and design in particular can motivate transit-oriented development, a Commonwealth goal for smart growth land use, which could further reduce automobile congestion and improve air quality.

negative consequential effect on our neighborhoods for decades. The extension of the Community Path now directly coincides with the Green Line Extension; and the report, as you will see and it appears, presents only fragments of the path at various stations, with no unified conceptual plan. We will stand firm by our mutual agreement and verbal commitment by MassDOT to include a one hundred percent design as an essential element in the Green Line Extension Plan.

I-001-005

We'll also stand by our contention that it is essential that both projects, the Green Line Extension and the Community Path extension, be constructed simultaneously. And I am confident --

I-001-006

[Applause]

MAYOR JOSEPH CURTATONE: I am confident that the officials from MassDOT and all other participating state agencies will also agree with me that community involvement and public coordination should, and must, intensify as this project progresses. Therefore, again, we encourage everyone here this evening to submit written feedback by January 8, 2010, as we all work together to ensure the final plan preserves the character and identity of each individual neighborhood.

Again, I want to thank you for coming here tonight. I do want to thank the new Secretary Mullan,

I-001-005

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-001-006

Please see response to Comment I-001-005.

former Secretary Aloisi, and the Governor, for their commitment to see this project through. Let's make sure we do it right. It's a one-short deal. Thank you very much.

MS. KATHERINE FICHTER: I actually want to start by echoing and seconding something the Mayor said which is that, while all of us here in this room have done a lot of work, we still have a long way to go; and that's something we need to do cooperatively, and it's something that I want you to keep mind when you're thinking about commenting -- as I hear the train. The designs and the plans and the recommendations that you see here represent about a ten percent level. So although, as I say, we've done a lot, we have a long way to go, and we're looking to you for input, ideas, suggestions. Just keep in mind that we're early, and we're going to be back a lot.

Actually, one thing I meant to do earlier and forgot, can everybody please who's in the room who's a member of the Green Line Extension Project Team just stand up or wave. I just want people to recognize you and know who you are. Don't be shy. Most of them are hiding over here. But just so you know, if you do want to talk to anybody after, that would be great. The other thing is, folks hugging the back wall, don't be shy. Feel free to come on in.

Okay. So let's get going for real. So why are

we here? As I said, we are here because we have released the Draft Environmental Impact Report/Environmental Assessment for the Green Line Extension. Just in case anyone was wondering, the reason why it has two names -- the first part of it actually represents the state environmental requirement, which is this report. The second piece, the Environmental Assessment, is the federal environmental requirement. We are doing these in conjunction, which has some benefits and some negatives; but that's why we always call it the DEIREA, which is quite a mouthful.

As we said, this is a comprehensive assessment of the environmental impacts of the project, presents the conceptual project design, which is about the ten percent level; and it's also a preliminary discussion of what we would be proposing for some of the mitigation options to offset some of the impacts that we're seeing. We're doing the public hearing. We talked about that, and there's a transcript being made that will be part of the official record.

Again, just to reiterate, we are early in the process. This is a sort of awkward table, but it gives you just a sense of what we've done and how far we have to go. I'll be talking a bit more about some of these steps, but really this is just a visual to give you a sense of where

we are, and you see the yellow circle on the bottom.

So what happens after tonight? As I say, we recommend, please, if you have the time, think about submitting your comments on your own. Even though we're keeping a record, it's best to have -- you have a chance to say them as you want to in your words, and they'll go directly to the Secretary of Environmental Affairs; and they will be informed by those comments when they scope us for our further work on this effort.

This other point is very important. We had a lot of public requests that we extend the comment period beyond its original date. We know that this is a big document. This actually has to companion pieces that are not here tonight. So we've given people until January eighth. That's about as far as we feel like we can go and keep the project moving. So anything you submit should be in by January eighth; and again, the information for how to do that is in the Fact Sheet, and it's also on our project website.

Just very quickly, in case we have people who haven't been following the project so carefully, how did we get here? Some sort of mass transit service running out of Lechmere northwest into this area has been proposed, I believe, since the 1940s. There have been a lot of different planning studies, and here we are. There have

been a lot of different planning studies, and this -- the fact that we are here tonight owes a huge amount to the grass roots advocates who have kept this project alive, who carried it, who insisted the state make it a commitment and stick to that commitment; and we really, all of us, owe a debt of gratitude to all the people who've given a lot of nights like this one to keep this project going. And because of their work, this project is now a legal commitment of the Commonwealth of Massachusetts. We are required to extend Green Line service from Lechmere to Medford Hillside in Medford and Union Square in Somerville by the final day of 2014.

I'm not going to bore you with the details, but that legal commitment is actually embedded in the Clean Air Act. We are required to do it as part of the large-scale mitigation for the Central Artery Project. So a lot of what underlies the Green Line Project depends on the air quality benefits that we project the project to provide; and we have been working, as I said, on this current phase since October of 2006.

Okay. This is the hardest slide, and I'm not going to spend a lot of time on it, but I'm sure a lot of people in the audience have questions. People have talked to me about this. How is the MBTA going to afford this? How is the Commonwealth going to afford both build it and

then to operate it? There's stuff in the newspaper every day about the state of the Commonwealth's finances, about the state of transportation financing. That's something I live with and work with all the time. That's something I know people are worried about. So I just wanted to talk very, very quickly about this just to kind of leave you with a couple of ideas that might be helpful when you're thinking about this project and thinking about your comments.

First of all, there are sort of two major types of funding -- and I'm really simplifying this -- but there are two major types of funding that the MBTA needs to run its system. The first is capital funds or construction funds, which allow them to build new things, and that's what we will be looking for to fund the Green Line Extension, the actual construction of it; and then there's sort of day-to-day operating money -- what does it take to turn on the lights, to pay the drivers, to keep the vehicles fueled, those kinds of things.

When people talk about the big gap in MBTA finances, they tend to be talking more about the everyday operating, but it really affects both things. And as a result, it affects what we do on the Green Line Extension because every time we need to make a decision about how big the project is going to be, where is it going to go, is it

going to have this feature or that feature, we're always having to think about those funding constraints, both on the construction side today and in the next couple of years, and on the long-term operating side, because we are bequeathing this project to the Commonwealth, and it will then have to run as part of the T System. So that really does affect us, and I know that we all wish it didn't but it does, and it's something that we think about all the time.

People may have heard of the D'Alessandro Report which came out in the last few weeks, kind of another itemization of the T's -- another detailed itemization of the T's funding issues. The bottom line for our purposes is that funding is very precious right now for transportation. We need to be very careful with it, and we need to think every time there might be an amenity or sort of an extra that people would like to add onto a project, we may not necessarily be able to do it.

The Governor has said very clearly he is committed to this project. That's very important. It puts us in a very special place, and we're trying to hold onto that; but please be aware of the financial considerations when you're thinking about your comments. And this is actually sort of a new issue that has changed since I was here in March, the last time we really talked about this

project together. Some of this stuff is new and is affecting how we think about things differently.

So why are we doing this? Why are we extending the Green Line? There are a lot of reasons, and probably a lot of people in this room have different reasons; but there are a bunch that we tend to think about a lot. The first, very basic, Somerville and Medford are communities that we call transit-friendly. These are places that have a lot of characteristics that make them really ripe for very good public transit. They're very dense, high populations, a lot of people don't own automobiles. There are a lot of reasons why people want to go into the core of Boston. All of these things make this a good place for better transit than what you have now.

I talked about the air quality. That's part of the legal commitment. We're clearly looking to reduce the existing traffic congestion that the Mayor had to deal with this evening. We all know the traffic's really bad here. We're also looking at providing new opportunities for economic development. We've seen that all over the Commonwealth when we've put in new transportation infrastructure, and we really believe it can happen here now; and we are projecting currently 52,000 new boardings, which is new boardings and alightings, people getting on and off at the new Green Line stations after it opens. Is

that for 2030? That's what we'd be looking to see in 2030. So those things all together make this a very strong project, and makes it certainly one of our top transportation priorities right now. Another train --

Okay. So what are we looking to propose to do? Oh, that's really hard to see, isn't it? All right. If everybody looks at their Fact Sheet, there's a map of the project in the Fact Sheet. We are proposing roughly a four-mile extension of the Green Line northwest from a relocated Lechmere station. I assume most people know that Lechmere needs to be relocated. I'll talk about that a little bit more in a second.

We're looking at six new stations in Somerville and Medford, and we'll be making use of the existing Lowell and Fitchburg commuter rail rights of way. That's a really important point for this project that I want people to remember. We are using existing rail rights of way, which means we are having extremely limited impact on the residential and business neighborhoods which is really important. It's one of the things that makes this is a really, really good project and really great for the communities around it.

So we are doing the Main Line branch, which we are currently proposing to College Avenue in Medford, and then a secondary branch -- not secondary but a smaller

branch to Union Square in Somerville. Doing this project meets the legal air quality requirements that we are committed to. The station locations that are proposed here are unchanged from what we've been proposing for a long time. If you've come to any of our meetings in the past, you'll have seen these proposals. They've been well vetted in the public. We feel comfortable with them now.

We're certainly eager to hear from people on specific details but, taken generally, we are imagining these stations as what we call neighborhood stations. They're embedded in neighborhoods. They're not big, sort of Alewife-style stations that are outside of residential fabric. We want them to be places that people can walk to, that people can bicycle to, that fit in nicely, and that means both in terms of how they relate in space to the neighborhoods around them, but also in design and architecture. We're looking to do what we can to tailor these stations to fit the neighborhoods that they're in.

Following on something the Mayor said, we have proposed for some of the stations limited short-term automobile drop-off and pickup. This is sometimes called "kiss and ride," which is sort of a weird, cute term. We know there are concerns about this, and I would say that the reason we have proposed it is because our sense of how communities work is that, even if you don't provide a place

for people to do drop-off, they will do it anyway. Two stations that I use a lot are Harvard Square and Central, both in Cambridge, both as dense as you can imagine, and people are still doing automobile drop-off and pickup, just because that's what people do. They take people to the subway when they have luggage, when they've got little babies; and if you don't provide some safe place for people to do it, even for a few minutes, you can create safety issues. So we're going to be working with the City to try to find a way to make that palatable, but for now we're thinking that's a good idea.

Also, on the bus issue, we fully agree that these stations need to be well integrated with the bus network. We are proposing, for now, to retain the existing bus system. We've heard from a lot of people that a lot of the existing bus routes are very important to them. We don't want to change those until we have a better sense of how the Green Line Extension works in these neighborhoods. Over time, as the Green Line settles in, as people start to use it, as travel patterns become clear, we may look to modify the bus network; but for now, we're trying to align the stations as well as possible with existing bus stops, and we will continue to do that as we go forward.

The other piece I wanted to talk about -- a piece that I'm sure a lot of people are interested in tonight --

is the proposed extension from College Avenue then onto Route 16, Mystic Valley Parkway, which is close to the U-Haul place, if anybody's ever had to move and rented their own U-Haul. We have proposed that we believe that the best version of the Green Line Extension goes all the way to Route 16. At the moment, we cannot afford to do that final piece. So what we are proposing is that by 2014, by our legal deadline, we will meet the legal requirement, and we will bring the Green Line to Medford Hillside. We have, for the moment, slated funding for the 2016 to 2020 timeframe to do that remaining piece.

So we are still thinking about this as a complete project, but we are having to think about it in phases because of financial reasons. And some people have asked me, "All right, I'm looking at this document that talks about everything all the way to Route 16, but I don't know if you're going to do it in the short-term. How do I comment on it, how do I think about it?" I would suggest that you comment on the whole thing because the whole thing is being presented here. We've evaluated impacts for the whole thing, but again, we'll be coming back in phases to talk about big pieces of the project. So there'll be other opportunities, but I'd encourage you to think about it now as well.

Okay. The Community Path the Mayor mentioned,

this is a very important part of the project. It is a multi-use path that is projected to run alongside the Green Line between Cedar Street -- is that right -- Cedar Street, potentially beyond into the North Point area, and then hopefully eventually feeding into the Charles River Basin, some of the existing paths that would bring people into Boston. We have committed to perform up through final design for the Community Path between Cedars and North Point. We think this is really important. At the moment, we're not able to assume financial responsibility for the construction phase, but we also agree that it would be optimal to have it done in conjunction with the Green Line Extension, and we're looking to work with the City. We're really eager to keep working on this together to figure out how we can do it because we also feel like it's a really important thing.

Okay. So as the Mayor mentioned, part of the Green Line Extension Project is the construction of a maintenance facility -- maintenance and storage for the Green Line vehicles that will serve the north side of the system. We need to build this facility somewhere as part of this extension project. The existing maintenance capacity for the Green Line is not sufficient to handle the new load that will be brought by the extension. In addition, the facilities are not located in the right

place. To not have a maintenance facility or to not have it correctly located will hamper the service. It will make it inefficient. It will introduce some of the problems that people may have experienced elsewhere on the Green Line, and we're really hoping to eliminate as much as possible.

So let me just walk people quickly through where we are on this. The DEIR talks about it in depth, which I'm sure we'll be hearing about tonight. But just a sort of quick overview, we are proposing a location known as Yard 8. That's a traditional railroad site. It's in the Inner Belt neighborhood of Somerville. That is the analysis that you will see in the document. We've talked about that in depth in the past. We understand that there's a lot of concern about that location within Somerville for a number of different reasons, and we are sensitive to that, and we are continuing to try to work to find some other solution that meets everybody's needs.

So in service of that, we are proposing, and we are already undertaking, additional analysis, both of the so-called Mirror H site, which straddles Cambridge and Somerville. It makes use of part of the NorthPoint area of Cambridge, if people are familiar of that, and several parcels in Somerville. That's a location that's been proposed by Somerville. We know there's a lot of interest

in it. We've done some analysis, we'll be doing some more.

We are also looking at a new site which is what we are calling Option L, which is here, which is a site we haven't considered in the past. We are beginning the analysis of it now. We hope to have that ready for vetting in the public hopefully next month. It has some advantages. It is close to BET, the existing Boston Engine Terminal, which we know is an interest. It doesn't block the middle of Inner Belt the way we've talked about in the past. It does have some additional costs, additional other issues, property acquisition issues, that we're trying to figure out.

So the bottom line is that we are still working on this. The analysis that you see here is for Yard 8. So if you want to comment, please comment on Yard 8. That is what is before the Environmental Agency right now, but we're going to continue to work with it, and we're going to be back out in the public probably before Christmas to talk about this more.

Okay. Very quickly, numbers are not my thing, but I know people are interested in the cost of this project. So we wanted to put them up here. They're also actually in the Fact Sheet, if people want to look at them there. You don't need to write them down. But we tend to think about our costs in two ways. We did our initial

analysis in 2008. So we have them in 2008 dollars, and that's about $804,000,000, and then we also have to do analysis in what's called "year of expenditure." When you build a project like this, you don't spend everything all at once obviously. You have a cash flow over a certain number of years, and this is a way of sort of representing that idea. It's higher because we're spending into the future, and money gets more expensive as you go forward.

Keep in mind, please, these numbers represent the extension project without the Mystic Valley Parkway/Route 16 addition that we talked about; and we have here both capital and operating. Question, how are we going to pay for all this? We're hoping to receive federal funding to help us with the construction costs. We would be hoping for about fifty percent federal funding. We are in the process of applying for that money now. That is a long and complex process, and we will be competing against transit projects all over the country. So we believe this is a good project, a competitive project. We think it meets a lot of the needs that the federal government is looking for when it looks to fund transit project, but you never know. So we need to keep working as hard as we can, and we'll also be looking for your support as part of that application to help make this strong against all of the other projects going on.

So project impacts -- project impacts are sort of the heart of what's in a DEIR. That's really why you do it, to try to identify how is a project going to change the physical environment in which it's being introduced, and we really think about impacts in two ways. There's the natural environment, which is things like air, water, other things that sort of -- plants, those kinds of things. We then look a lot at the human environment, which means historic resources, noise, vibration, automobile traffic, all of the different ways in which a big infrastructure project will influence the communities in which it's going into.

The important point to make here, the Green Line Project is a very low-impact project. You can never do any big project, particularly in an urban community that's dense like this one, without having some kind of impact; but relatively speaking, this one is really low, and one of the reasons for that is because we're making use of the railroad corridors that I talked about earlier.

So just a couple of points, we've identified here the number of buildings and intersections that are impacted on noise, vibration, and traffic metrics. These may seem like big numbers but, keeping in mind that we're dealing with thousands of structures in this corridor, this is actually pretty low on the property side, which we know is

of a lot of interest to people. The really big point is that we have zero private houses displaced. That's a huge thing. We've worked hard to do that, and we're really proud of it. Thank you.

[Applause]

MS. KATHERINE FICHTER: The acquisitions that we are talking about are primarily small ones. When we're dealing with residential, there's slices of backyards. We know that's obviously really important to people, and we're going to be dealing with it very sensitively; but we're really proud of the fact that we don't have to touch anyone's home. That's a huge thing. We are looking to take some commercial buildings. As we get farther along into the process, we'll approach owners about how we do that. There's a process of appraising the properties and, if you're a business, you're actually eligible for relocation. It's an involved process, and we're not there yet; but we actually have some information on our website about how this will happen, and we'll be continuing to work with the communities and the homeowners as we go forward.

My last two slides are on what are our sort of proposed mitigation. Keeping in mind that this is early, but we feel pretty comfortable with the ideas that we're putting out there; and as we move forward, we'll be looking to work more closely with neighborhoods, sort of micro-

neighborhoods, and then with residents and business as well. On the noise side, we'd be looking at things like noise walls and barriers, the kind of things that you sometimes see along highways, although we'd be looking for designs that are much more sensitive than what you usually see on highways.

In places where sound walls may not be appropriate or may not be effective, we'll be looking to do actual insulation in structures, new windows, other kinds of insulation. We can also do things actually with the rail and the tracks. We can lubricate them to cut down on sounds, squeaking, and we can use continuously welded track, which also sort of stops the like tha-tha-tha-tha-tha-tha sound that you often hear with the trains.

Vibration, which is a corollary to noise, there are things we can do at the track level. We can put ballast mats under track which absorb some of the vibration, and we can also do special things with the track to try to reduce it. Keeping in mind this is light rail, Green Line, it's a trolley. It's not like commuter rail. It's not like Amtrak. It's not heavy like that. It does still make sound and cause vibration, but it's less than what you would get with a traditional railroad. There is a lot more information on this in the DEIR as well, and we'll have more information to come.

Similarly, on traffic, we have proposals for the intersections where we do expect to have some effect. We'll be looking to make pedestrian improvements. We'll be looking to do roadway and signal improvements. Some of these may, in some cases, improve existing conditions. Obviously, for Lechmere, which is sort of a special circumstance, we're going to be looking to do some significant roadwork that was proposed as part of the NorthPoint project; and we'll be working with the communities to actually look at parking enforcement. We know this is of particular interest in Medford, and we'll be working on that as we go forward.

And I think, just one point to make about mitigation, mitigation can become a very emotional issue, as I think probably people know, and it's appropriate. We're looking to put something big in a neighborhood, and it's going to change things; and people get worried, and I completely understand that. And we'll be looking to work really individually with people to come up with a portfolio of mitigation that works. We don't want to put in things that don't work. Sometimes people ask for things because they've heard about them or they think they're going to be good, and they won't necessarily. So we're going to work with you to figure out the things that really are effective and then to get those implemented.

So I'm going to close in a second. This photo is from the D Line, the Riverside Branch. Our stations are not going to look like this; but a colleague of mine took this picture, and I thought it was really beautiful, so I wanted to use it.

Just quickly on next steps, what happens now? We have tonight, everybody submits their comments either tonight in speaking or they'll do them in writing in the next month or so. The Massachusetts Environmental Policy Act Office will sort of give us guidance on where do we go from here, do we need to do more work, how do we answer all the questions and comments. We will go through that process in the winter and the spring if we need to.

We're simultaneously looking to move into the next big phase of this project which is called Preliminary Engineering, which will move us beyond the ten percent design level that we're at now into something closer to thirty percent. We'll be doing a lot of work out here. We already have people doing survey work. We're going to be doing geotechnical work. You may see people in the right of way doing that. We will be out a lot more doing public involvement. It will probably change somewhat from what we've done once we sort of have basic consensus on a broad design of the project.

We're going to be working closely on things like

station design, how do the stations work with bicycle connections, road connections, pedestrian connections. We're really going to be working with people on those particular issues. So please don't get sick of us because we're going to be back. Please keep participating. Please do comments, and I will be quiet and let Nancy take over, and thank you.

MS. NANCY FARRELL: Okay. In case you just came in, I just want to remind everyone that there is a sign-up list to speak and that all speakers will get two minutes. We already have about two and half hours worth of speakers. So that is why I will cut people off at two minutes. We do want to hear what you have to say, but you can supplement your oral comments with written comments. We will begin with the first group of speakers, Lauren DiLorenzo from Medford, Leo Sacco from Medford, and Frank Gilberti. And please, when you come to the microphone, please tell us your name and address.

MS. LAUREN DILORENZO: Lauren DiLorenzo, I'm the Director of the Office of Community Development for the City of Medford. The comments that I make tonight will be brief, and they will be focused on the City of Medford, though I think some of the issues may also relate to Somerville. The purpose of this meeting really is for us to express comments, and the task before city

administrators and interested individuals is really to read the Draft Environmental Impact Report and to offer comments about whether we feel the information is sufficient to analyze the project and its environmental impact, and also to look at the mitigation that's being proposed and identify whether it's sufficient or not; and that ultimate task will go to the MEPA Office to make that determination.

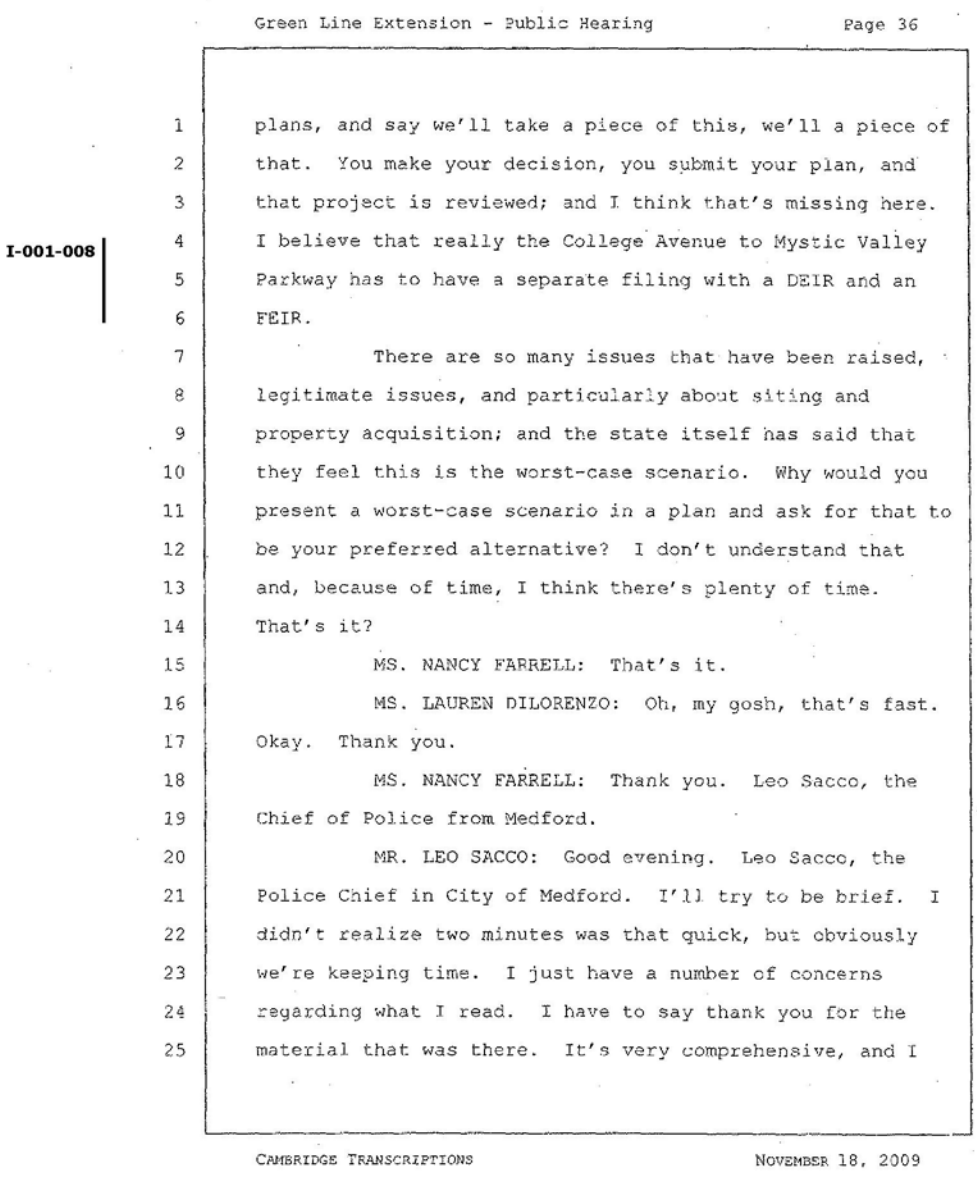
But is the intent of the state agency, MassDOT now, to have this draft filed and considered a final document; and this is not really about support of the project or not support of the project, but it's really about review of some technical information. And there is a lot of valuable information that's been prepared, but there is a lot of information that's missing also. The comments that I submit -- I won't detail every item. You're probably saying thank you. But the ultimate determination that I have made is that the DEIR is inadequate, and that a final Environmental Impact Report should be prepared.

I-001-007

The other issue that's of real concern to me is, and I think a lot of people will say when they get up in their comments about information that is missing and particularly about the terminus at Mystic Valley Parkway. The state is actually asking for two things. Now, when somebody comes in to build a project in the City of Medford or anywhere, you don't submit a filing on two sets of

I-001-007

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.



Green Line Extension - Public Hearing Page 36

I-001-008

plans, and say we'll take a piece of this, we'll a piece of that. You make your decision, you submit your plan, and that project is reviewed; and I think that's missing here. I believe that really the College Avenue to Mystic Valley Parkway has to have a separate filing with a DEIR and an FEIR.

There are so many issues that have been raised, legitimate issues, and particularly about siting and property acquisition; and the state itself has said that they feel this is the worst-case scenario. Why would you present a worst-case scenario in a plan and ask for that to be your preferred alternative? I don't understand that and, because of time, I think there's plenty of time. That's it?

MS. NANCY FARRELL: That's it.

MS. LAUREN DILORENZO: Oh, my gosh, that's fast. Okay. Thank you.

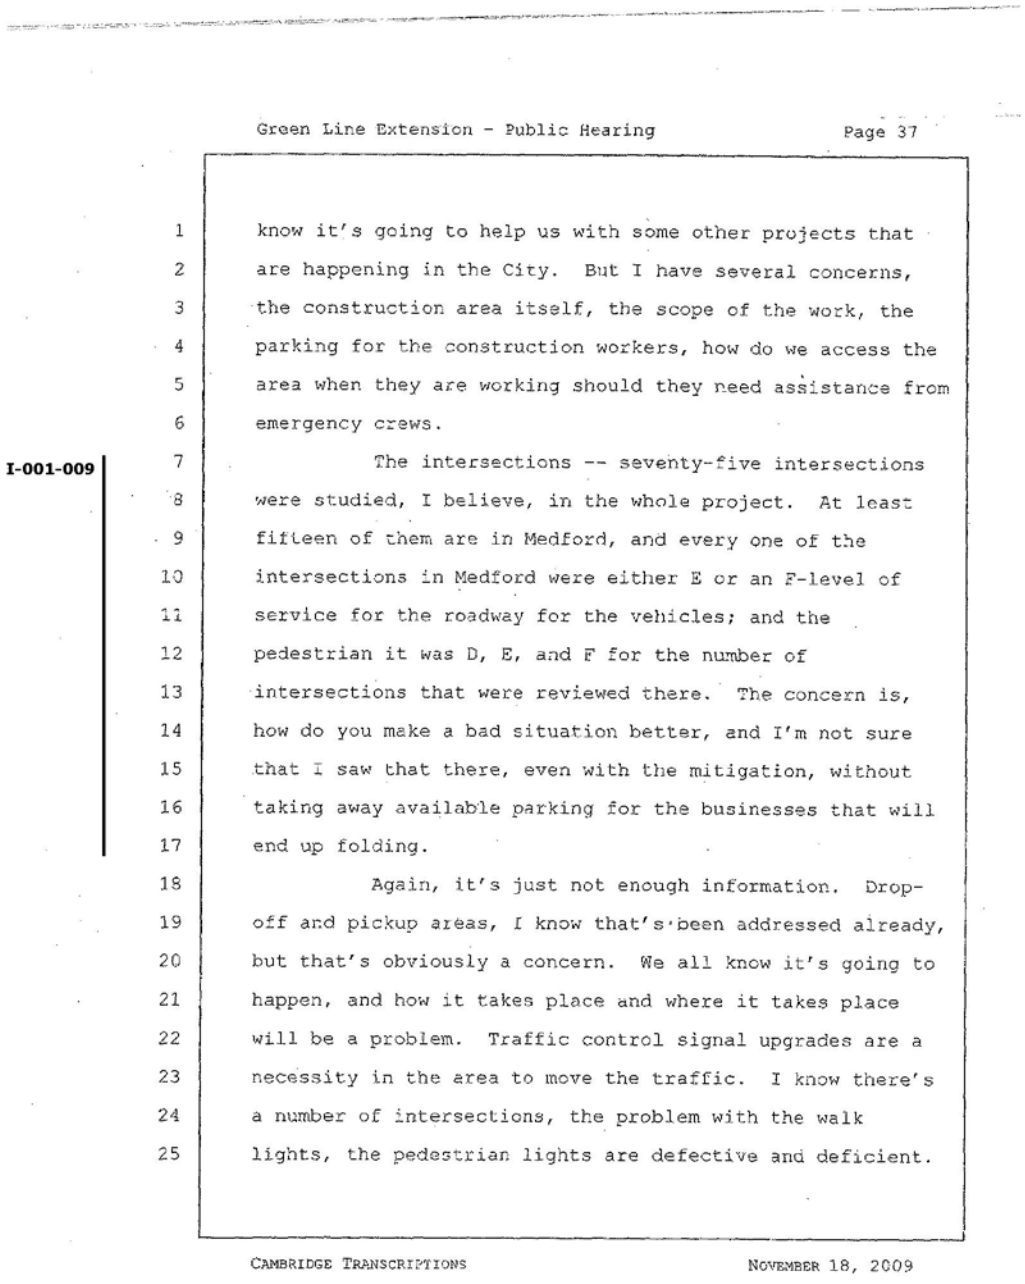
MS. NANCY FARRELL: Thank you. Leo Sacco, the Chief of Police from Medford.

MR. LEO SACCO: Good evening. Leo Sacco, the Police Chief in City of Medford. I'll try to be brief. I didn't realize two minutes was that quick, but obviously we're keeping time. I just have a number of concerns regarding what I read. I have to say thank you for the material that was there. It's very comprehensive, and I

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-008

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.



Green Line Extension - Public Hearing Page 37

know it's going to help us with some other projects that are happening in the City. But I have several concerns, the construction area itself, the scope of the work, the parking for the construction workers, how do we access the area when they are working should they need assistance from emergency crews.

I-001-009

The intersections -- seventy-five intersections were studied, I believe, in the whole project. At least fifteen of them are in Medford, and every one of the intersections in Medford were either E or an F-level of service for the roadway for the vehicles; and the pedestrian it was D, E, and F for the number of intersections that were reviewed there. The concern is, how do you make a bad situation better, and I'm not sure that I saw that there, even with the mitigation, without taking away available parking for the businesses that will end up folding.

Again, it's just not enough information. Drop-off and pickup areas, I know that's been addressed already, but that's obviously a concern. We all know it's going to happen, and how it takes place and where it takes place will be a problem. Traffic control signal upgrades are a necessity in the area to move the traffic. I know there's a number of intersections, the problem with the walk lights, the pedestrian lights are defective and deficient.

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-009

As described in Section 5.5 of the DEIR/EA, there are number of intersections that are projected to decline in levels of service by 2030 both with and without the Green Line Extension Project. The decline in traffic operations is mostly due to existing congestion levels, additional traffic expected in the region unrelated to the proposed project, and recent changes to the Americans with Disabilities Act (and associated state regulations), which requires that pedestrian phases at traffic signals be timed for a slower walking speed.

As stated by the Secretary of Environmental Affairs in his December 2006 Certificate on the EENF, the purpose of the DEIR analysis "is not to hold EOT (now MassDOT) responsible for mitigating longstanding congestion problems but, rather, to identify the specific impacts and benefits of this project." In this spirit, MassDOT has made several suggestions for traffic mitigation at locations where the proposed project contributes to a decline in overall intersection level of service. The proposed mitigation is sufficient to mitigate project impacts, but in most cases not sufficient to provide superior levels of service where they do not exist today.

The traffic control lights themselves are deficient in the level of flow.

Again, in the spirit of keeping it brief and allowing other people to speak, those are my concerns. I have to say, as the Chief, I'm very happy that traffic and parking is the number one issue in the City of Medford, that it isn't violent crime, but it's serious enough that it gets the attention of every person in the City. Thank you.

MS. NANCY FARRELL: Thank you, sir. Frank Gilberti, the Fire Chief in Medford, and next will be Karen Rose, the Director of Public Health in Medford.

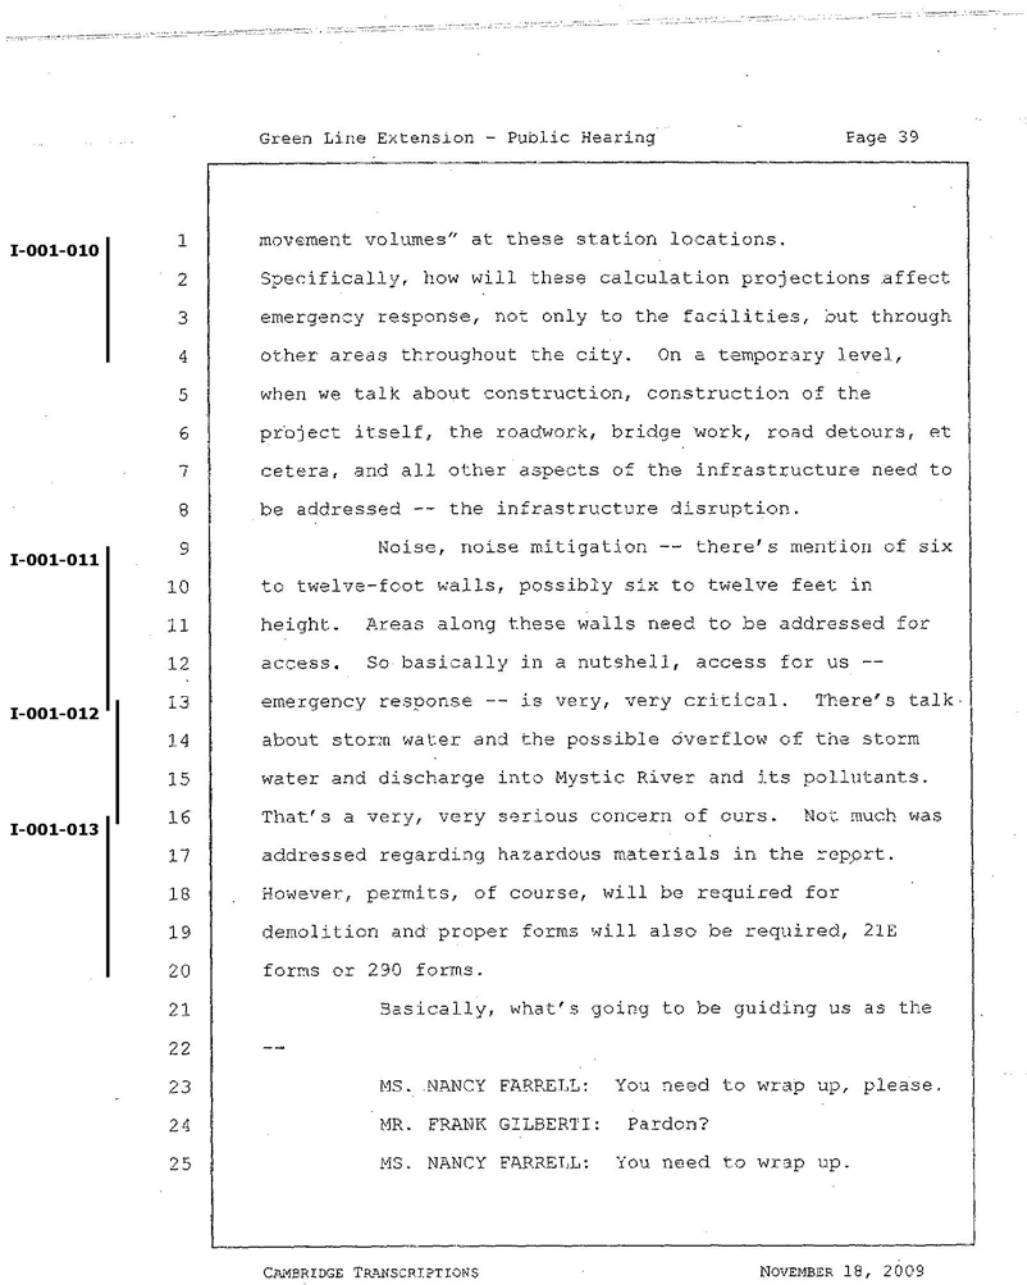
MR. FRANK GILBERTI: Good evening, thank you. My name is Frank Gilberti, Chief of the Fire Department in Medford, and some of my comments may be redundant, as Chief Sacco touched on. But I'll be talking about a few of the issues affecting emergency response regarding the Green Line. Land use alternatives, depending upon the plan chosen, may require demolition of up to ten structures in Medford, and they speak of track relocation. Steep walls, as the report implies, may be necessary, and emergency access point along the entire route of the tracks is a very, very serious concern of mine.

I-001-010

Regarding the traffic, considerable thought must be given as to what is referred to as "peak hour turning

I-001-010

Detailed traffic design plans will be developed during preliminary engineering. MassDOT will specifically coordinate with emergency response providers to plan for appropriate site and community access during and beyond the construction phase.



Green Line Extension - Public Hearing Page 39

movement volumes" at these station locations. Specifically, how will these calculation projections affect emergency response, not only to the facilities, but through other areas throughout the city. On a temporary level, when we talk about construction, construction of the project itself, the roadwork, bridge work, road detours, et cetera, and all other aspects of the infrastructure need to be addressed -- the infrastructure disruption.

Noise, noise mitigation -- there's mention of six to twelve-foot walls, possibly six to twelve feet in height. Areas along these walls need to be addressed for access. So basically in a nutshell, access for us -- emergency response -- is very, very critical. There's talk about storm water and the possible overflow of the storm water and discharge into Mystic River and its pollutants. That's a very, very serious concern of ours. Not much was addressed regarding hazardous materials in the report. However, permits, of course, will be required for demolition and proper forms will also be required, 21E forms or 290 forms.

Basically, what's going to be guiding us as the --

MS. NANCY FARRELL: You need to wrap up, please.

MR. FRANK GILBERTI: Pardon?

MS. NANCY FARRELL: You need to wrap up.

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-011

MassDOT will specifically coordinate with emergency response providers to plan for appropriate site and community access during and beyond the construction phase.

I-001-012

As described in DEIR/EA Section 5.9, the Project would be required to comply with federal and state stormwater discharge permit requirements during both the construction and operational phases. Compliance with these standards would include using Best Management Practices to prevent contamination of stormwater and control erosion and accretion (sedimentation) from stormwater runoff from the railroad alignment, stations, and maintenance facility.

I-001-013

An analysis of hazardous materials potentially present within the Green Line Extension Study Area is provided in DEIR/EA Section 5.14, Hazardous Materials. Additional investigation may be conducted during the next phases of the Project to determine the nature and extent of any contamination and remediate any sites as appropriate. This work would be conducted in accordance with the Commonwealth's Massachusetts Contingency Plan requirements.

MR. GILBERTI: Okay. Basically what's going to be guiding the Fire Department is standard NFPA standard, and I'm sure you're well aware of that fixed railway systems. Thank you. Thank you for your time.

MS. NANCY FARRELL: Thank you. Karen Rose and then Cassandra Koutalidis.

MS. KAREN ROSE: Good evening. I will try to shorten my comments. As far as the air quality, I think that in the report it talks about a slight increase in diesel particulates relating to moving the tracks. I think this should be a five-star project, as it looks like you're trying to make it. I think we should mitigate existing conditions and really make the quality of life much better, the health of people's lives much better. The Transportation Reform Act signed by Governor Patrick on June twenty-sixth of this year requires MDPH to study health effects exposure of fine and ultrafine particulate air pollution upon populations located close to sources of such pollution. This would be an ideal time to bring them in and make the benefits in the mitigation of the Green Line Extension.

I-001-014

Station design, I also agree, College Ave. in particular, with the five-point intersection, seems dangerous, especially with the entrance on the bridge side, as well as the Route 16, Mystic Valley. Also, indoor air

I-001-014

The Green Line Extension will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality. As required by the Secretary's Certificate on the DEIR/EA, the FEIR includes a narrative clarifying the relationships of air quality modeling data to MassDEP and EPA requirements for State Implementation Plan (SIP) consistency.

quality at the stations, there's a comment in there -- and I won't read it because I'll waste my time -- indoor air quality mitigation doesn't also equate to what happens to the outdoor air quality when those same odors, irritations, and harmful effects are moved outside.

Regarding noise and vibration, I think there were not enough studies done. There's on three noise meters, two vibration, and one combo unit in Medford. It's very hard for somebody like myself that needs the detail to be able to see higher incidents. Obviously, in the report it states that the 10 decibels equals a doubling of perceived loudness. We need to really take a better look at that. Obviously, using the maximum of noise barriers and insulation would be ideal. Work for demolition and construction -- a huge issue for us. Pest control, dust control, noise, all of that -- we need much more detail than what we have. It's very hard -- and I realize this is ten percent -- but it's very, very hard to deal with that.

I also, just on socioeconomic and environmental justice, have some concerns regarding elderly because of the housing project and our immigrant population, which isn't reflected. Thank you.

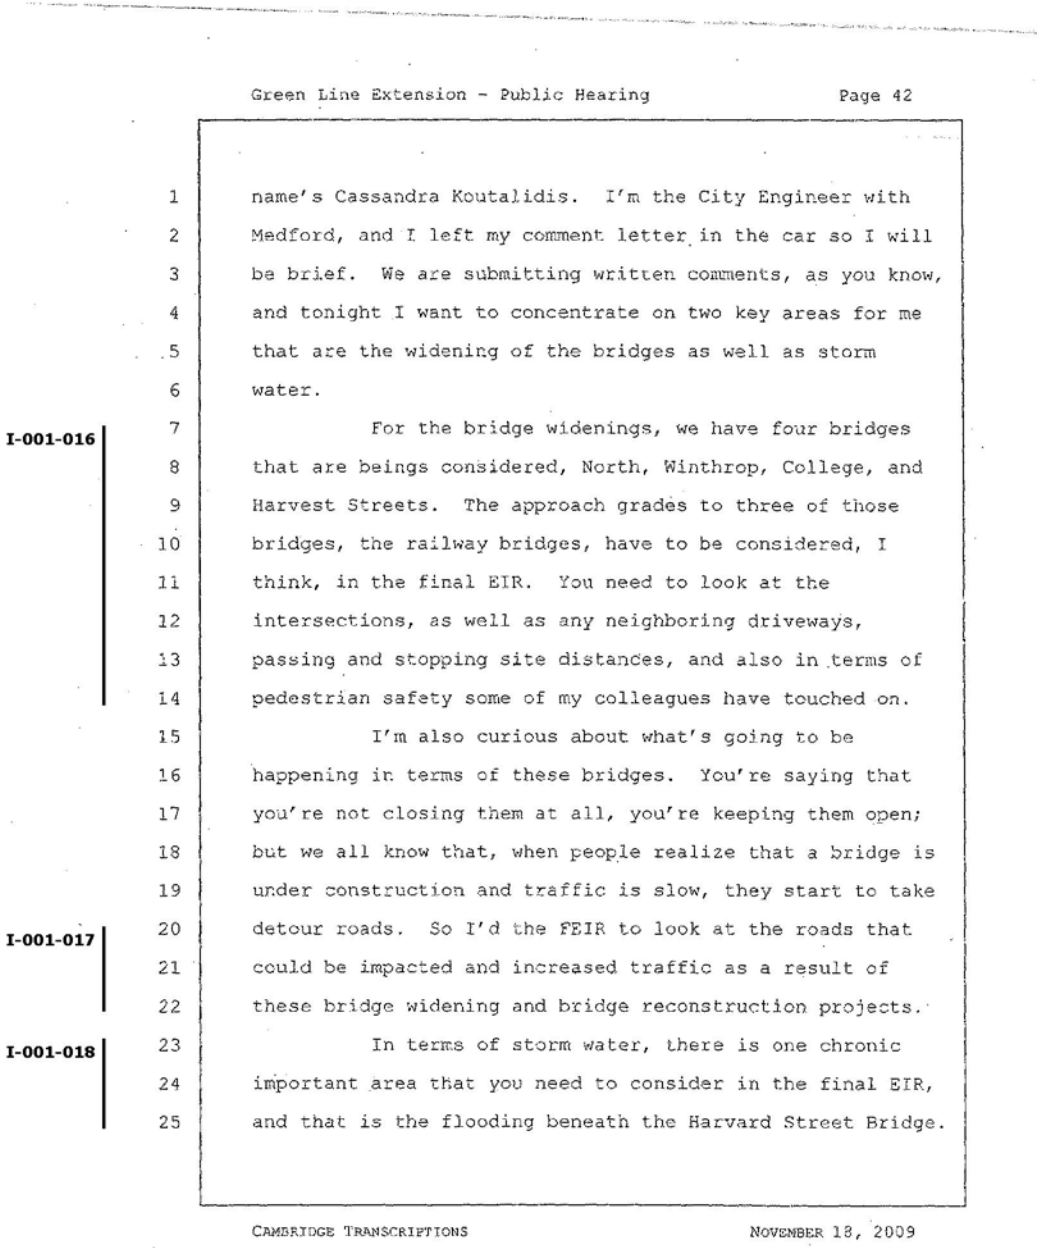
MS. NANCY FARRELL: Thank you. Cassandra and then Diane McLeod from Medford.

MS. CASSANDRA KOUTALIDIS: Good evening. My

I-001-015

I-001-015

Construction impacts of the Project are described in each environmental resource section in DEIR/EA Chapter 5, Environmental Consequences. Pedestrian and vehicular access to abutting properties will be maintained at all times. Construction contractors will be required to comply with relevant federal, state, and local laws, regulations, and codes to eliminate or minimize adverse effects (such as noise and vibration levels, and traffic flow) to environmental and social resources. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the next phases of the Project: design and construction.



Green Line Extension - Public Hearing Page 42

name's Cassandra Koutalidis. I'm the City Engineer with Medford, and I left my comment letter in the car so I will be brief. We are submitting written comments, as you know, and tonight I want to concentrate on two key areas for me that are the widening of the bridges as well as storm water.

I-001-016

For the bridge widenings, we have four bridges that are beings considered, North, Winthrop, College, and Harvest Streets. The approach grades to three of those bridges, the railway bridges, have to be considered, I think, in the final EIR. You need to look at the intersections, as well as any neighboring driveways, passing and stopping site distances, and also in terms of pedestrian safety some of my colleagues have touched on.

I'm also curious about what's going to be happening in terms of these bridges. You're saying that you're not closing them at all, you're keeping them open; but we all know that, when people realize that a bridge is under construction and traffic is slow, they start to take detour roads. So I'd the FEIR to look at the roads that could be impacted and increased traffic as a result of these bridge widening and bridge reconstruction projects.

I-001-017

I-001-018

In terms of storm water, there is one chronic important area that you need to consider in the final EIR, and that is the flooding beneath the Harvard Street Bridge.

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-016

MassDOT will specifically coordinate with emergency response providers to plan for appropriate site and community access during and beyond the construction phase. Detailed construction management plans will be prepared during preliminary engineering.

I-001-017

DEIR/EA Table 6-1, Project Mitigation Commitments, lists the traffic and parking measures to which MassDOT has committed to mitigate impacts. These mitigation measures address pedestrian and roadway traffic signal improvement needs, impacts during construction, and parking enforcement coordination. MassDOT has prepared a limited scope FEIR to address specific requirements of the Secretary's Certificate on the DEIR/EA.

I-001-018

The Project would be required to comply with federal and state stormwater discharge permit requirements during both the construction and operational phases. Compliance with these standards would include using Best Management Practices to prevent contamination of stormwater and control erosion and accretion (sedimentation) from stormwater runoff from the railroad alignment, stations, and maintenance facility.

I-001-018

That will not go away, it will get worse, and I'd like the document and the studies to consider how you can capture and store and attenuate the storm water flow after the rain event has passed. There are options. If you look at adjacent properties, if you can find something in the street, I think that's a project that could be undertaken as part of the final studies.

I-001-019

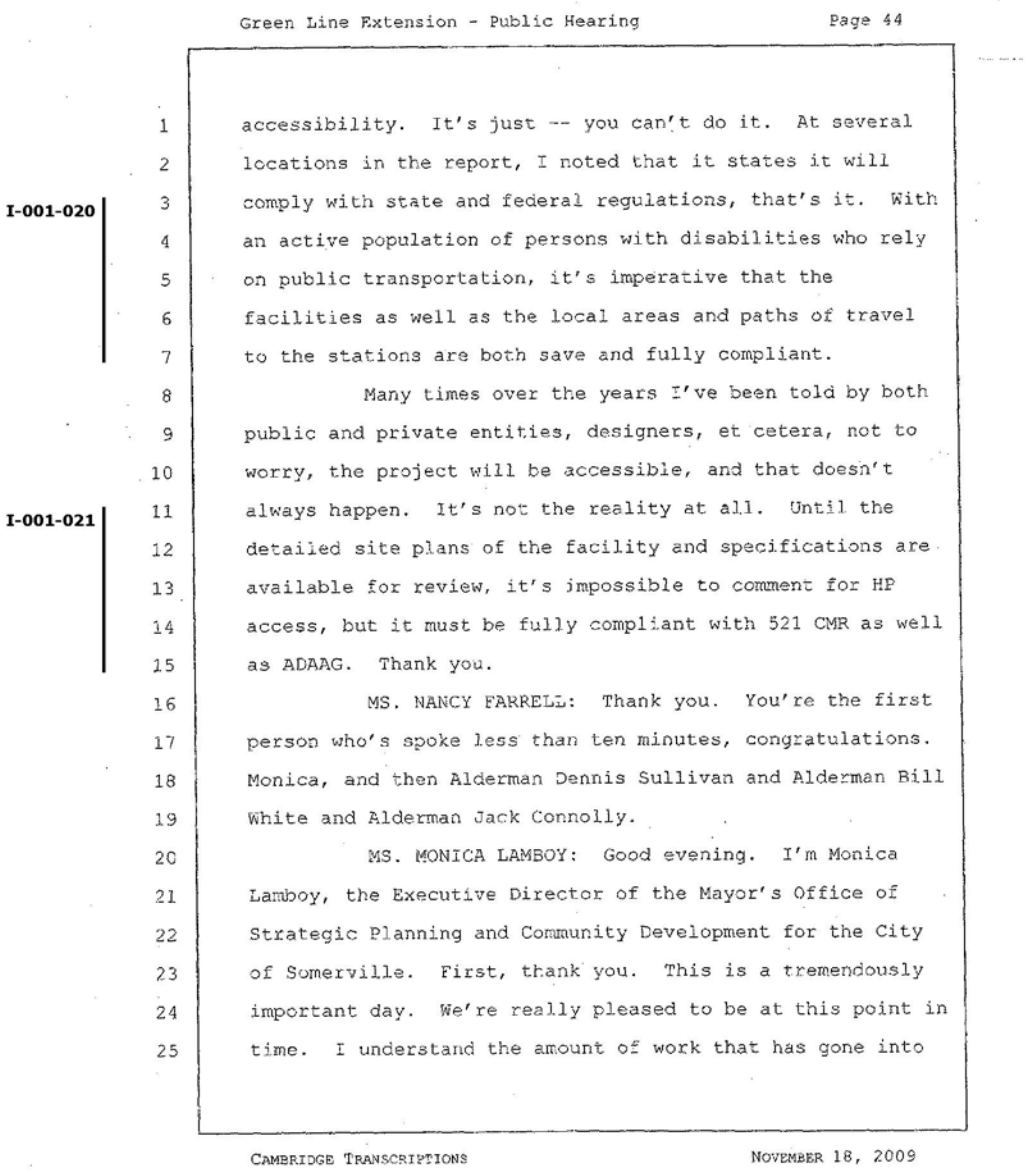
I'm also concerned about any increase in peak flows to our system, as well as maintaining our system's connections to the drain lines that are in the right of way that go out to the Mystic River currently. You're showing underdrains. You're showing potential groundwater pumping. I'd like to know if there's going to be any pumping to the city's systems and what the capacity impacts would be. On Orchard Street and in that area, we're clearly over capacity, and we need to have some consideration made for that. Thank you.

MS. NANCY FARRELL: Thank you. Diane McLeod from Medford, and then we'll have Monica Lamboy from Somerville.

MS. DIANE MCLEOD: Thank you. My name is Diane McLeod from Medford. I'm the Diversity Director for the City and, in that capacity, serve as ADA Coordinator, as well as Liaison to the Commission for Persons with Disabilities. My first concern is that, at ten percent design, it's impossible to review this document for

I-001-019

Please see response to Comment I-001-018.



Green Line Extension - Public Hearing Page 44

accessibility. It's just -- you can't do it. At several locations in the report, I noted that it states it will comply with state and federal regulations, that's it. With an active population of persons with disabilities who rely on public transportation, it's imperative that the facilities as well as the local areas and paths of travel to the stations are both save and fully compliant.

Many times over the years I've been told by both public and private entities, designers, et cetera, not to worry, the project will be accessible, and that doesn't always happen. It's not the reality at all. Until the detailed site plans of the facility and specifications are available for review, it's impossible to comment for HP access, but it must be fully compliant with 521 CMR as well as ADAAG. Thank you.

MS. NANCY FARRELL: Thank you. You're the first person who's spoke less than ten minutes, congratulations. Monica, and then Alderman Dennis Sullivan and Alderman Bill White and Alderman Jack Connolly.

MS. MONICA LAMBOY: Good evening. I'm Monica Lamboy, the Executive Director of the Mayor's Office of Strategic Planning and Community Development for the City of Somerville. First, thank you. This is a tremendously important day. We're really pleased to be at this point in time. I understand the amount of work that has gone into

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-020

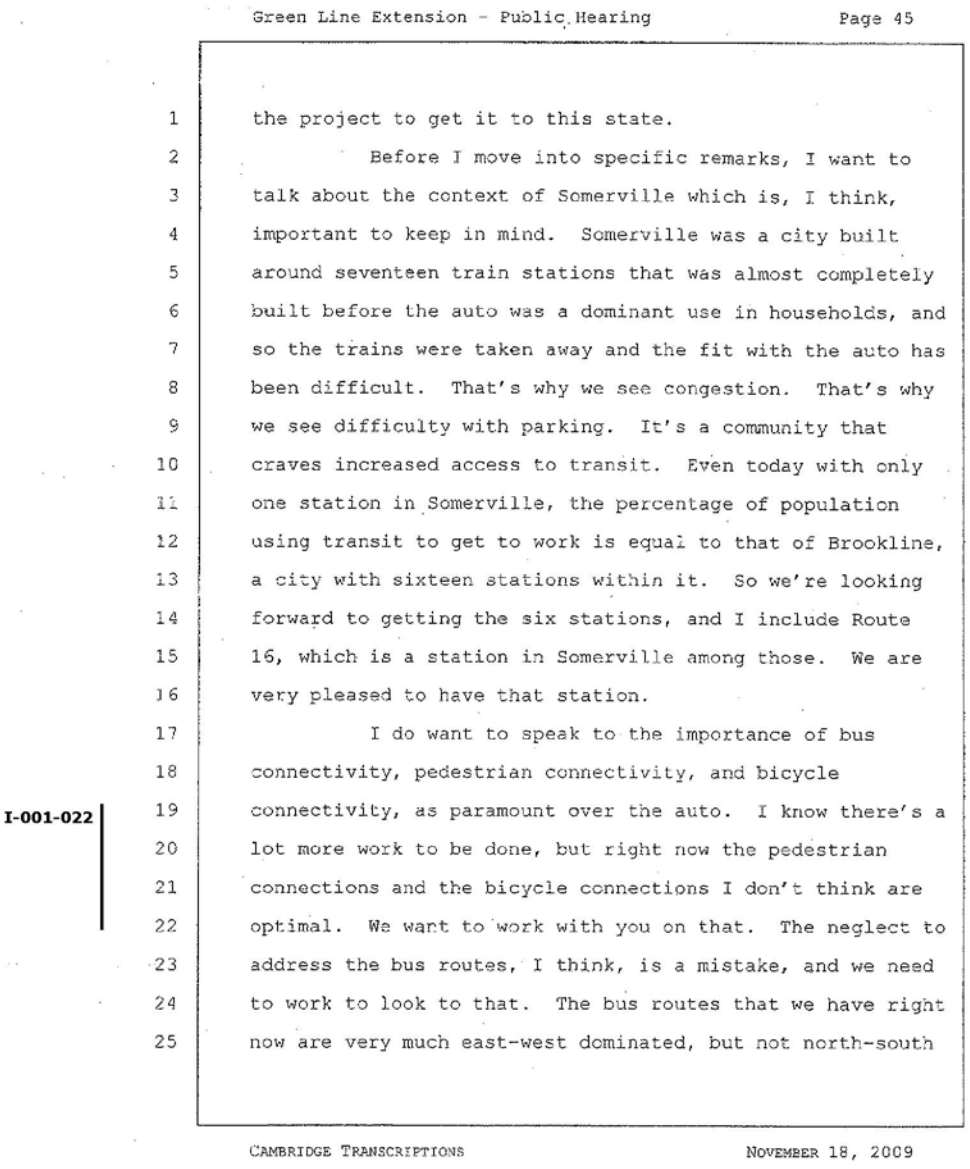
I-001-021

I-001-020

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. Designs for each station will be further developed during the Project's preliminary engineering stage. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. Specific design details and station elements will be further developed during preliminary engineering. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access. The process for stakeholder coordination during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-001-021

Please see response to Comment I-001-020.



Green Line Extension - Public Hearing Page 45

the project to get it to this state.

Before I move into specific remarks, I want to talk about the context of Somerville which is, I think, important to keep in mind. Somerville was a city built around seventeen train stations that was almost completely built before the auto was a dominant use in households, and so the trains were taken away and the fit with the auto has been difficult. That's why we see congestion. That's why we see difficulty with parking. It's a community that craves increased access to transit. Even today with only one station in Somerville, the percentage of population using transit to get to work is equal to that of Brookline, a city with sixteen stations within it. So we're looking forward to getting the six stations, and I include Route 16, which is a station in Somerville among those. We are very pleased to have that station.

I do want to speak to the importance of bus connectivity, pedestrian connectivity, and bicycle connectivity, as paramount over the auto. I know there's a lot more work to be done, but right now the pedestrian connections and the bicycle connections I don't think are optimal. We want to work with you on that. The neglect to address the bus routes, I think, is a mistake, and we need to work to look to that. The bus routes that we have right now are very much east-west dominated, but not north-south

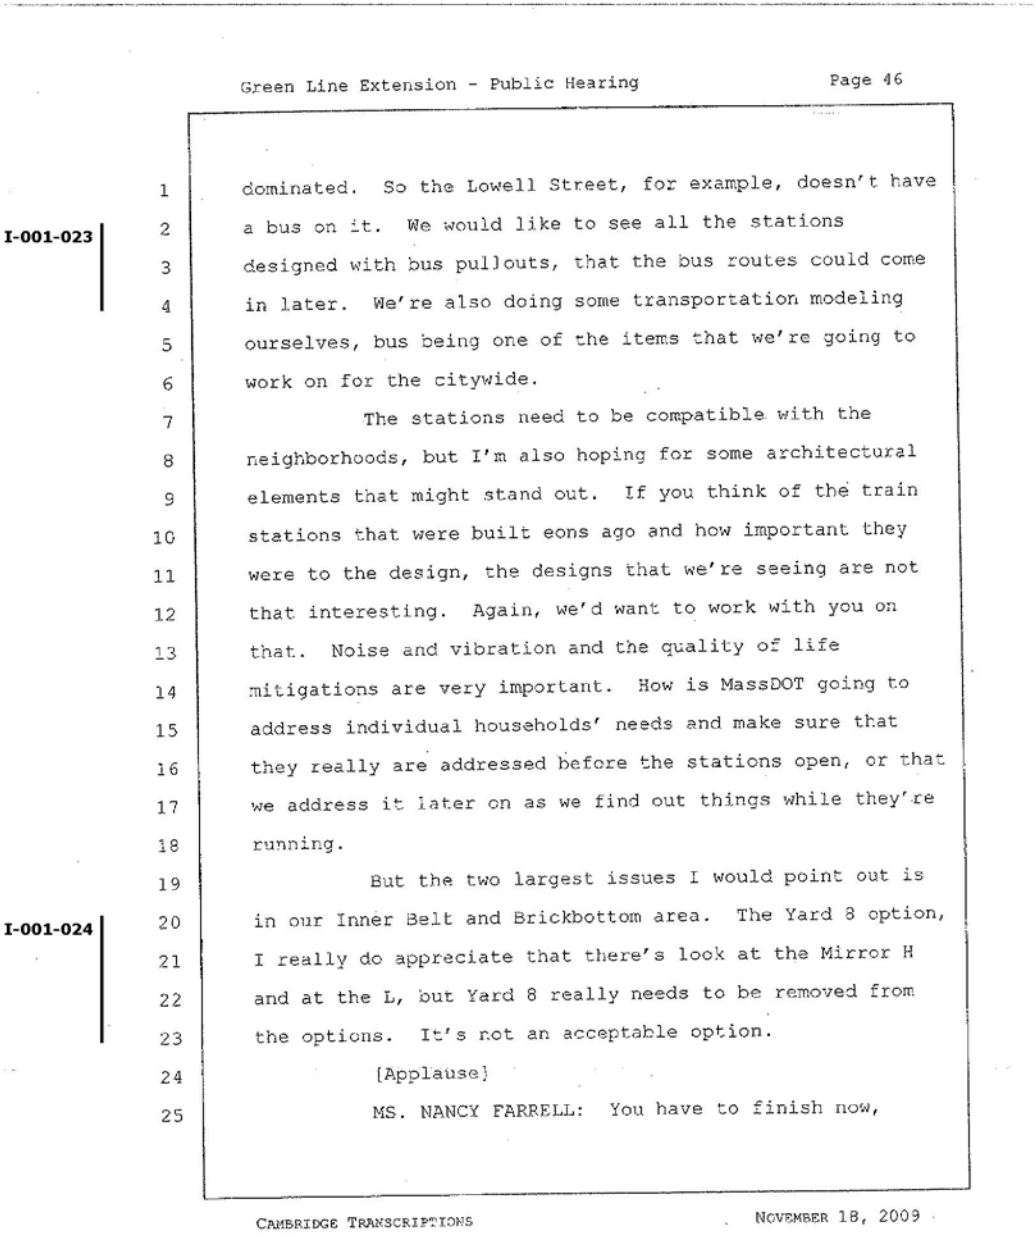
CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-022

I-001-022

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.



Green Line Extension - Public Hearing Page 46

dominated. So the Lowell Street, for example, doesn't have a bus on it. We would like to see all the stations designed with bus pullouts, that the bus routes could come in later. We're also doing some transportation modeling ourselves, bus being one of the items that we're going to work on for the citywide.

I-001-023

The stations need to be compatible with the neighborhoods, but I'm also hoping for some architectural elements that might stand out. If you think of the train stations that were built eons ago and how important they were to the design, the designs that we're seeing are not that interesting. Again, we'd want to work with you on that. Noise and vibration and the quality of life mitigations are very important. How is MassDOT going to address individual households' needs and make sure that they really are addressed before the stations open, or that we address it later on as we find out things while they're running.

But the two largest issues I would point out is in our Inner Belt and Brickbottom area. The Yard 8 option, I really do appreciate that there's look at the Mirror H and at the L, but Yard 8 really needs to be removed from the options. It's not an acceptable option.

I-001-024

[Applause]

MS. NANCY FARRELL: You have to finish now,

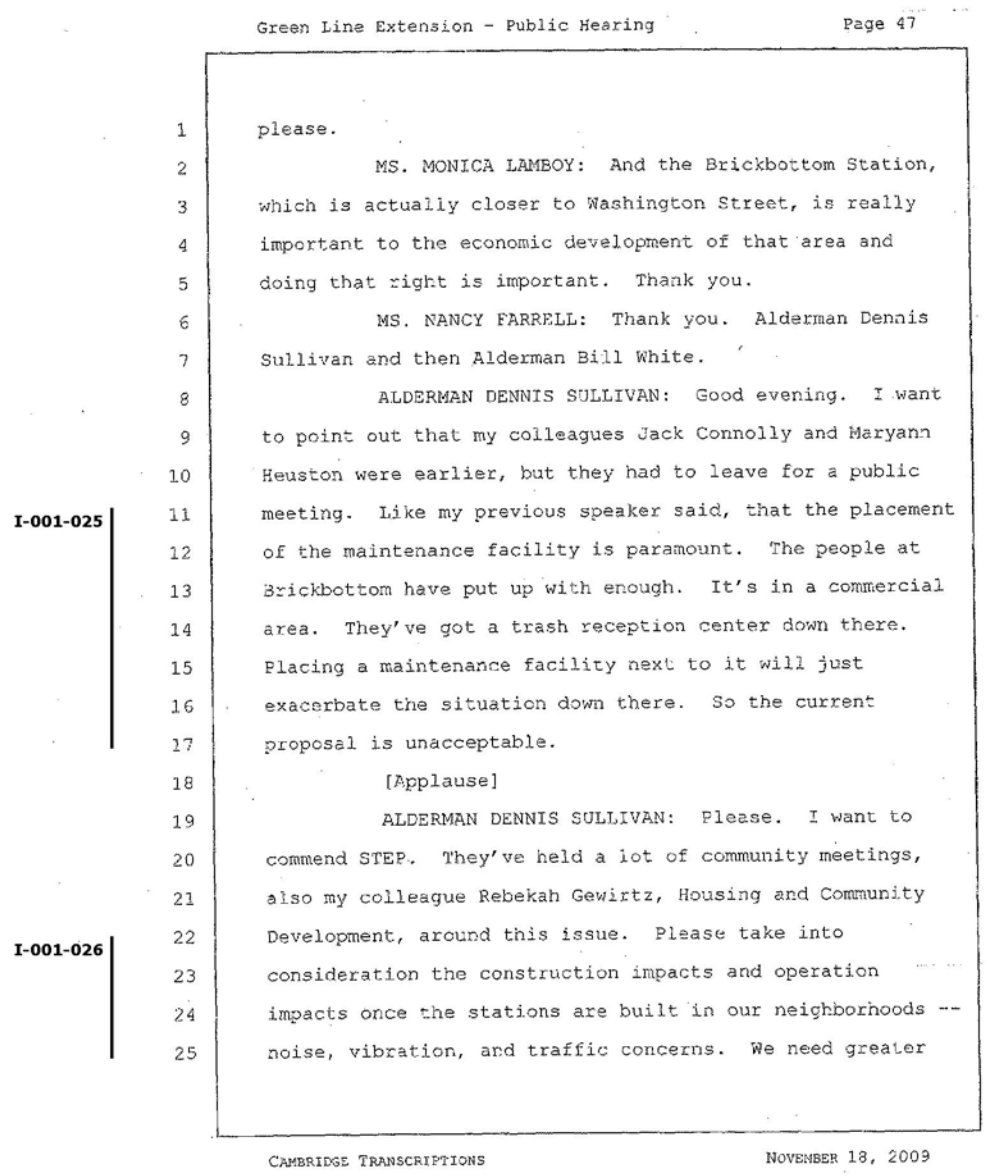
CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-023

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

I-001-024

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.



Green Line Extension - Public Hearing Page 47

please.

MS. MONICA LAMBOY: And the Brickbottom Station, which is actually closer to Washington Street, is really important to the economic development of that area and doing that right is important. Thank you.

MS. NANCY FARRELL: Thank you. Alderman Dennis Sullivan and then Alderman Bill White.

ALDERMAN DENNIS SULLIVAN: Good evening. I want to point out that my colleagues Jack Connolly and Maryann Heuston were earlier, but they had to leave for a public meeting. Like my previous speaker said, that the placement of the maintenance facility is paramount. The people at Brickbottom have put up with enough. It's in a commercial area. They've got a trash reception center down there. Placing a maintenance facility next to it will just exacerbate the situation down there. So the current proposal is unacceptable.

[Applause]

ALDERMAN DENNIS SULLIVAN: Please. I want to commend STEP. They've held a lot of community meetings, also my colleague Rebekah Gewirtz, Housing and Community Development, around this issue. Please take into consideration the construction impacts and operation impacts once the stations are built in our neighborhoods -- noise, vibration, and traffic concerns. We need greater

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

Green Line Extension - Public Hearing Page 48

involvement. People have to be involved on the location and the design of the train stations. What I've seen so far, I'm not impressed. I think that we need greater outreach.

I-001-027 Stations should be handicapped accessible, pedestrian accessible, and have greater access for bicyclists, including places to lock up bicycles. And I-001-028 also, I would like to see commuter rail accessibility only if the commuter rail could be converted to electric so it doesn't negatively impact our air quality because what we're trying to do here is improve our air quality. Thank you very much.

MS. NANCY FARRELL: Thank you, Alderman. Alderman Bill White.

ALDERMAN BILL WHITE: Good evening. Ward 3 Alderman Tom Taylor was ill this evening, and he's going to be submitting written comments.

MS. NANCY FARRELL: Thank you.

I-001-029 ALDERMAN BILL WHITE: I'm going to confine my comments to Yard 8 because I believe that Yard 8 is a really bad decision.

[Applause]

ALDERMAN BILL WHITE: Let's look at the record. Let's look at the facts. That's what the Commonwealth is obligated to do in these environmental impact reports. The

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

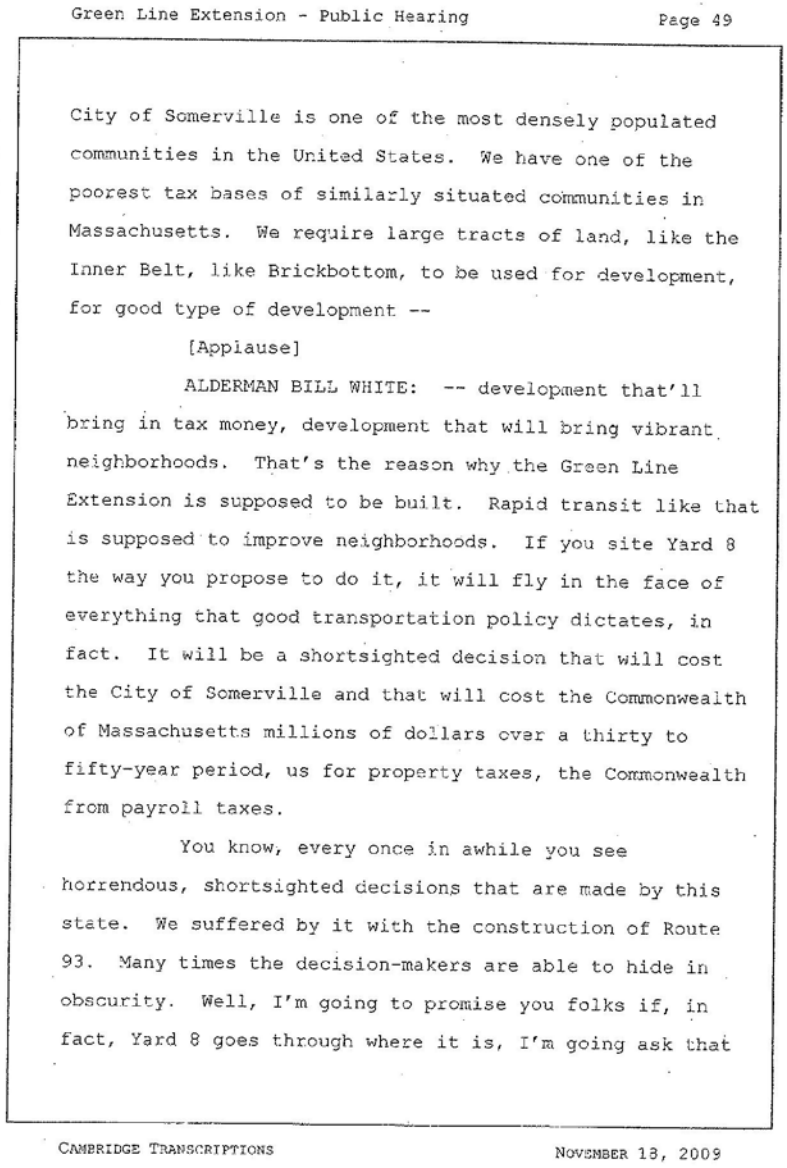
In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-001-028

The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), and the MBTA.

The conceptual future electrification of MBTA commuter rail lines in the Study Area is beyond the scope of the Green Line Extension Project. However, the conceptual plans in the DEIR/EA and FEIR do not preclude future electrification of commuter rail. The Green Line



Green Line Extension - Public Hearing Page 49

City of Somerville is one of the most densely populated communities in the United States. We have one of the poorest tax bases of similarly situated communities in Massachusetts. We require large tracts of land, like the Inner Belt, like Brickbottom, to be used for development, for good type of development --

[Applause]

ALDERMAN BILL WHITE: -- development that'll bring in tax money, development that will bring vibrant neighborhoods. That's the reason why the Green Line Extension is supposed to be built. Rapid transit like that is supposed to improve neighborhoods. If you site Yard 8 the way you propose to do it, it will fly in the face of everything that good transportation policy dictates, in fact. It will be a shortsighted decision that will cost the City of Somerville and that will cost the Commonwealth of Massachusetts millions of dollars over a thirty to fifty-year period, us for property taxes, the Commonwealth from payroll taxes.

You know, every once in awhile you see horrendous, shortsighted decisions that are made by this state. We suffered by it with the construction of Route 93. Many times the decision-makers are able to hide in obscurity. Well, I'm going to promise you folks if, in fact, Yard 8 goes through where it is, I'm going ask that

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

Extension will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project.

I-001-029

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

the Somerville Library create some library shelf space, and we're going to call it "DOT's Folly," and we're going have the information there. We're going to have the names of the decision-makers.

[Applause]

ALDERMAN BILL WHITE: So twenty-five and thirty years from now, when people are shaking their heads and saying what a horrible decision it was to site the maintenance facility at Yard 8 and how it cost the City of Somerville millions of dollars, everybody will know who's responsible for it. Your parents are here. You don't want to be responsible for that.

[Laughter]

ALDERMAN BILL WHITE: Let's not make it DOT's Folly.

MS. KATHERINE FICHTER: Thank you, Alderman.

ALDERMAN BILL WHITE: Thank you.

MS. NANCY FARRELL: Thank you.

[Applause]

MS. NANCY FARRELL: Alderman Rebekah Gewirtz from Somerville.

ALDERMAN REBEKAH GEWIRTZ: Well, it is hard to follow-up Bill White. He is terrific. Thank you for the opportunity to testify today. My name is Rebekah Gewirtz. I'm the Ward 6 Alderman, and I'm the Chair of the Housing

and Community Development Committee of the Board of Aldermen. My colleague Dennis Sullivan spoke. He's on that committee, as is Alderman Bill Roche, who I know was with us here earlier today.

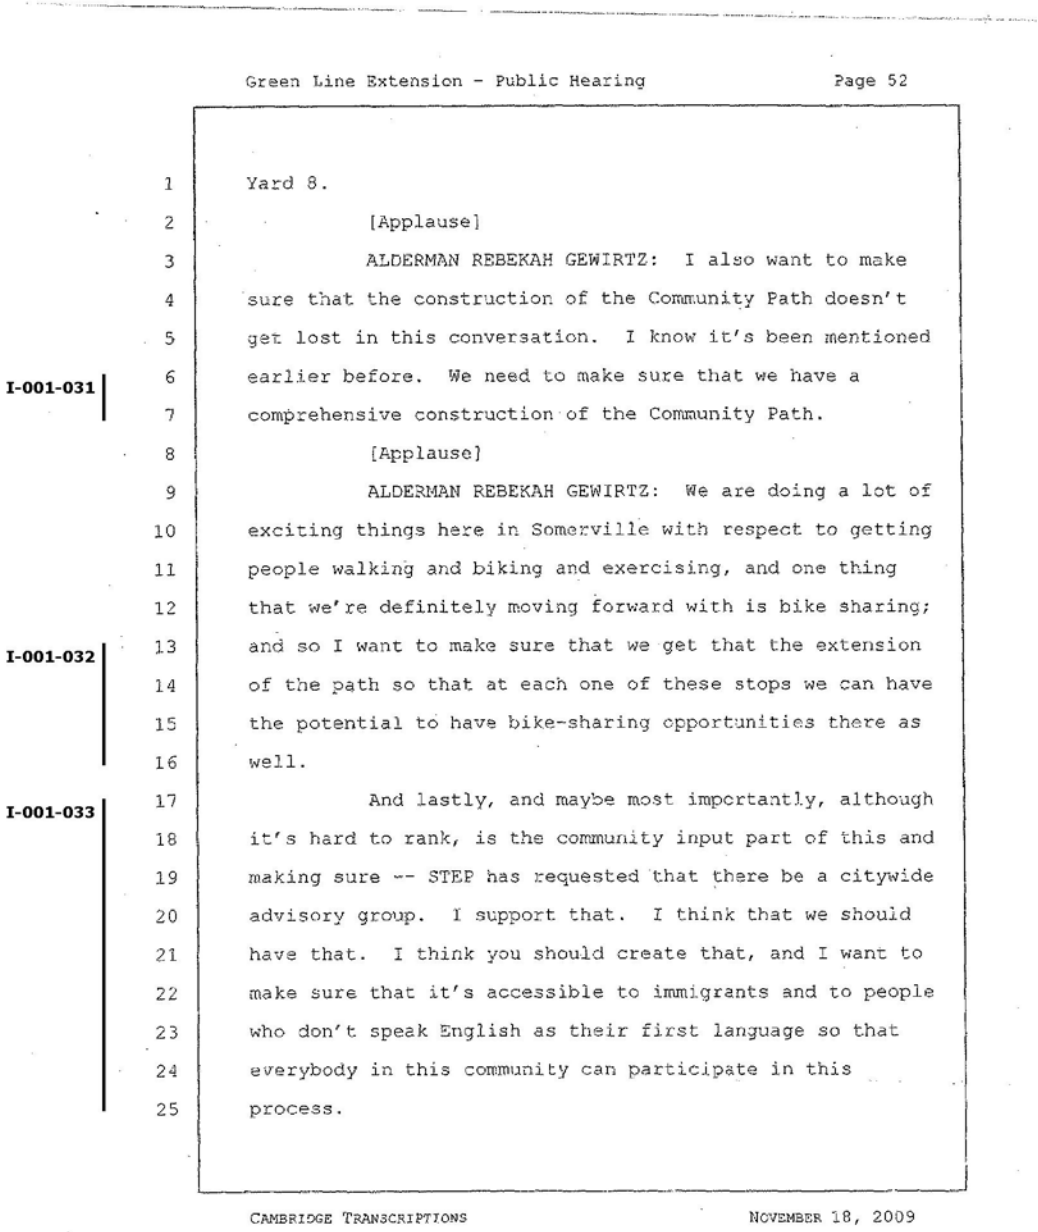
In the capacity as Chair of Housing and Community Development, I have worked really hard to try to create a space where members of the community, STEP and others, and the administration and the Board of Aldermen, can all come together to talk about what we want to see in terms of the Green Line Extension, and make sure that we are all on the same page. Three major things have come to the forefront that I wanted to speak on today. I know have limited time.

I want to first talk about the maintenance facility. I cannot echo enough what both of my colleagues have said and what I know the Mayor said earlier and what Monica Lamboy -- to her credit, she has done a terrific job as well -- has said about the location of the maintenance facility. We understand that we have to have the maintenance facility. We don't like it, but we don't want it at Yard 8. It's going to negatively impact the residents at Brickbottom and other residents, and it's going to cut off our economic development potential at the Inner Belt. What we want to have the state look at is Option L and also Mirror Scheme H, and I cannot emphasize that enough, that we do not want Yard 8. We do not want

I-001-030

I-001-030

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.



Green Line Extension - Public Hearing Page 52

Yard 8.

[Applause]

ALDERMAN REBEKAH GEWIRTZ: I also want to make sure that the construction of the Community Path doesn't get lost in this conversation. I know it's been mentioned earlier before. We need to make sure that we have a comprehensive construction of the Community Path.

[Applause]

ALDERMAN REBEKAH GEWIRTZ: We are doing a lot of exciting things here in Somerville with respect to getting people walking and biking and exercising, and one thing that we're definitely moving forward with is bike sharing; and so I want to make sure that we get that the extension of the path so that at each one of these stops we can have the potential to have bike-sharing opportunities there as well.

And lastly, and maybe most importantly, although it's hard to rank, is the community input part of this and making sure -- STEP has requested that there be a citywide advisory group. I support that. I think that we should have that. I think you should create that, and I want to make sure that it's accessible to immigrants and to people who don't speak English as their first language so that everybody in this community can participate in this process.

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-031

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-001-032

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-001-033

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-001-033

Green Line Extension - Public Hearing Page 53

MS. NANCY FARRELL: Thank you. You're out of time.

ALDERMAN REBEKAH GEWIRTZ: Thank you very much.

MS. NANCY FARRELL: Thank you. Councilor Craig Kelley from Cambridge.

MR. CRAIG KELLEY: Thank you very much. I'm very excited about the Green Line Extension. Little of it goes through Cambridge, but what does in Lechmere is important to get right, and that's actually going to set the tone for the rest of the development farther out towards Medford. We need to get Lechmere Station right. As the Mayor said earlier, this a one-shot deal. When this project goes forward, we can't go back and say, boy, we wish we would've done something differently. I know the people in East Cambridge have some great ideas for relocating Lechmere Station, and I hope that those great ideas are incorporated into future decision-making.

I-001-034 I think the Mayor is also correct when he says we don't want parking at these things. This is mass transit. We don't want people driving in -- I live in Cambridge but, if I lived in Medford or Somerville, I wouldn't want folks driving in from Reading and parking at the station down the street from me.

[Applause]

I-001-035 COUNCILOR CRAIG KELLEY: So we want them to take

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-034

The Project is intended, in part, to relieve traffic congestion, as described in DEIR/EA Chapter 2, Purpose and Need. Some station access points for passenger drop-off/pick-up are likely to impact local traffic flow, as outlined in DEIR/EA Section 5.5, Traffic. As described in DEIR/EA Chapter 6, these impacts will be minimized to the extent practical. However, with the exception of relocated Lechmere Station, no parking is provided at any of the new Green Line Extension stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes how MassDOT will coordinate with municipalities and stakeholders to address traffic and parking concerns. Additionally, FEIR Chapter 4 summarizes the impacts of College Avenue as a terminal station.

I-001-035

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

I-001-035

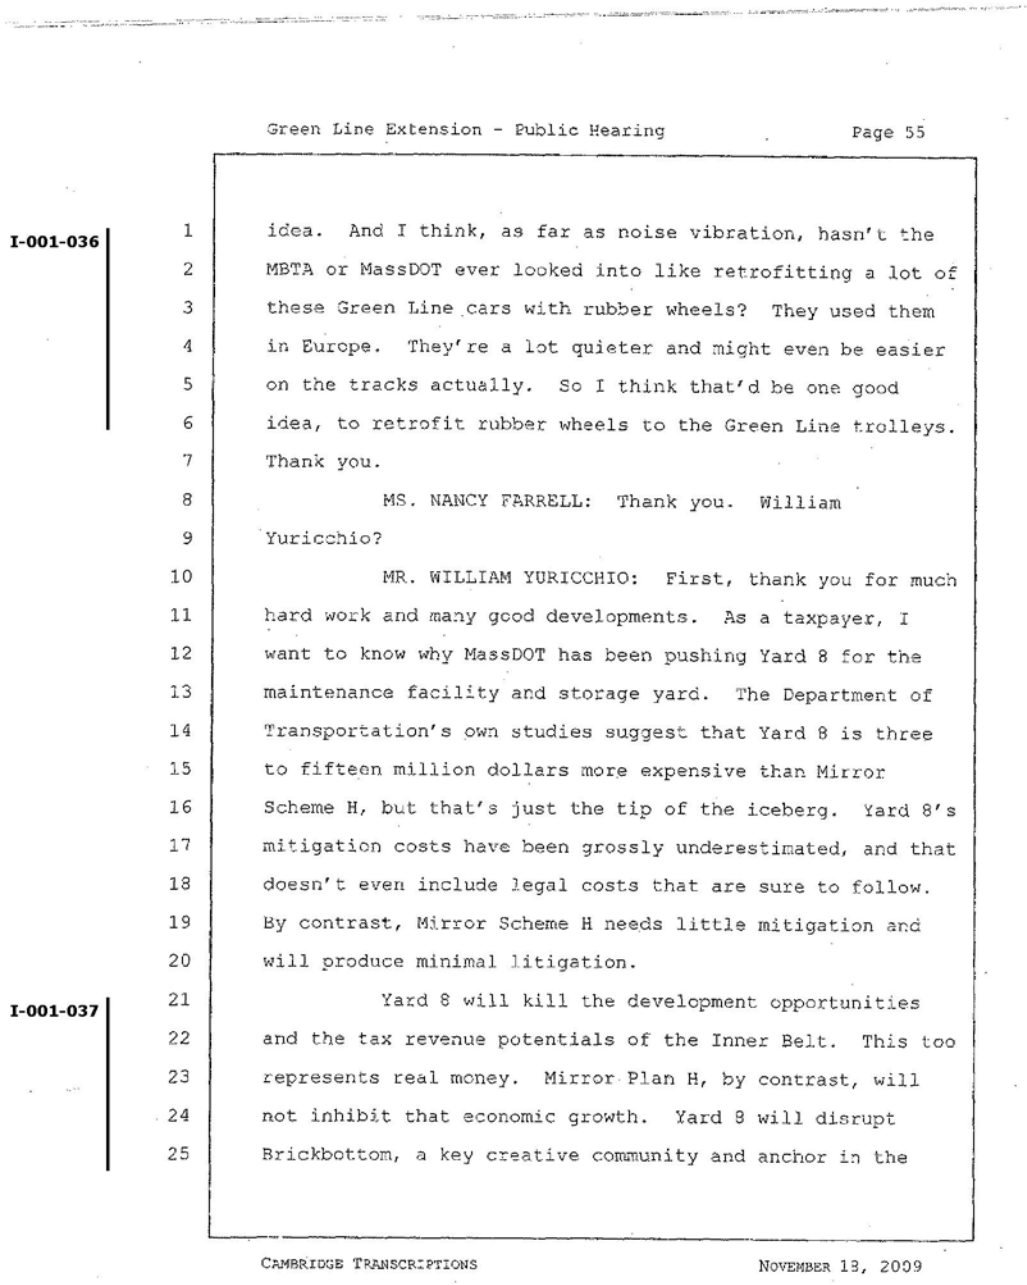
buses there. We want to make sure the bus routes are going to work. I will reiterate again, and I'm sure it'll be done again and again, this is a one-shot deal. Once it's built, it's done. Once the planning's at the thirty percent state, it's probably kind of done, too. So we need to make sure we don't get there faster than is wise, and we wind up with a good project. Thank you.

[Applause]

MS. NANCY FARRELL: Thank you. We're moving to the public comment portion. I'll take a break again later and see if there are any more elected officials. The first three public speakers are Tom Gilbert, William Yuricchio, and Robert Martel. Are you here, gentlemen? Tom Gilbert? Hey, Tom.

MR. TOM GILBERT: Hi, my name is Tom Gilbert. I'm from the Teele Square region in West Somerville. I think for the most part, I think it's really great that we're moving along here and really making this reality. At the same time, I guess I have the same concerns that a lot of the elected leaders have as far as regarding like public domain, you know, various houses would have to come down because -- you know, especially around the Route 16 area, I know that's pretty sensitive and everything.

And I guess having more studies and what's actually going to happen I think would really be a good



Green Line Extension - Public Hearing Page 55

I-001-036

idea. And I think, as far as noise vibration, hasn't the MBTA or MassDOT ever looked into like retrofitting a lot of these Green Line cars with rubber wheels? They used them in Europe. They're a lot quieter and might even be easier on the tracks actually. So I think that'd be one good idea, to retrofit rubber wheels to the Green Line trolleys. Thank you.

MS. NANCY FARRELL: Thank you. William Yuricchio?

MR. WILLIAM YURICCHIO: First, thank you for much hard work and many good developments. As a taxpayer, I want to know why MassDOT has been pushing Yard 8 for the maintenance facility and storage yard. The Department of Transportation's own studies suggest that Yard 8 is three to fifteen million dollars more expensive than Mirror Scheme H, but that's just the tip of the iceberg. Yard 8's mitigation costs have been grossly underestimated, and that doesn't even include legal costs that are sure to follow. By contrast, Mirror Scheme H needs little mitigation and will produce minimal litigation.

I-001-037

Yard 8 will kill the development opportunities and the tax revenue potentials of the Inner Belt. This too represents real money. Mirror Plan H, by contrast, will not inhibit that economic growth. Yard 8 will disrupt Brickbottom, a key creative community and anchor in the

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 13, 2009

I-001-036

The Green Line Extension would be compatible with the existing MBTA Green Line network. This light rail network uses a steel wheel technology.

I-001-037

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-001-037

redevelopment of the area. Mirror Scheme H is away from existing and proposed residences and will have minimal impact. Please think about the future. The decisions we make now will affect not just the lives of the people in this room here tonight, but they will affect generations to come; and when you add up the cost to taxpayers and the permanent loss of tax revenues from the Inner Beltway, the implications are profound. Thank you.

MS. NANCY FARRELL: Thank you. Hi.

MR. ROBERT MARTEL: Hello, I'm Robert Martel, the Property Manager for the Brickbottom Artists Building. Would the residents of Brickbottom that are here raise your hand or stand up, please?

[Applause]

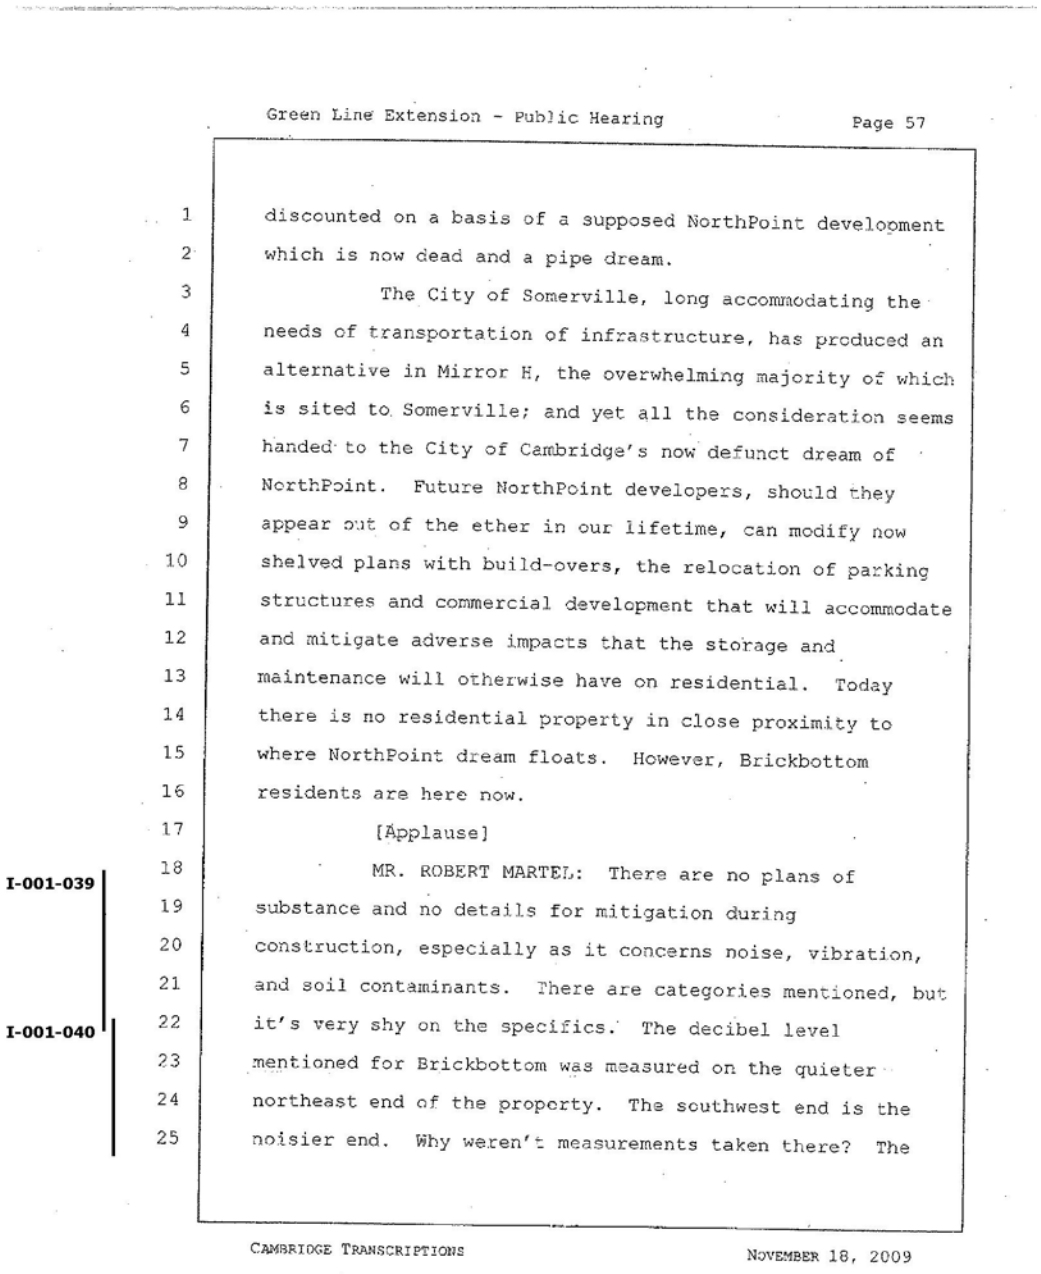
MR. ROBERT MARTEL: Okay. I could speak for the residents of Brickbottom to say that there hasn't been one of its 220 residents and workers who has ever mentioned to me any opposition to the Green Line Extension. However,

I-001-038

the storage and maintenance Yard 8 proposal is unacceptable across the city, yet we don't have a finished analysis of the alternative sites. The analysis on Mirror H offered in the DEIR is essentially the same analysis offered a year ago. Unused land at the BET, that's the Boston Engine Terminal, has not been thoroughly considered, and we don't know why. H, the less expensive alternative, is often

I-001-038

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.



Green Line Extension - Public Hearing Page 57

discounted on a basis of a supposed NorthPoint development which is now dead and a pipe dream.

The City of Somerville, long accommodating the needs of transportation of infrastructure, has produced an alternative in Mirror H, the overwhelming majority of which is sited to Somerville; and yet all the consideration seems handed to the City of Cambridge's now defunct dream of NorthPoint. Future NorthPoint developers, should they appear out of the ether in our lifetime, can modify now shelved plans with build-overs, the relocation of parking structures and commercial development that will accommodate and mitigate adverse impacts that the storage and maintenance will otherwise have on residential. Today there is no residential property in close proximity to where NorthPoint dream floats. However, Brickbottom residents are here now.

[Applause]

MR. ROBERT MARTEL: There are no plans of substance and no details for mitigation during construction, especially as it concerns noise, vibration, and soil contaminants. There are categories mentioned, but it's very shy on the specifics. The decibel level mentioned for Brickbottom was measured on the quieter northeast end of the property. The southwest end is the noisier end. Why weren't measurements taken there? The

I-001-039

I-001-040

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-039

Construction impacts of the Project are described in each environmental resource section in DEIR/EA Chapter 5, Environmental Consequences. Pedestrian and vehicular access to abutting properties will be maintained at all times. Construction contractors will be required to comply with relevant federal, state, and local laws, regulations, and codes to eliminate or minimize adverse effects (such as noise and vibration levels, and traffic flow) to environmental and social resources. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the next phases of the Project: design and construction.

I-001-040

Potential noise and vibration impacts were assessed for the southwest facade of the Brickbottom Artists Building, which abuts the existing MBTA Fitchburg Commuter Rail line. Because the northeast façade represents the location of the building with a potential for more severe noise impact, findings for the southwest façade were not originally reported in the DEIR/EA. These findings have been included in FEIR Chapter 8. All noise projections take into account proposed changes to the topography of the alignment, including things such as retaining walls and grading.

During preliminary engineering, MassDOT will conduct further analysis for several individual properties, including the Brickbottom Artists Lofts. As described in FEIR Chapter 8, MassDOT will then be able to identify the specific measures that will be appropriate for mitigating the Project's noise and vibration impacts. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-001-040

Brickbottom Artists Building is the only residence in the Green Line Extension that will be flanked on two sides by the Green Line trolley line rails. Why don't we have an analysis of sound and vibration on both sides?

I-001-041

The City of Somerville and its residents need regular oversight meetings for residents and stakeholders to meet with DOT and qualified experts to perform detailed oversight and community contact before, during, and after construction. We need to have written agreements about such oversight with DOT before the MEPA process concludes. We need written agreements as to the nature and extent of mitigations before construction. Mitigations, in fact, have yet to be identified.

MS. NANCY FARRELL: You need to wrap up, Mr. Martel.

MR. ROBERT MARTEL: We need a public process that can oversee the implementation of mitigations before and during and after construction. Thank you.

MS. NANCY FARRELL: Thank you very much.

[Applause]

MS. NANCY FARRELL: We have Jeff Roelofs, John Kyper, and Michael Hegarty coming up.

MR. JEFF ROELOFS: Good evening. I'm Jeff Roelofs, attorney for Brickbottom, and my first two comments really are directed at the public. This document,

I-001-041

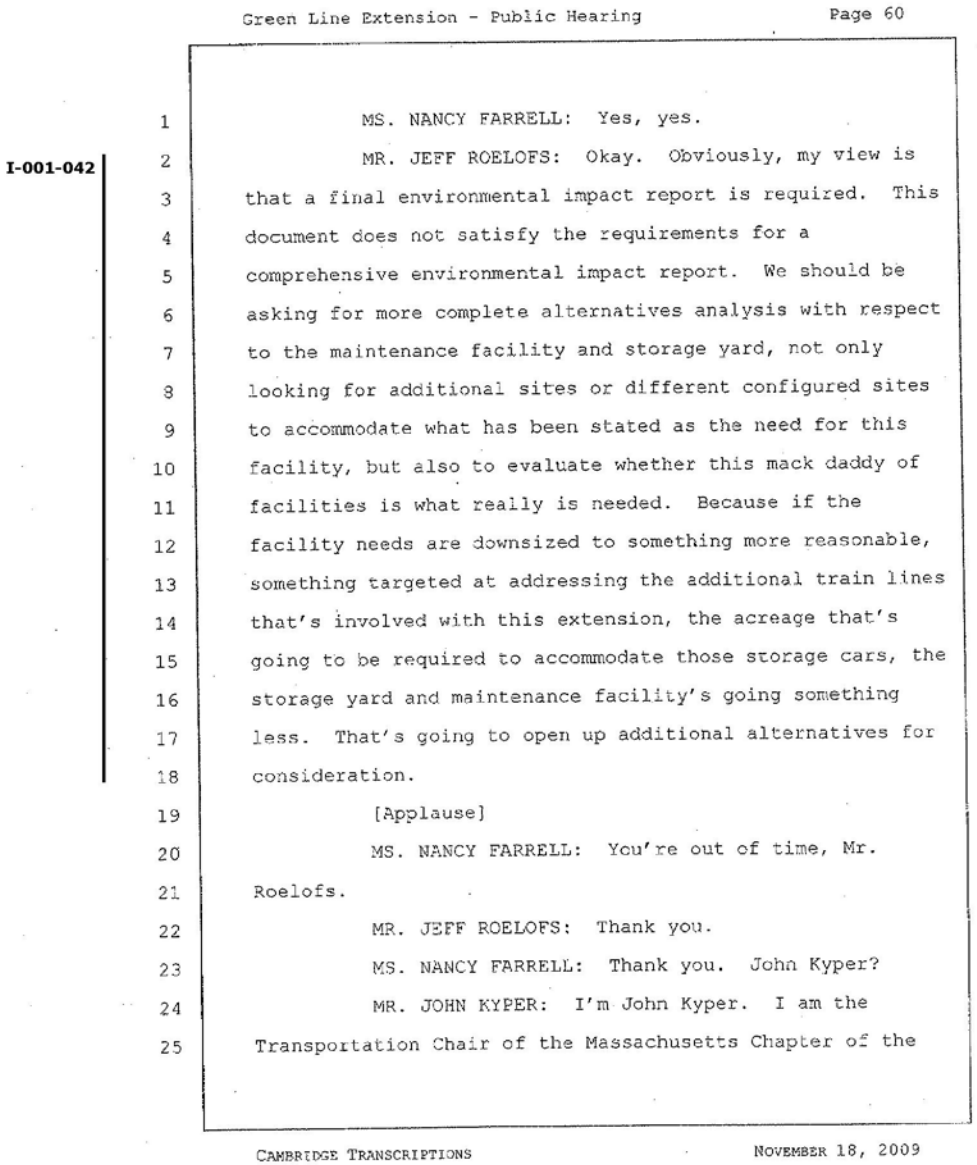
Chapter 8 of the FEIR identifies the proposed mitigation measures for the Green Line Extension Project, and the steps that will be followed to develop the final mitigation plan. In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project, including mitigation and construction.

although it's entitled the Draft EIR, you should know is being asked by the Department of Transportation, MassDOT, to be treated as the final EIR. The only reason this public meeting is happening tonight is because this project is within the MEPA process. The Department is looking to end the MEPA process. Your first comment, when you submit your comments in writing, should be, "Keep the MEPA process open, require the preparation of a Final Environmental Impact Report."

[Applause]

MR. JEFF ROELOFS: Don't lose sight of that because that is your context for additional public involvement in any meaningful context. My other point to the commenters is that your comments, to be most effective, should tie into the 2006 decision from the Secretary that defined the scope of what was supposed to be done for this document. So if you have a concern, I assume that in that document they required -- the Secretary required DOT to address that concern -- tie your concerns and your comments and requests for more information and analysis into that scope because you're more likely to get the Secretary to require something further if he agrees with you that that particular aspect of the scope was not satisfied.

Now, my comments are to the MEPA -- is the MEPA review analyst here tonight?



Green Line Extension - Public Hearing Page 60

I-001-042

MS. NANCY FARRELL: Yes, yes.

MR. JEFF ROELOFS: Okay. Obviously, my view is that a final environmental impact report is required. This document does not satisfy the requirements for a comprehensive environmental impact report. We should be asking for more complete alternatives analysis with respect to the maintenance facility and storage yard, not only looking for additional sites or different configured sites to accommodate what has been stated as the need for this facility, but also to evaluate whether this mack daddy of facilities is what really is needed. Because if the facility needs are downsized to something more reasonable, something targeted at addressing the additional train lines that's involved with this extension, the acreage that's going to be required to accommodate those storage cars, the storage yard and maintenance facility's going something less. That's going to open up additional alternatives for consideration.

[Applause]

MS. NANCY FARRELL: You're out of time, Mr. Roelofs.

MR. JEFF ROELOFS: Thank you.

MS. NANCY FARRELL: Thank you. John Kyper?

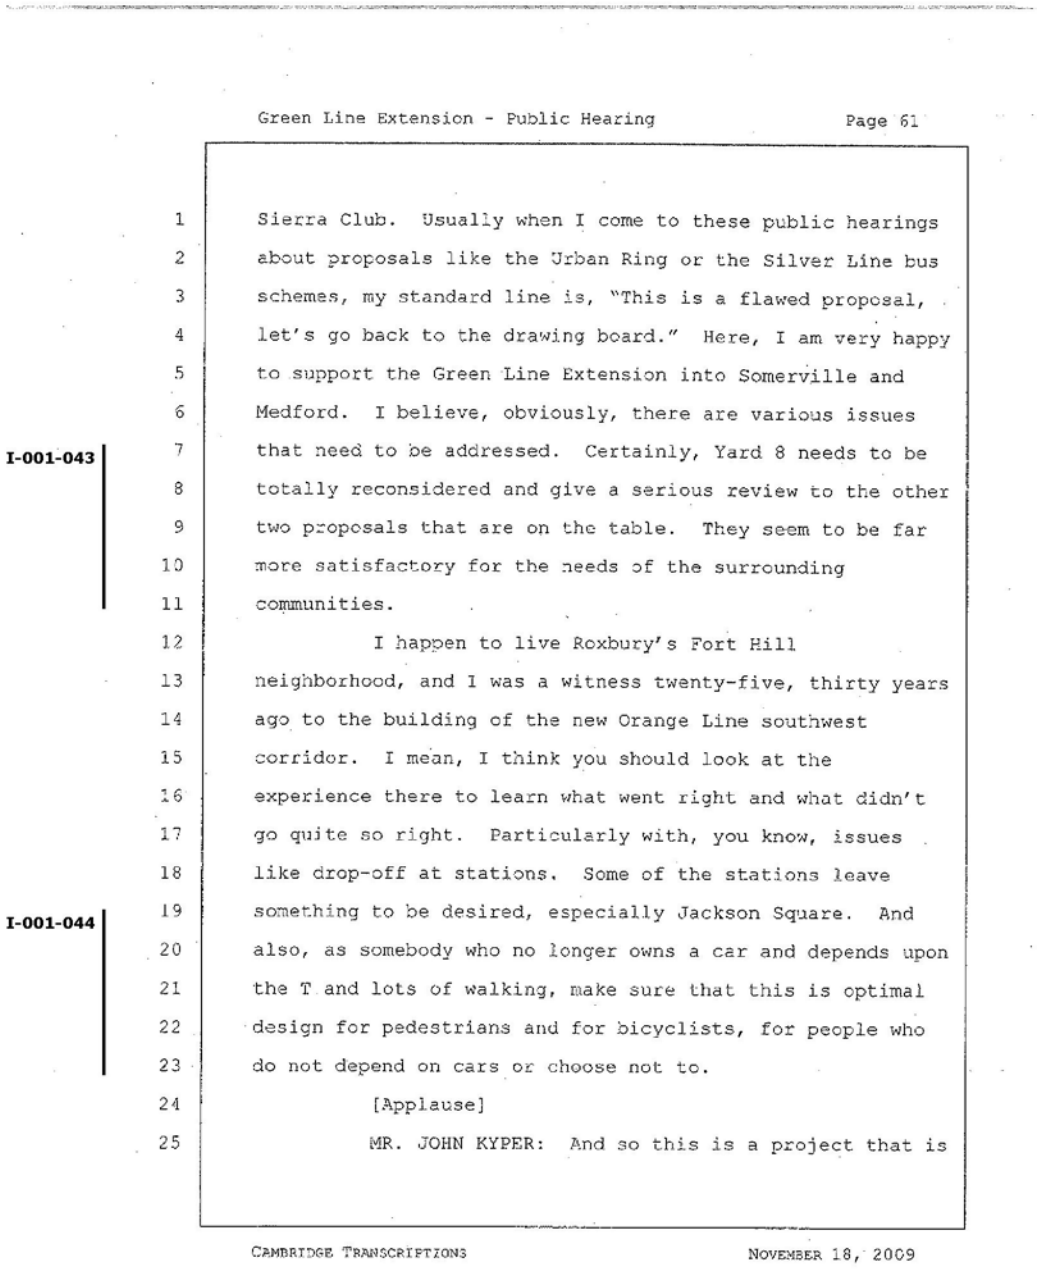
MR. JOHN KYPER: I'm John Kyper. I am the Transportation Chair of the Massachusetts Chapter of the

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-042

The Green Line Extension storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the Project. Chapter 2 of the FEIR fully describes the environmental impacts of the proposed storage and maintenance facility. In order to maximize operating efficiencies, the facility must be constructed within the same timeframe as the Green Line Extension Project, in the vicinity of the Green Line Extension right-of-way, and north of downtown Boston.

The storage and maintenance facility alternatives include storage for Green Line Extension vehicles and replacement of the existing Lechmere Station vehicle storage. Storage capacity is also provided for vehicles currently stored in trackways between Lechmere Station and Government Center; this storage will be lost due to the Green Line Extension.



Green Line Extension - Public Hearing Page 61

Sierra Club. Usually when I come to these public hearings about proposals like the Urban Ring or the Silver Line bus schemes, my standard line is, "This is a flawed proposal, let's go back to the drawing board." Here, I am very happy to support the Green Line Extension into Somerville and Medford. I believe, obviously, there are various issues that need to be addressed. Certainly, Yard 8 needs to be totally reconsidered and give a serious review to the other two proposals that are on the table. They seem to be far more satisfactory for the needs of the surrounding communities.

I happen to live Roxbury's Fort Hill neighborhood, and I was a witness twenty-five, thirty years ago to the building of the new Orange Line southwest corridor. I mean, I think you should look at the experience there to learn what went right and what didn't go quite so right. Particularly with, you know, issues like drop-off at stations. Some of the stations leave something to be desired, especially Jackson Square. And also, as somebody who no longer owns a car and depends upon the T and lots of walking, make sure that this is optimal design for pedestrians and for bicyclists, for people who do not depend on cars or choose not to.

[Applause]

MR. JOHN KYPER: And so this is a project that is

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-043

I-001-044

I-001-043

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-001-044

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

really, as was expressed, is long overdue. When I first moved down from Vermont in 1969 and took the Green Line out to Lechmere for some reason or another, my first reaction was, "Why does it end here?"

MS. NANCY FARRELL: And, unfortunately, you have to end there.

[Laughter]

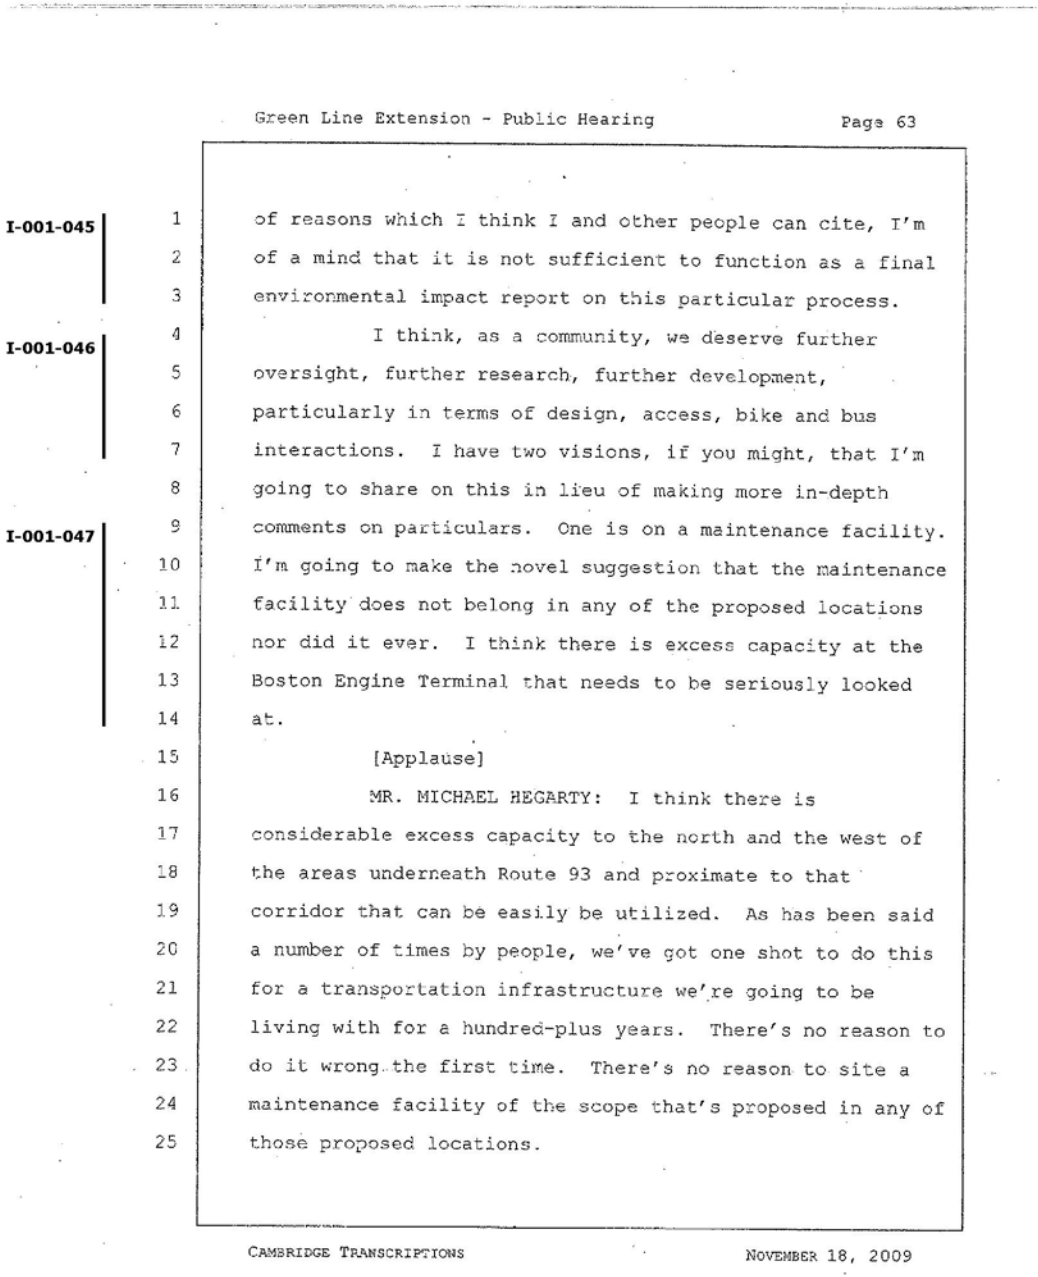
MR. JOHN KYPER: Yes. Well, the irony is I learned many years later that the current Lechmere Station looked so shabby because it was built as a temporary station because they were --

MS. NANCY FARRELL: And that was not a joke, Mr. Kyper. You're out of time.

MR. JOHN KYPER: Seriously, thank you.

MS. NANCY FARRELL: Thank you. Michael Hegarty, Scott Coolidge, and Adelaide Smith, are our next three speakers.

MR. MICHAEL HEGARTY: Hi, Michael Hegarty, East Cambridge resident. I want to start by saying how enthusiastic and how happy and how much I support and how excited I am about this entire project. I think, you know -- I know I personally, and I think my neighborhood and the community all resoundingly support this project. That being said, having spent a bit of time looking through the current Draft Environment Impact Report, I am, for a number



Green Line Extension - Public Hearing Page 63

I-001-045

of reasons which I think I and other people can cite, I'm of a mind that it is not sufficient to function as a final environmental impact report on this particular process.

I-001-046

I think, as a community, we deserve further oversight, further research, further development, particularly in terms of design, access, bike and bus interactions. I have two visions, if you might, that I'm going to share on this in lieu of making more in-depth comments on particulars. One is on a maintenance facility.

I-001-047

I'm going to make the novel suggestion that the maintenance facility does not belong in any of the proposed locations nor did it ever. I think there is excess capacity at the Boston Engine Terminal that needs to be seriously looked at.

[Applause]

MR. MICHAEL HEGARTY: I think there is considerable excess capacity to the north and the west of the areas underneath Route 93 and proximate to that corridor that can be easily be utilized. As has been said a number of times by people, we've got one shot to do this for a transportation infrastructure we're going to be living with for a hundred-plus years. There's no reason to do it wrong the first time. There's no reason to site a maintenance facility of the scope that's proposed in any of those proposed locations.

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-045

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

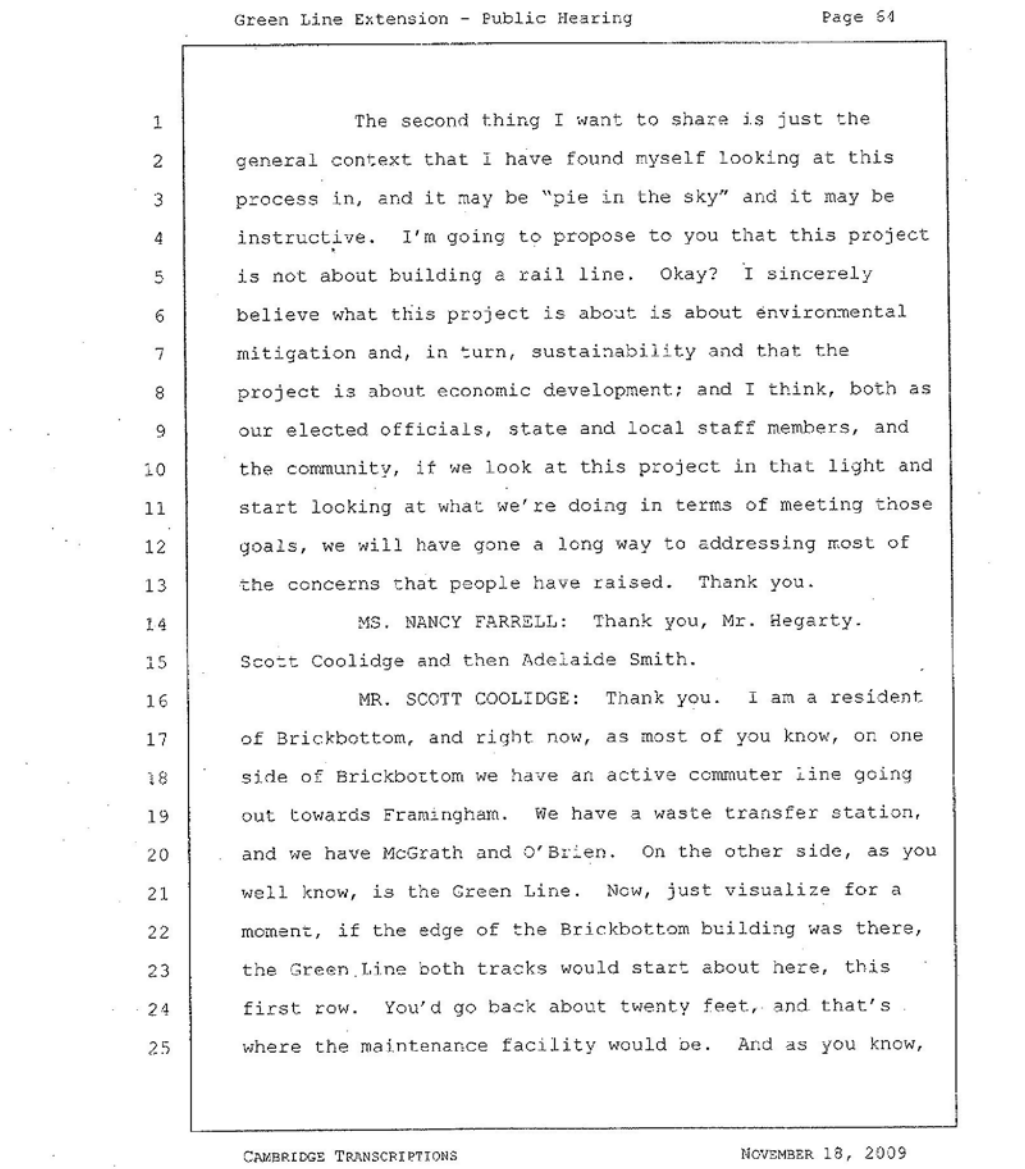
I-001-046

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-001-047

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility



Green Line Extension - Public Hearing Page 64

The second thing I want to share is just the general context that I have found myself looking at this process in, and it may be "pie in the sky" and it may be instructive. I'm going to propose to you that this project is not about building a rail line. Okay? I sincerely believe what this project is about is about environmental mitigation and, in turn, sustainability and that the project is about economic development; and I think, both as our elected officials, state and local staff members, and the community, if we look at this project in that light and start looking at what we're doing in terms of meeting those goals, we will have gone a long way to addressing most of the concerns that people have raised. Thank you.

MS. NANCY FARRELL: Thank you, Mr. Hegarty. Scott Coolidge and then Adelaide Smith.

MR. SCOTT COOLIDGE: Thank you. I am a resident of Brickbottom, and right now, as most of you know, on one side of Brickbottom we have an active commuter line going out towards Framingham. We have a waste transfer station, and we have McGrath and O'Brien. On the other side, as you well know, is the Green Line. Now, just visualize for a moment, if the edge of the Brickbottom building was there, the Green Line both tracks would start about here, this first row. You'd go back about twenty feet, and that's where the maintenance facility would be. And as you know,

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

As explained in FEIR Chapter 2, MassDOT has explored opportunities for the Green Line Extension storage and maintenance facility to share resources with the Boston Engine Terminal. The independent needs and constraints of these facilities limit opportunities for shared resources. MassDOT will coordinate with the MBTA during preliminary engineering to maximize efficient land utilization between these storage and maintenance facilities, if possible.

it's a multi-level building. So again, as most people have said, it seems to be completely unacceptable for all of us. Thank you.

[Applause]

MR. NANCY FARRELL: Thank you, sir. Adelaide Smith, Connie Blazyk, and Carolyn Rosen, the next three.

MS. ADELAIDE SMITH: Adelaide Smith. I'm also a resident of Brickbottom, and I would like to just quote from the Secretary's Certificate just to speak more to what people have been talking about. But first I'd like to say that our manager is right, no one is against the Green Line at Brickbottom. I mean, we know where we built this artists' enclave. So it's not like don't put anything there.

However, the Secretary's Certificate reads, "No segment of the population should be denied environmental benefits or should bear a disproportionate burden of environmental impacts." And I would suggest that, in fact, that is what's being done to those of us who live in Brickbottom. We are the only residential building in the area. If we had the maintenance facility and/or the storage, we will have light blocked from artists. Sound and vibration is, as has already been said, going to be probably impossible to mitigate; and we have 220 people, including children, who are going to impacted by this. And

also, I'd just like to say, you know, severe economic issues really should not be able to mitigate these issues. We can't say there's not enough money, and therefore we have to do something. Thank you.

MS. NANCY FARRELL: Thank you. Connie Blazyk?

MS. CONNIE BLAZYK: Hi, my name is Connie Blazyk. I'm also a member of the Brickbottom community and a very concerned citizen about the Yard 8 maintenance facility and storage yard proposal and the DEIR. As many others have said, the proposed Yard 8 maintenance facility and large storage yard will take 11.5 acres of land from the City of Somerville, much of it privately held, land that is already permitted and zoned for development; and it will remove it from the City's commercial tax base.

The Yard 8 proposal also creates a permanent barrier to neighborhood cohesion by dissecting the Inner Belt from the Brickbottom area. The Yard 8 facility and storage yard will have a severe impact on the residents of Brickbottom, as well as other residents in the area. Contrary to what has been said here tonight, there will be no ramification in terms of impact on residents, and that is particularly the case in terms of mitigation as outlined in the DEIR. It is simply confusing and inefficient. Only 40 residences in Brickbottom will get any soundproofing out of a building of 155 units. Brickbottom, as well as other

I-001-048

I-001-048

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-001-048

impacted buildings, including the Glass Factory, need mitigation, especially noise and vibration mitigation, in place before construction not after.

[Applause]

MS. CONNIE BLAZYK: We need a process in which to address mitigation issues during construction, as well as after the fact, providing us with a means of redress if specific project goals are not met. And a very sad example of that was recently born to light in *The Boston Globe*, a story of a woman living in the Sullivan Square area, having lived in a home for thirty years and she has redress. There's no money left with which for her to rectify her situation.

I-001-049

Finally, the Yard 8 decision did not involve the Citizen's Advisory Group in evaluating potential sites for the maintenance facility and storage yard. Additionally, mandated land use planning was not performed. That is a violation of the Certificate of the Secretary's mandate for community involvement in this project. The DEIR and what has been said here tonight, promises were made to more fully examine both the Mirror H and L --

MS. NANCY FARRELL: Time, please.

MS. CONNIE BLAZYK: -- Options. We will be waiting. We applaud those details. We want to see them very soon. Thank you very much.

I-001-049

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

MS. NANCY FARRELL: Thank you. The next three speakers are Carolyn Rosen, Peter Marquez, and George Gabin.

MS. CAROLYN ROSEN: My name is Carolyn Rosen. I'm the chairperson of GLAM, and we have membership in the audience. I'm not going to repeat much of what the Brickbottom attorney already said because that was part of my speech. This is an open-ended environmental contract that basically asked us to trust EOT. Basically, it says, we're going to recommend Yard 8, but we're going to study Yard 8. We're going to put a 300-car parking garage at Route 16, but we're not going to a parking garage at Route 16. This is an open-ended environmental contract that's an oxymoron that does not provide details with meaningful outcomes.

I-001-050

GLAM has filed a civil rights case with the Federal Transportation Administration around the lack of environmental justice and disability authentic participation within this project. That civil rights case is now under review by the FTA and includes a lack of participation up to hate crimes that have committed against our groups that we have informed EOT of, of which they have shaken their head and said, I have no responsibility.

We are now also talking to attorneys about an injunction between taking this project from College Ave. to

I-001-050

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

Route 16. We do not believe that the impact upon our community of taking land acquisition and property taxes that are up to $400,000, and we can test EOT's numbers as being inaccurate in this report, another shoddy job that they've done, and the impact on a HUD housing program that houses people with disabilities and people of African-American, who are vulnerable populations.

We do not believe that one federal law trumps another federal law around civil rights. This project is a joke in the fact that there is not enough money to even maintain the systems that we have right at the moment. GLAM is recommending that Route 16 be dropped out of the DEIR due to its heavy mitigation impact on EJ populations, and we are asking that this project be slowed down until money can be identified.

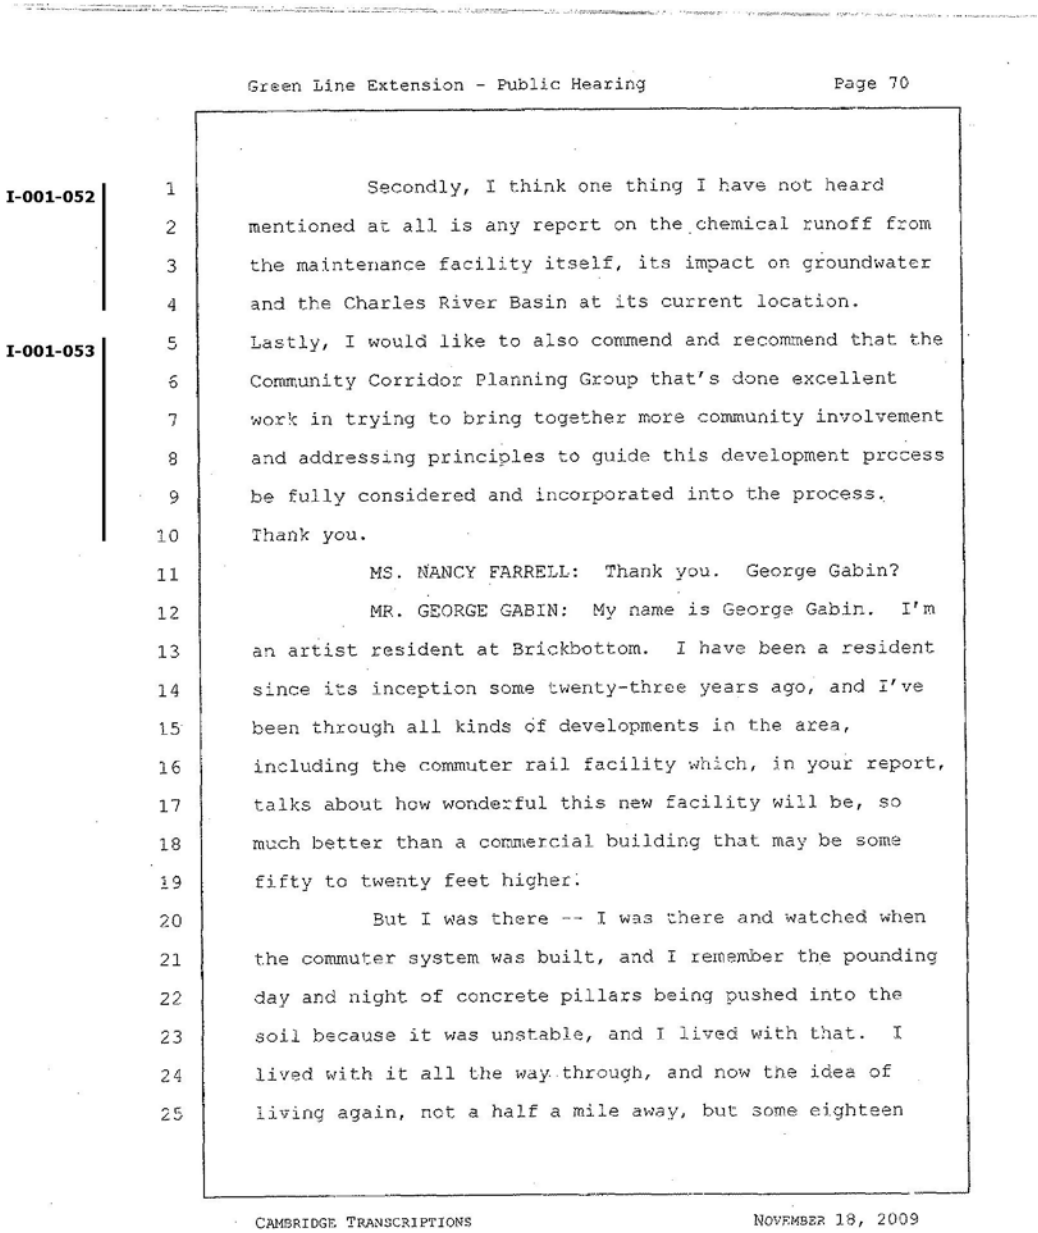
I-001-051

MS. NANCY FARRELL: Time. Thank you, Ms. Rosen. Peter Marquez, George Gabin, and Rob Cassel.

MR. PETER MARQUEZ: My comments will be brief. I just want to thank everybody for doing the work they have done so far. However, the DEIR is inadequate. I believe that more work needs to be done in order to fully flesh out the environmental impacts and quality of life impacts, which are cursory at best in this report. Noise and vibration is additive, and we need to consider that as we move forward.

I-001-051

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.



Green Line Extension - Public Hearing Page 70

I-001-052

I-001-053

Secondly, I think one thing I have not heard mentioned at all is any report on the chemical runoff from the maintenance facility itself, its impact on groundwater and the Charles River Basin at its current location. Lastly, I would like to also commend and recommend that the Community Corridor Planning Group that's done excellent work in trying to bring together more community involvement and addressing principles to guide this development process be fully considered and incorporated into the process. Thank you.

MS. NANCY FARRELL: Thank you. George Gabin?

MR. GEORGE GABIN: My name is George Gabin. I'm an artist resident at Brickbottom. I have been a resident since its inception some twenty-three years ago, and I've been through all kinds of developments in the area, including the commuter rail facility which, in your report, talks about how wonderful this new facility will be, so much better than a commercial building that may be some fifty to twenty feet higher.

But I was there -- I was there and watched when the commuter system was built, and I remember the pounding day and night of concrete pillars being pushed into the soil because it was unstable, and I lived with that. I lived with it all the way through, and now the idea of living again, not a half a mile away, but some eighteen

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-052

As described in DEIR/EA Section 5.9, the Project would be required to comply with federal and state stormwater discharge permit requirements during both the construction and operational phases. Compliance with these standards would include using Best Management Practices to prevent contamination of stormwater and control erosion and accretion (sedimentation) from stormwater runoff from the railroad alignment, stations, and maintenance facility.

I-001-053

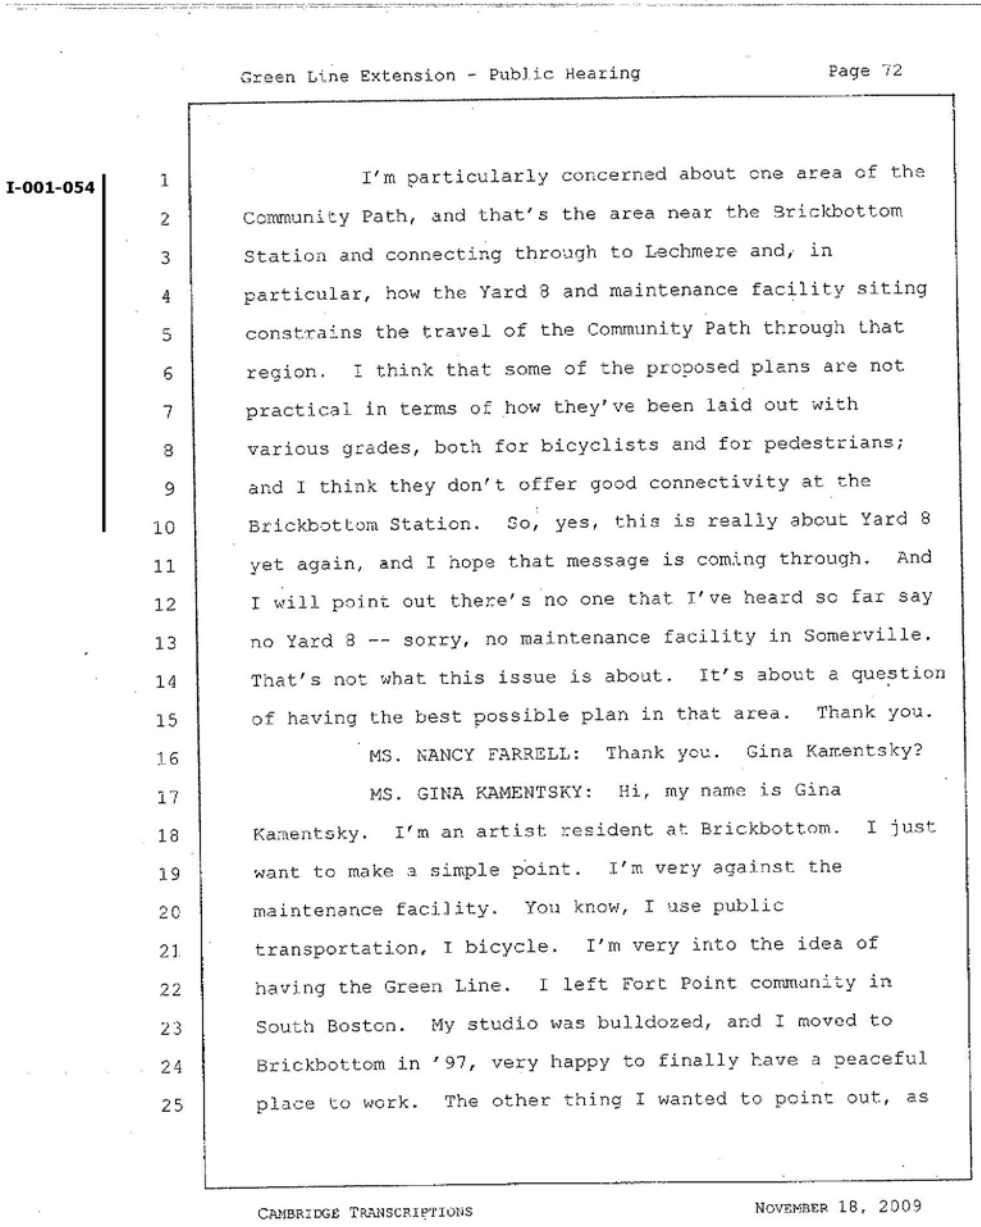
MassDOT has reviewed and considered the "Core Community Principles" for station area land use, presented by Community Corridor Planning. As described in the FEIR, Section 6.2 of the Public Involvement Plan, MassDOT will hold land use workshops to discuss related issues with the community.

feet boggles the imagination of anybody. We are a creative group of people who are being threatened, and the threat is without end. From the moment your bulldozers come, we will be in misery; and it will not end as long as we stay in that building, and yet we are stuck. We are the victims of this project, and I say to you, I'm seventy-eight years old -- soon I'll be seventy-nine -- if it comes to it, I will be the first one laying down in front of those bulldozers.

[Applause]

MS. NANCY FARRELL: Thank you, sir. Rob Cassel, and then the next two speakers are Gina Kamentsky and Ramon Bueno.

MR. ROB CASSEL: George, you're a tough act to follow. Hi, I'm Rob Cassel. I'm also a resident at Brickbottom; and I'd like to speak briefly about a point that a number of folks have brought up today, an area where I believe the DEIR is deficient, and that's with the Community Path and how that's been laid out. I think the Community Path provides not just bicycle access, as many peopie think of it but foot access and, tied into the stations correctly, is going to be a tremendous asset for areas that aren't particularly near the stations that are being proposed for the Green Line, will draw in even more passengers, get more cars off the road, and encourage more economic development.



Green Line Extension - Public Hearing Page 72

I-001-054

I'm particularly concerned about one area of the Community Path, and that's the area near the Brickbottom Station and connecting through to Lechmere and, in particular, how the Yard 8 and maintenance facility siting constrains the travel of the Community Path through that region. I think that some of the proposed plans are not practical in terms of how they've been laid out with various grades, both for bicyclists and for pedestrians; and I think they don't offer good connectivity at the Brickbottom Station. So, yes, this is really about Yard 8 yet again, and I hope that message is coming through. And I will point out there's no one that I've heard so far say no Yard 8 -- sorry, no maintenance facility in Somerville. That's not what this issue is about. It's about a question of having the best possible plan in that area. Thank you.

MS. NANCY FARRELL: Thank you. Gina Kamentsky?

MS. GINA KAMENTSKY: Hi, my name is Gina Kamentsky. I'm an artist resident at Brickbottom. I just want to make a simple point. I'm very against the maintenance facility. You know, I use public transportation, I bicycle. I'm very into the idea of having the Green Line. I left Fort Point community in South Boston. My studio was bulldozed, and I moved to Brickbottom in '97, very happy to finally have a peaceful place to work. The other thing I wanted to point out, as

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-054

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

artists, many of us we -- I'm there twenty-four-seven. I sleep there, I work there. I'm very impacted by what goes on around me, and I just want everyone to consider that when you think about this. Thank you.

MS. NANCY FARRELL: Thank you. Ramon Bueno?

MR. RAMON BUENO: Good evening. I've lived in Somerville for about thirty years and at Brickbottom for about twenty-two years. I'm not going to repeat most of what's been said. I just one to highlight one particular angle, which is that our community has been a strong supporter and very excited about the Green Line Extension from the beginning. So that's not an issue for us, and that's despite the fact that, you know, we have a commuter line running a few feet from our building, cargo trains on both sides. Despite the fact that, once it's running, for 365 days a year from morning to night, we're going to have trains on both -- you know, the split for Union Square and the other one is right next to our building. So that's not an issue for most of us either. As a community, we support that.

I-001-055

The issue is with Yard 8 and the maintenance facility is, is there a limit to what a community has to put up with? We feel like there is a limit, and the impact is going to be permanent, inordinate, and disproportionate impact on our community, as well as to the City and all the

I-001-055

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-001-055

issues that the aldermen pointed out for development. So we feel that this report cannot be the final one, and that we hope that the alternatives are actually being seriously looked at, not just as a palliative for the opposition. Thank you very much.

[Applause]

MS. NANCY FARRELL: The next three speakers are Chip Olson, William Wood, and Heather Van Aelst.

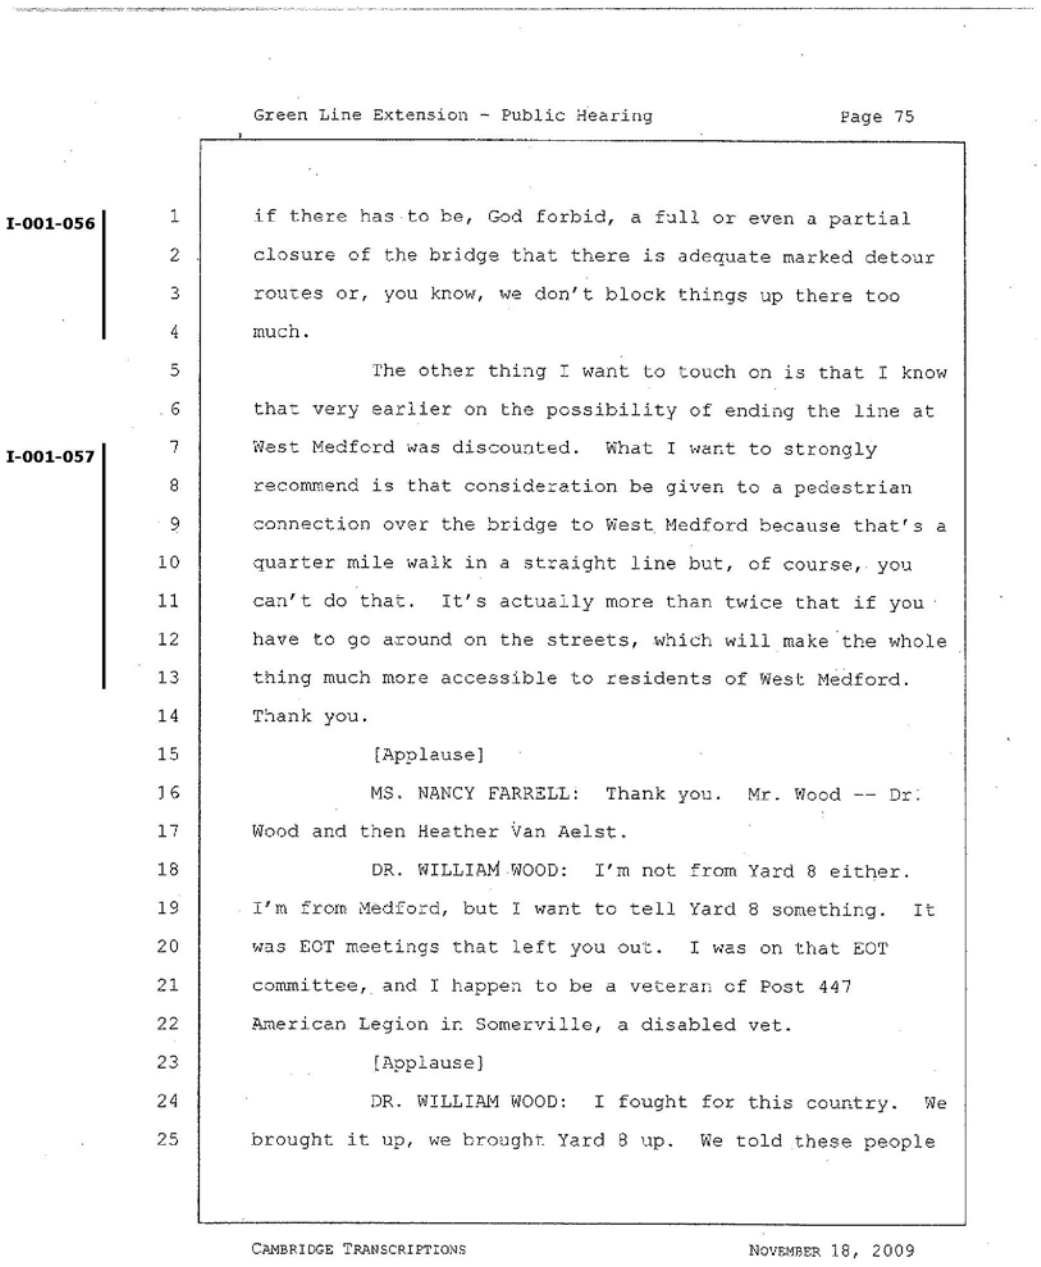
MR. CHIP OLSON: Good evening. My name's Chip Olson. I live at 80 Pritchard Ave. in Somerville, and my comments have nothing to do with Brickbottom. I wanted to touch on one specific issue with regard to construction mitigation, which is that, as you know, there's going to be a number of bridges that need to be rebuilt. I live near one of these, the Broadway Bridge in Somerville and Ball Square, and every year the City of Somerville closes that bridge and that stretch of Broadway for the fireworks at Trum Field. This results in all the traffic going eastbound on Broadway being routed down my narrow one-way residential street. A couple of years ago a gasoline tanker got stuck because it couldn't make the turn at the end of the street.

I-001-056

I don't particularly want all the traffic for two years of the bridge reconstruction going down my street. So I wanted to ask that a lot of consideration be given to,

I-001-056

Construction impacts of the Project are described in each environmental resource section in DEIR/EA Chapter 5, Environmental Consequences. Detailed construction plans will be developed in the next phase of the Project. Affected bridges are described in DEIR/EA Section 3.7.2. Detour routes and emergency access during construction will be developed during preliminary engineering as part of the Traffic Management Plan. At least one bridge will need to be closed during construction (Medford Street). A temporary bridge may be able to maintain a single lane of traffic at the Broadway Bridge. For all other bridges, at least one lane will be maintained during construction. Pedestrian and vehicular access to abutting properties will be maintained at all times. Project bridge designs and construction staging plans will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during design and construction.



Green Line Extension - Public Hearing Page 75

I-001-056

if there has to be, God forbid, a full or even a partial closure of the bridge that there is adequate marked detour routes or, you know, we don't block things up there too much.

The other thing I want to touch on is that I know that very earlier on the possibility of ending the line at

I-001-057

West Medford was discounted. What I want to strongly recommend is that consideration be given to a pedestrian connection over the bridge to West Medford because that's a quarter mile walk in a straight line but, of course, you can't do that. It's actually more than twice that if you have to go around on the streets, which will make the whole thing much more accessible to residents of West Medford. Thank you.

[Applause]

MS. NANCY FARRELL: Thank you. Mr. Wood -- Dr. Wood and then Heather Van Aelst.

DR. WILLIAM WOOD: I'm not from Yard 8 either. I'm from Medford, but I want to tell Yard 8 something. It was EOT meetings that left you out. I was on that EOT committee, and I happen to be a veteran of Post 447 American Legion in Somerville, a disabled vet.

[Applause]

DR. WILLIAM WOOD: I fought for this country. We brought it up, we brought Yard 8 up. We told these people

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-057

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

that not everybody in Somerville agreed with all of the Green Line Extension. I too support the Green Line Extension and publicly have said so; and when I publicly said this, my brothers and sisters said, "You don't support the Green Line." Well, that was a lie. I was then castrated in your newspaper, saying I don't support the disabled community or the environmental community because I wanted to save West Medford, an African American community, from the things you're talking about about Brickbottom. The DEIR report is not sufficient. I actually went out and got a person who does environmental justice for free to read the original comments. She's read them again. It's not efficient enough for DEIR.

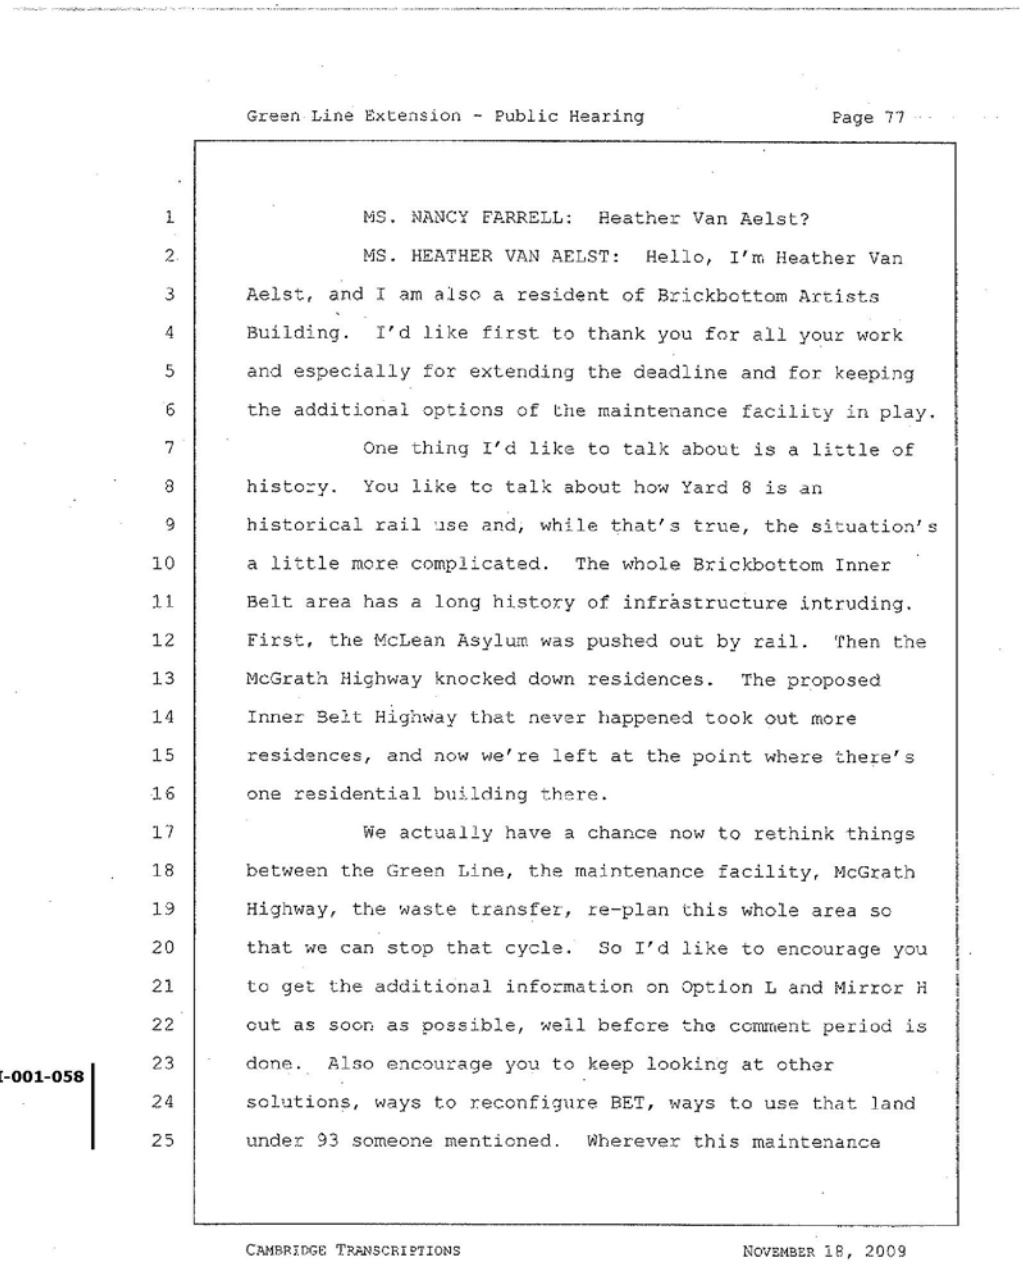
We set a group up called GLAM. It was an opposing group, opposing to nothing. We were an educational group. We would take people in from everywhere. We said to EOT over and over again, you need more community activity in this meeting. You need people talking. You need people dealing with the subject.

MS. NANCY FARRELL: Bill, you're out of time.

DR. WILLIAM WOOD: I'm out of time. That's what usually happens at -- sorry, it's not EOT anymore, whatever it's called.

MS. NANCY FARRELL: Thank you.

[Applause]



Green Line Extension - Public Hearing Page 77

MS. NANCY FARRELL: Heather Van Aelst?

MS. HEATHER VAN AELST: Hello, I'm Heather Van Aelst, and I am also a resident of Brickbottom Artists Building. I'd like first to thank you for all your work and especially for extending the deadline and for keeping the additional options of the maintenance facility in play.

One thing I'd like to talk about is a little of history. You like to talk about how Yard 8 is an historical rail use and, while that's true, the situation's a little more complicated. The whole Brickbottom Inner Belt area has a long history of infrastructure intruding. First, the McLean Asylum was pushed out by rail. Then the McGrath Highway knocked down residences. The proposed Inner Belt Highway that never happened took out more residences, and now we're left at the point where there's one residential building there.

We actually have a chance now to rethink things between the Green Line, the maintenance facility, McGrath Highway, the waste transfer, re-plan this whole area so that we can stop that cycle. So I'd like to encourage you to get the additional information on Option L and Mirror H out as soon as possible, well before the comment period is done. Also encourage you to keep looking at other solutions, ways to reconfigure BET, ways to use that land under 93 someone mentioned. Wherever this maintenance

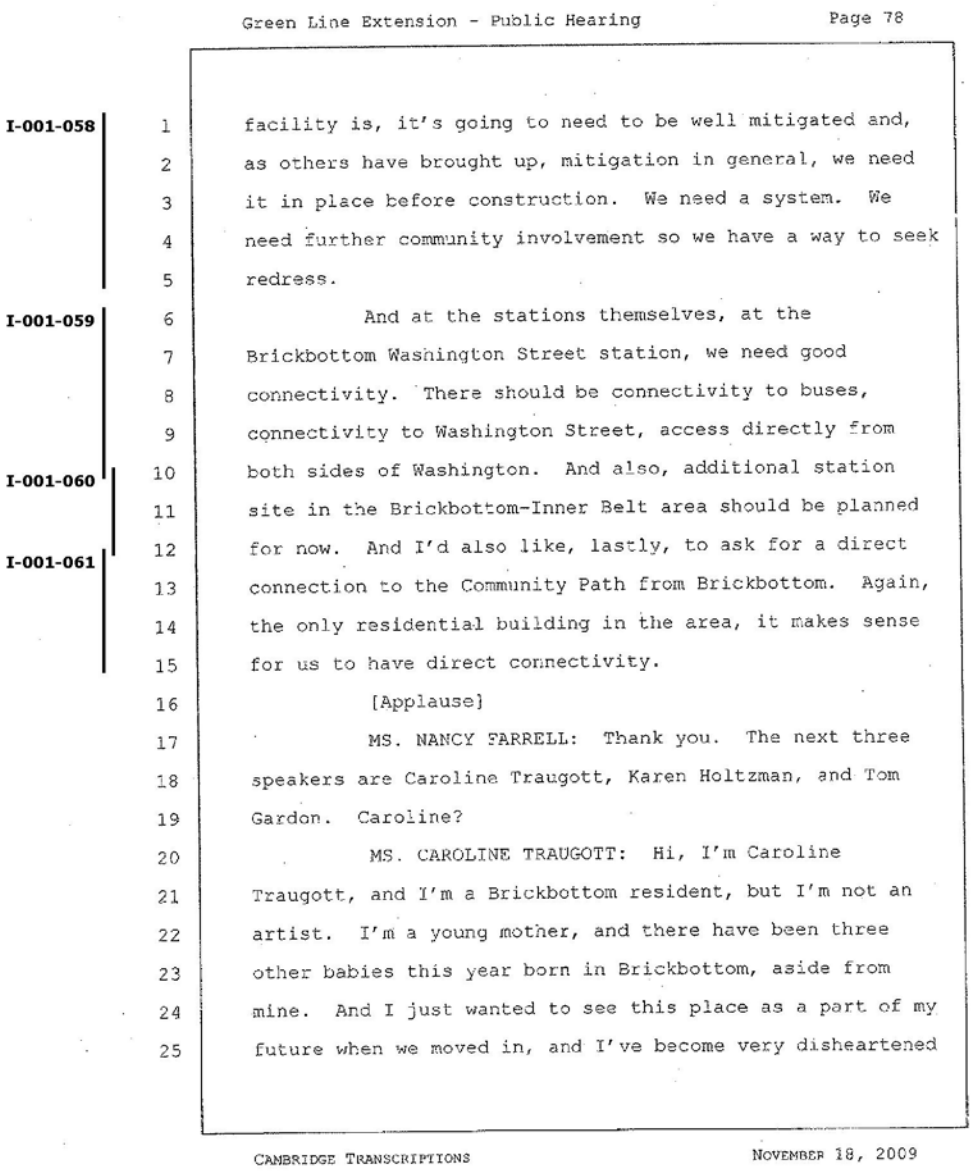
I-001-058

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-058

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.



Green Line Extension - Public Hearing Page 78

I-001-058 facility is, it's going to need to be well mitigated and, as others have brought up, mitigation in general, we need it in place before construction. We need a system. We need further community involvement so we have a way to seek redress.

I-001-059 And at the stations themselves, at the Brickbottom Washington Street station, we need good connectivity. There should be connectivity to buses, connectivity to Washington Street, access directly from both sides of Washington. And also, additional station site in the Brickbottom-Inner Belt area should be planned for now. And I'd also like, lastly, to ask for a direct connection to the Community Path from Brickbottom. Again, the only residential building in the area, it makes sense for us to have direct connectivity.

[Applause]

MS. NANCY FARRELL: Thank you. The next three speakers are Caroline Traugott, Karen Holtzman, and Tom Gardon. Caroline?

MS. CAROLINE TRAUGOTT: Hi, I'm Caroline Traugott, and I'm a Brickbottom resident, but I'm not an artist. I'm a young mother, and there have been three other babies this year born in Brickbottom, aside from mine. And I just wanted to see this place as a part of my future when we moved in, and I've become very disheartened

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-059

The conceptual plan for the Brickbottom Station will be refined during the preliminary engineering stage, taking into consideration municipal, neighbor, and other stakeholder concerns to the extent practical. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

I-001-060

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

I-001-061

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

about Yard 8, obviously. And I heard you, Kate, say many times in your speech how proud you were of not moving residents; but I can assure you that, if this goes through, people will move, and you can't let that happen. That cannot happen. Thank you.

MS. NANCY FARRELL: Thank you. Karen Holtzman and Tom Gardon.

MS. KAREN HOLTZMAN: My name is Karen Holtzman and, yes, I live at Brickbottom. I've lived there for twenty-two years. My home on the top floor of the Cannery Building will be about eighteen feet from the Green Line Extension tracks and a few hundred feet from the proposed maintenance facility and storage yard. For most of those twenty-two years, I have tramped down the McGrath Highway to get to Lechmere Station to take the Green Line to work. This walk is often unpleasant, and I have always looked forward to having a Green Line station closer to my home. However, I'm opposed to the siting of the maintenance facility and storage yard in Yard 8, and I'm opposed to an ill-conceived Green Line Extension.

Reading through the DEIR/EA, I see many problems with construction and mitigation of the Green Line, as well as the siting of the maintenance facility and storage yard. There are many vague and deceptive or misleading statements. I don't have time to elaborate on many of them

here obviously, and many other people have hit on them. But let me just give one example specific. On page 5-113 it says, and I quote, "Rail operations alone would increase noise levels at the Brickbottom lofts from 57.6 dB(a) to 75.3 dB(a), which would constitute a severe impact. The addition of the maintenance facility noise to this scenario would increase overall noise levels to 76.4 dB(a), an increase of only 1.1 dB(a)."

First, the second statement I quoted is disingenuous. A maintenance facility and storage yard for eighty cars would be running twenty-four hours seven days a week. The Green Line does not run around the clock. With the maintenance facility and storage yard, the extreme rise in the noise level would be an all day every day event. There would not be an hour or four hours when there would respite from the noise, vibration, and lights. Second, as noted on page 5-118, some residences on upper floors, "would not benefit from a potential noise barrier." For those, it is suggested that exposure to severe noise could perhaps be mitigated --

MS. NANCY FARRELL: You're out of time.

MS. KAREN HOLTZMAN: -- by "adding windows," and it won't work. That's all I'm saying.

[Applause]

MS. KAREN HOLTZMAN: And no one is going to

compensate me for the loss when I can't live there from twenty-four hours a day noise, and you are not taking my property but, in effect, you are.

MS. NANCY FARRELL: Thank you.

[Applause]

MS. NANCY FARRELL: Tom Gardon, then Jim McGinness and Doug McCall.

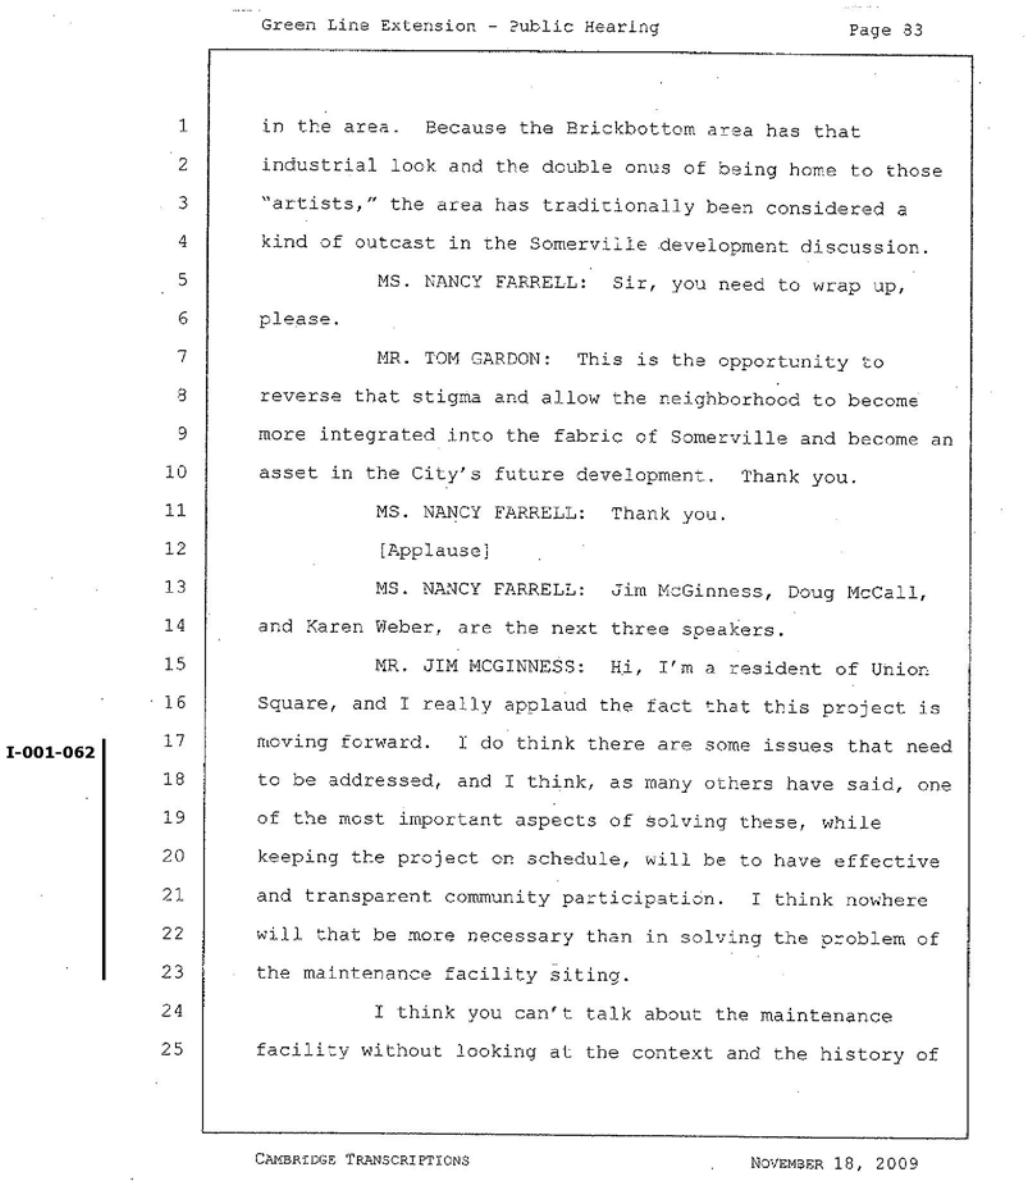
MR. TOM GARDON: I'm another non-artist resident of Brickbottom and, yes, I do support the Green Line Extension, of course. The DEIR speaks to environmental justice, and I suspect there are many ways, both legally and literally, to interpret that phrase. But if there is an injustice being perpetrated in this proposal, it is on the Brickbottom/Inner Belt community and, by extension, the City of Somerville.

Brickbottom is being asked to acquiesce to being surrounded by two Green Line tracks that would be operating from 5:30 a.m. until 12:30 p.m. There are being asked to allow the construction and the twenty-four/seven operation of a maintenance facility and storage yard to be located yards away from the buildings. The City of Somerville is being asked once again to bear the brunt of project construction and land-takings, while losing hope for future development. The citizens of Somerville are being told that there will be no future property tax relief because

the MBTA is taking one of the few remaining parcels of developable land in the City. And the residents of Brickbottom are being told that they are not relevant in the expansion plans of the MBTA, that there will be negligible monies allotted for mitigation and that any benefit that a Green Line station in the area might bring will be offset by 11.5 acres of noise, vibration, and pollutants that will affect the lives of residents and the City's growth.

The DEIR states that, because Brickbottom is already situated next to a rail yard, the residents will find little change in the area. Like many sections of the report, this fantasy speaks to the lofty hopes and aspirations of the MBTA and hearkens not at all to reality. The rail activity in the area adjacent to Yard 8 is sporadic, sometimes not existent for days, and has minimal impact on the community. To suggest that construction of a maintenance facility and storage yard will somehow be little more than a nuisance is disingenuous.

The Brickbottom Artists buildings have been a point of focus in many of these meetings, and I worry that the residents of the buildings are being overlooked. There are 220 people occupying the buildings. There are 155 units in the building. There are people who consider the area home, raise families, pay taxes, and are happy to be



Green Line Extension - Public Hearing Page 83

in the area. Because the Brickbottom area has that industrial look and the double onus of being home to those "artists," the area has traditionally been considered a kind of outcast in the Somerville development discussion.

MS. NANCY FARRELL: Sir, you need to wrap up, please.

MR. TOM GARDON: This is the opportunity to reverse that stigma and allow the neighborhood to become more integrated into the fabric of Somerville and become an asset in the City's future development. Thank you.

MS. NANCY FARRELL: Thank you.

[Applause]

MS. NANCY FARRELL: Jim McGinness, Doug McCall, and Karen Weber, are the next three speakers.

MR. JIM MCGINNESS: Hi, I'm a resident of Union Square, and I really applaud the fact that this project is moving forward. I do think there are some issues that need to be addressed, and I think, as many others have said, one of the most important aspects of solving these, while keeping the project on schedule, will be to have effective and transparent community participation. I think nowhere will that be more necessary than in solving the problem of the maintenance facility siting.

I think you can't talk about the maintenance facility without looking at the context and the history of

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-062

I-001-062

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

regional transportation impact on Somerville. Somerville right now has major roadways, I93, Routes 28 and 38, cutting through it. Railroad right of ways slice the City into pieces that have trouble communicating. They interfere with emergency access, commerce, and mobility. There are other major maintenance facilities, the bus maintenance in Charlestown, the Boston Engine Terminal, a proposed bus terminal, a maintenance facility in Wellington just across the river. I think, in evaluating the impact of this maintenance facility, you have to take previous history and the heavy burden that this particular area already bears into account.

And perhaps more important, I think the overarching goal, as stated in the Secretary's Certificate policy goal within MEPA review is for the use and reuse of land, is to direct public infrastructure investments to spur revitalization of previously developed urban sites over underdeveloped green field sites. This is really the framework in which this project should have been evaluated, and I think nowhere is the failure of realistic land use planning more evident than in the way in which the choices for maintenance facility siting were made. I think the DEIR basically looks at direct, frankly, trivial impacts, the costs of property-takings, and job losses but, of course, there's much bigger things on the table. And for

Somerville and for the region as whole, that translates to facilitating the development of Inner Belt, more than 100 acres which could transform the economic situation of Somerville and provide a huge amount of additional payroll taxes to the state.

BY NANCY FARRELL: Jim, you're out of time.

MR. JIM MCGINNESS: Okay. So anyway, I hope that this project remains on-track and that in the future we're able to have a strong community process to resolve this question. Thank you.

BY NANCY FARRELL: Thank you.

[Applause]

BY NANCY FARRELL: Doug McCall, Karen Weber, and Beverly Sky are the next three speakers. Doug McCall? Okay. I think we lost him. Karen Weber, and then Beverly Sky, and Joel Weber.

MS. KAREN WEBER: Good evening. It's a delight to be here and see the tension of the community and the rail, and hopefully all of this is going to be resolved in a very fruitful and productive way so that everyone can really appreciate how we can move into the future and into a green future because, obviously, we need to create our spaces in a sustainable and healthy way. And so that brings me to suggest that, in all of our conversations, I haven't heard anything about looking at the stations

I-001-063

I-001-063

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual designs. Detailed designs for each station, the maintenance facility, and the entire Project will be refined during the preliminary engineering phase. As stated in DEIR/EA Section 3.7, the Project will emphasize low-energy, low-impact, "green" design. The process for coordinating with the local communities during Project design is described in the Public Involvement Plan, Chapter 6 of the FEIR.

I-001-063

themselves for a green type of building, looking at solar in terms of lighting and providing electricity, and green roofs.

For those of you who don't know, I don't know if you can see a picture here of buildings that have plants on them, some vegetation. There's one little space in Somerville on Prospect Hill that has one, but hopefully, there'll be many more. And this would be an incredible opportunity to help with sound mitigation, storm water mitigation, giving it that special touch that would give you something that really could be a leader for the MBTA, for Somerville, and for the state. Thank you very much.

MS. NANCY FARRELL: Thank you.

[Applause]

MS. NANCY FARRELL: Beverly Sky?

MS. BEVERLY SKY: Thank you. I'm one of the founding artists at Brickbottom, and I've been there for twenty-two years. And although most of us have gotten used to it, at around twelve o'clock at night when the trains are occasionally idling right outside of our building, you can feel the vibration in our brick floors. It's a brick building. That's why it's called Brickbottom, and the vibration is really intense and will keep you up while those trains are idling.

But I just want to say that I'm just so disturbed

that we've been writing letters for years now, and that the maintenance facility is still taken seriously to be located right next to our building is just very disturbing to me and shows a disregard for the lives of all the families that live at Brickbottom. And I just want to say that I would be right next to George when the bulldozers pull up, if they should. Thank you.

MS. NANCY FARRELL: Thank you.

[Applause]

MS. NANCY FARRELL: Joel Weber, Rafael Mares, and then Steve Mackey.

MR. JOEL WEBER: I'm Joel Weber. I'm a Somerville resident. Sometimes when I go for a walk along Broadway near the bridge, I notice that the visibility is somewhat limited because of how high the bridge is above the surrounding area, and it's a problem on both sides of the bridge, which leaves me with the impress that perhaps at one time the road may have crossed the railroad tracks at grade and, when the time came for grade separation, the bridge was simply built above the tracks. I think that we might be better off looking at lowering the tracks and making that area level again.

I've seen comments in the draft report about ADA accessibility to the station from the bridge being a problem because of the grade on the bridge, and I think

I-001-064

I-001-064

The DEIR/EA and FEIR include conceptual Project designs. Designs for each station, the storage and maintenance facility, and the entire project alignment will be refined during the Project's preliminary engineering stage. The process for coordinating with local communities during Project design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-001-065

this is really a problem with having not lowered the tracks. Even if you build a building next to the track so that people can get into the station from one side in a wheelchair, I'm concerned about access for people in wheelchairs going from one side of the tracks to the other. I think that lowering the tracks could improve accessibility across the tracks in our community. And so I think that we should look at lowering the tracks at Lowell Street, at Broadway, at Harvard Avenue lowering the tracks and putting the road above the tracks, and I'm not sure, you know, at the stations beyond that whether the tracks should also be lowered there. Thank you.

MS. NANCY FARRELL: Thank you.

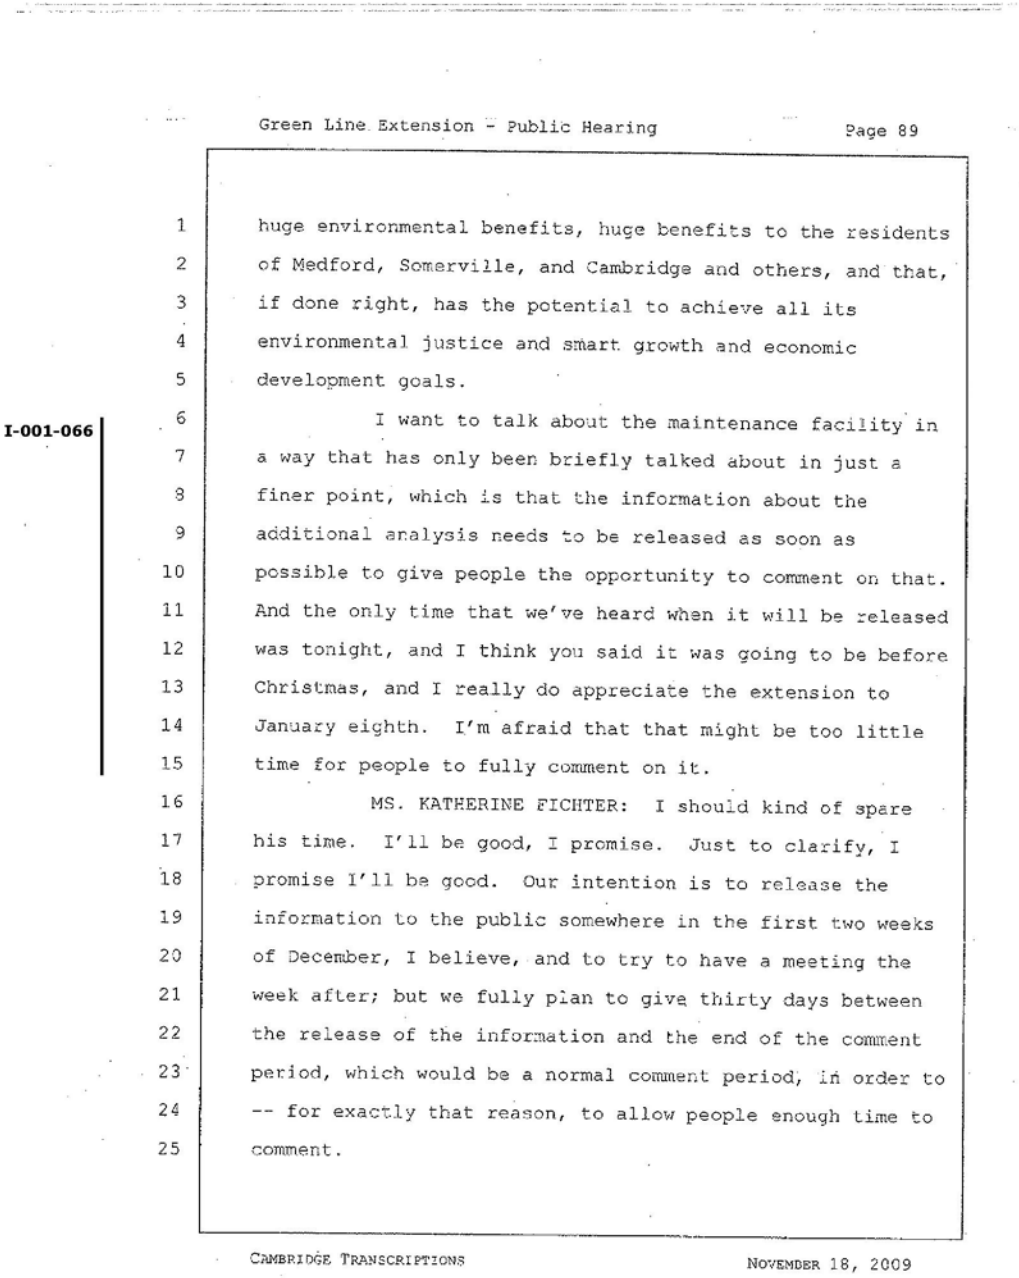
[Applause]

MS. NANCY FARRELL: Rafael Mares? And then we'll have Steve Mackey, Alyson Schultz, and Alan Greene.

MR. RAFAEL MARES: Good evening. My name is Rafael Mares. I'm a staff attorney at the Conservation Law Foundation and, while I will try to be brief, I learned in law school never to promise that. I'd like to start by thanking MassDOT for getting us to this crucial stage in the environmental review process. I don't want to lose track of the fact that this is a major milestone, and we appreciate that. And I also don't want to lose track of the fact that this is a great project that will provide

I-001-065

The conceptual track, system, and bridge designs presented in DEIR/EA Section 3.7 will be refined in the preliminary engineering phase of the Project. The process for coordinating with local communities during Project design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.



Green Line Extension - Public Hearing Page 89

huge environmental benefits, huge benefits to the residents of Medford, Somerville, and Cambridge and others, and that, if done right, has the potential to achieve all its environmental justice and smart growth and economic development goals.

I-001-066

I want to talk about the maintenance facility in a way that has only been briefly talked about in just a finer point, which is that the information about the additional analysis needs to be released as soon as possible to give people the opportunity to comment on that. And the only time that we've heard when it will be released was tonight, and I think you said it was going to be before Christmas, and I really do appreciate the extension to January eighth. I'm afraid that that might be too little time for people to fully comment on it.

MS. KATHERINE FICHTER: I should kind of spare his time. I'll be good, I promise. Just to clarify, I promise I'll be good. Our intention is to release the information to the public somewhere in the first two weeks of December, I believe, and to try to have a meeting the week after; but we fully plan to give thirty days between the release of the information and the end of the comment period, which would be a normal comment period, in order to -- for exactly that reason, to allow people enough time to comment.

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-066

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

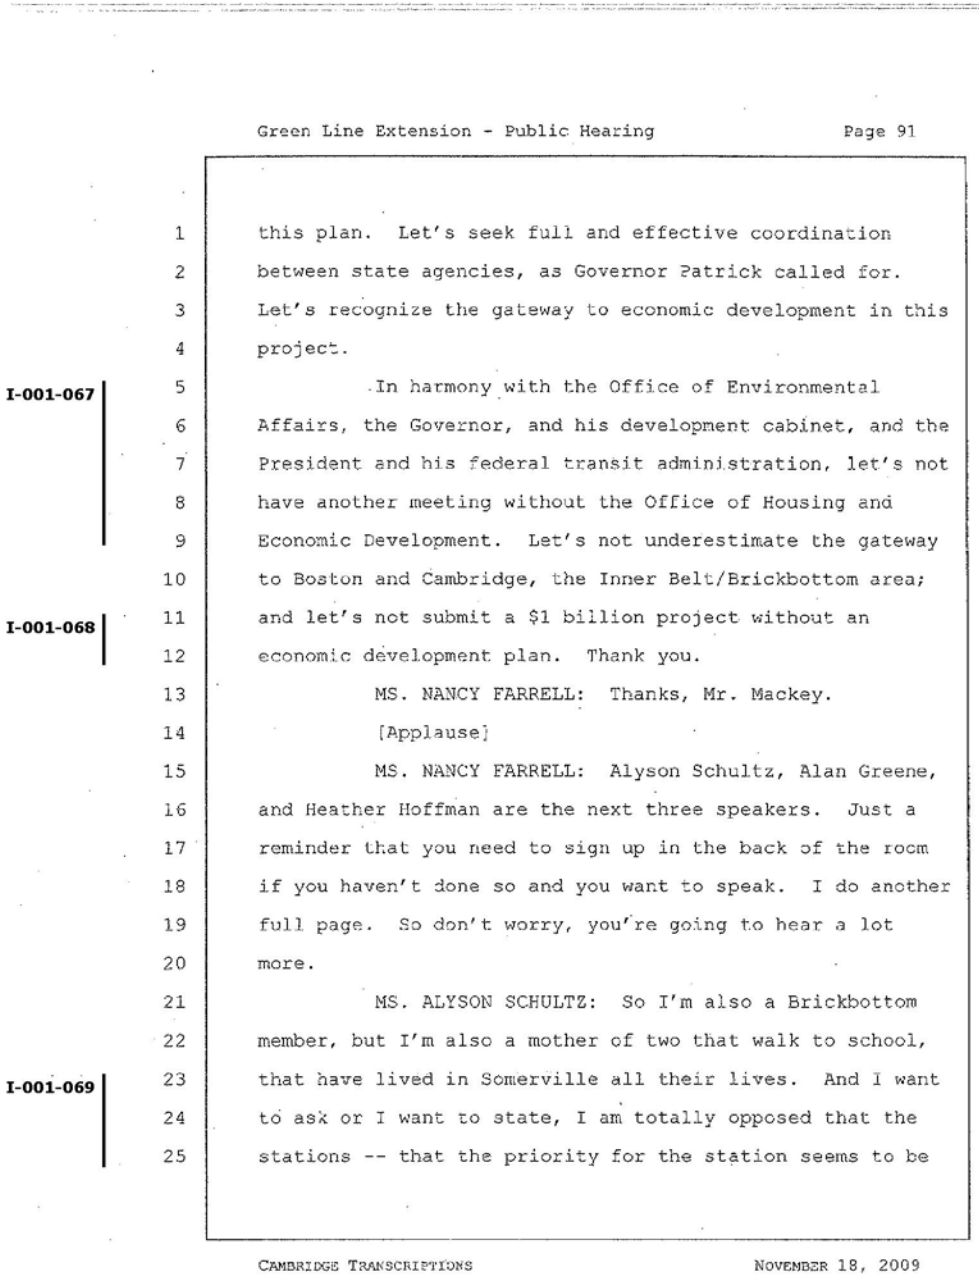
Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

MR. RAFAEL MARES: Great, I appreciate because you can obviously see that is the hot button issue that we have here. All right. Thank you very much.

MS. NANCY FARRELL: Thank you. Steve Mackey?

MR. STEVEN MACKEY: Good evening. Thank you. My name is Steven Mackey. I work for the Somerville Chamber of Commerce, a local membership association of 320 small business and enterprises, of which we count Brickbottom Artists Association as one. In 2006, the Massachusetts Secretary of Environmental Affairs required that transit-oriented development and land use be addressed in the plan for the Green Line Extension. A year later, in 2007, Governor Patrick established a cabinet department to promote economic development through, among other means, transit-oriented development and smart growth, stating, "The key to the Commonwealth's economic success is the full and effective coordination between state agencies."

Last week, President Obama's appointee Ray LaHood, the U.S. Secretary of Transportation, said, "We see transportation as a gateway to economic development and a better quality of life. To put that into action, DOT will listen more carefully to the state, regional, and community priorities." And added, "The kinds of priorities that small businesses help shape." In harmony with these leaders, let's really address development and land use in



Green Line Extension - Public Hearing Page 91

this plan. Let's seek full and effective coordination between state agencies, as Governor Patrick called for. Let's recognize the gateway to economic development in this project.

I-001-067

In harmony with the Office of Environmental Affairs, the Governor, and his development cabinet, and the President and his federal transit administration, let's not have another meeting without the Office of Housing and Economic Development. Let's not underestimate the gateway to Boston and Cambridge, the Inner Belt/Brickbottom area; and let's not submit a $1 billion project without an economic development plan. Thank you.

I-001-068

MS. NANCY FARRELL: Thanks, Mr. Mackey.

[Applause]

MS. NANCY FARRELL: Alyson Schultz, Alan Greene, and Heather Hoffman are the next three speakers. Just a reminder that you need to sign up in the back of the room if you haven't done so and you want to speak. I do another full page. So don't worry, you're going to hear a lot more.

MS. ALYSON SCHULTZ: So I'm also a Brickbottom member, but I'm also a mother of two that walk to school, that have lived in Somerville all their lives. And I want to ask or I want to state, I am totally opposed that the stations -- that the priority for the station seems to be

I-001-069

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-067

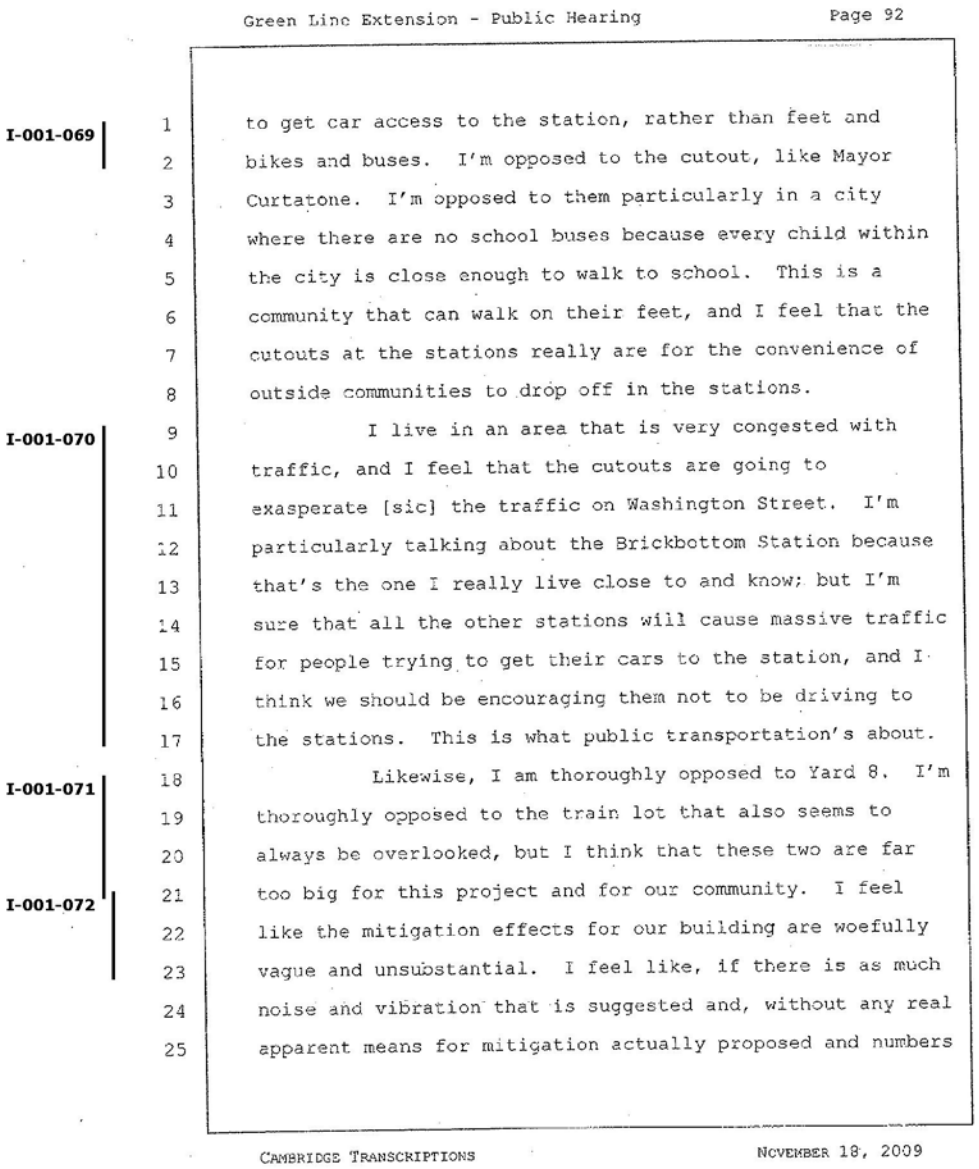
MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses. This will help ensure compliance with legal requirements and, to the extent feasible, consistency with planning and other projects.

I-001-068

Anticipated indirect and cumulative effects of the Project, including impacts on corridor transportation and traffic, growth, property values, land use, transit-oriented and economic development are described in DEIR/EA Section 5.15, Indirect and Cumulative Effects. As stated in FEIR Section 6.4, MassDOT and the MBTA will conduct a series of public workshops to gather input on land use and facility design issues from the communities. These workshops will offer an opportunity to discuss how facility design can influence indirect and cumulative effects. The stations have been designed to meet MBTA standards, as well as to be ADA-compliant.

I-001-069

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. These stations are designed to be consistent with MBTA standards and compliant with ADA. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.



Green Line Extension - Public Hearing Page 92

I-001-069 to get car access to the station, rather than feet and bikes and buses. I'm opposed to the cutout, like Mayor Curtatone. I'm opposed to them particularly in a city where there are no school buses because every child within the city is close enough to walk to school. This is a community that can walk on their feet, and I feel that the cutouts at the stations really are for the convenience of outside communities to drop off in the stations.

I-001-070 I live in an area that is very congested with traffic, and I feel that the cutouts are going to exasperate [sic] the traffic on Washington Street. I'm particularly talking about the Brickbottom Station because that's the one I really live close to and know; but I'm sure that all the other stations will cause massive traffic for people trying to get their cars to the station, and I think we should be encouraging them not to be driving to the stations. This is what public transportation's about.

I-001-071 Likewise, I am thoroughly opposed to Yard 8. I'm thoroughly opposed to the train lot that also seems to always be overlooked, but I think that these two are far too big for this project and for our community. I feel

I-001-072 like the mitigation effects for our building are woefully vague and unsubstantial. I feel like, if there is as much noise and vibration that is suggested and, without any real apparent means for mitigation actually proposed and numbers

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-070

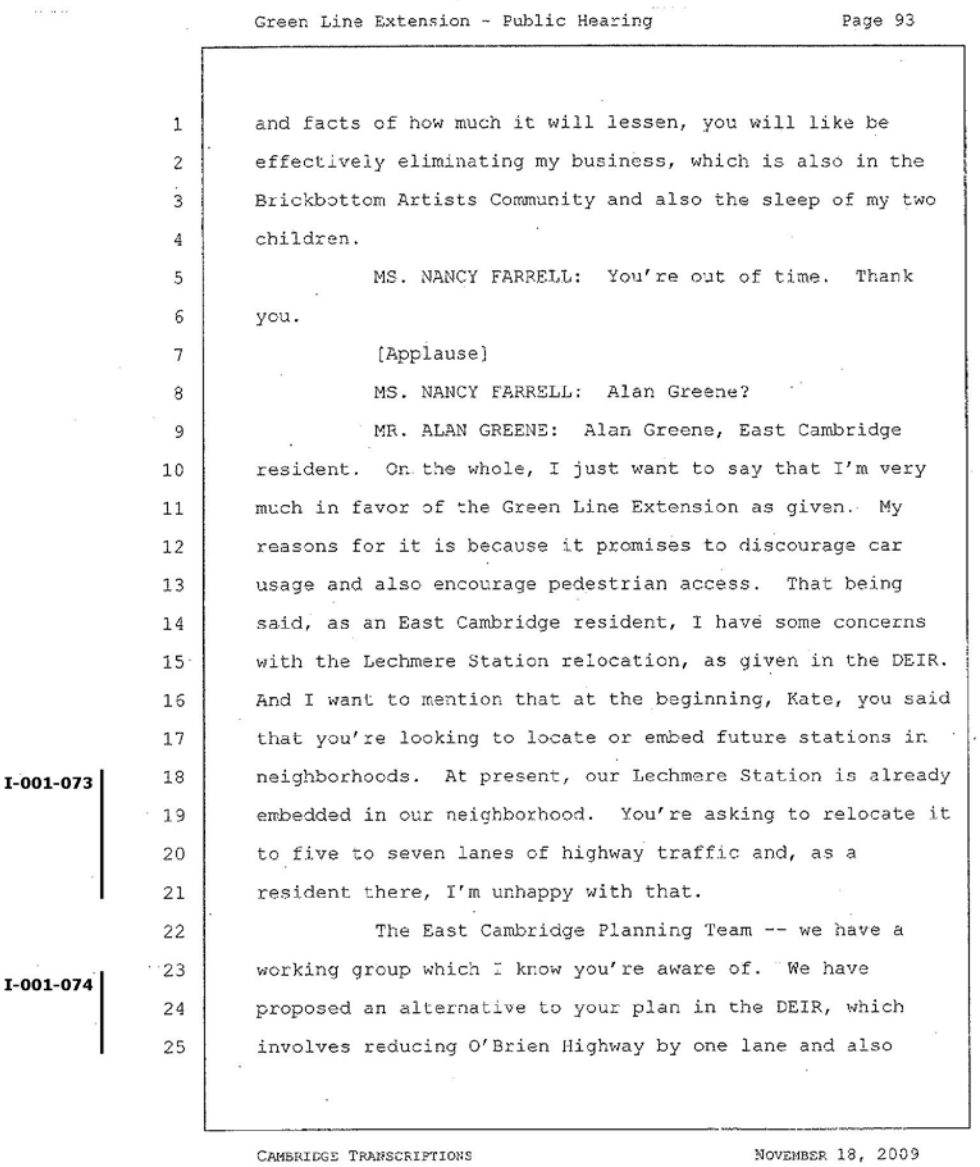
The Project is intended, in part, to relieve traffic congestion, as described in DEIR/EA Chapter 2, Purpose and Need. Some station access points for passenger drop-off/pick-up are likely to impact local traffic flow, as outlined in DEIR/EA Section 5.5, Traffic. As described in DEIR/EA Chapter 6, these impacts will be minimized to the extent practical. However, with the exception of relocated Lechmere Station, no parking is provided at any of the new Green Line Extension stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes how MassDOT will coordinate with municipalities and stakeholders to address traffic and parking concerns. Additionally, FEIR Chapter 4 summarizes the impacts of College Avenue as a terminal station.

I-001-071

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-001-072

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.



Green Line Extension - Public Hearing Page 93

and facts of how much it will lessen, you will like be effectively eliminating my business, which is also in the Brickbottom Artists Community and also the sleep of my two children.

MS. NANCY FARRELL: You're out of time. Thank you.

[Applause]

MS. NANCY FARRELL: Alan Greene?

MR. ALAN GREENE: Alan Greene, East Cambridge resident. On the whole, I just want to say that I'm very much in favor of the Green Line Extension as given. My reasons for it is because it promises to discourage car usage and also encourage pedestrian access. That being said, as an East Cambridge resident, I have some concerns with the Lechmere Station relocation, as given in the DEIR. And I want to mention that at the beginning, Kate, you said that you're looking to locate or embed future stations in neighborhoods. At present, our Lechmere Station is already embedded in our neighborhood. You're asking to relocate it to five to seven lanes of highway traffic and, as a resident there, I'm unhappy with that.

The East Cambridge Planning Team -- we have a working group which I know you're aware of. We have proposed an alternative to your plan in the DEIR, which involves reducing O'Brien Highway by one lane and also

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-073

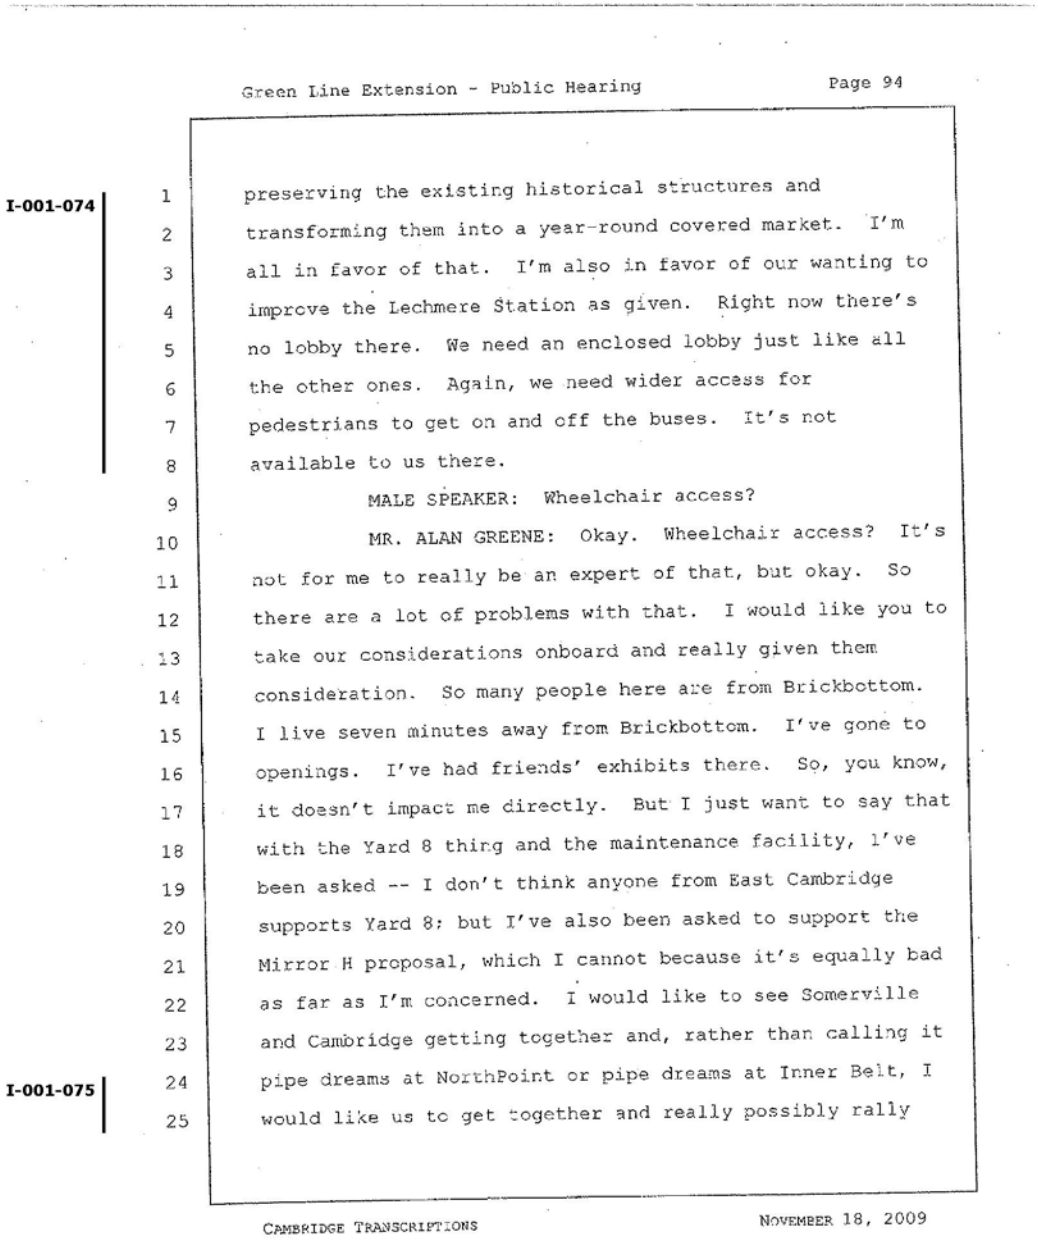
I-001-074

I-001-073

Revised conceptual plans for Lechmere Station, including modifications to the station headhouse and entrances, enclosed automatic fare collection, and other amenities are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-001-074

Please see response to Comment I-001-073.



Green Line Extension - Public Hearing Page 94

I-001-074

preserving the existing historical structures and transforming them into a year-round covered market. I'm all in favor of that. I'm also in favor of our wanting to improve the Lechmere Station as given. Right now there's no lobby there. We need an enclosed lobby just like all the other ones. Again, we need wider access for pedestrians to get on and off the buses. It's not available to us there.

MALE SPEAKER: Wheelchair access?

MR. ALAN GREENE: Okay. Wheelchair access? It's not for me to really be an expert of that, but okay. So there are a lot of problems with that. I would like you to take our considerations onboard and really given them consideration. So many people here are from Brickbottom. I live seven minutes away from Brickbottom. I've gone to openings. I've had friends' exhibits there. So, you know, it doesn't impact me directly. But I just want to say that with the Yard 8 thing and the maintenance facility, I've been asked -- I don't think anyone from East Cambridge supports Yard 8; but I've also been asked to support the Mirror H proposal, which I cannot because it's equally bad as far as I'm concerned. I would like to see Somerville and Cambridge getting together and, rather than calling it

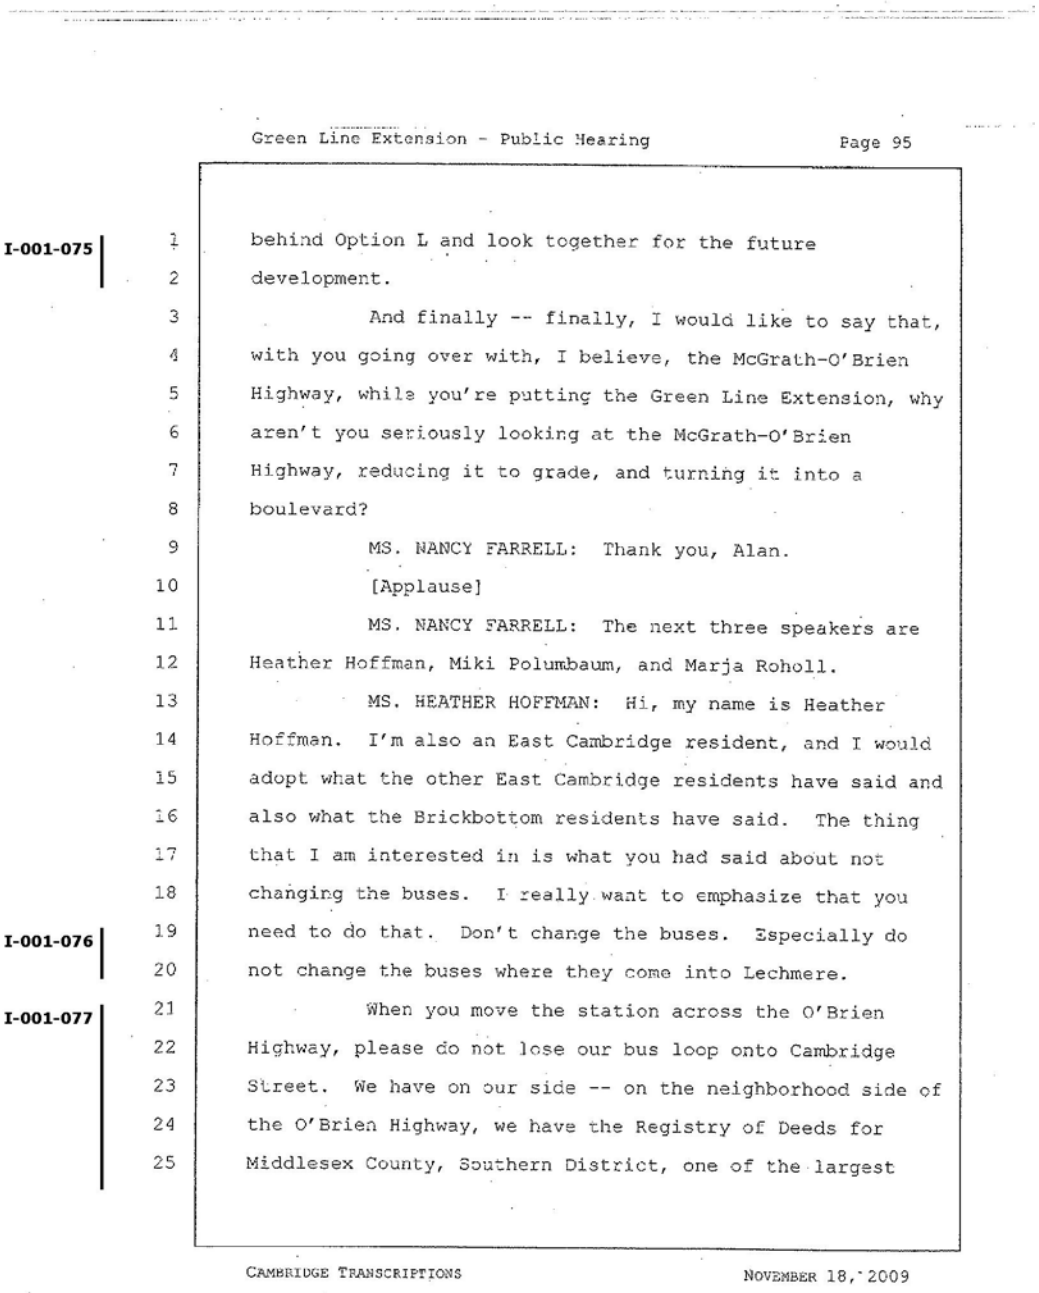
I-001-075

pipe dreams at NorthPoint or pipe dreams at Inner Belt, I would like us to get together and really possibly rally

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-075

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, Option L is identified as the preferred maintenance facility site.



Green Line Extension - Public Hearing Page 95

I-001-075

behind Option L and look together for the future development.

And finally -- finally, I would like to say that, with you going over with, I believe, the McGrath-O'Brien Highway, while you're putting the Green Line Extension, why aren't you seriously looking at the McGrath-O'Brien Highway, reducing it to grade, and turning it into a boulevard?

MS. NANCY FARRELL: Thank you, Alan.

[Applause]

MS. NANCY FARRELL: The next three speakers are Heather Hoffman, Miki Polumbaum, and Marja Roholl.

MS. HEATHER HOFFMAN: Hi, my name is Heather Hoffman. I'm also an East Cambridge resident, and I would adopt what the other East Cambridge residents have said and also what the Brickbottom residents have said. The thing that I am interested in is what you had said about not changing the buses. I really want to emphasize that you need to do that. Don't change the buses. Especially do not change the buses where they come into Lechmere.

I-001-076

I-001-077

When you move the station across the O'Brien Highway, please do not lose our bus loop onto Cambridge Street. We have on our side -- on the neighborhood side of the O'Brien Highway, we have the Registry of Deeds for Middlesex County, Southern District, one of the largest

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-076

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-001-077

Revised conceptual plans for Lechmere Station, including bus facilities and bus waiting areas, are included in FEIR Chapter 5, Lechmere Station. Routes 80, 87 and 88 are expected to enter the station directly from O'Brien Highway via Water Street and not travel to Cambridge Street. The path for Route 69 can remain on Cambridge Street in East Cambridge, with inbound service along North First Street, O'Brian Highway, and Water Street.

I-001-077

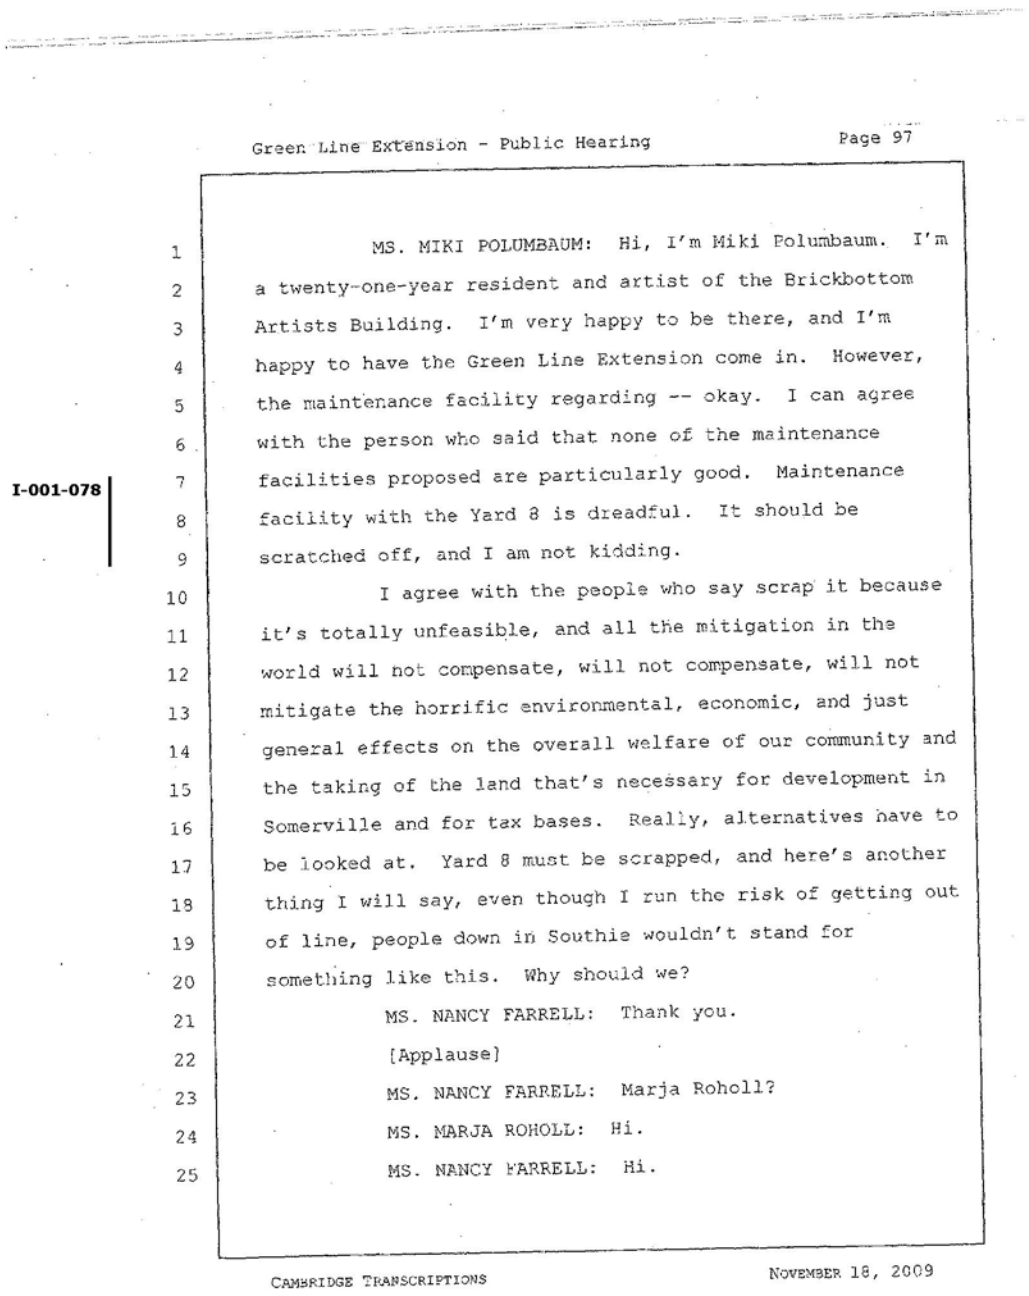
registries of deeds in the country. We have the Middlesex County Probate Court where tons of people come for divorces, for dealing with estates, conservatorships, adoptions, all kinds of things. We have the Cambridge Galleria Mall. All of these things would -- it would be silly to have all of these users have to cross the O'Brien Highway if they're coming by bus. So please do not lose that really important access for our neighborhood.

I would also like to suggest that, in keeping with the idea of access by the buses, that you have the stop at Third and Cambridge Street and the stop at First and Cambridge Streets be available for people to get on for free to get across the O'Brien Highway to the new station. I don't think that this would set a bad precedent. I can't think of anywhere else in the MBTA system that you're likely to have something like this, where you're moving a station from a neighborhood across a multi-lane highway. That way, even though there will still be plenty of need to mitigate the conditions for pedestrians crossing the highway, that's one way that you can make it a whole lot safer for people. Thank you.

MS. NANCY FARRELL: Thank you.

[Applause]

MS. NANCY FARRELL: Miki? Sorry I murdered your name there.



Green Line Extension - Public Hearing Page 97

MS. MIKI POLUMBAUM: Hi, I'm Miki Polumbaum. I'm a twenty-one-year resident and artist of the Brickbottom Artists Building. I'm very happy to be there, and I'm happy to have the Green Line Extension come in. However, the maintenance facility regarding -- okay. I can agree with the person who said that none of the maintenance facilities proposed are particularly good. Maintenance facility with the Yard 8 is dreadful. It should be scratched off, and I am not kidding.

I-001-078

I agree with the people who say scrap it because it's totally unfeasible, and all the mitigation in the world will not compensate, will not compensate, will not mitigate the horrific environmental, economic, and just general effects on the overall welfare of our community and the taking of the land that's necessary for development in Somerville and for tax bases. Really, alternatives have to be looked at. Yard 8 must be scrapped, and here's another thing I will say, even though I run the risk of getting out of line, people down in Southie wouldn't stand for something like this. Why should we?

MS. NANCY FARRELL: Thank you.

[Applause]

MS. NANCY FARRELL: Marja Roholl?

MS. MARJA ROHOLL: Hi.

MS. NANCY FARRELL: Hi.

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-078

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

MS. MARJA ROHOLL: My name is Marja Roholl, also another resident from Brickbottom, and I thank you for including Mirror Scheme H and Option L as alternative sites for the maintenance facility and the storage yard. As you know, Mirror H Scheme has a strong preference of the City of Somerville, the Brickbottom residents, and other stakeholders, for reasons that have been expressed already by other speakers.

My concern -- and it's also being mentioned and that's probably happening why you're a little bit one of the later speakers -- is the decision process by itself. It seems to me that the process is being rushed where it comes to the alternative sites. A complete analysis of the alternative sites has not yet been made public for input and discussions, although being promised to be released a couple of weeks ago, and yet we are supposed to give our inputs before January eighth, maybe now January fifteenth, but still that is a really short period.

I mean, thirty days that's what you're referring to, and that's including the Christmas period, is a really very short time to respond where people jobs and their own businesses to do, and it took you apparently years to work it out to come up with the analysis. So I think that a little bit more time would reflect that you are really serious about taking the alternatives into considerations

I-001-079

I-001-079

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, Option L is identified as the preferred maintenance facility site.

I-001-080

because the lifelong implications of the choices that are going to be made for the many people in Brickbottom and the future of Somerville's economy are too serious to be treated as afterthoughts. Please take the time to discuss with the communities the benefits of Mirror Plan H and Option L. Thank you.

MS. NANCY FARRELL: Thank you.

[Applause]

MS. NANCY FARRELL: The next three speakers are Pauline Lim, Ellen Band, and Elisabeth Bayle.

MS. PAULINE LIM: Hi, I'm Pauline Lim, and I'm an artist and I live at Brickbottom, and I've been there since 1989. I'm also a bicycle commuter. I go every day through NorthPoint, and it's a wonderful commute because it's absolutely deserted. It's my playground because there are no residents. I practice rollerblading there and feel free to fall down and not feel like anyone's going to run over me because it's like a ghost town. I also run across the Charlestown Bridge, and I look down and see the giant, huge wasteland where there could be many other maintenance facilities, rather than the one right outside people's bedroom windows.

I also, because I'm an MGH resident, I sometimes look at the window and say, "Oh, MGH Somerville is right there," and I wish I could work there because it would be

I-001-080

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

like a two-minute commute, except for that there's this impassable railroad track right in the way. And I used to say, "Oh, it'd be so easy to go to the grocery store, it's right there," but there's this other railroad track, and it makes you have to go many miles out of your way to get somewhere that you can see, you could throw a stone to.

Yard 8, everybody says it, I wrote letters. They acted like, "Oh, no, Yard 8 is the only way, sorry." I got these letters back. They never said that there was an alternative, and now they're saying there's an alternative. So who's the rich person who has all the influence, and why don't they listen to all these people? Are we just too small? I mean, there's enough of us, but I guess we're just not very powerful. What's up? That's terrible.

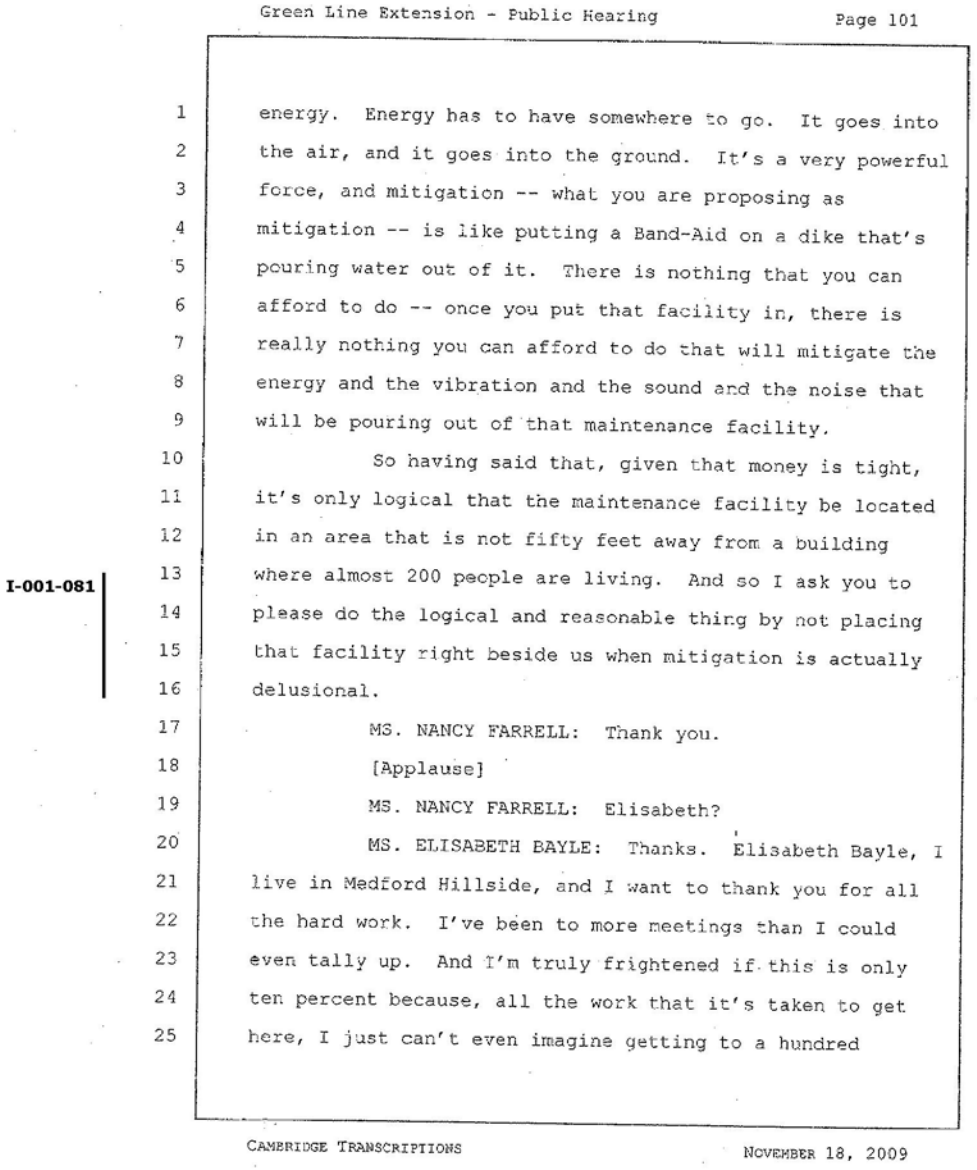
MS. NANCY FARRELL: Thank you.

[Applause]

MS. NANCY FARRELL: Ellen Band, Elisabeth Bayle.

MS. ELLEN BAND: Hi, I'm Ellen Band. I also live at Brickbottom, and I want to say, first, that I am a lifelong urban dweller and very much in favor of public transit. I'm also a composer, a musician, and a sound artist, and I have worked my whole life with sound and vibration. So I want to address the issue of mitigation in Yard 8. I am completely opposed to Yard 8.

Sound, noise, and vibration are all forms of



Green Line Extension - Public Hearing Page 101

energy. Energy has to have somewhere to go. It goes into the air, and it goes into the ground. It's a very powerful force, and mitigation -- what you are proposing as mitigation -- is like putting a Band-Aid on a dike that's pouring water out of it. There is nothing that you can afford to do -- once you put that facility in, there is really nothing you can afford to do that will mitigate the energy and the vibration and the sound and the noise that will be pouring out of that maintenance facility.

So having said that, given that money is tight, it's only logical that the maintenance facility be located in an area that is not fifty feet away from a building where almost 200 people are living. And so I ask you to please do the logical and reasonable thing by not placing that facility right beside us when mitigation is actually delusional.

I-001-081

MS. NANCY FARRELL: Thank you.

[Applause]

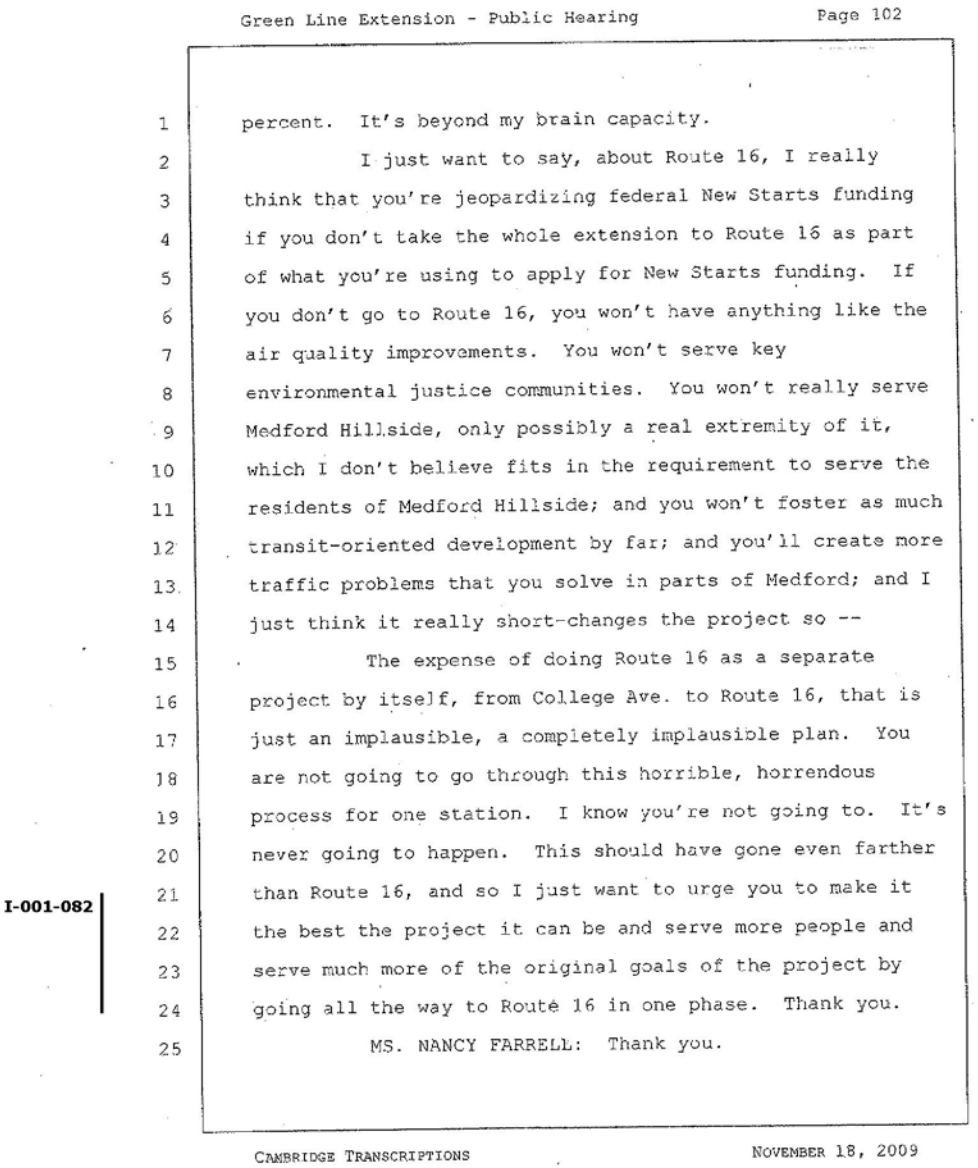
MS. NANCY FARRELL: Elisabeth?

MS. ELISABETH BAYLE: Thanks. Elisabeth Bayle, I live in Medford Hillside, and I want to thank you for all the hard work. I've been to more meetings than I could even tally up. And I'm truly frightened if this is only ten percent because, all the work that it's taken to get here, I just can't even imagine getting to a hundred

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-081

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.



Green Line Extension - Public Hearing Page 102

percent. It's beyond my brain capacity.

I just want to say, about Route 16, I really think that you're jeopardizing federal New Starts funding if you don't take the whole extension to Route 16 as part of what you're using to apply for New Starts funding. If you don't go to Route 16, you won't have anything like the air quality improvements. You won't serve key environmental justice communities. You won't really serve Medford Hillside, only possibly a real extremity of it, which I don't believe fits in the requirement to serve the residents of Medford Hillside; and you won't foster as much transit-oriented development by far; and you'll create more traffic problems that you solve in parts of Medford; and I just think it really short-changes the project so --

The expense of doing Route 16 as a separate project by itself, from College Ave. to Route 16, that is just an implausible, a completely implausible plan. You are not going to go through this horrible, horrendous process for one station. I know you're not going to. It's never going to happen. This should have gone even farther than Route 16, and so I just want to urge you to make it the best the project it can be and serve more people and serve much more of the original goals of the project by going all the way to Route 16 in one phase. Thank you.

MS. NANCY FARRELL: Thank you.

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-082

I-001-082

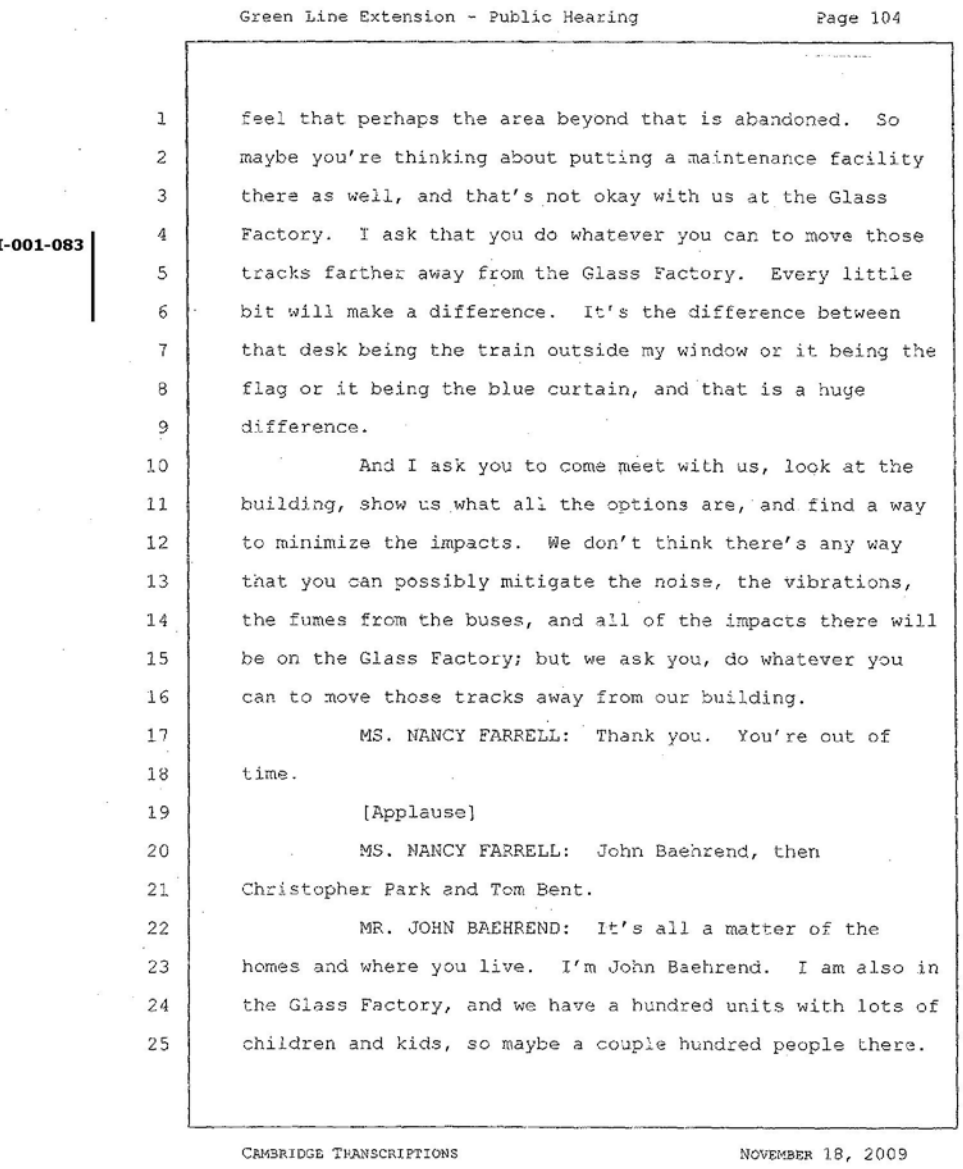
Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

[Applause]

MS. NANCY FARRELL: The next three speakers are Ivy Turner, John Baehrend, and Christopher Park.

MS. IVY TURNER: Hi, I'm Ivy Turner, Glass Factory resident. We actually exist. NorthPoint exists, we live there. I'm also the organizer of the newly formed Glass Factor Action Committee. We are one of the most severely impacted buildings by this project. First, we will have tracks running the entire length of our building, coming down what used to be our green space, which is a narrow space -- so narrow that, from my window, I can almost reach out and touch the tracks. I'm at the corner closest to the tracks, possibly as close as that desk. I don't know exactly how close because nowhere you do state what the height or the distance will be. When you came and met with us, we couldn't get that information. We still don't have it. So we don't know exactly how bad it will be or if you'll completely cut off the light to the entire second floor of the building, or will it be the third floor or both floors or exactly what it will be.

Beyond that, we get to look out at 250 parking spaces. I don't really understand that. And we also get buses and fumes. If we look to the right though, we get to see what is possibly the ugliest station design I have ever seen. So it just goes from bad to worse, and now people



Green Line Extension - Public Hearing Page 104

I-001-083

feel that perhaps the area beyond that is abandoned. So maybe you're thinking about putting a maintenance facility there as well, and that's not okay with us at the Glass Factory. I ask that you do whatever you can to move those tracks farther away from the Glass Factory. Every little bit will make a difference. It's the difference between that desk being the train outside my window or it being the flag or it being the blue curtain, and that is a huge difference.

And I ask you to come meet with us, look at the building, show us what all the options are, and find a way to minimize the impacts. We don't think there's any way that you can possibly mitigate the noise, the vibrations, the fumes from the buses, and all of the impacts there will be on the Glass Factory; but we ask you, do whatever you can to move those tracks away from our building.

MS. NANCY FARRELL: Thank you. You're out of time.

[Applause]

MS. NANCY FARRELL: John Baehrend, then Christopher Park and Tom Bent.

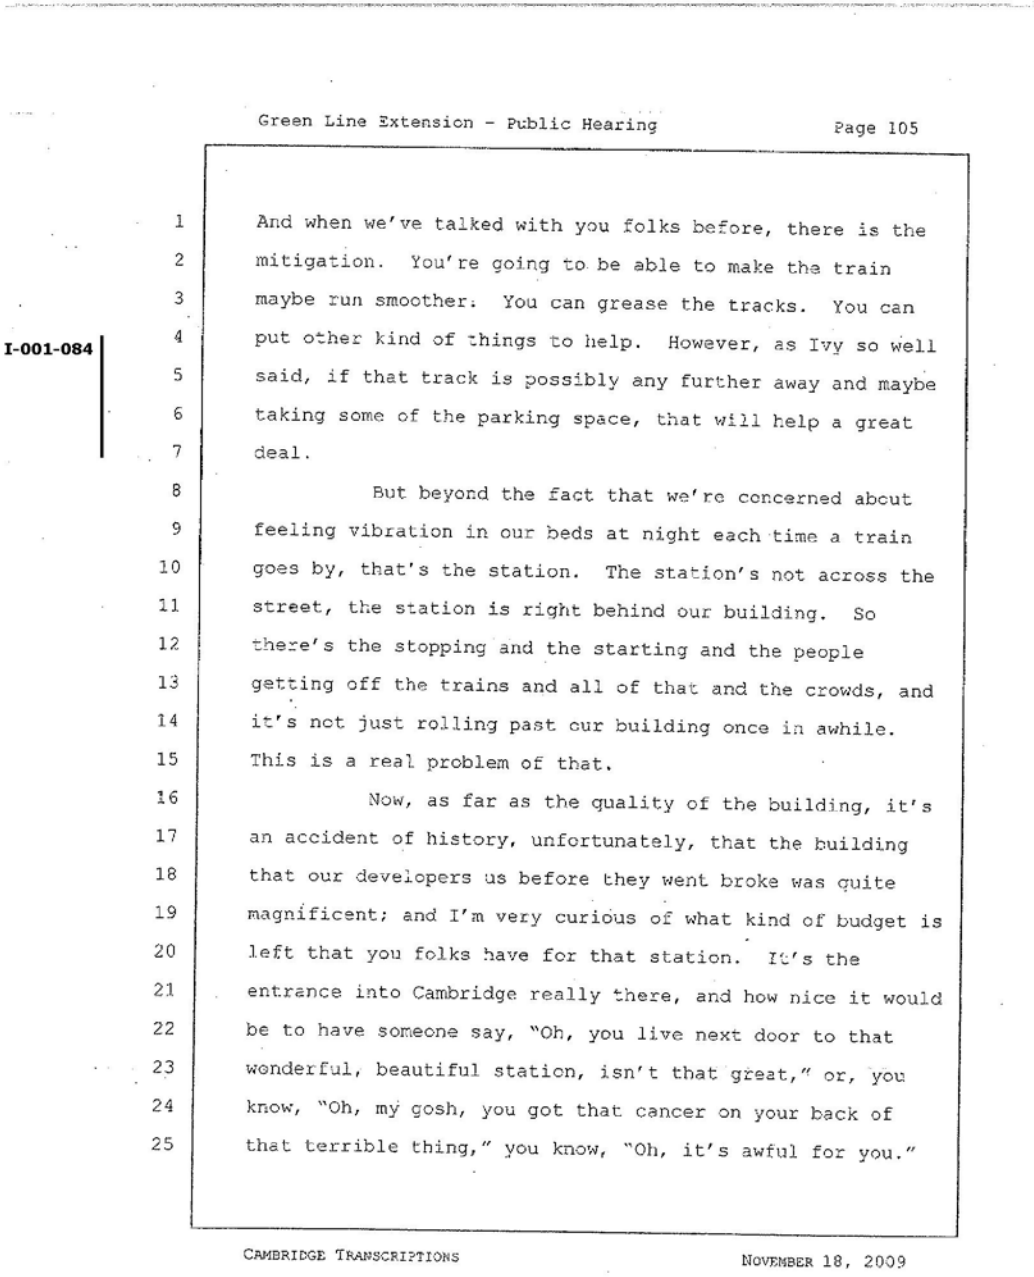
MR. JOHN BAEHREND: It's all a matter of the homes and where you live. I'm John Baehrend. I am also in the Glass Factory, and we have a hundred units with lots of children and kids, so maybe a couple hundred people there.

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-083

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.



Green Line Extension - Public Hearing Page 105

I-001-084

And when we've talked with you folks before, there is the mitigation. You're going to be able to make the train maybe run smoother. You can grease the tracks. You can put other kind of things to help. However, as Ivy so well said, if that track is possibly any further away and maybe taking some of the parking space, that will help a great deal.

But beyond the fact that we're concerned about feeling vibration in our beds at night each time a train goes by, that's the station. The station's not across the street, the station is right behind our building. So there's the stopping and the starting and the people getting off the trains and all of that and the crowds, and it's not just rolling past our building once in awhile. This is a real problem of that.

Now, as far as the quality of the building, it's an accident of history, unfortunately, that the building that our developers us before they went broke was quite magnificent; and I'm very curious of what kind of budget is left that you folks have for that station. It's the entrance into Cambridge really there, and how nice it would be to have someone say, "Oh, you live next door to that wonderful, beautiful station, isn't that great," or, you know, "Oh, my gosh, you got that cancer on your back of that terrible thing," you know, "Oh, it's awful for you."

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-084

FEIR Chapter 5 describes the revised conceptual plans for Lechmere Station, including station design, track alignment, bus routings, and other elements. Changes to the track alignment depicted in the DEIR/EA were evaluated, but could result in additional impacts on area abutters. Proposed mitigation measures for area abutters are also described in FEIR Chapter 5. During preliminary engineering, specific station design elements will be further developed.

And, of course, it's not just how we feel about it. We can't sell our units, and our life savings are in there. Retired folks and young people who are hoping to get a leg up are really, really hurting. A little bit of -- particularly, as Ivy said, being able to move that track back and to have something that we can be proud of. Have a competition like they did at the Charles MGH. Thank you very much.

MS. NANCY FARRELL: Thank you.

[Applause]

MS. NANCY FARRELL: Christopher Park, Tom Bent, and then Brian Sylvain.

MR. CHRISTOPHER PARK: Hello, Kate. My name is Christopher, a resident at the Glass Factory building, as well as a trustee there; and I recognize you, Kate, from several of our correspondences and many of the people who have attended here. What's new to me is the fact that, from what I understand, this will be the final draft of the DEIR, which I find a little bit displeasing simply because there are a number of things I find, unfortunately, incomplete.

The DEIR for the Glass Factory specifically states that we are assigned a "severe" noise impact from the project, and that's good. I like the fact that you recognize that, well, the trains are going to effectively

be about fifteen or twenty feet away from our building, but what they don't really address is the fact that the noise-absorbing walls that are outlined in the pages can't be actually installed on our property simply because the tracks are going to be close. So what you suggest or what the DEIR suggests is sound insulation and that is something that -- you know, unfortunately, they assigned an estimated budget, but I don't understand how you could possibly assign an estimated budget with only ten percent design of the actual station, as well as not knowing information about our building. So it's a little bit puzzling for me to really understand where this budget is coming from, whether it's accurate, how much will it be allocated and will, in fact, we actually receive this budget.

I-001-085

In addition, strangely enough, the report also lists that our building will have no projected vibration impact. I can't possibly see that being the truth simply because, again as Ivy and John stated, we're only a few meters from the tracks. So, again, I'm just wondering why this is the case and why there is no property-related vibration mitigation budget right now in the DEIR report. It's only the mitigations related to the track construction.

MS. NANCY FARRELL: Mr. Park, you're out of time.

MR. CHRISTOPHER PARK: Okay. And finally, just

I-001-085

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

one quick final point here, you know, we have 10,900 commuters to access Lechmere in 2030. It's by far the most commuters on a daily basis. Let's try to make this the best, beautiful station as we possibly can. The Lechmere station to us is what Yard 8 is to the Brickbottom. So let's try to keep that in mind. Thank you.

MS. NANCY FARRELL: Thank you.

[Applause]

MS. NANCY FARRELL: Tom Bent, Brian Sylvain, and Max Malaret.

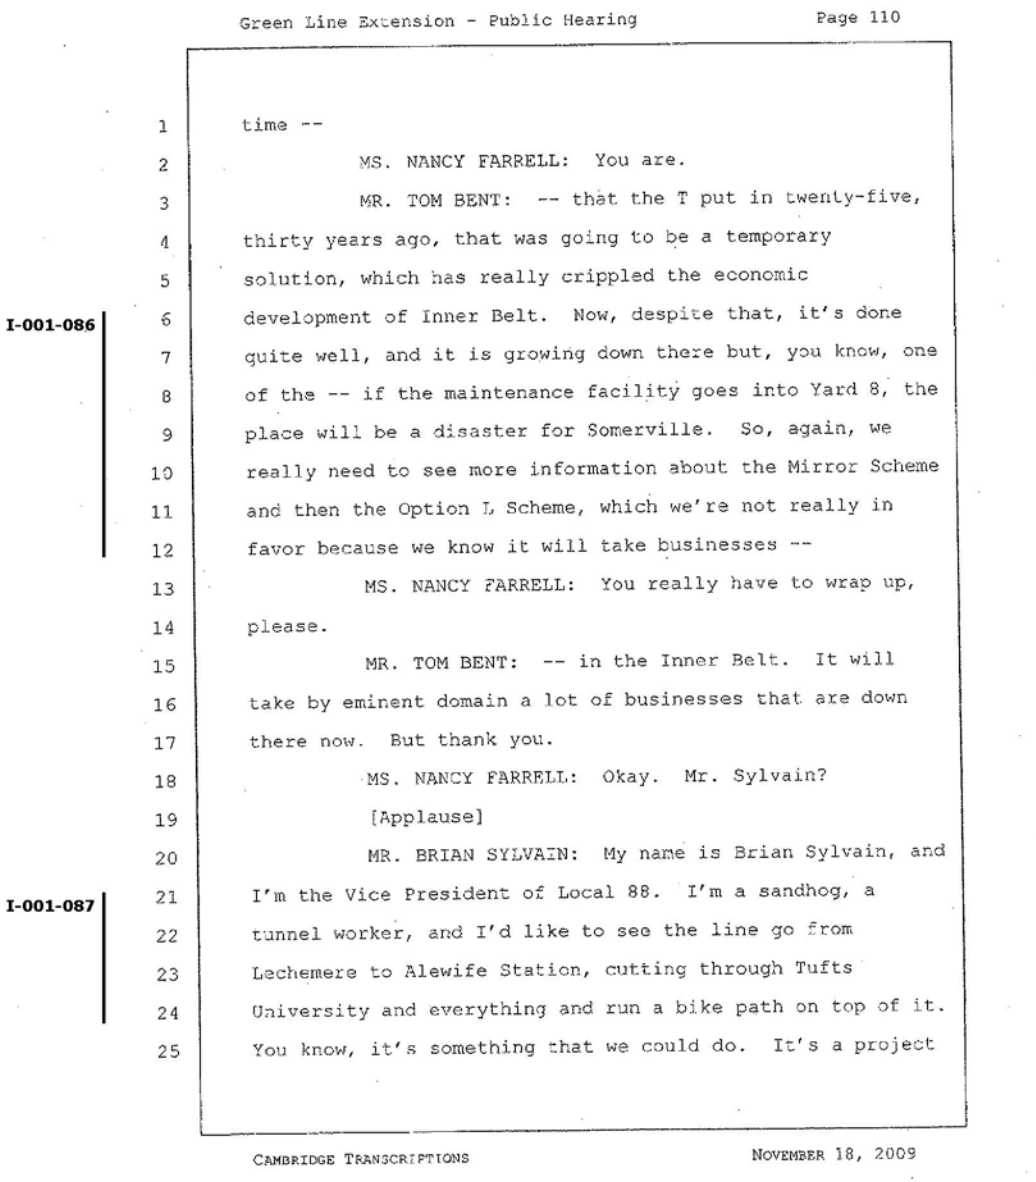
MR. TOM BENT: Hello. I wanted to thank you for tonight and for all the efforts that you put in. I'm involved in it somewhat. I'm Somerville's representative on the Boston Metropolitan Planning Organization. So I know what you're going through, and I appreciate, you know, all you've done to this point.

But my name is Tom Bent. I've lived in Somerville all my life, and my business is pretty close to ground zero down at the Inner Belt. And one of the things that struck me was, last night I was in another three-hour meeting, a citywide planning meeting, with a lot of residents in the city. And one of the themes that kept coming up over and over was the, you know, how do we get Somerville off being one of the highest recipients of state aid. And, you know, one of the conversations that we had

with some of the people at our table was that the reason why we're in this situation is because of what the state has done to us for the past hundred years, you know, with what they've done to us with 93, Route 28, you know, every commuter line that goes into Boston goes through Somerville but doesn't stop in Somerville. You know, we finally got a Red Line stop, but that was mainly because Arlington didn't want it which I'm sure they, you know, are sorry about now. So for a long time Somerville has taken the brunt of all the transportation decisions, good and bad, throughout the state.

We're also, as you know, the host of the Boston Engine Terminal, and so what we were looking at was, you know, what are the last frontiers of Somerville for economic development; and one is Assembly Square, which we thank the Governor and Congressman Capuano and Senator Kerry for stimulus money and for being behind the extension of the Orange Line station. But then comes Boynton Yards, which is down in Union Square which will be -- you know, hopefully, it'll be a plus with the spur going in. But we have the Inner Belt, which is one of the largest sections in Somerville, and what we're worried about down there is the loss of economic development, you know, obviously.

We have the issue with the temporary overpass that was put in, the tubes -- you know, I'm running out of



Green Line Extension - Public Hearing Page 110

time --

MS. NANCY FARRELL: You are.

MR. TOM BENT: -- that the T put in twenty-five, thirty years ago, that was going to be a temporary solution, which has really crippled the economic development of Inner Belt. Now, despite that, it's done quite well, and it is growing down there but, you know, one of the -- if the maintenance facility goes into Yard 8, the place will be a disaster for Somerville. So, again, we really need to see more information about the Mirror Scheme and then the Option L Scheme, which we're not really in favor because we know it will take businesses --

MS. NANCY FARRELL: You really have to wrap up, please.

MR. TOM BENT: -- in the Inner Belt. It will take by eminent domain a lot of businesses that are down there now. But thank you.

MS. NANCY FARRELL: Okay. Mr. Sylvain?

[Applause]

MR. BRIAN SYLVAIN: My name is Brian Sylvain, and I'm the Vice President of Local 88. I'm a sandhog, a tunnel worker, and I'd like to see the line go from Lechemere to Alewife Station, cutting through Tufts University and everything and run a bike path on top of it. You know, it's something that we could do. It's a project

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-086

I-001-087

I-001-086

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-001-087

Tunneling alternatives were evaluated but dismissed, as described in DEIR/EA Appendix B, Section 7.

that was on Southie last year. It was a two-mile tunnel. We did it in nine months. It's as dry as this room we're in. It's not -- we did very little on the big dig, just some of the dangerous stuff and some of the stuff that other people weren't qualified to do.

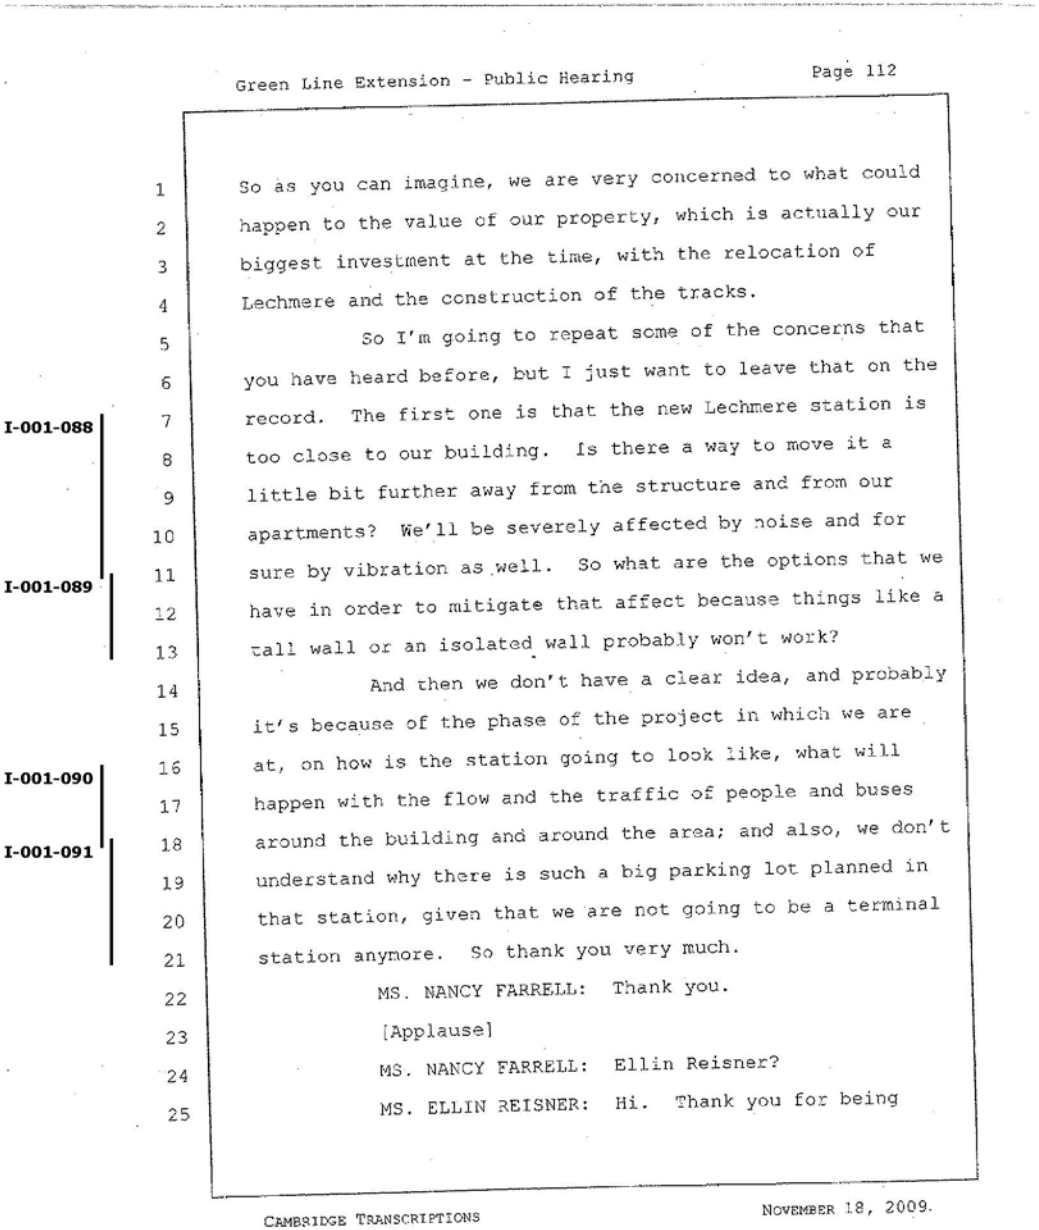
Currently, I work in East Boston, and I'm installing 48-inch short tunnel with a small tunnel boring machine; and it's a two-mile project, and we've got a mile done. We started in April. So I think that tunnel boring is the way to go. It's an electric powered device. There's no diesel, there's no excavators, there's no pile-driving. We also do caissons, and the gentleman that lives at the Brickbottom that was worried about the pile-driving, I think that you guys need to look at caissons. It's a drilled-shaft method with an auger. It's also what we do. We also do test boring, geotechnical work. So it's -- you know, let's do it right. That's all I have.

MS. NANCY FARRELL: Thank you, sir.

[Applause]

MS. NANCY FARRELL: The next three speakers are Max Malaret, Ellen Reisner, and Nicholas Watson.

MR. MAX MALARET: Good night. My name is Max Malaret. I'm a resident the Glass Factory building. I was renting until two months ago when my wife and I decided to buy an apartment there. We have a six-month-old daughter.



Green Line Extension - Public Hearing Page 112

So as you can imagine, we are very concerned to what could happen to the value of our property, which is actually our biggest investment at the time, with the relocation of Lechmere and the construction of the tracks.

So I'm going to repeat some of the concerns that you have heard before, but I just want to leave that on the record. The first one is that the new Lechmere station is too close to our building. Is there a way to move it a little bit further away from the structure and from our apartments? We'll be severely affected by noise and for sure by vibration as well. So what are the options that we have in order to mitigate that affect because things like a tall wall or an isolated wall probably won't work?

And then we don't have a clear idea, and probably it's because of the phase of the project in which we are at, on how is the station going to look like, what will happen with the flow and the traffic of people and buses around the building and around the area; and also, we don't understand why there is such a big parking lot planned in that station, given that we are not going to be a terminal station anymore. So thank you very much.

MS. NANCY FARRELL: Thank you.

[Applause]

MS. NANCY FARRELL: Ellin Reisner?

MS. ELLIN REISNER: Hi. Thank you for being

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009.

I-001-088

I-001-089

I-001-090

I-001-091

I-001-088

FEIR Chapter 5 describes the revised conceptual plans for Lechmere Station, including station design, track alignment, bus routings, and other elements. Changes to the track alignment depicted in the DEIR/EA were evaluated, but could result in additional impacts on area abutters. Proposed mitigation measures for area abutters are also described in FEIR Chapter 5. During preliminary engineering, specific station design elements will be further developed.

I-001-089

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-001-090

Revised conceptual plans for Lechmere Station, including modifications to the station headhouse and entrances, enclosed automatic fare collection, and other amenities are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-001-091

Please see response to Comment I-001-090.

here, and I want to commend you for all the hard work that's been done. We're very excited about the Green Line coming, but we are concerned about the many aspects of the environmental review. Now, I'm going to limit my comments because most of them I will put in writing. But what I want to really focus on, something that has only been talked about a little bit, is what the role of the community is going to be in the next phases.

I-001-092

As a member of the Advisory Committee, I think it's really, really important that we work with MassDOT to come up with a way to do the public involvement collaboratively so that we have an oversight group, as we've had, but also at the neighborhood level with the people who are going to be most impacted by the construction and also by the station designs. I really think it's important. I think someone mentioned the need to bring people in who have not been part of the process, who don't speak English. I would like to really work with MassDOT, and I know other members of STEP and the City really want to do this; and I think, if we can do that together, that would be great.

I-001-093

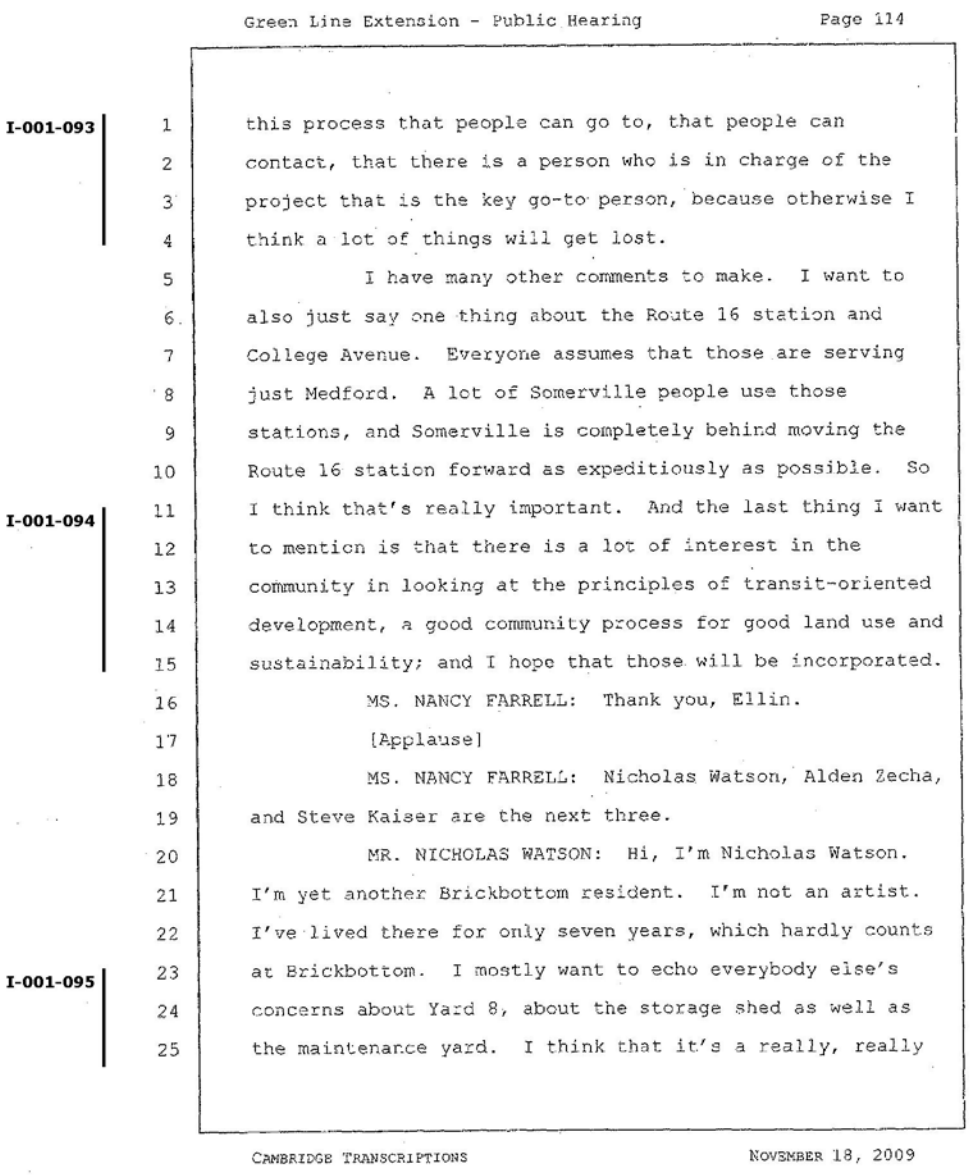
The other recommendation that I want to make is that, when they built the Red Line station in Davis Square, there was a field office for the MBTA there. And I think it's really going to be critical to have a field office in

I-001-092

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-001-093

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.



Green Line Extension - Public Hearing Page 114

this process that people can go to, that people can contact, that there is a person who is in charge of the project that is the key go-to person, because otherwise I think a lot of things will get lost.

I have many other comments to make. I want to also just say one thing about the Route 16 station and College Avenue. Everyone assumes that those are serving just Medford. A lot of Somerville people use those stations, and Somerville is completely behind moving the Route 16 station forward as expeditiously as possible. So I think that's really important. And the last thing I want to mention is that there is a lot of interest in the community in looking at the principles of transit-oriented development, a good community process for good land use and sustainability; and I hope that those will be incorporated.

MS. NANCY FARRELL: Thank you, Ellin.

[Applause]

MS. NANCY FARRELL: Nicholas Watson, Alden Zecha, and Steve Kaiser are the next three.

MR. NICHOLAS WATSON: Hi, I'm Nicholas Watson. I'm yet another Brickbottom resident. I'm not an artist. I've lived there for only seven years, which hardly counts at Brickbottom. I mostly want to echo everybody else's concerns about Yard 8, about the storage shed as well as the maintenance yard. I think that it's a really, really

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-094

Direct and indirect impacts to land use are described in DEIR/EA Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for sustainable land use, which could further reduce automobile traffic congestion and improve air quality.

I-001-095

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-001-095

bad idea from the point of view of the 220 people. One building, this is an environmental impact on 220 people.

But also, having only lived around where I do for seven years, I've watched the neighborhood go up. I've watched Union Square go up. When the Green Line was proposed, and I support it thoroughly, the idea that Union Square would be one of the great beneficiaries of this was very, very exciting to me. We're actually part of the Union Square community. We stand to benefit from that as well. If you just look at the map of the area, what the yard is -- it's a simply stupid idea. There's no way that it cuts -- it doesn't just cut off -- it cuts Union Square off from the whole of the east of Somerville as well. So I can't understand how this is being contemplated.

I think there's a problem of trust at this point in how we're going to move forward on this, but I think we have to move forward very, very slowly and consider things far more carefully. Thank you.

MS. NANCY FARRELL: Thank you.

[Applause]

MS. NANCY FARRELL: Alden Zecha?

MR. ALDEN ZECHA: Good evening. My name is Alden Zecha. I happen to be a resident at Brickbottom as well, but I'm actually here to speak more in a professional capacity. In my professional capacity, I operate a

consulting business that focus specifically on financial decision-making for large corporations. In that capacity, I'm extremely excited to see the Green Line moving forward because I think the economic development potential for expansion of public transport is incredible for this area, and it will benefit both Somerville, Medford, and communities well beyond that.

I was also extremely excited to see specific points that Kate brought up in her presentation earlier tonight, and I'd, in fact, like to quote and repeat some of those points in order to make sure that they're clearly understood by the audience as large as well as yourselves. Kate specifically cited a few items. One of the items she said was, one of the five major reasons that we are extending the Green Line is to "provide opportunities for economic development." In addition, she cited that one of the three bottom line points is that "financial considerations influence project decision-making." And then, finally, in a passing comment not actually on the screen, Kate happened to acknowledge that the Mirror Scheme H "does not block economic development," and implies through that that the Yard 8 decision or the Yard 8 location would block economic development, which I personally do happen to agree with from a financial perspective.

Keeping those three ideas in mind taken directly from Kate's presentation earlier tonight, as well as DOT's own stated analyses that they've published and are publicly available, that say that the Yard 8 location will cost more to the tune of somewhere between three and fifteen million dollars under current estimates and, with historic hindsight on most government transportation projects indicating that cost overruns are a factor, we should keep that in mind. I would advocate that financial considerations be taken into account in order to look at the decision as to where to site both the maintenance facility and the storage yard.

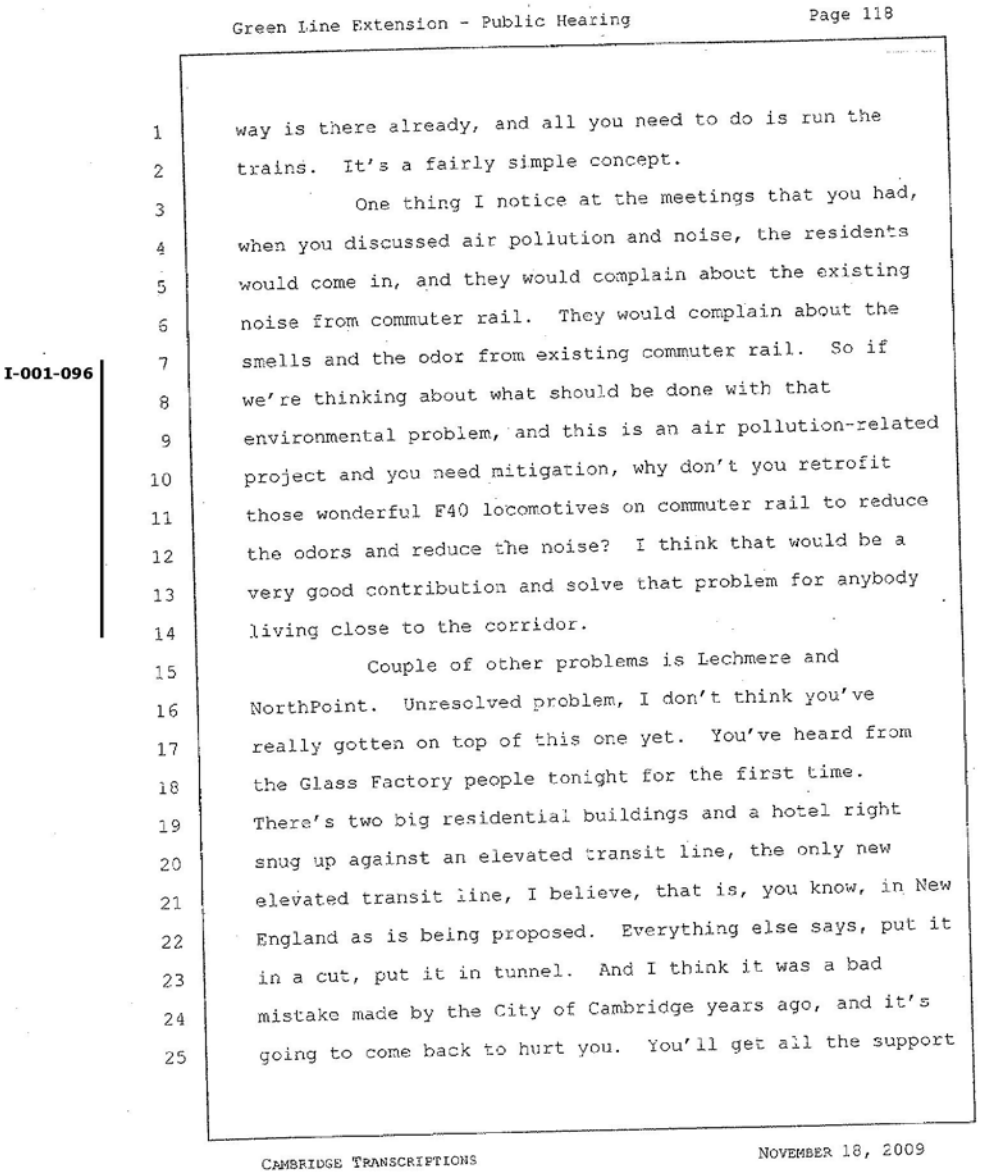
MS. NANCY FARRELL: You're out of time.

MR. ALDEN ZECHA: Thank you.

[Applause]

MS. NANCY FARRELL: Steve Kaiser, and the next two will be Wig Zamore and Cheryl Bakey.

MR. STEVE KAISER: My name is Steve Kaiser. I'm a resident of Cambridge, and I would like to say that, in concept, I support the Green Line Extension through Somerville. It's the only transit project I see that the state has that really makes sense. Things like the Urban Ring or the Silver Line tunnel or the Blue Line to Lynn make absolutely no sense at all. What you have in Somerville is the people are there already. The right of



Green Line Extension - Public Hearing Page 118

way is there already, and all you need to do is run the trains. It's a fairly simple concept.

One thing I notice at the meetings that you had, when you discussed air pollution and noise, the residents would come in, and they would complain about the existing noise from commuter rail. They would complain about the smells and the odor from existing commuter rail. So if we're thinking about what should be done with that environmental problem, and this is an air pollution-related project and you need mitigation, why don't you retrofit those wonderful F40 locomotives on commuter rail to reduce the odors and reduce the noise? I think that would be a very good contribution and solve that problem for anybody living close to the corridor.

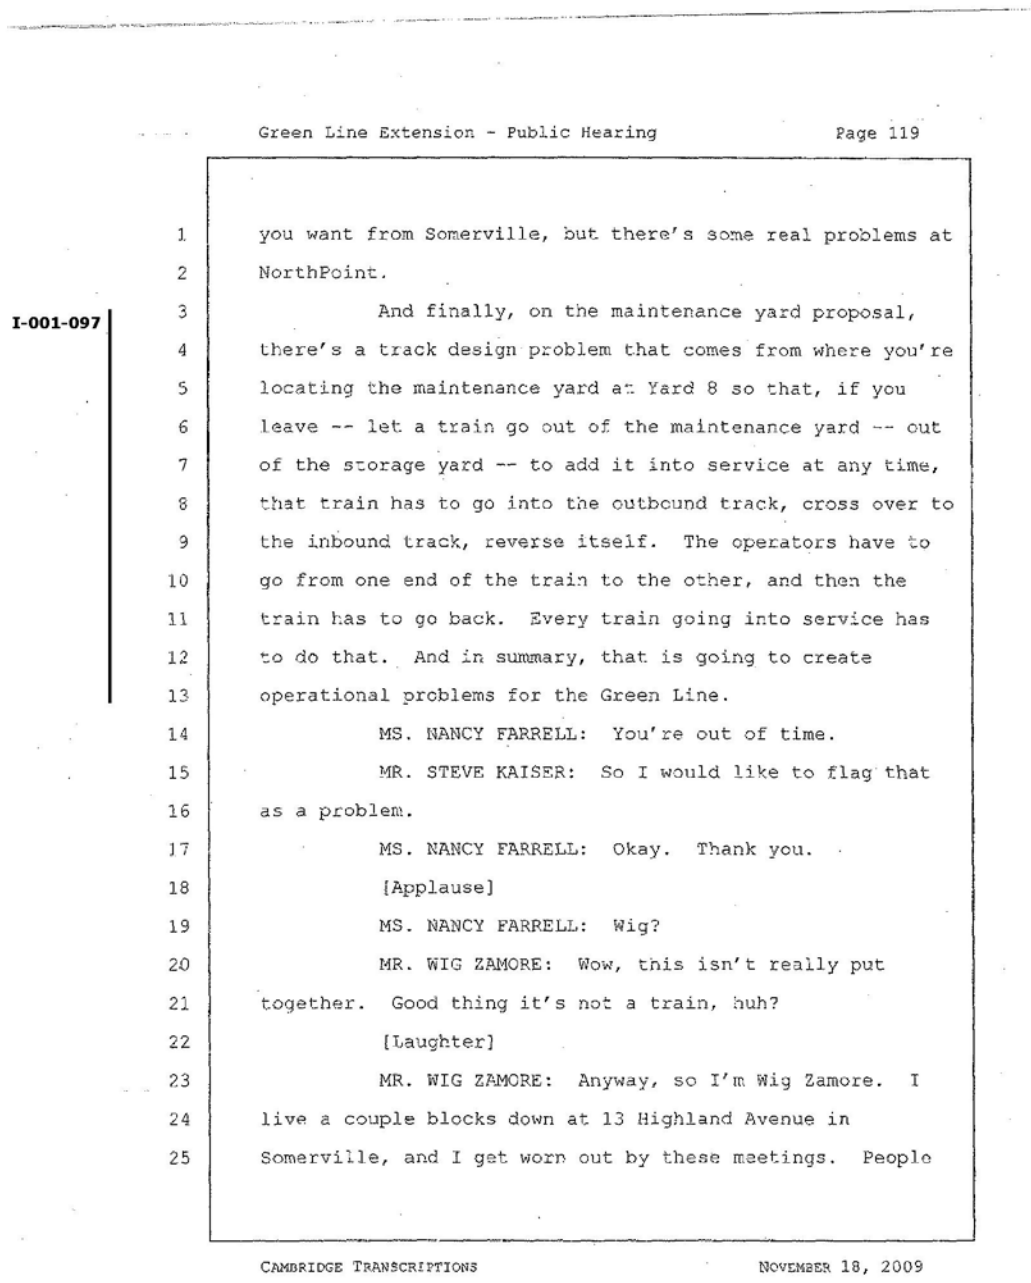
Couple of other problems is Lechmere and NorthPoint. Unresolved problem, I don't think you've really gotten on top of this one yet. You've heard from the Glass Factory people tonight for the first time. There's two big residential buildings and a hotel right snug up against an elevated transit line, the only new elevated transit line, I believe, that is, you know, in New England as is being proposed. Everything else says, put it in a cut, put it in tunnel. And I think it was a bad mistake made by the City of Cambridge years ago, and it's going to come back to hurt you. You'll get all the support

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-096

I-001-096

New federal ultra low sulfur diesel fuel standards will reduce the air pollution effects of diesel-powered trains, buses, and automobiles.



Green Line Extension - Public Hearing Page 119

you want from Somerville, but there's some real problems at NorthPoint.

I-001-097

And finally, on the maintenance yard proposal, there's a track design problem that comes from where you're locating the maintenance yard at Yard 8 so that, if you leave -- let a train go out of the maintenance yard -- out of the storage yard -- to add it into service at any time, that train has to go into the outbound track, cross over to the inbound track, reverse itself. The operators have to go from one end of the train to the other, and then the train has to go back. Every train going into service has to do that. And in summary, that is going to create operational problems for the Green Line.

MS. NANCY FARRELL: You're out of time.

MR. STEVE KAISER: So I would like to flag that as a problem.

MS. NANCY FARRELL: Okay. Thank you.

[Applause]

MS. NANCY FARRELL: Wig?

MR. WIG ZAMORE: Wow, this isn't really put together. Good thing it's not a train, huh?

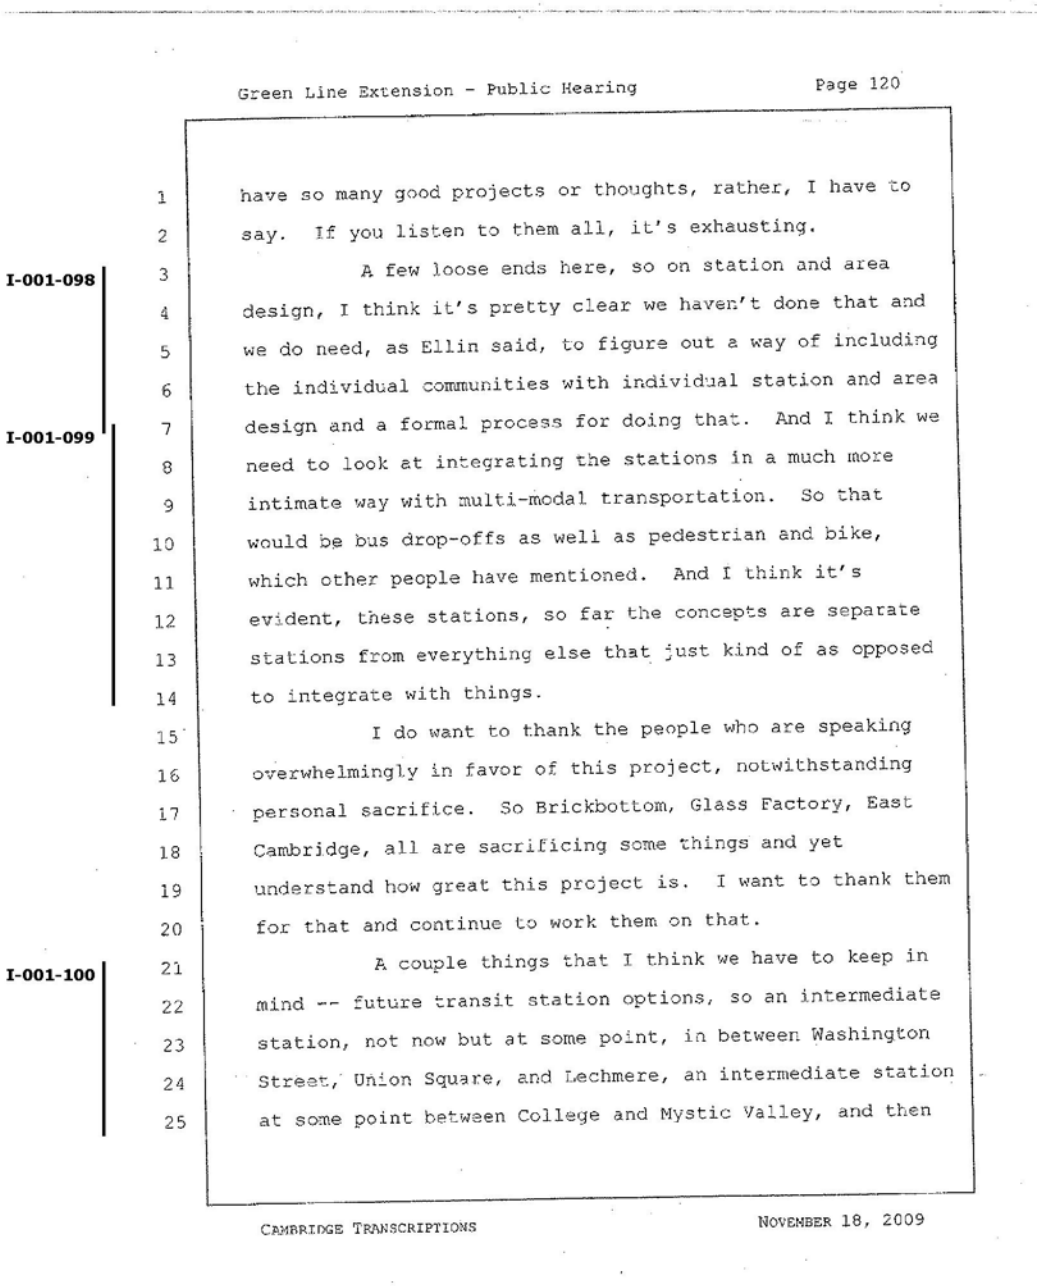
[Laughter]

MR. WIG ZAMORE: Anyway, so I'm Wig Zamore. I live a couple blocks down at 13 Highland Avenue in Somerville, and I get worn out by these meetings. People

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-097

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.



Green Line Extension - Public Hearing Page 120

have so many good projects or thoughts, rather, I have to say. If you listen to them all, it's exhausting.

A few loose ends here, so on station and area design, I think it's pretty clear we haven't done that and we do need, as Ellin said, to figure out a way of including the individual communities with individual station and area design and a formal process for doing that. And I think we need to look at integrating the stations in a much more intimate way with multi-modal transportation. So that would be bus drop-offs as well as pedestrian and bike, which other people have mentioned. And I think it's evident, these stations, so far the concepts are separate stations from everything else that just kind of as opposed to integrate with things.

I do want to thank the people who are speaking overwhelmingly in favor of this project, notwithstanding personal sacrifice. So Brickbottom, Glass Factory, East Cambridge, all are sacrificing some things and yet understand how great this project is. I want to thank them for that and continue to work them on that.

A couple things that I think we have to keep in mind -- future transit station options, so an intermediate station, not now but at some point, in between Washington Street, Union Square, and Lechmere, an intermediate station at some point between College and Mystic Valley, and then

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-098 I-001-099 I-001-100

I-001-098

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

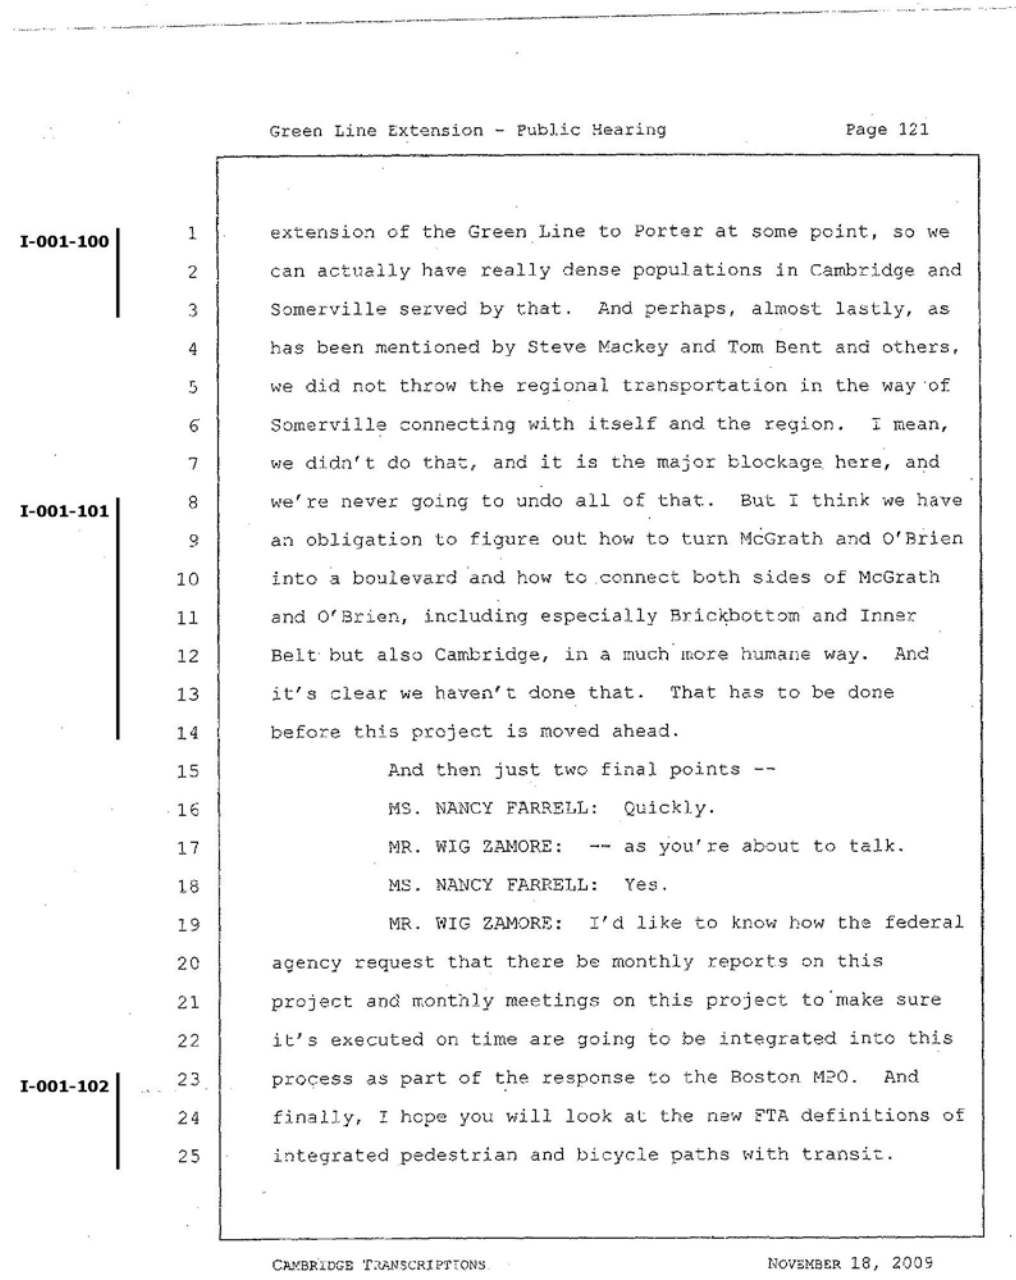
I-001-099

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-001-100

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.



Green Line Extension - Public Hearing Page 121

I-001-100

extension of the Green Line to Porter at some point, so we can actually have really dense populations in Cambridge and Somerville served by that. And perhaps, almost lastly, as has been mentioned by Steve Mackey and Tom Bent and others, we did not throw the regional transportation in the way of Somerville connecting with itself and the region. I mean, we didn't do that, and it is the major blockage here, and

I-001-101

we're never going to undo all of that. But I think we have an obligation to figure out how to turn McGrath and O'Brien into a boulevard and how to connect both sides of McGrath and O'Brien, including especially Brickbottom and Inner Belt but also Cambridge, in a much more humane way. And it's clear we haven't done that. That has to be done before this project is moved ahead.

And then just two final points --

MS. NANCY FARRELL: Quickly.

MR. WIG ZAMORE: -- as you're about to talk.

MS. NANCY FARRELL: Yes.

MR. WIG ZAMORE: I'd like to know how the federal agency request that there be monthly reports on this project and monthly meetings on this project to make sure it's executed on time are going to be integrated into this process as part of the response to the Boston MPO. And

I-001-102

finally, I hope you will look at the new FTA definitions of integrated pedestrian and bicycle paths with transit.

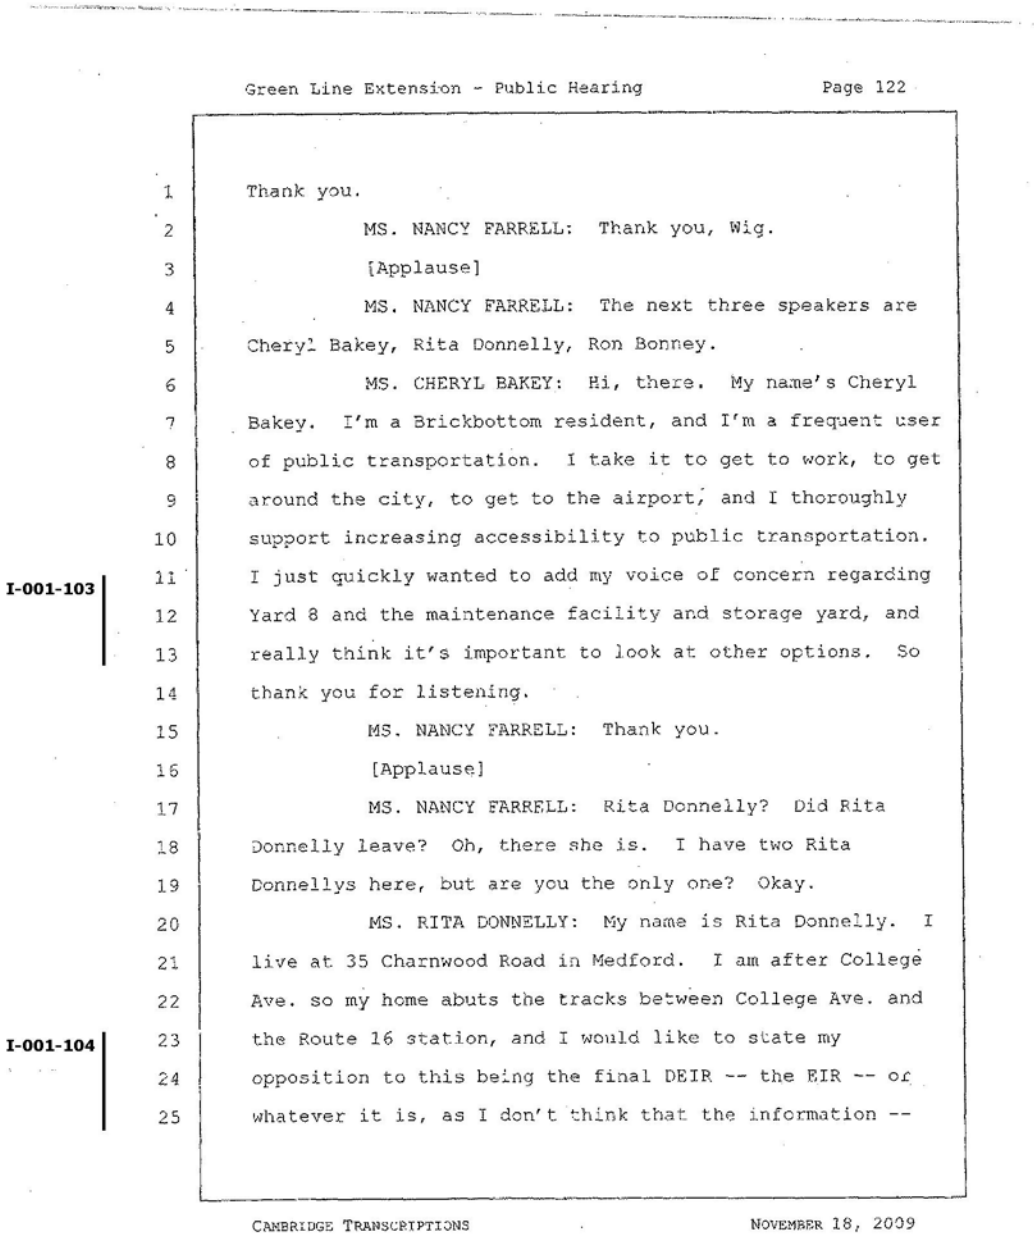
CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-101

DEIR/EA Section 3.9 describes the compatibility of the Green Line Extension with other regional projects, such as the conceptual reconstruction of McGrath Highway and the Urban Ring transit corridor initiative. MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses to ensure, to the extent feasible, consistency with planning and other projects.

I-001-102

MassDOT is familiar with FTA guidence related to the funding of pedestrian and bicycle facilities. Thank you for your interest in the Green Line Extension Project.



Green Line Extension - Public Hearing Page 122

Thank you.

MS. NANCY FARRELL: Thank you, Wig.

[Applause]

MS. NANCY FARRELL: The next three speakers are Cheryl Bakey, Rita Donnelly, Ron Bonney.

MS. CHERYL BAKEY: Hi, there. My name's Cheryl Bakey. I'm a Brickbottom resident, and I'm a frequent user of public transportation. I take it to get to work, to get around the city, to get to the airport, and I thoroughly support increasing accessibility to public transportation. I just quickly wanted to add my voice of concern regarding Yard 8 and the maintenance facility and storage yard, and really think it's important to look at other options. So thank you for listening.

MS. NANCY FARRELL: Thank you.

[Applause]

MS. NANCY FARRELL: Rita Donnelly? Did Rita Donnelly leave? Oh, there she is. I have two Rita Donnellys here, but are you the only one? Okay.

MS. RITA DONNELLY: My name is Rita Donnelly. I live at 35 Charnwood Road in Medford. I am after College Ave. so my home abuts the tracks between College Ave. and the Route 16 station, and I would like to state my opposition to this being the final DEIR -- the EIR -- or whatever it is, as I don't think that the information --

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-103

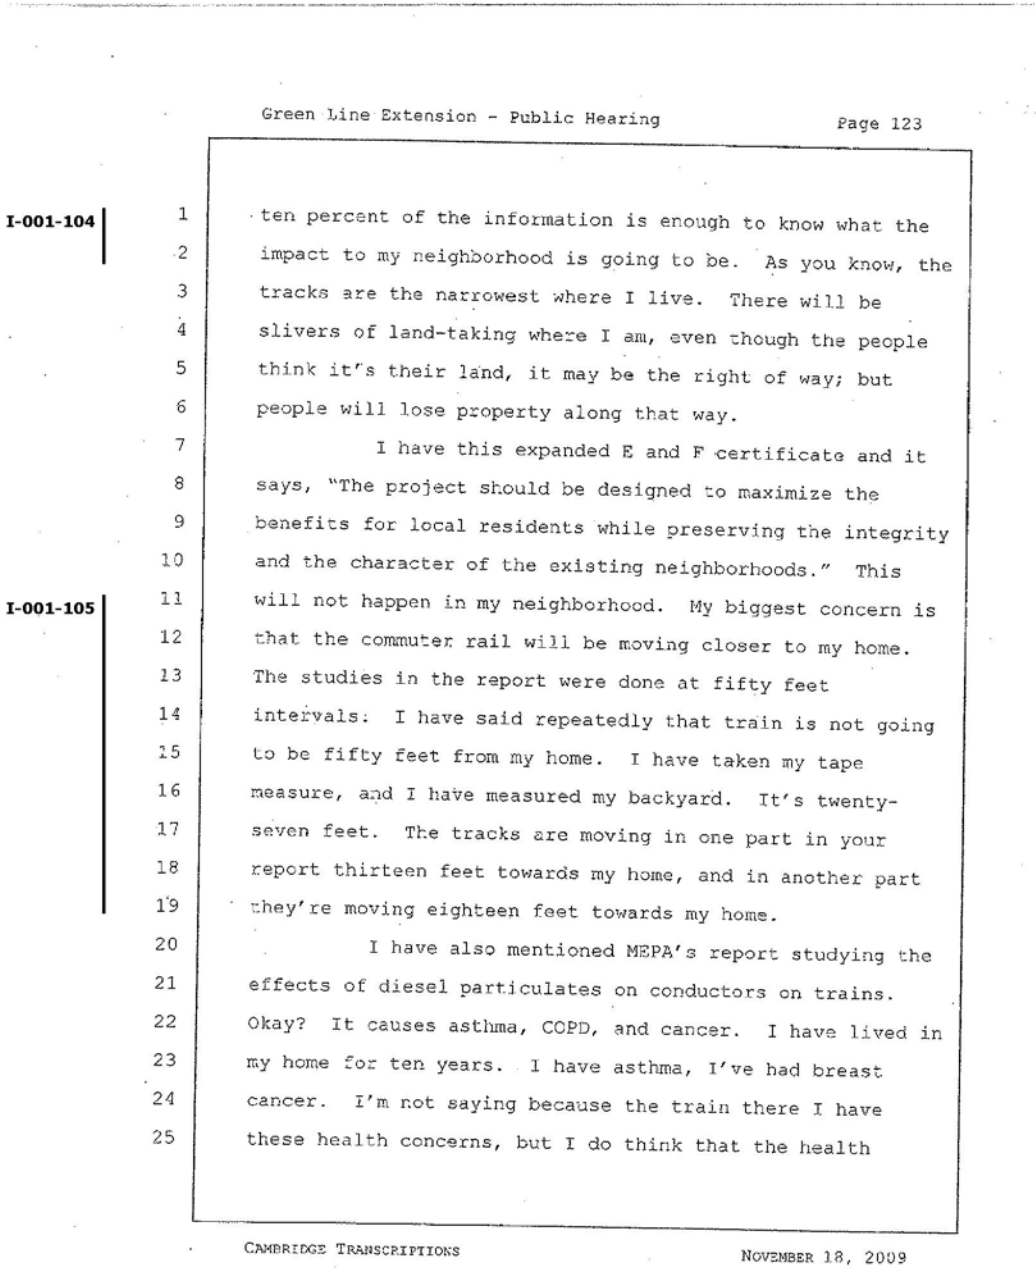
I-001-104

I-001-103

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-001-104

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.



Green Line Extension - Public Hearing Page 123

I-001-104

ten percent of the information is enough to know what the impact to my neighborhood is going to be. As you know, the tracks are the narrowest where I live. There will be slivers of land-taking where I am, even though the people think it's their land, it may be the right of way; but people will lose property along that way.

I have this expanded E and F certificate and it says, "The project should be designed to maximize the benefits for local residents while preserving the integrity and the character of the existing neighborhoods." This

I-001-105

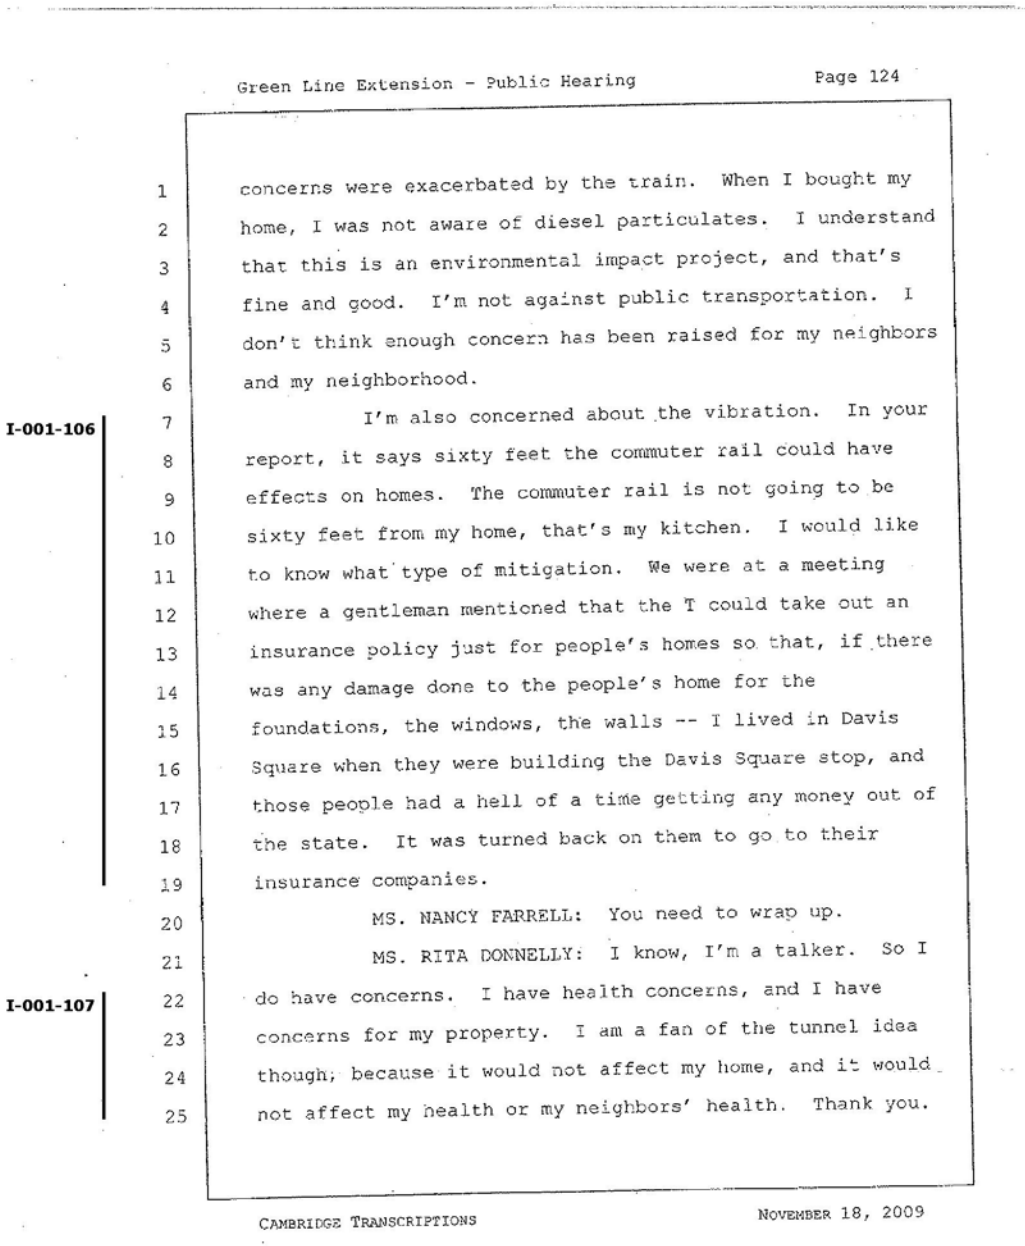
will not happen in my neighborhood. My biggest concern is that the commuter rail will be moving closer to my home. The studies in the report were done at fifty feet intervals. I have said repeatedly that train is not going to be fifty feet from my home. I have taken my tape measure, and I have measured my backyard. It's twenty-seven feet. The tracks are moving in one part in your report thirteen feet towards my home, and in another part they're moving eighteen feet towards my home.

I have also mentioned MEPA's report studying the effects of diesel particulates on conductors on trains. Okay? It causes asthma, COPD, and cancer. I have lived in my home for ten years. I have asthma, I've had breast cancer. I'm not saying because the train there I have these health concerns, but I do think that the health

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-105

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.



Green Line Extension - Public Hearing Page 124

concerns were exacerbated by the train. When I bought my home, I was not aware of diesel particulates. I understand that this is an environmental impact project, and that's fine and good. I'm not against public transportation. I don't think enough concern has been raised for my neighbors and my neighborhood.

I'm also concerned about the vibration. In your report, it says sixty feet the commuter rail could have effects on homes. The commuter rail is not going to be sixty feet from my home, that's my kitchen. I would like to know what type of mitigation. We were at a meeting where a gentleman mentioned that the T could take out an insurance policy just for people's homes so that, if there was any damage done to the people's home for the foundations, the windows, the walls -- I lived in Davis Square when they were building the Davis Square stop, and those people had a hell of a time getting any money out of the state. It was turned back on them to go to their insurance companies.

MS. NANCY FARRELL: You need to wrap up.

MS. RITA DONNELLY: I know, I'm a talker. So I do have concerns. I have health concerns, and I have concerns for my property. I am a fan of the tunnel idea though; because it would not affect my home, and it would not affect my health or my neighbors' health. Thank you.

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-106

I-001-107

I-001-106

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-001-107

Tunneling alternatives were evaluated but dismissed, as described in DEIR/EA Appendix B, Section 7.

MS. NANCY FARRELL: Thank you.

[Applause]

MS. NANCY FARRELL: Ron Bonney, then Alan Moore and Rachel Stark.

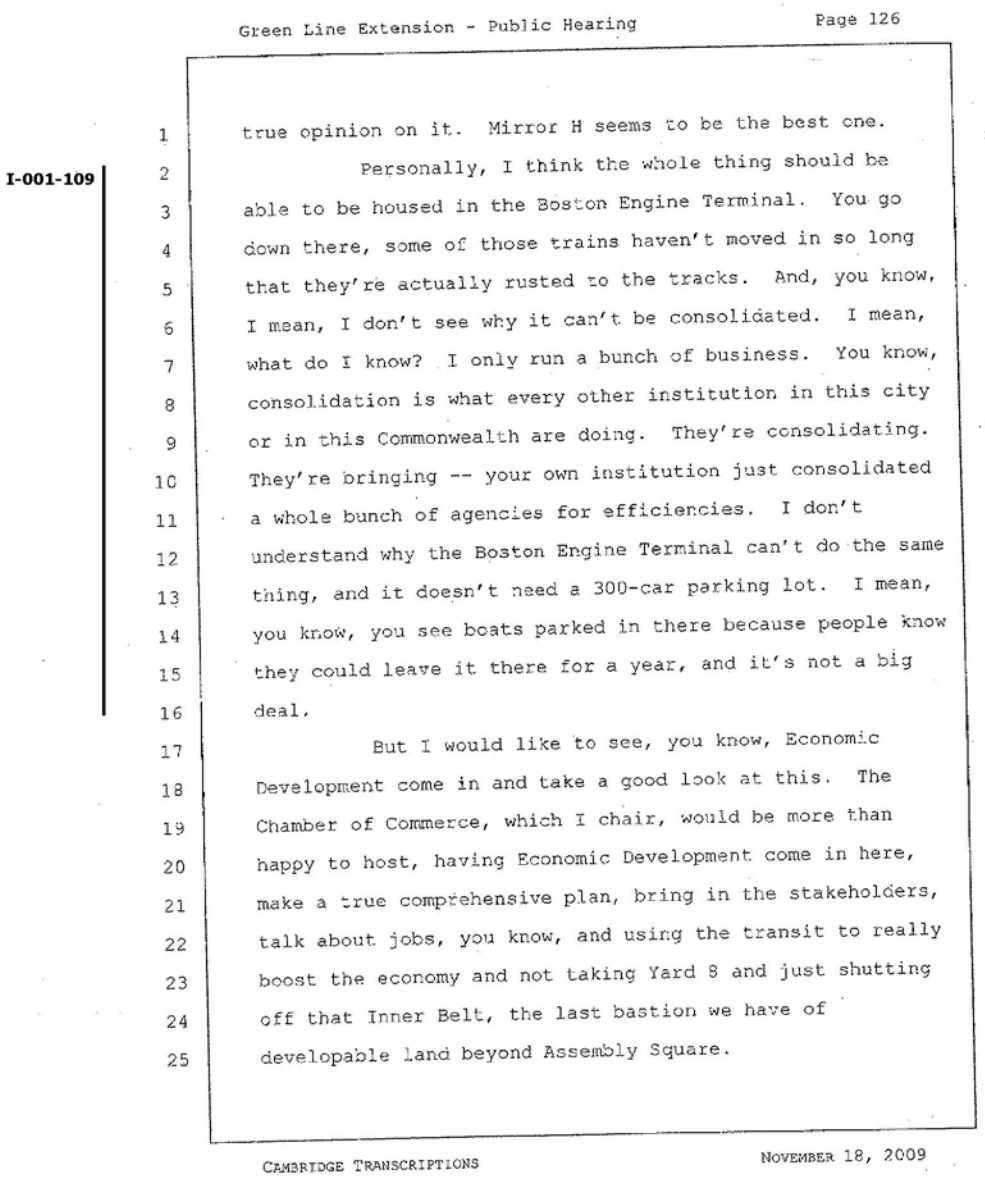
MR. RON BONNEY: Good evening, ma'am. Thank you very much for coming here. I understand it's quite a process to sit there and listen to so many different opinions. I don't think you'll find a community that is more supportive of the Green Line and the process of bringing -- or I should say returning public transportation to Somerville. You know, I mean, Somerville gave up all those homes when 93 came in. We gave up all the rapid transit stops when they were removed from Somerville. So this isn't a process of Somerville receiving some grand gift. It's simply making right something was taken away.

I-001-108

And then along comes the maintenance facility. Yard 8 would be horrific. It's one of the last bastions that Somerville has left to create, you know, future economic activity that will allow us to build up our tax base to be able to pay for our own schools without depending on state aid, which we've recently seen with the 9C cuts to our schools, teachers, fire. The only opportunity we have to come off that reliance is to build our economic base and, when you look at this new L Option, we don't have enough details to be able to actually offer a

I-001-108

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.



Green Line Extension - Public Hearing Page 126

I-001-109

true opinion on it. Mirror H seems to be the best one.

Personally, I think the whole thing should be able to be housed in the Boston Engine Terminal. You go down there, some of those trains haven't moved in so long that they're actually rusted to the tracks. And, you know, I mean, I don't see why it can't be consolidated. I mean, what do I know? I only run a bunch of business. You know, consolidation is what every other institution in this city or in this Commonwealth are doing. They're consolidating. They're bringing -- your own institution just consolidated a whole bunch of agencies for efficiencies. I don't understand why the Boston Engine Terminal can't do the same thing, and it doesn't need a 300-car parking lot. I mean, you know, you see boats parked in there because people know they could leave it there for a year, and it's not a big deal.

But I would like to see, you know, Economic Development come in and take a good look at this. The Chamber of Commerce, which I chair, would be more than happy to host, having Economic Development come in here, make a true comprehensive plan, bring in the stakeholders, talk about jobs, you know, and using the transit to really boost the economy and not taking Yard 8 and just shutting off that Inner Belt, the last bastion we have of developable land beyond Assembly Square.

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-109

As explained in FEIR Chapter 2, MassDOT has explored opportunities for the Green Line Extension storage and maintenance facility to share resources with the Boston Engine Terminal. The independent needs and constraints of these facilities limit opportunities for shared resources. MassDOT will coordinate with the MBTA during preliminary engineering to maximize efficient land utilization between these storage and maintenance facilities, if possible.

MS. NANCY FARRELL: Thank you. You're out of time.

MR. RON BONNEY: Thank you.

MS. NANCY FARRELL: Thank you.

[Applause]

MS. NANCY FARRELL: Alan Moore?

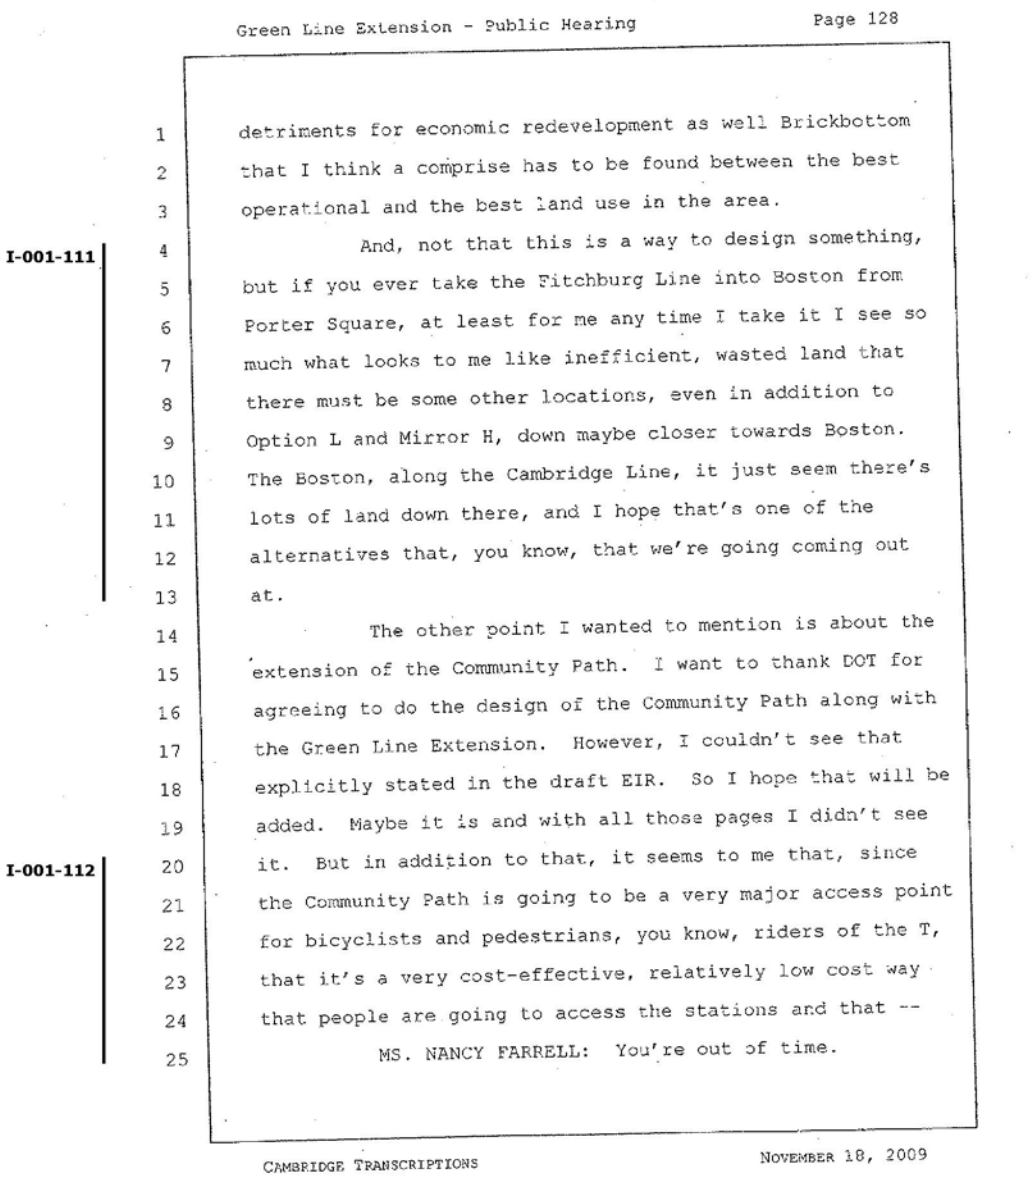
MR. ALAN MOORE: Thank you. Alan Moore, I'm a member of the Somerville Bicycle Committee and Friends of the Community Path, but I'm just speaking for myself tonight. I want to say I totally support the extension of the Green Line, and I wish to thank the DOT and everyone for all the work they've been doing. I think the draft EIR is quite a good document as a draft. Unfortunately, I know the wish was that it could be also the final EIR, and I guess I just don't see how it can be. There just seems to be a lot of shortcomings, and I'd like to mention a few of those now and then again in writing.

One of them is not going to Route 16 at this point, just in brief, just doesn't make sense to me why it wouldn't be designed and constructed all as one project. The other, the location of the maintenance facility, which there's been a lot of discussion, you know, I can understand why operationally that Yard 8 makes sense. I don't think, you know, there's arguments against that it makes sense in that sense, but it just has so many

I-001-110

I-001-110

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.



Green Line Extension - Public Hearing Page 128

detriments for economic redevelopment as well Brickbottom that I think a comprise has to be found between the best operational and the best land use in the area.

I-001-111

And, not that this is a way to design something, but if you ever take the Fitchburg Line into Boston from Porter Square, at least for me any time I take it I see so much what looks to me like inefficient, wasted land that there must be some other locations, even in addition to Option L and Mirror H, down maybe closer towards Boston. The Boston, along the Cambridge Line, it just seem there's lots of land down there, and I hope that's one of the alternatives that, you know, that we're going coming out at.

The other point I wanted to mention is about the extension of the Community Path. I want to thank DOT for agreeing to do the design of the Community Path along with the Green Line Extension. However, I couldn't see that explicitly stated in the draft EIR. So I hope that will be added. Maybe it is and with all those pages I didn't see it.

I-001-112

But in addition to that, it seems to me that, since the Community Path is going to be a very major access point for bicyclists and pedestrians, you know, riders of the T, that it's a very cost-effective, relatively low cost way that people are going to access the stations and that --

MS. NANCY FARRELL: You're out of time.

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-111

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-001-112

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-001-112

MR. ALAN MOORE: -- okay -- and that really most of the cost of the construction of it really should be made part of the project like it was on the Linear Path of the Red Line and the southwest corridor on the Orange Line, and that it should be put in -- the cost should be put into the funding request to New Starts. Thank you.

MS. NANCY FARRELL: Okay. Thank you.

[Applause]

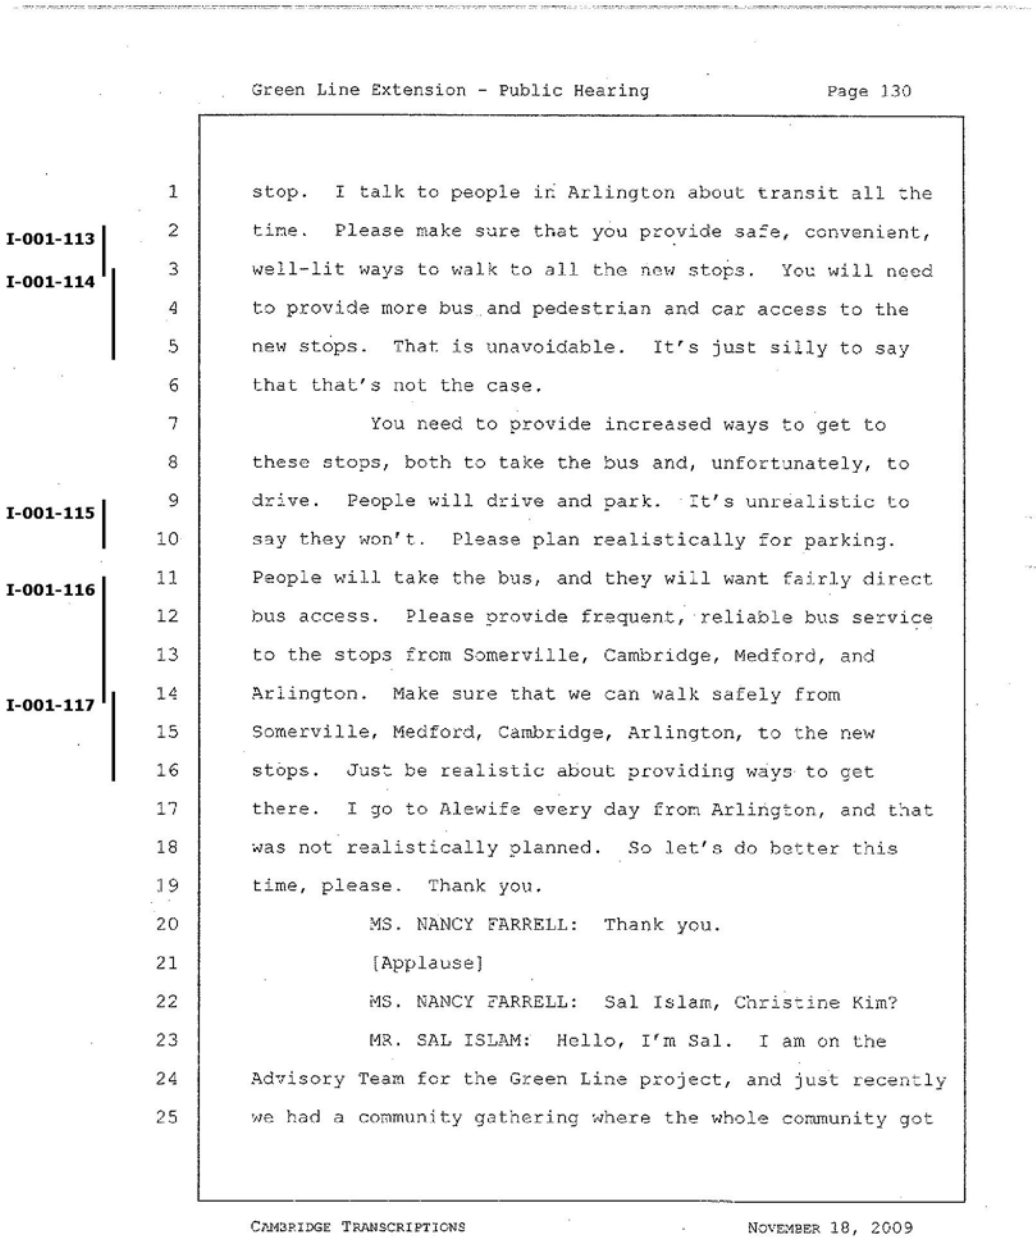
MS. NANCY FARRELL: Rachel Stark? I'm sorry, after Rachel, we'll have Sal Islam, Christine Kim, and Alex Epstein. Hello.

MS. RACHEL STARK: Hi. I'm trying not to break Somerville here.

MS. NANCY FARRELL: It's pretty powerful there, huh?

MS. RACHEL STARK: There you have it. Hi, my name is Rachel Stark, and I'm the Founder and Chair of Walking in Arlington -- which is so far the first Arlingtonian to speak that I know of -- which is a pedestrian advocacy and walking safety group. I am delighted that you are talking about extending the Green Line. Thank you so much, and thank you for these public meetings, many of which I've been to.

Lots of people from Arlington would love to be able to walk and cycle and take the bus to a Green Line



Green Line Extension - Public Hearing Page 130

I-001-113
I-001-114
I-001-115
I-001-116
I-001-117

stop. I talk to people in Arlington about transit all the time. Please make sure that you provide safe, convenient, well-lit ways to walk to all the new stops. You will need to provide more bus and pedestrian and car access to the new stops. That is unavoidable. It's just silly to say that that's not the case.

You need to provide increased ways to get to these stops, both to take the bus and, unfortunately, to drive. People will drive and park. It's unrealistic to say they won't. Please plan realistically for parking. People will take the bus, and they will want fairly direct bus access. Please provide frequent, reliable bus service to the stops from Somerville, Cambridge, Medford, and Arlington. Make sure that we can walk safely from Somerville, Medford, Cambridge, Arlington, to the new stops. Just be realistic about providing ways to get there. I go to Alewife every day from Arlington, and that was not realistically planned. So let's do better this time, please. Thank you.

MS. NANCY FARRELL: Thank you.

[Applause]

MS. NANCY FARRELL: Sal Islam, Christine Kim?

MR. SAL ISLAM: Hello, I'm Sal. I am on the Advisory Team for the Green Line project, and just recently we had a community gathering where the whole community got

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-113

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-001-114

together at the Argenziano School, and we came up with eleven core principles that the community wanted for the Green Line to effect. This is Aaron. He's also working with me from Groundwork Somerville.

[MR. AARON NEVIN]: Hi. Are we onto main issues now? One of the biggest concerns we've had has been surrounding community involvement. We've been working with the community for the last at least year now just trying to boost up morale because, without the community's involvement in this, there is no program, there is no Green Line. It's just going to be stuck and have no real input or real value. Like when the Red Line was put in, community didn't have any say in the matter.

I-001-118

MR. SAL ISLAM: And also, we feel that access is very important right now. The Red Line is connected completely by the bike path, and that's also another concern is to encourage walking and biking to reduce pollution. And basically, improvement of access should be considered in the planning of the Green Line.

MS. NANCY FARRELL: Thank you. Will you submit those principles to us?

MR. SAL ISLAM: Yeah, do you want it right now?

MS. NANCY FARRELL: You can leave it in the back, please.

MR. SAL ISLAM: Okay.

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-001-115

The Project is intended, in part, to relieve traffic congestion, as described in DEIR/EA Chapter 2, Purpose and Need. Some station access points for passenger drop-off/pick-up are likely to impact local traffic flow, as outlined in DEIR/EA Section 5.5, Traffic. As described in DEIR/EA Chapter 6, these impacts will be minimized to the extent practical. However, with the exception of relocated Lechmere Station, no parking is provided at any of the new Green Line Extension stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes how MassDOT will coordinate with municipalities and stakeholders to address traffic and parking concerns. Additionally, FEIR Chapter 4 summarizes the impacts of College Avenue as a terminal station.

I-001-116

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

MS. NANCY FARRELL: Thank you.
MR. SAL ISLAM: All right.
MS. NANCY FARRELL: Thank you.
[MR. AARON NEVIN]: Thank you.
[Applause]
MS. NANCY FARRELL: Christine Kim, Alex Epstein, and Dan Tremitiere. Christine, are you here?
AUDIENCE MEMBER: No, she left.
MS. NANCY FARRELL: She left. Okay. Alex Epstein? Alex is here. Okay. We're getting there, people. Thank you for your patience, or you had nothing exciting to do tonight, I guess, besides be here.
MR. ALEX EPSTEIN: This is quite exciting. I'm Alex Epstein. I'm a member of STEP and Somerville Bicycle Committee, but I'll be speaking as a Somerville-Cambridge or Cambriville resident. And I'd like to point out a hundred years ago Somerville developed organically as a rail transit community. Seventy years ago we were short-changed of that. This is a partial restoration, and I'm thrilled to see it, and thank you for the efforts to this point.
I do not own a car. One out of three Somervillians does not own a car. There's every reason to believe that the car ownership rate will continue to decrease, and we should be proactive in promoting that

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

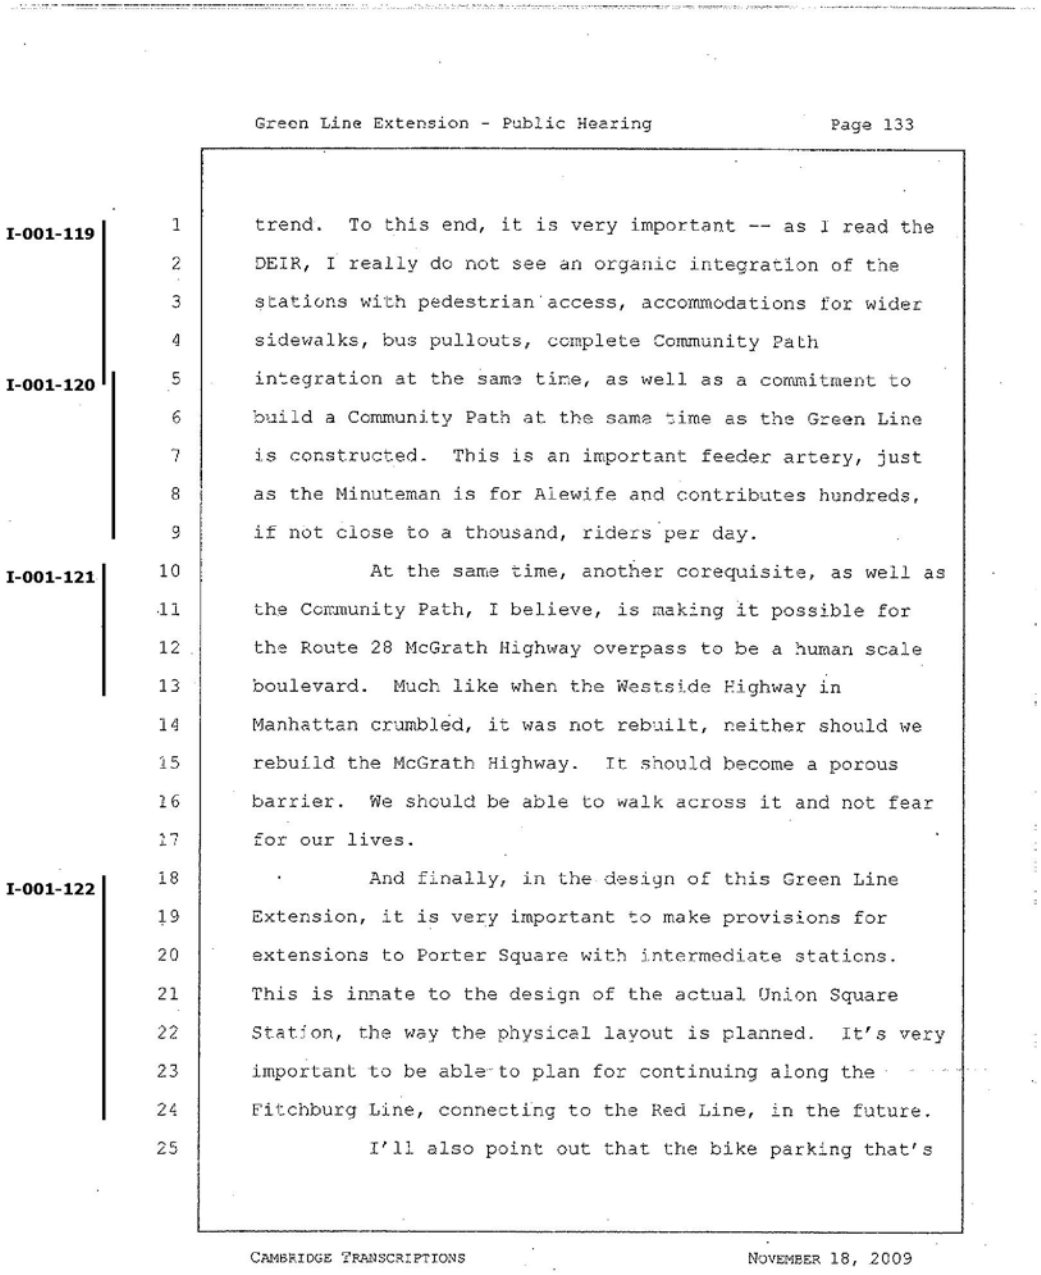
In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.



Green Line Extension - Public Hearing Page 133

I-001-119

trend. To this end, it is very important -- as I read the DEIR, I really do not see an organic integration of the stations with pedestrian access, accommodations for wider sidewalks, bus pullouts, complete Community Path

I-001-120

integration at the same time, as well as a commitment to build a Community Path at the same time as the Green Line is constructed. This is an important feeder artery, just as the Minuteman is for Alewife and contributes hundreds, if not close to a thousand, riders per day.

I-001-121

At the same time, another corequisite, as well as the Community Path, I believe, is making it possible for the Route 28 McGrath Highway overpass to be a human scale boulevard. Much like when the Westside Highway in Manhattan crumbled, it was not rebuilt, neither should we rebuild the McGrath Highway. It should become a porous barrier. We should be able to walk across it and not fear for our lives.

I-001-122

And finally, in the design of this Green Line Extension, it is very important to make provisions for extensions to Porter Square with intermediate stations. This is innate to the design of the actual Union Square Station, the way the physical layout is planned. It's very important to be able to plan for continuing along the Fitchburg Line, connecting to the Red Line, in the future.

I'll also point out that the bike parking that's

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-119

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. These stations are designed to be consistent with MBTA standards and compliant with ADA. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-001-120

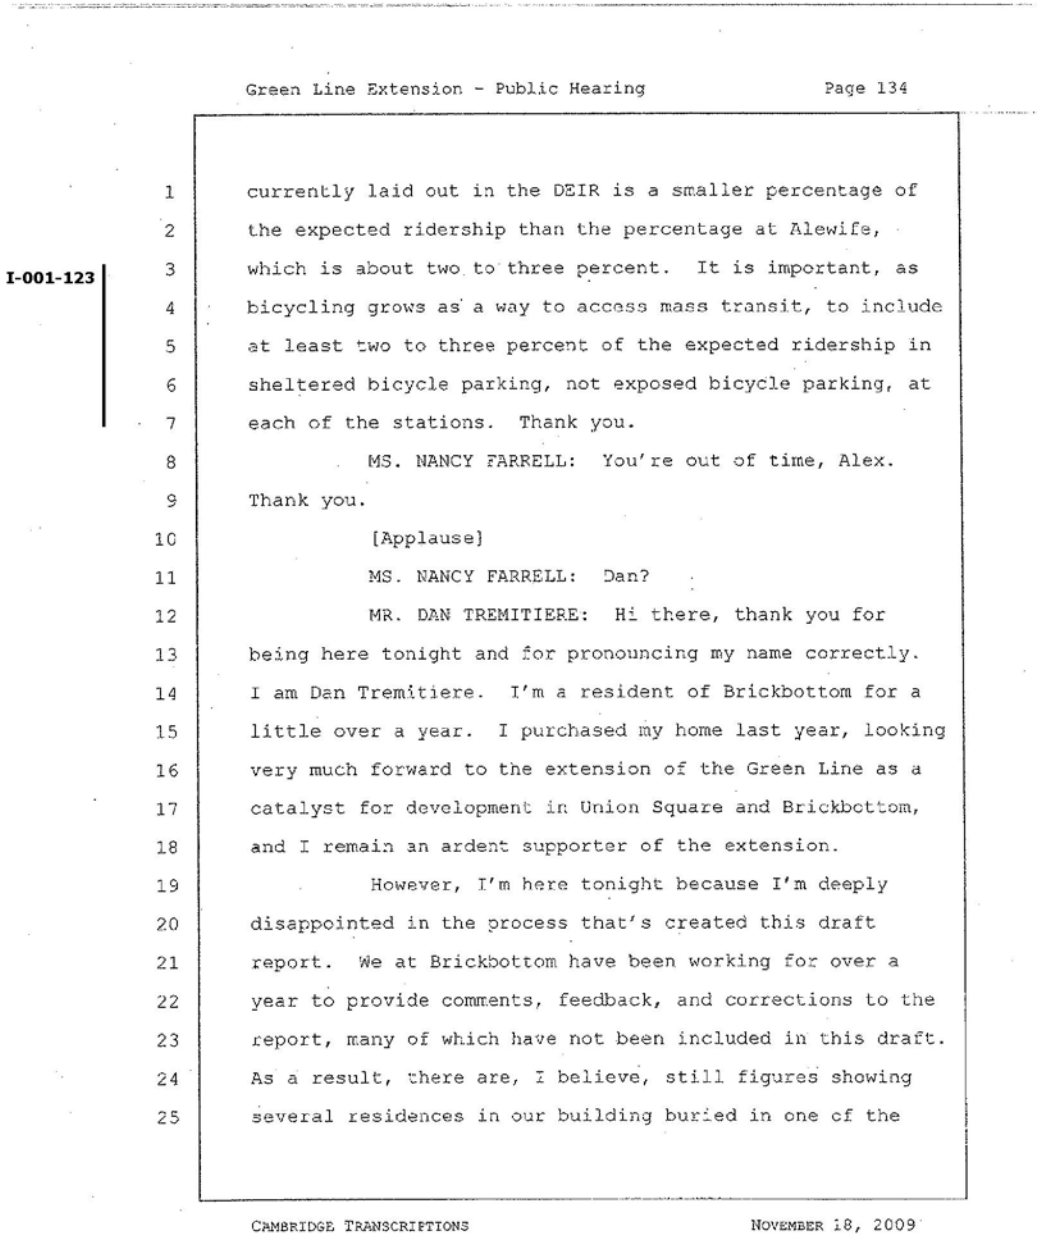
MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-001-121

DEIR/EA Section 3.9 describes the compatibility of the Green Line Extension with other regional projects, such as the conceptual reconstruction of McGrath Highway and the Urban Ring transit corridor initiative. MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses to ensure, to the extent feasible, consistency with planning and other projects.

I-001-122

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.



Green Line Extension - Public Hearing Page 134

I-001-123

currently laid out in the DEIR is a smaller percentage of the expected ridership than the percentage at Alewife, which is about two to three percent. It is important, as bicycling grows as a way to access mass transit, to include at least two to three percent of the expected ridership in sheltered bicycle parking, not exposed bicycle parking, at each of the stations. Thank you.

MS. NANCY FARRELL: You're out of time, Alex. Thank you.

[Applause]

MS. NANCY FARRELL: Dan?

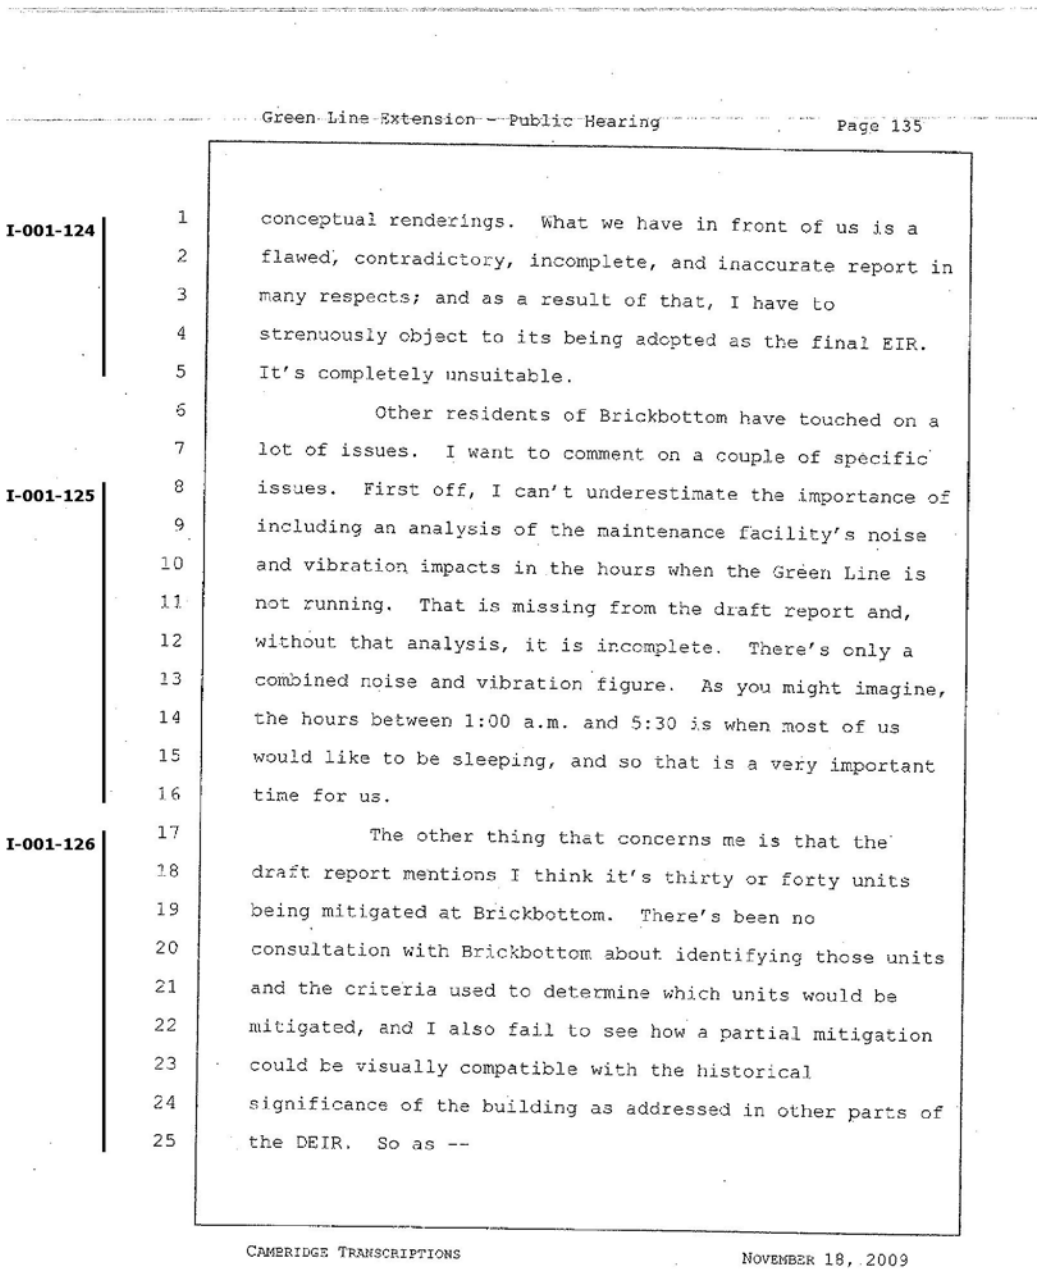
MR. DAN TREMITIERE: Hi there, thank you for being here tonight and for pronouncing my name correctly. I am Dan Tremitiere. I'm a resident of Brickbottom for a little over a year. I purchased my home last year, looking very much forward to the extension of the Green Line as a catalyst for development in Union Square and Brickbottom, and I remain an ardent supporter of the extension.

However, I'm here tonight because I'm deeply disappointed in the process that's created this draft report. We at Brickbottom have been working for over a year to provide comments, feedback, and corrections to the report, many of which have not been included in this draft. As a result, there are, I believe, still figures showing several residences in our building buried in one of the

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-123

The amount of bicycle storage at each station is based on ridership projections developed by CTPS. DEIR/EA Appendix D includes the methods CTPS used to analyze demand for bicycle parking. Detailed bicycle parking designs will be further developed during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.



Green Line Extension – Public Hearing Page 135

I-001-124

conceptual renderings. What we have in front of us is a flawed, contradictory, incomplete, and inaccurate report in many respects; and as a result of that, I have to strenuously object to its being adopted as the final EIR. It's completely unsuitable.

Other residents of Brickbottom have touched on a lot of issues. I want to comment on a couple of specific

I-001-125

issues. First off, I can't underestimate the importance of including an analysis of the maintenance facility's noise and vibration impacts in the hours when the Green Line is not running. That is missing from the draft report and, without that analysis, it is incomplete. There's only a combined noise and vibration figure. As you might imagine, the hours between 1:00 a.m. and 5:30 is when most of us would like to be sleeping, and so that is a very important time for us.

I-001-126

The other thing that concerns me is that the draft report mentions I think it's thirty or forty units being mitigated at Brickbottom. There's been no consultation with Brickbottom about identifying those units and the criteria used to determine which units would be mitigated, and I also fail to see how a partial mitigation could be visually compatible with the historical significance of the building as addressed in other parts of the DEIR. So as --

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-124

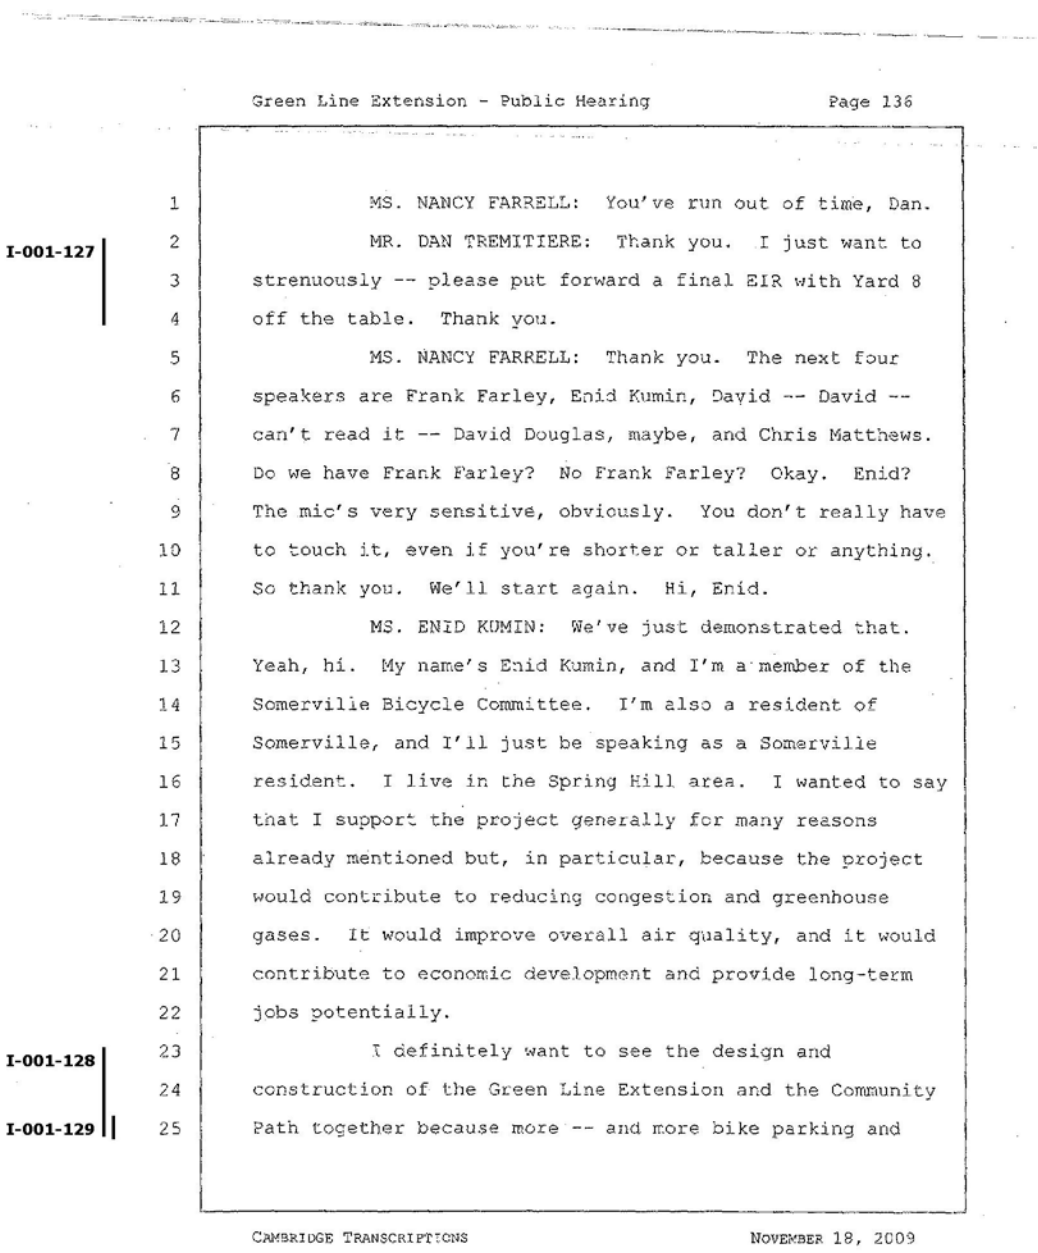
In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

I-001-125

As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds. FEIR Chapter 8 describes specific proposed mitigation measures, plans for monitoring after construction, and next steps pertaining to mitigation. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-001-126

As described in Section 6.5.4.7 of the DEIR/EA, noise mitigation measures such as new doors, windows, or other insulating treatments will be appropriate for the historic property and meet the Secretary of Interior's standards for rehabilitation.



Green Line Extension - Public Hearing Page 136

MS. NANCY FARRELL: You've run out of time, Dan.

I-001-127

MR. DAN TREMITIERE: Thank you. I just want to strenuously -- please put forward a final EIR with Yard 8 off the table. Thank you.

MS. NANCY FARRELL: Thank you. The next four speakers are Frank Farley, Enid Kumin, David -- David -- can't read it -- David Douglas, maybe, and Chris Matthews. Do we have Frank Farley? No Frank Farley? Okay. Enid? The mic's very sensitive, obviously. You don't really have to touch it, even if you're shorter or taller or anything. So thank you. We'll start again. Hi, Enid.

MS. ENID KUMIN: We've just demonstrated that. Yeah, hi. My name's Enid Kumin, and I'm a member of the Somerville Bicycle Committee. I'm also a resident of Somerville, and I'll just be speaking as a Somerville resident. I live in the Spring Hill area. I wanted to say that I support the project generally for many reasons already mentioned but, in particular, because the project would contribute to reducing congestion and greenhouse gases. It would improve overall air quality, and it would contribute to economic development and provide long-term jobs potentially.

I-001-128

I definitely want to see the design and construction of the Green Line Extension and the Community Path together because more -- and more bike parking and

I-001-129

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-127

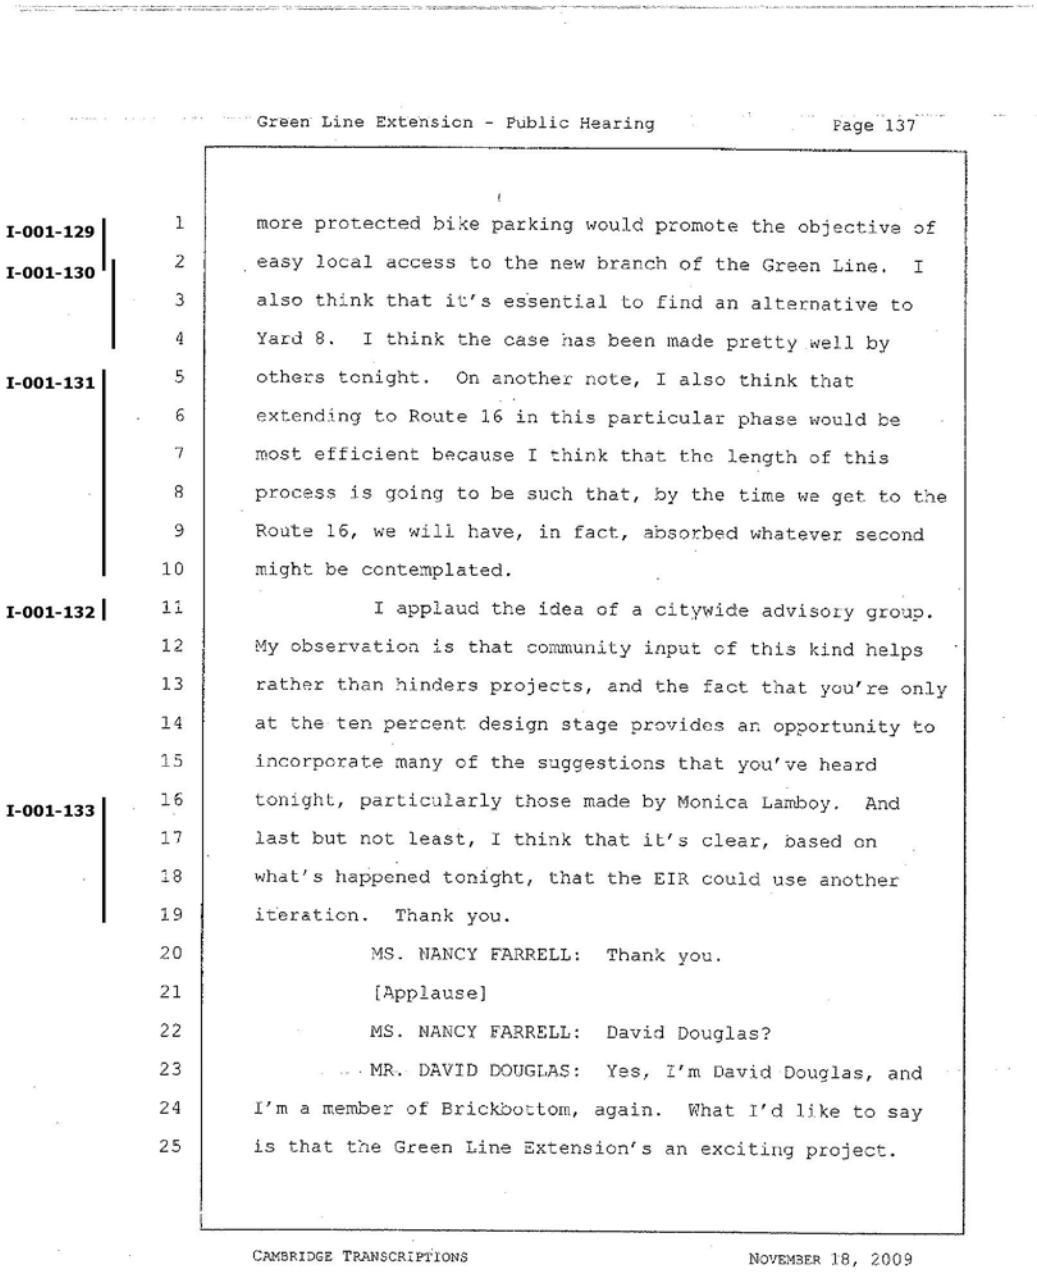
An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-001-128

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-001-129

The amount of bicycle storage at each station is based on ridership projections developed by CTPS. DEIR/EA Appendix D includes the methods CTPS used to analyze demand for bicycle parking. Detailed bicycle parking designs will be further developed during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.



Green Line Extension - Public Hearing Page 137

more protected bike parking would promote the objective of easy local access to the new branch of the Green Line. I also think that it's essential to find an alternative to Yard 8. I think the case has been made pretty well by others tonight. On another note, I also think that extending to Route 16 in this particular phase would be most efficient because I think that the length of this process is going to be such that, by the time we get to the Route 16, we will have, in fact, absorbed whatever second might be contemplated.

I applaud the idea of a citywide advisory group. My observation is that community input of this kind helps rather than hinders projects, and the fact that you're only at the ten percent design stage provides an opportunity to incorporate many of the suggestions that you've heard tonight, particularly those made by Monica Lamboy. And last but not least, I think that it's clear, based on what's happened tonight, that the EIR could use another iteration. Thank you.

MS. NANCY FARRELL: Thank you.

[Applause]

MS. NANCY FARRELL: David Douglas?

MR. DAVID DOUGLAS: Yes, I'm David Douglas, and I'm a member of Brickbottom, again. What I'd like to say is that the Green Line Extension's an exciting project.

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-130

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-001-131

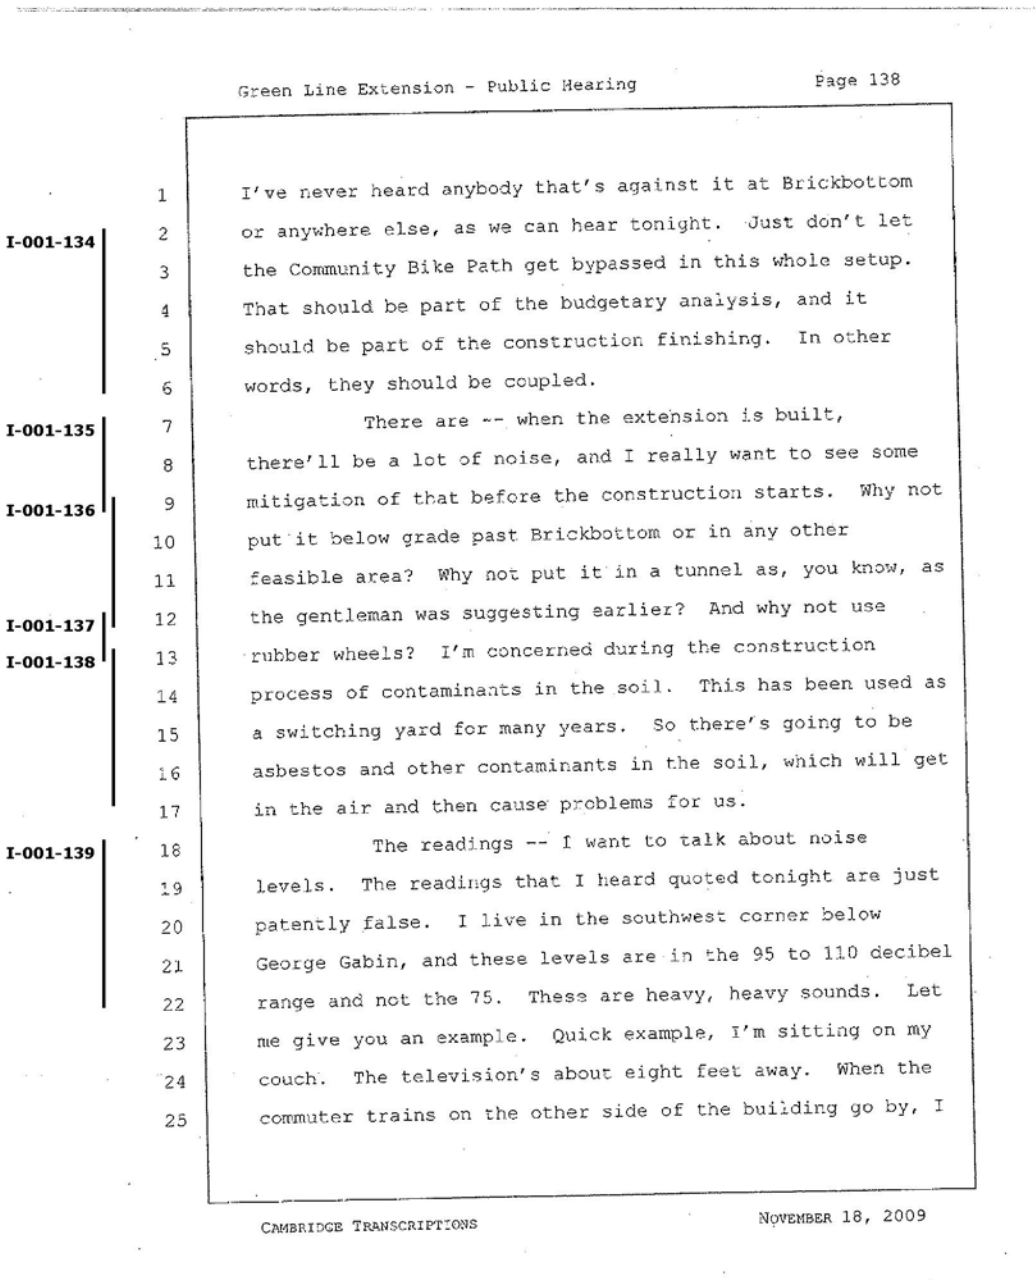
Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-001-132

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-001-133

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.



Green Line Extension - Public Hearing Page 138

I've never heard anybody that's against it at Brickbottom or anywhere else, as we can hear tonight. Just don't let the Community Bike Path get bypassed in this whole setup. That should be part of the budgetary analysis, and it should be part of the construction finishing. In other words, they should be coupled.

There are -- when the extension is built, there'll be a lot of noise, and I really want to see some mitigation of that before the construction starts. Why not put it below grade past Brickbottom or in any other feasible area? Why not put it in a tunnel as, you know, as the gentleman was suggesting earlier? And why not use rubber wheels? I'm concerned during the construction process of contaminants in the soil. This has been used as a switching yard for many years. So there's going to be asbestos and other contaminants in the soil, which will get in the air and then cause problems for us.

The readings -- I want to talk about noise levels. The readings that I heard quoted tonight are just patently false. I live in the southwest corner below George Gabin, and these levels are in the 95 to 110 decibel range and not the 75. These are heavy, heavy sounds. Let me give you an example. Quick example, I'm sitting on my couch. The television's about eight feet away. When the commuter trains on the other side of the building go by, I

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-134

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-001-135

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-001-136

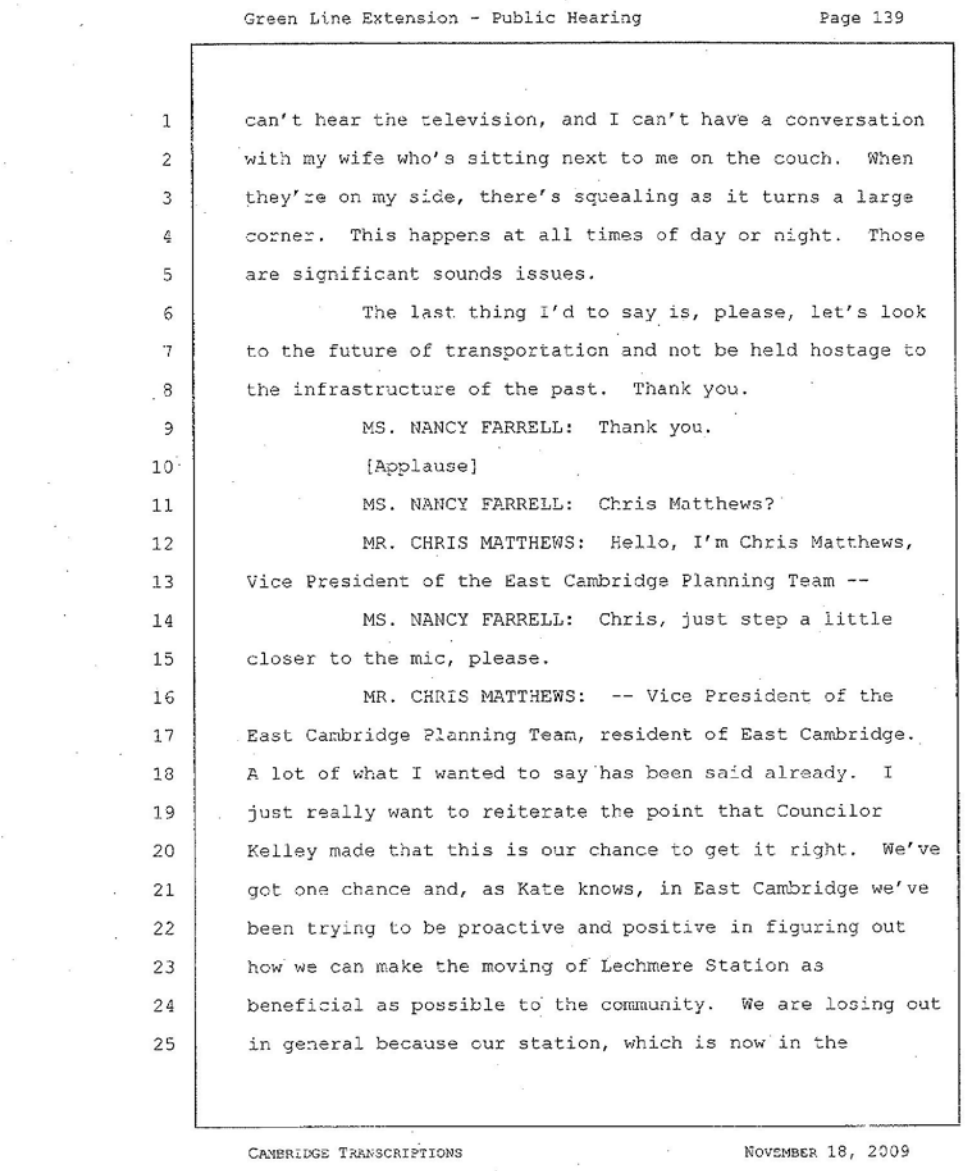
Tunneling alternatives were evaluated but dismissed, as described in DEIR/EA Appendix B, Section 7.

I-001-137

The Green Line Extension would be compatible with the existing MBTA Green Line network. This light rail network uses a steel wheel technology.

I-001-138

An analysis of hazardous materials potentially present within the Green Line Extension Study Area is provided in DEIR/EA Section 5.14, Hazardous Materials. Additional investigation may be conducted during the next phases of the Project to determine the nature and extent



Green Line Extension - Public Hearing Page 139

can't hear the television, and I can't have a conversation with my wife who's sitting next to me on the couch. When they're on my side, there's squealing as it turns a large corner. This happens at all times of day or night. Those are significant sounds issues.

The last thing I'd to say is, please, let's look to the future of transportation and not be held hostage to the infrastructure of the past. Thank you.

MS. NANCY FARRELL: Thank you.

[Applause]

MS. NANCY FARRELL: Chris Matthews?

MR. CHRIS MATTHEWS: Hello, I'm Chris Matthews, Vice President of the East Cambridge Planning Team --

MS. NANCY FARRELL: Chris, just step a little closer to the mic, please.

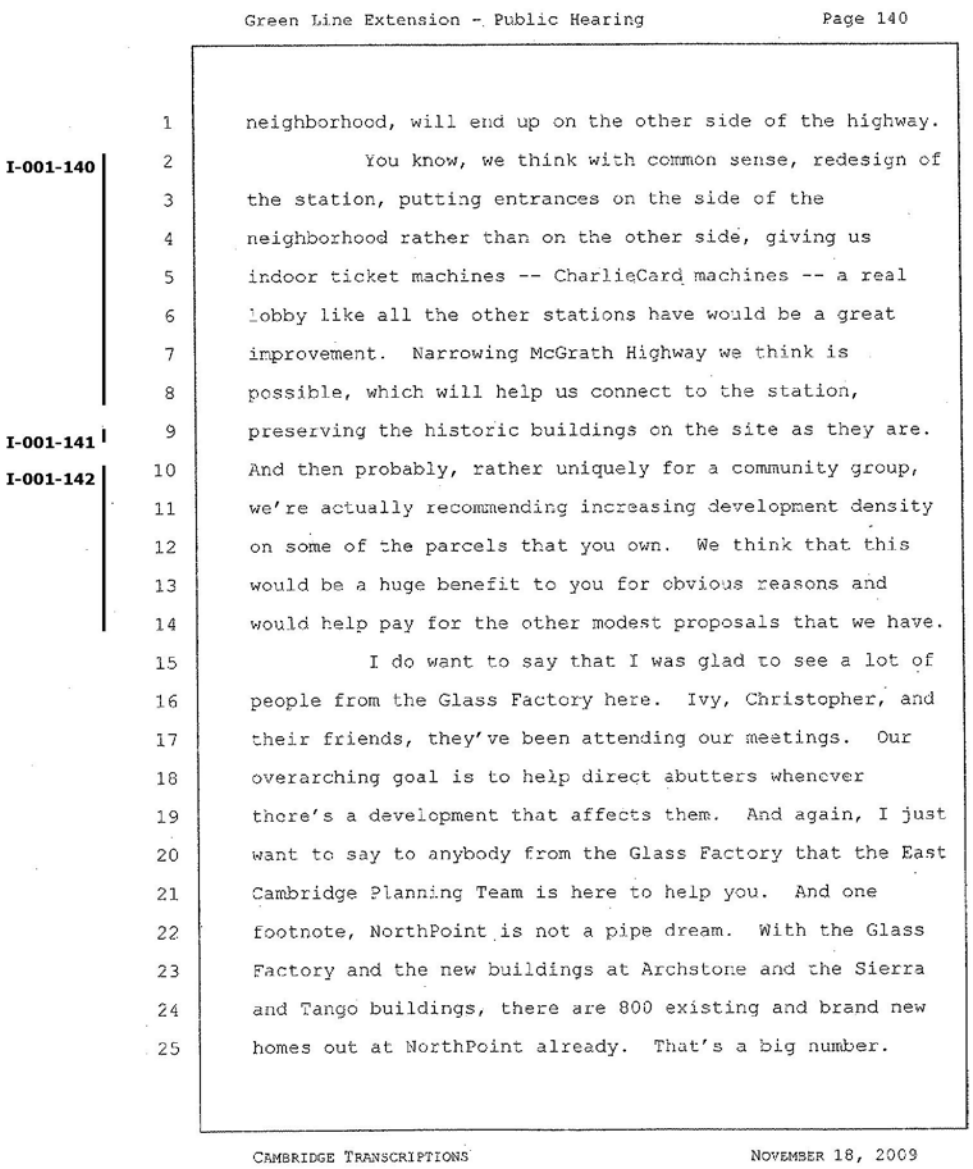
MR. CHRIS MATTHEWS: -- Vice President of the East Cambridge Planning Team, resident of East Cambridge. A lot of what I wanted to say has been said already. I just really want to reiterate the point that Councilor Kelley made that this is our chance to get it right. We've got one chance and, as Kate knows, in East Cambridge we've been trying to be proactive and positive in figuring out how we can make the moving of Lechmere Station as beneficial as possible to the community. We are losing out in general because our station, which is now in the

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

of any contamination and remediate any sites as appropriate. This work would be conducted in accordance with the Commonwealth's Massachusetts Contingency Plan requirements.

I-001-139

DEIR/EA Sections 5.7, Noise, and 5.8, Vibration, describe the noise and vibration impacts, respectively, expected from the Project. Pursuant to FTA-established guidelines, these impacts have been identified and evaluated for moderate and severe impacts to sensitive receptors. FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments, describes the mitigation measures that would be implemented to eliminate, minimize, or offset impacts above regulatory thresholds.



Green Line Extension - Public Hearing Page 140

neighborhood, will end up on the other side of the highway.

You know, we think with common sense, redesign of the station, putting entrances on the side of the neighborhood rather than on the other side, giving us indoor ticket machines -- CharlieCard machines -- a real lobby like all the other stations have would be a great improvement. Narrowing McGrath Highway we think is possible, which will help us connect to the station, preserving the historic buildings on the site as they are. And then probably, rather uniquely for a community group, we're actually recommending increasing development density on some of the parcels that you own. We think that this would be a huge benefit to you for obvious reasons and would help pay for the other modest proposals that we have.

I do want to say that I was glad to see a lot of people from the Glass Factory here. Ivy, Christopher, and their friends, they've been attending our meetings. Our overarching goal is to help direct abutters whenever there's a development that affects them. And again, I just want to say to anybody from the Glass Factory that the East Cambridge Planning Team is here to help you. And one footnote, NorthPoint is not a pipe dream. With the Glass Factory and the new buildings at Archstone and the Sierra and Tango buildings, there are 800 existing and brand new homes out at NorthPoint already. That's a big number.

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-140

I-001-141

I-001-142

I-001-140

Revised conceptual plans for Lechmere Station, including modifications to the station headhouse and entrances, enclosed automatic fare collection, and other amenities are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-001-141

Reducing the width of the McGrath Highway is not part of the Green Line Extension Project. As described in Chapter 5, Lechmere Station, MassDOT will prepare the current Lechmere Station site for redevelopment once the station has been relocated.

I-001-142

Direct and indirect impacts to land use are described in DEIR/EA Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for sustainable land use, which could further reduce automobile traffic congestion and improve air quality.

MS. NANCY FARRELL: Thank you.

[Applause]

MS. NANCY FARRELL: The next few speakers are Shi Shen Yang, David Dahlbacka, and Jared Ingersoll. Any of those people here? Okay. Who of the -- David? Come on up. David, you and I used to work together. See, I'm so memorable.

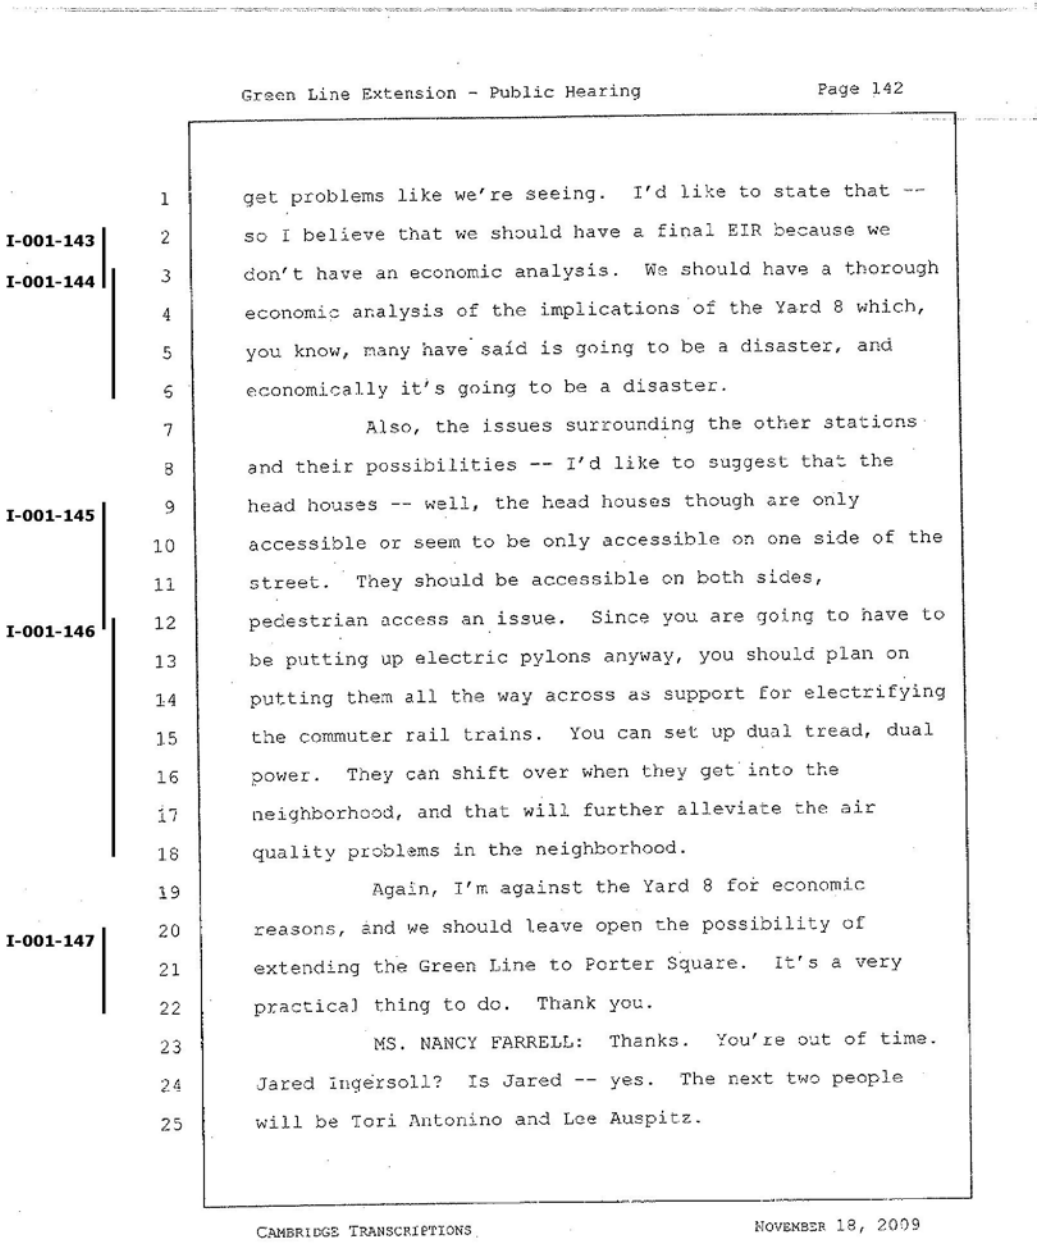
[Laughter]

MR. DAVID DAHLBACKA: Well, we'll have a talk afterwards.

MS. NANCY FARRELL: Okay.

MR. DAVID DAHLBACKA: Okay. I wanted to say, first of all, that I've been in favor of the Green Line Extension since I first heard of it. I've thought it was a very, very good idea. There are some issues I had with the DEIR's minimizing of the economic contribution. The attitude was that it would not actually stimulate economic growth, it would merely change its location and, considering what happened in Davis Square, that's not a realistic description.

What I've been hearing and what I've read in the DEIR says that this is a case of engineering out where the Green Line, the MBTA, decided that they were going to do their operational thing. That's engineering out and, when you do that first without getting community input, you can



Green Line Extension - Public Hearing Page 142

get problems like we're seeing. I'd like to state that -- so I believe that we should have a final EIR because we don't have an economic analysis. We should have a thorough economic analysis of the implications of the Yard 8 which, you know, many have said is going to be a disaster, and economically it's going to be a disaster.

Also, the issues surrounding the other stations and their possibilities -- I'd like to suggest that the head houses -- well, the head houses though are only accessible or seem to be only accessible on one side of the street. They should be accessible on both sides, pedestrian access an issue. Since you are going to have to be putting up electric pylons anyway, you should plan on putting them all the way across as support for electrifying the commuter rail trains. You can set up dual tread, dual power. They can shift over when they get into the neighborhood, and that will further alleviate the air quality problems in the neighborhood.

Again, I'm against the Yard 8 for economic reasons, and we should leave open the possibility of extending the Green Line to Porter Square. It's a very practical thing to do. Thank you.

MS. NANCY FARRELL: Thanks. You're out of time. Jared Ingersoll? Is Jared -- yes. The next two people will be Tori Antonino and Lee Auspitz.

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-143

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

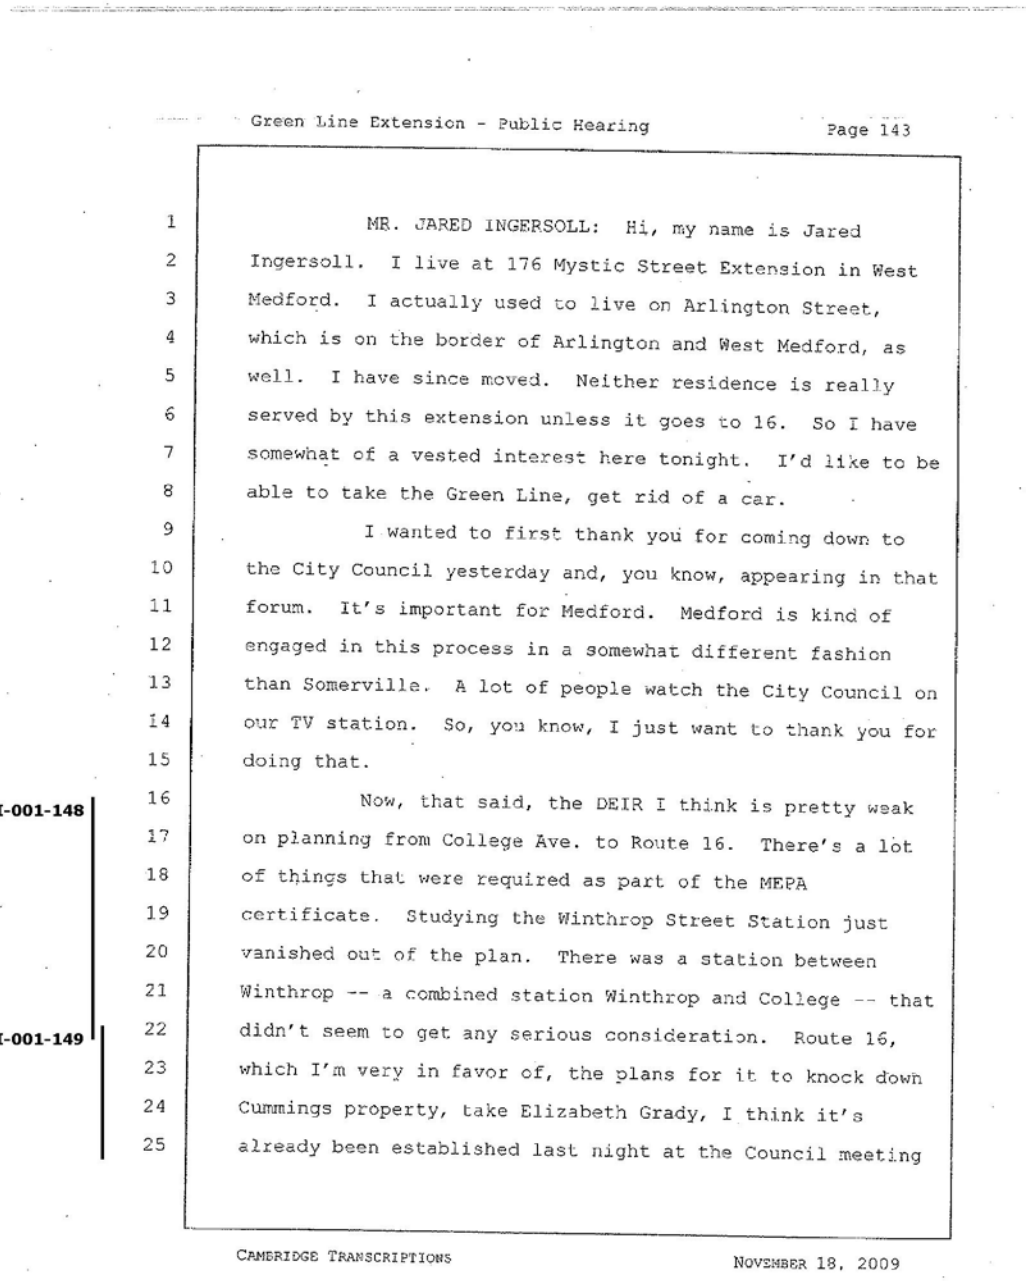
I-001-144

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-001-145

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.



Green Line Extension - Public Hearing Page 143

MR. JARED INGERSOLL: Hi, my name is Jared Ingersoll. I live at 176 Mystic Street Extension in West Medford. I actually used to live on Arlington Street, which is on the border of Arlington and West Medford, as well. I have since moved. Neither residence is really served by this extension unless it goes to 16. So I have somewhat of a vested interest here tonight. I'd like to be able to take the Green Line, get rid of a car.

I wanted to first thank you for coming down to the City Council yesterday and, you know, appearing in that forum. It's important for Medford. Medford is kind of engaged in this process in a somewhat different fashion than Somerville. A lot of people watch the City Council on our TV station. So, you know, I just want to thank you for doing that.

I-001-148

Now, that said, the DEIR I think is pretty weak on planning from College Ave. to Route 16. There's a lot of things that were required as part of the MEPA certificate. Studying the Winthrop Street Station just vanished out of the plan. There was a station between Winthrop -- a combined station Winthrop and College -- that

I-001-149

didn't seem to get any serious consideration. Route 16, which I'm very in favor of, the plans for it to knock down Cummings property, take Elizabeth Grady, I think it's already been established last night at the Council meeting

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-146

The potential future electrification of MBTA Commuter Rail lines in the Study Area is beyond the scope of the Green Line Extension Project. However, the conceptual plans in the DEIR/EA and FEIR do not preclude future electrification of commuter rail.

I-001-147

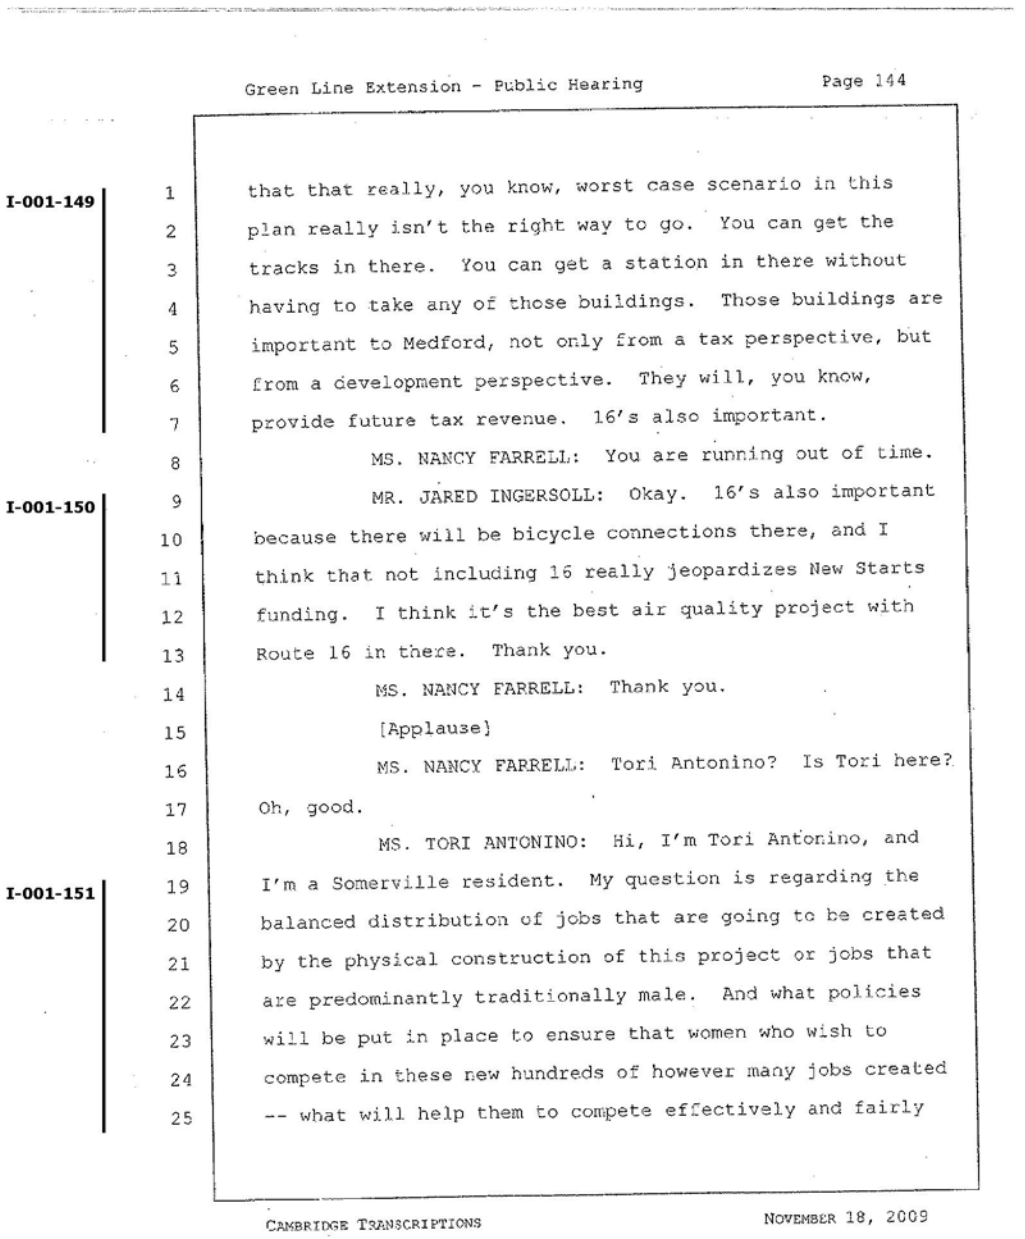
As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

I-001-148

As described in DEIR/EA Appendix B, Section 4.5, MassDOT's analysis and understanding of the ridership market potential concluded that the Winthrop Street area would be best served by a single station in the vicinity of College Avenue and Winthrop Street. As explained in DEIR/EA Section 3.7, the preferred station location is at College Avenue.

I-001-149

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.



Green Line Extension - Public Hearing Page 144

I-001-149

that that really, you know, worst case scenario in this plan really isn't the right way to go. You can get the tracks in there. You can get a station in there without having to take any of those buildings. Those buildings are important to Medford, not only from a tax perspective, but from a development perspective. They will, you know, provide future tax revenue. 16's also important.

MS. NANCY FARRELL: You are running out of time.

I-001-150

MR. JARED INGERSOLL: Okay. 16's also important because there will be bicycle connections there, and I think that not including 16 really jeopardizes New Starts funding. I think it's the best air quality project with Route 16 in there. Thank you.

MS. NANCY FARRELL: Thank you.

[Applause]

MS. NANCY FARRELL: Tori Antonino? Is Tori here? Oh, good.

I-001-151

MS. TORI ANTONINO: Hi, I'm Tori Antonino, and I'm a Somerville resident. My question is regarding the balanced distribution of jobs that are going to be created by the physical construction of this project or jobs that are predominantly traditionally male. And what policies will be put in place to ensure that women who wish to compete in these new hundreds of however many jobs created -- what will help them to compete effectively and fairly

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-150

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

I-001-151

Socioeconomic impacts, including projected effects on businesses, jobs, tax revenues, and community disruptions, are described in DEIR/EA Section 5.3, Socioeconomic Impacts. As required by the Secretary's Certificate on the DEIR/EA, additional analyses of the socioeconomic effects of the maintenance facility alternatives are described in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. A project workshop series will provide an opportunity to discuss broader impacts of the project on job creation, economic development, housing affordability, and other community impacts.

I-001-151

for these jobs? What might the policy makers effect? Shall we like raise Rosie the Riveter or --

MS. NANCY FARRELL: Maybe you didn't come in in the beginning. We're not answering questions tonight, but we will answer your question in writing.

MS. TORI ANTONINO: Oh, can it be a rhetorical --

MS. NANCY FARRELL: Oh, no, it should be answered. It should be a real question.

MS. TORI ANTONINO: I mean, but can you -- all right.

MS. NANCY FARRELL: But we can't answer it tonight because tonight we're just listening.

MS. TORI ANTONINO: All right. Well, there it is.

MS. NANCY FARRELL: Okay. Thank you.

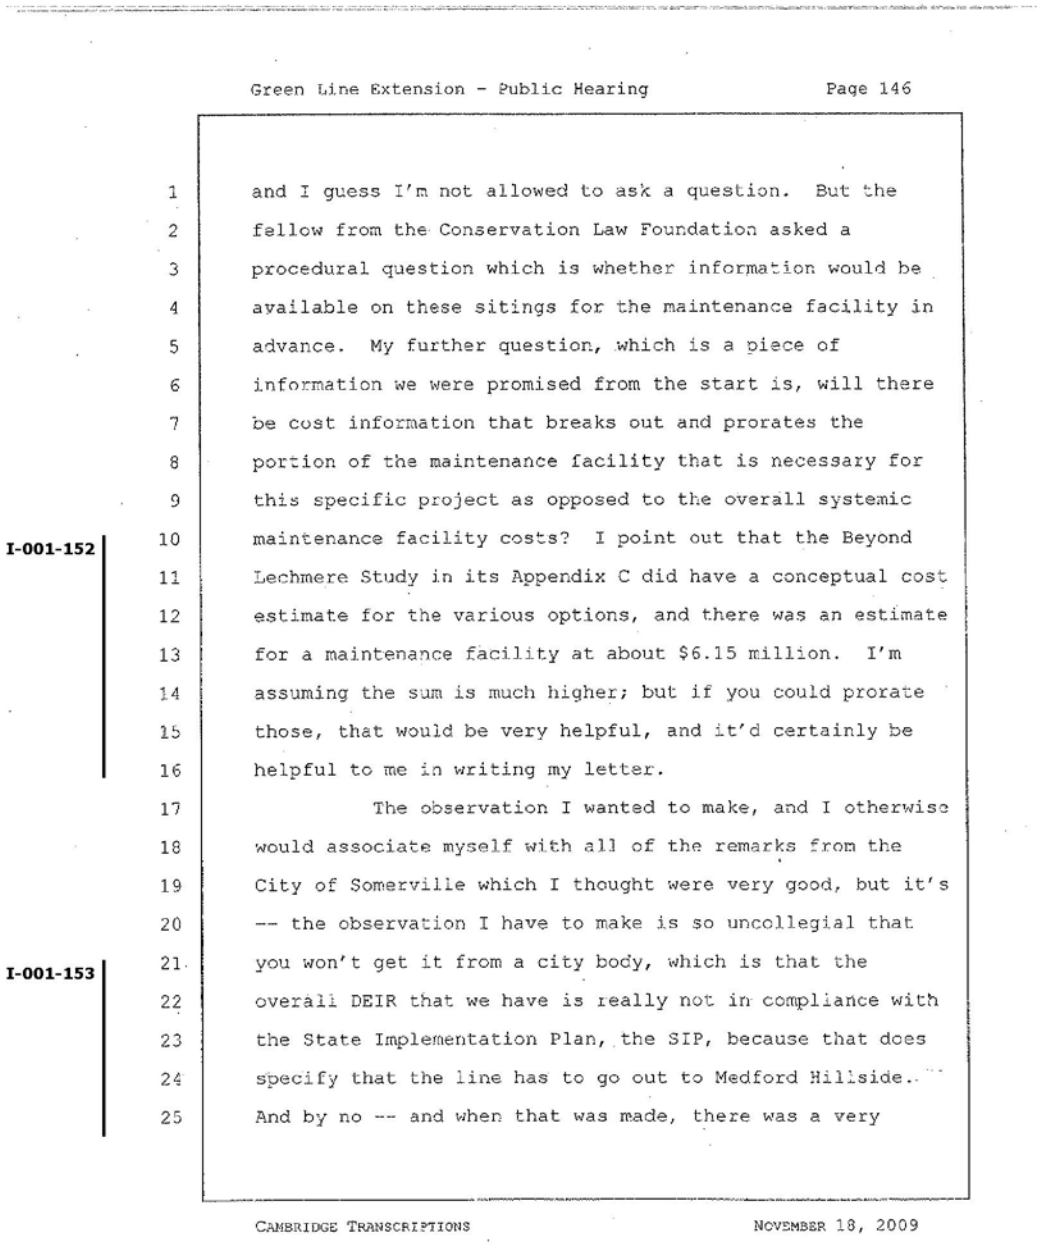
MS. TORI ANTONINO: I'll write a letter.

MS. NANCY FARRELL: Okay. Great.

MS. TORI ANTONINO: Thanks.

MS. NANCY FARRELL: No -- well, okay. Thank you. Lee?

MR. LEE AUSPITZ: I'm Lee Auspitz. I've been on the Citizen Advisory Committee for this project and for the precursor project, Beyond Lechmere Study. And I guess the Mayor honored me with these appointments because I had also been involved in the Davis Square activity for a long time,



Green Line Extension - Public Hearing Page 146

and I guess I'm not allowed to ask a question. But the fellow from the Conservation Law Foundation asked a procedural question which is whether information would be available on these sitings for the maintenance facility in advance. My further question, which is a piece of information we were promised from the start is, will there be cost information that breaks out and prorates the portion of the maintenance facility that is necessary for this specific project as opposed to the overall systemic maintenance facility costs? I point out that the Beyond Lechmere Study in its Appendix C did have a conceptual cost estimate for the various options, and there was an estimate for a maintenance facility at about $6.15 million. I'm assuming the sum is much higher; but if you could prorate those, that would be very helpful, and it'd certainly be helpful to me in writing my letter.

I-001-152

The observation I wanted to make, and I otherwise would associate myself with all of the remarks from the City of Somerville which I thought were very good, but it's -- the observation I have to make is so uncollegial that you won't get it from a city body, which is that the overall DEIR that we have is really not in compliance with the State Implementation Plan, the SIP, because that does specify that the line has to go out to Medford Hillside. And by no -- and when that was made, there was a very

I-001-153

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

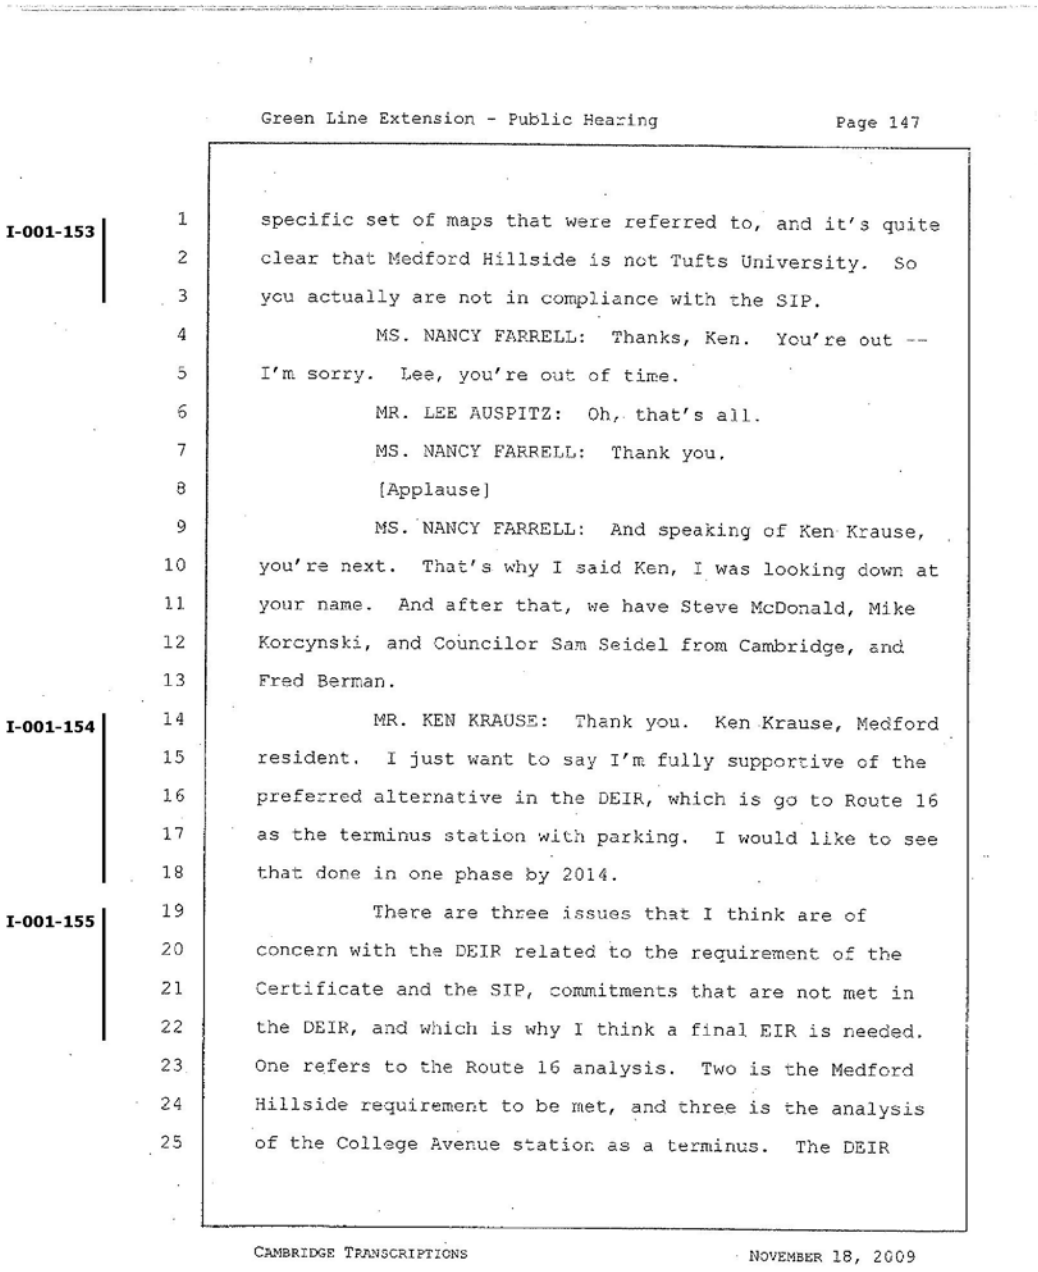
I-001-152

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-001-153

Since the release of the DEIR/EA, a few stakeholders raised concerns that the proposed College Avenue Station, serving as a terminal station for the Proposed Project, would not adequately serve the Medford Hillside neighborhood. Serving this neighborhood was identified as part of the SIP description. To address and resolve these concerns, CTPS prepared a memorandum demonstrating that the College Avenue Station location does adequately serve the walk market area for the Medford Hillside neighborhood. This memorandum is provided in Appendix C of the FEIR.



Green Line Extension - Public Hearing Page 147

I-001-153

specific set of maps that were referred to, and it's quite clear that Medford Hillside is not Tufts University. So you actually are not in compliance with the SIP.

MS. NANCY FARRELL: Thanks, Ken. You're out -- I'm sorry. Lee, you're out of time.

MR. LEE AUSPITZ: Oh, that's all.

MS. NANCY FARRELL: Thank you.

[Applause]

MS. NANCY FARRELL: And speaking of Ken Krause, you're next. That's why I said Ken, I was looking down at your name. And after that, we have Steve McDonald, Mike Korcynski, and Councilor Sam Seidel from Cambridge, and Fred Berman.

I-001-154

MR. KEN KRAUSE: Thank you. Ken Krause, Medford resident. I just want to say I'm fully supportive of the preferred alternative in the DEIR, which is go to Route 16 as the terminus station with parking. I would like to see that done in one phase by 2014.

I-001-155

There are three issues that I think are of concern with the DEIR related to the requirement of the Certificate and the SIP, commitments that are not met in the DEIR, and which is why I think a final EIR is needed. One refers to the Route 16 analysis. Two is the Medford Hillside requirement to be met, and three is the analysis of the College Avenue station as a terminus. The DEIR

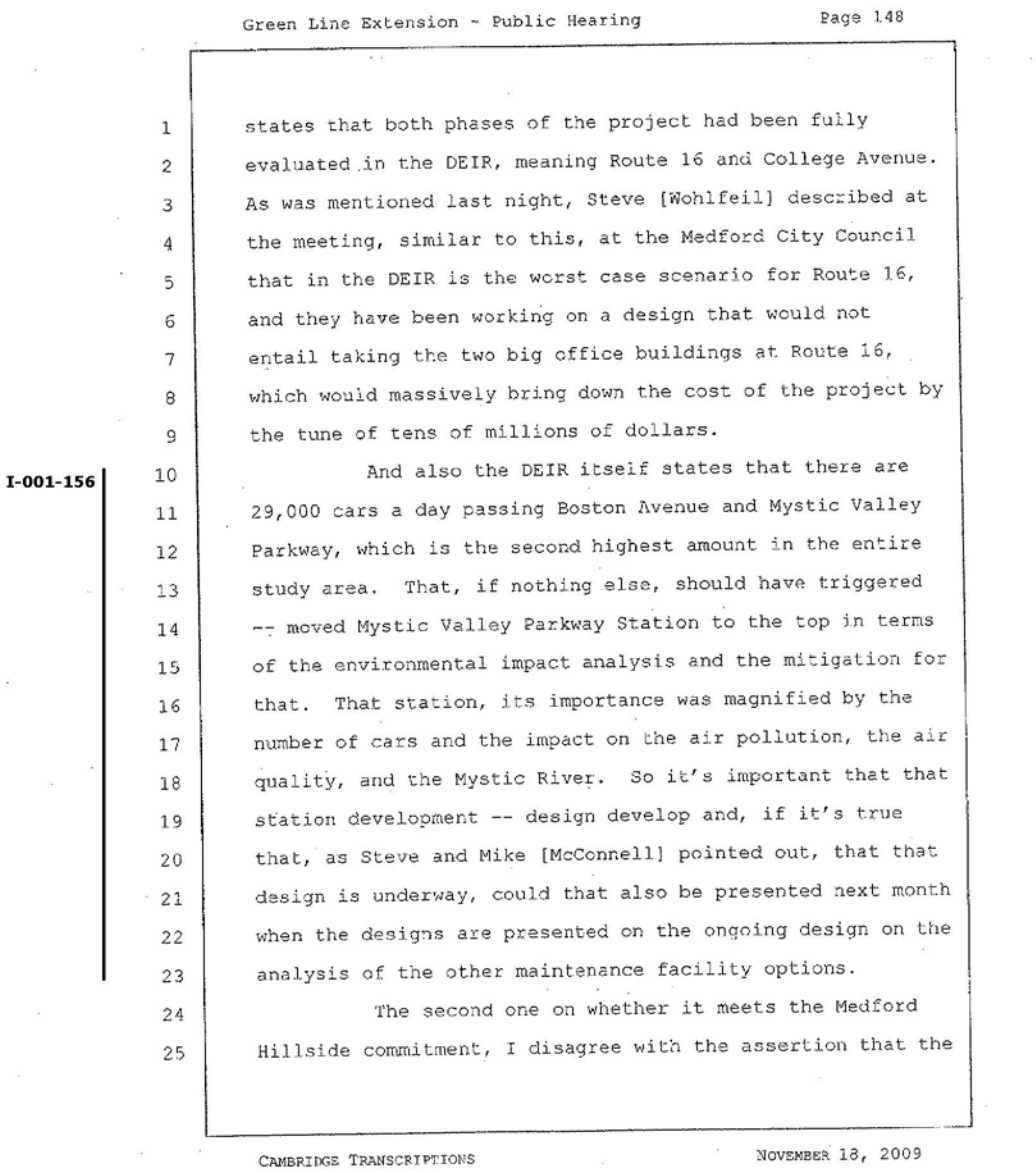
CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-154

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-001-155

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.



Green Line Extension - Public Hearing Page 148

states that both phases of the project had been fully evaluated in the DEIR, meaning Route 16 and College Avenue. As was mentioned last night, Steve [Wohlfeil] described at the meeting, similar to this, at the Medford City Council that in the DEIR is the worst case scenario for Route 16, and they have been working on a design that would not entail taking the two big office buildings at Route 16, which would massively bring down the cost of the project by the tune of tens of millions of dollars.

I-001-156

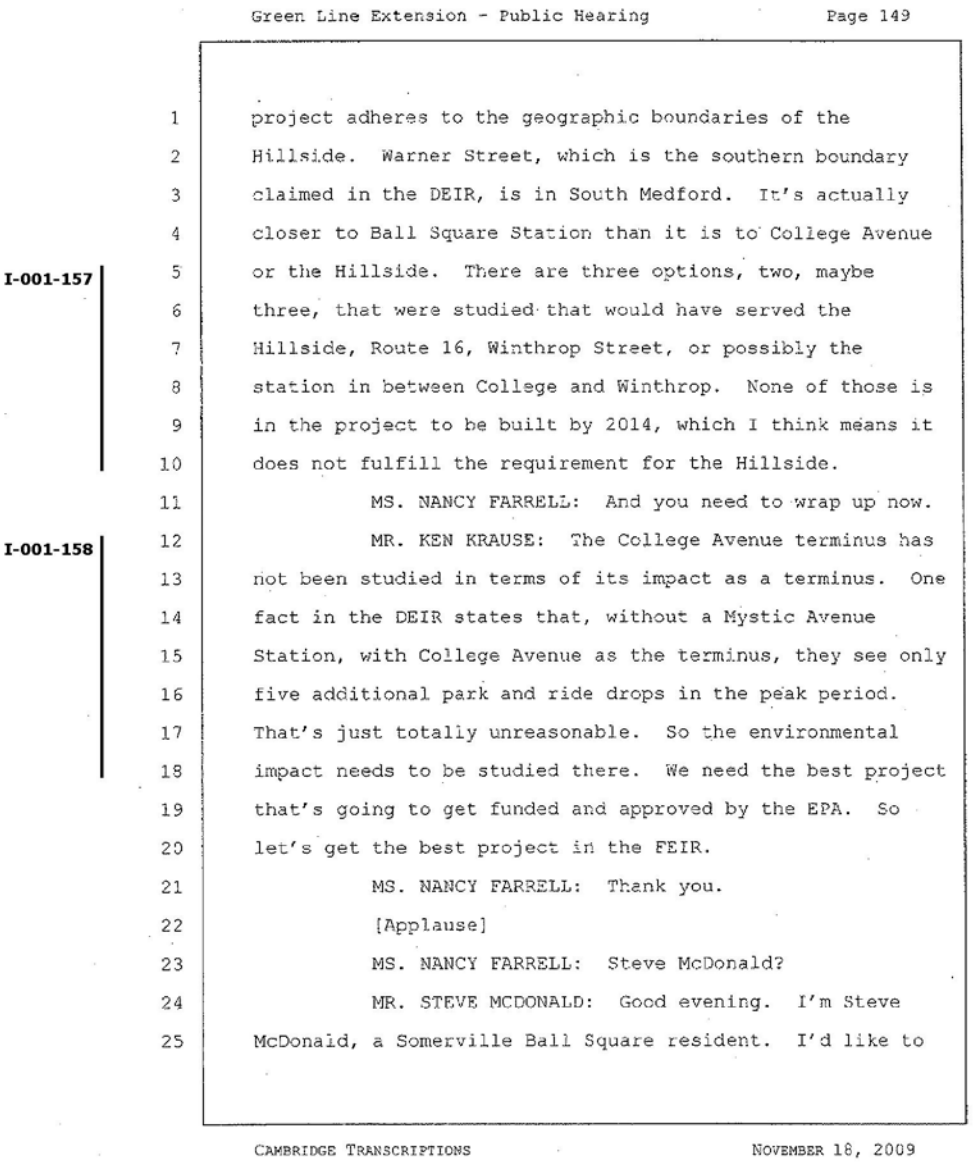
And also the DEIR itself states that there are 29,000 cars a day passing Boston Avenue and Mystic Valley Parkway, which is the second highest amount in the entire study area. That, if nothing else, should have triggered -- moved Mystic Valley Parkway Station to the top in terms of the environmental impact analysis and the mitigation for that. That station, its importance was magnified by the number of cars and the impact on the air pollution, the air quality, and the Mystic River. So it's important that that station development -- design develop and, if it's true that, as Steve and Mike [McConnell] pointed out, that that design is underway, could that also be presented next month when the designs are presented on the ongoing design on the analysis of the other maintenance facility options.

The second one on whether it meets the Medford Hillside commitment, I disagree with the assertion that the

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-156

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. The Proposed Project, with a terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (MassDEP DEIR/EA comment letter, January 8, 2010).



Green Line Extension - Public Hearing Page 149

project adheres to the geographic boundaries of the Hillside. Warner Street, which is the southern boundary claimed in the DEIR, is in South Medford. It's actually closer to Ball Square Station than it is to College Avenue or the Hillside. There are three options, two, maybe three, that were studied that would have served the Hillside, Route 16, Winthrop Street, or possibly the station in between College and Winthrop. None of those is in the project to be built by 2014, which I think means it does not fulfill the requirement for the Hillside.

MS. NANCY FARRELL: And you need to wrap up now.

MR. KEN KRAUSE: The College Avenue terminus has not been studied in terms of its impact as a terminus. One fact in the DEIR states that, without a Mystic Avenue Station, with College Avenue as the terminus, they see only five additional park and ride drops in the peak period. That's just totally unreasonable. So the environmental impact needs to be studied there. We need the best project that's going to get funded and approved by the EPA. So let's get the best project in the FEIR.

MS. NANCY FARRELL: Thank you.

[Applause]

MS. NANCY FARRELL: Steve McDonald?

MR. STEVE MCDONALD: Good evening. I'm Steve McDonald, a Somerville Ball Square resident. I'd like to

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-157

I-001-158

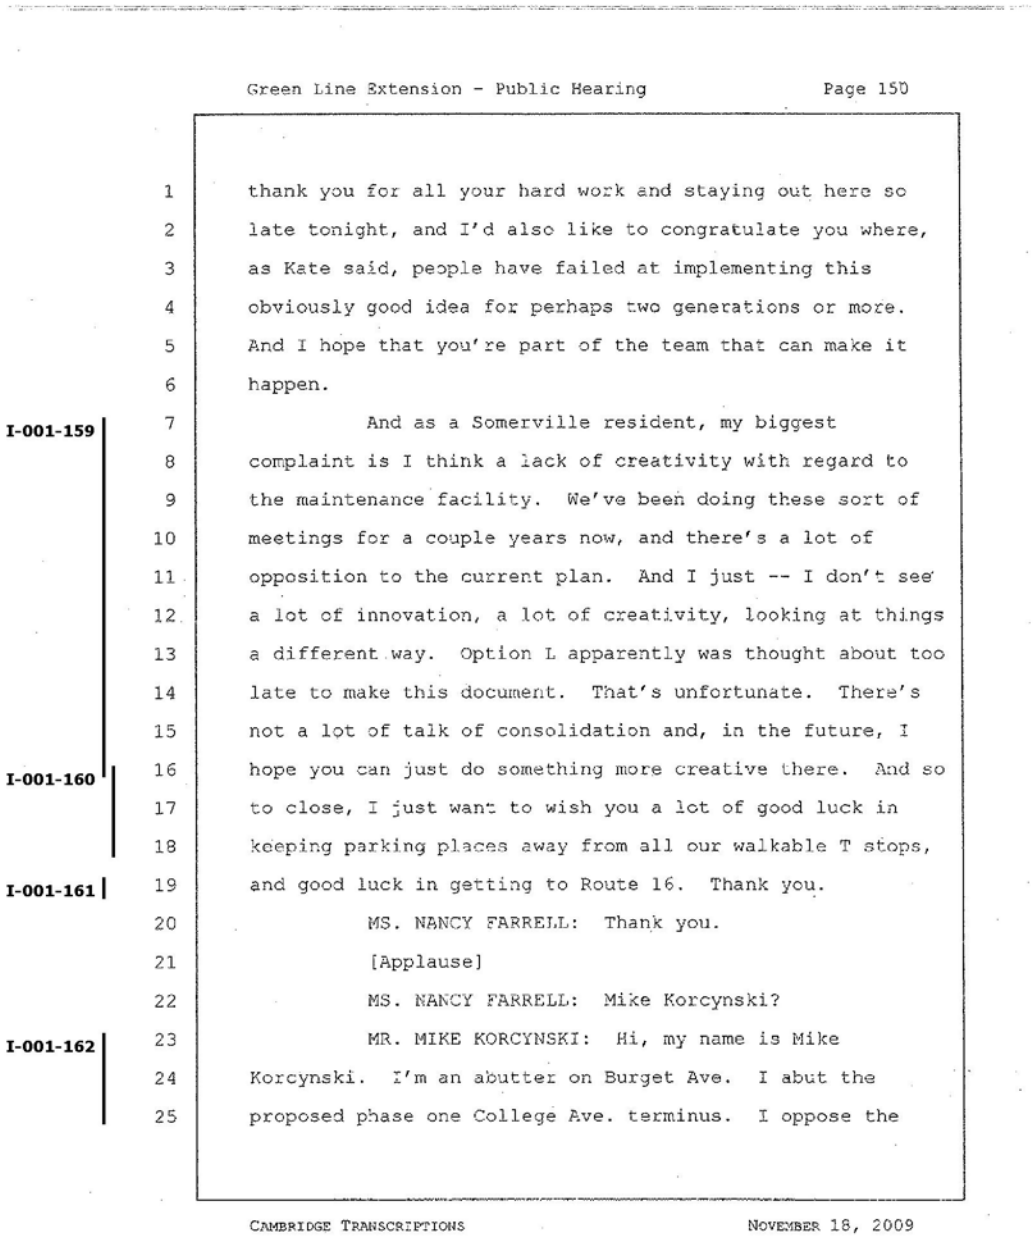
I-001-157

As directed by the Secretary's Certificate on the DEIR/EA, the FEIR includes a limited scope of issues related to the Green Line Extension Project. The Proposed Project, with a Medford Branch terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Although an extension to Mystic Valley Parkway/Route 16 is MassDOT's Preferred Alternative, financial constraints prohibit the Commonwealth from progressing the Project beyond College Avenue at this time.

Since the release of the DEIR/EA, a few stakeholders raised concerns that the proposed College Avenue Station, serving as a terminal station for the Proposed Project, would not adequately serve the Medford Hillside neighborhood. Serving this neighborhood was identified as part of the SIP description. To address and resolve these concerns, CTPS prepared a memorandum demonstrating that the College Avenue Station location does adequately serve the walk market area for the Medford Hillside neighborhood. This memorandum is provided in Appendix C of the FEIR.

I-001-158

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.



Green Line Extension - Public Hearing Page 150

thank you for all your hard work and staying out here so late tonight, and I'd also like to congratulate you where, as Kate said, people have failed at implementing this obviously good idea for perhaps two generations or more. And I hope that you're part of the team that can make it happen.

I-001-159 And as a Somerville resident, my biggest complaint is I think a lack of creativity with regard to the maintenance facility. We've been doing these sort of meetings for a couple years now, and there's a lot of opposition to the current plan. And I just -- I don't see a lot of innovation, a lot of creativity, looking at things a different way. Option L apparently was thought about too late to make this document. That's unfortunate. There's not a lot of talk of consolidation and, in the future, I

I-001-160 hope you can just do something more creative there. And so to close, I just want to wish you a lot of good luck in keeping parking places away from all our walkable T stops,

I-001-161 and good luck in getting to Route 16. Thank you.

MS. NANCY FARRELL: Thank you.

[Applause]

MS. NANCY FARRELL: Mike Korcynski?

I-001-162 MR. MIKE KORCYNSKI: Hi, my name is Mike Korcynski. I'm an abutter on Burget Ave. I abut the proposed phase one College Ave. terminus. I oppose the

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-159

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-001-160

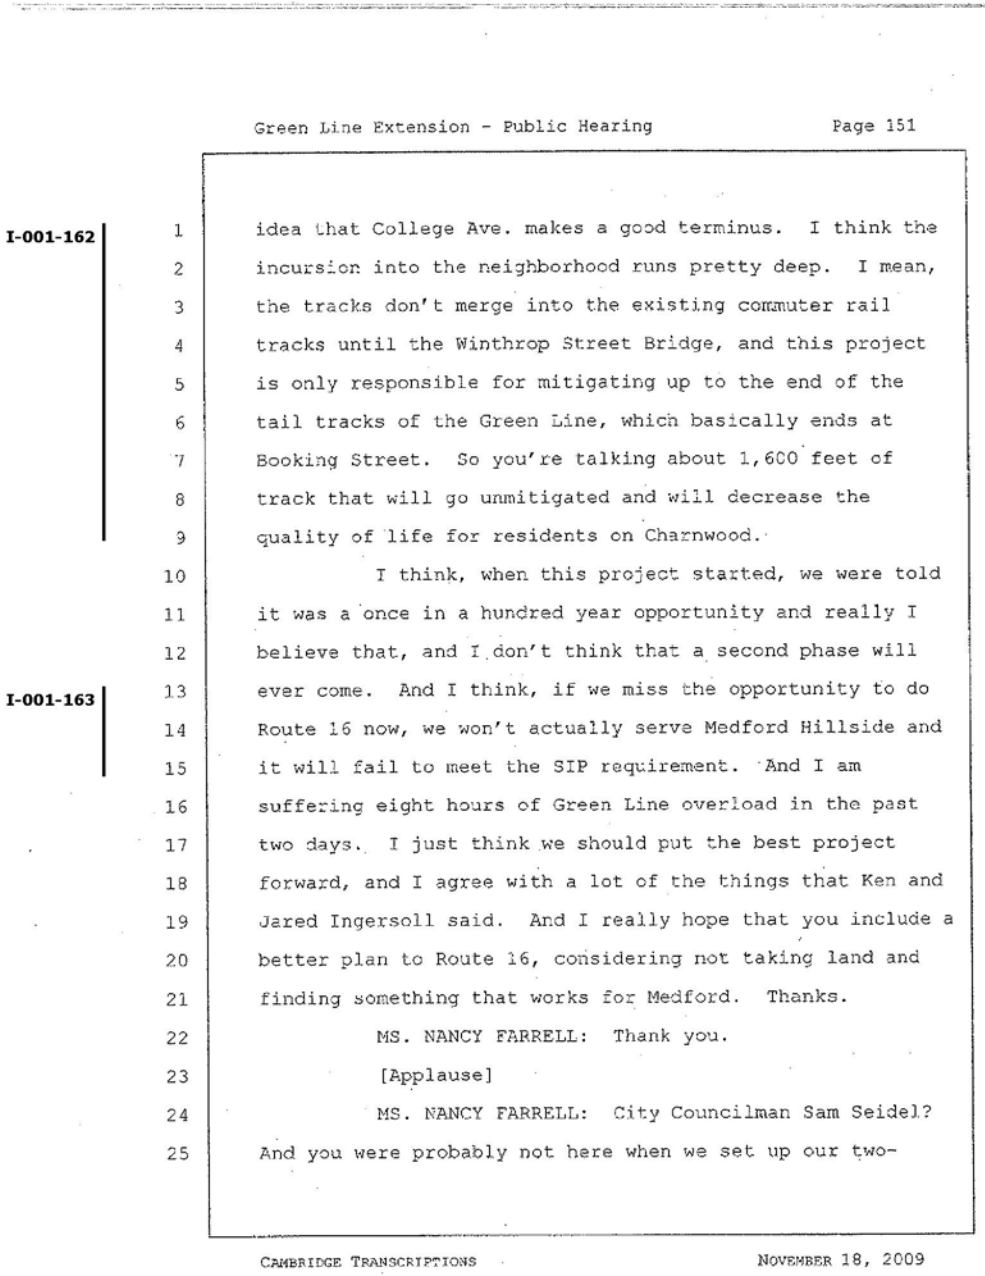
The Project is intended, in part, to relieve traffic congestion, as described in DEIR/EA Chapter 2, Purpose and Need. Some station access points for passenger drop-off/pick-up are likely to impact local traffic flow, as outlined in DEIR/EA Section 5.5, Traffic. As described in DEIR/EA Chapter 6, these impacts will be minimized to the extent practical. However, with the exception of relocated Lechmere Station, no parking is provided at any of the new Green Line Extension stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes how MassDOT will coordinate with municipalities and stakeholders to address traffic and parking concerns. Additionally, FEIR Chapter 4 summarizes the impacts of College Avenue as a terminal station.

I-001-161

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

I-001-162

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.



Green Line Extension - Public Hearing Page 151

I-001-162

idea that College Ave. makes a good terminus. I think the incursion into the neighborhood runs pretty deep. I mean, the tracks don't merge into the existing commuter rail tracks until the Winthrop Street Bridge, and this project is only responsible for mitigating up to the end of the tail tracks of the Green Line, which basically ends at Booking Street. So you're talking about 1,600 feet of track that will go unmitigated and will decrease the quality of life for residents on Charnwood.

I think, when this project started, we were told it was a once in a hundred year opportunity and really I believe that, and I don't think that a second phase will

I-001-163

ever come. And I think, if we miss the opportunity to do Route 16 now, we won't actually serve Medford Hillside and it will fail to meet the SIP requirement. And I am suffering eight hours of Green Line overload in the past two days. I just think we should put the best project forward, and I agree with a lot of the things that Ken and Jared Ingersoll said. And I really hope that you include a better plan to Route 16, considering not taking land and finding something that works for Medford. Thanks.

MS. NANCY FARRELL: Thank you.

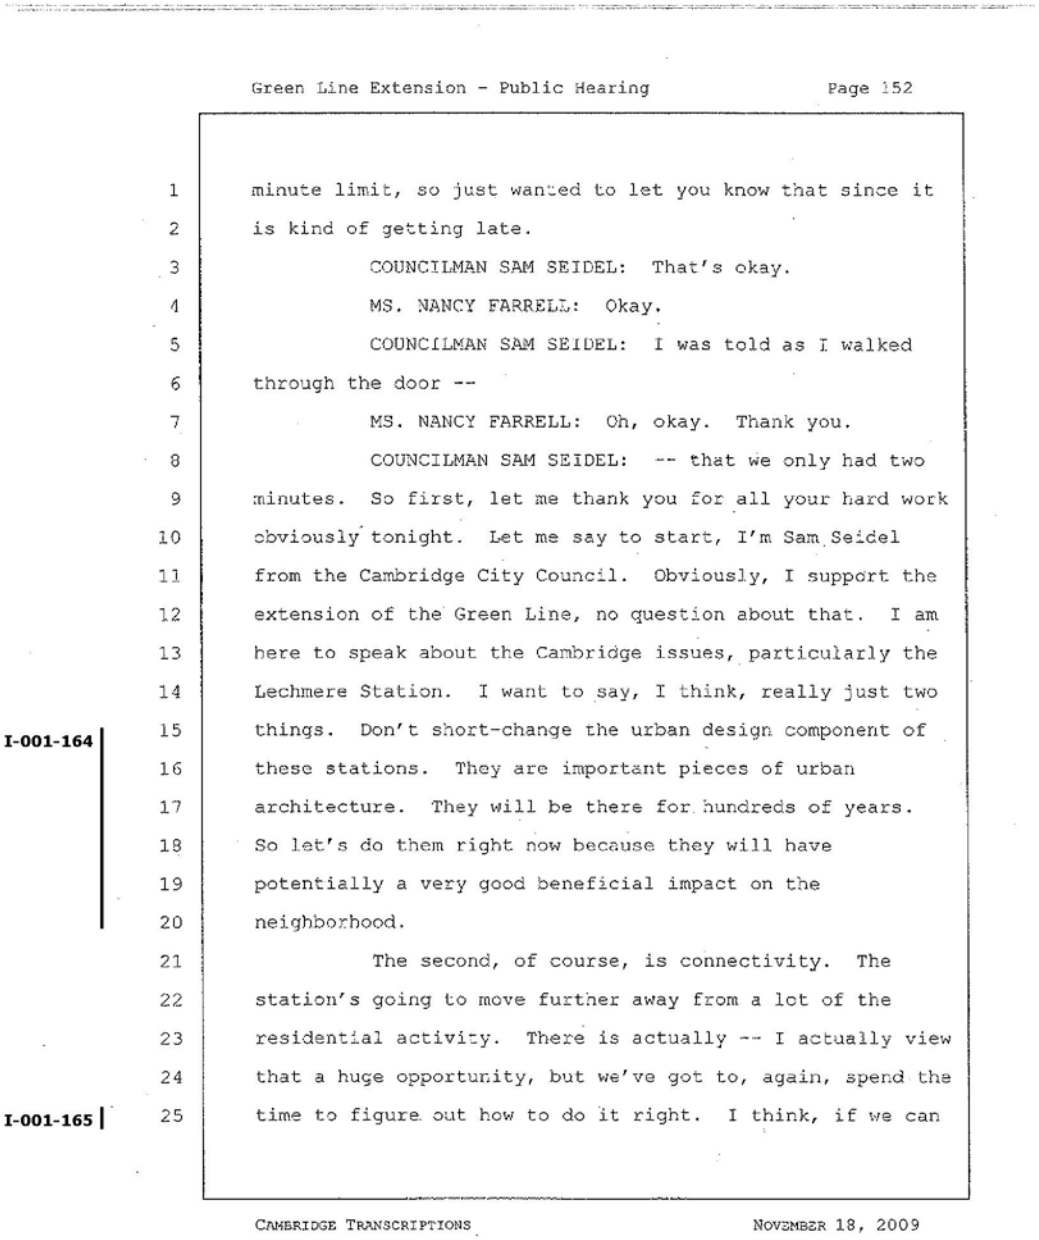
[Applause]

MS. NANCY FARRELL: City Councilman Sam Seidel? And you were probably not here when we set up our two-

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-163

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. The Proposed Project, with a terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Additionally, FEIR Chapter 4 includes a detailed description of College Avenue Station functioning as a terminal station.



Green Line Extension - Public Hearing Page 152

minute limit, so just wanted to let you know that since it is kind of getting late.

COUNCILMAN SAM SEIDEL: That's okay.

MS. NANCY FARRELL: Okay.

COUNCILMAN SAM SEIDEL: I was told as I walked through the door --

MS. NANCY FARRELL: Oh, okay. Thank you.

COUNCILMAN SAM SEIDEL: -- that we only had two minutes. So first, let me thank you for all your hard work obviously tonight. Let me say to start, I'm Sam Seidel from the Cambridge City Council. Obviously, I support the extension of the Green Line, no question about that. I am here to speak about the Cambridge issues, particularly the Lechmere Station. I want to say, I think, really just two things. Don't short-change the urban design component of these stations. They are important pieces of urban architecture. They will be there for hundreds of years. So let's do them right now because they will have potentially a very good beneficial impact on the neighborhood.

The second, of course, is connectivity. The station's going to move further away from a lot of the residential activity. There is actually -- I actually view that a huge opportunity, but we've got to, again, spend the time to figure out how to do it right. I think, if we can

I-001-164

I-001-165

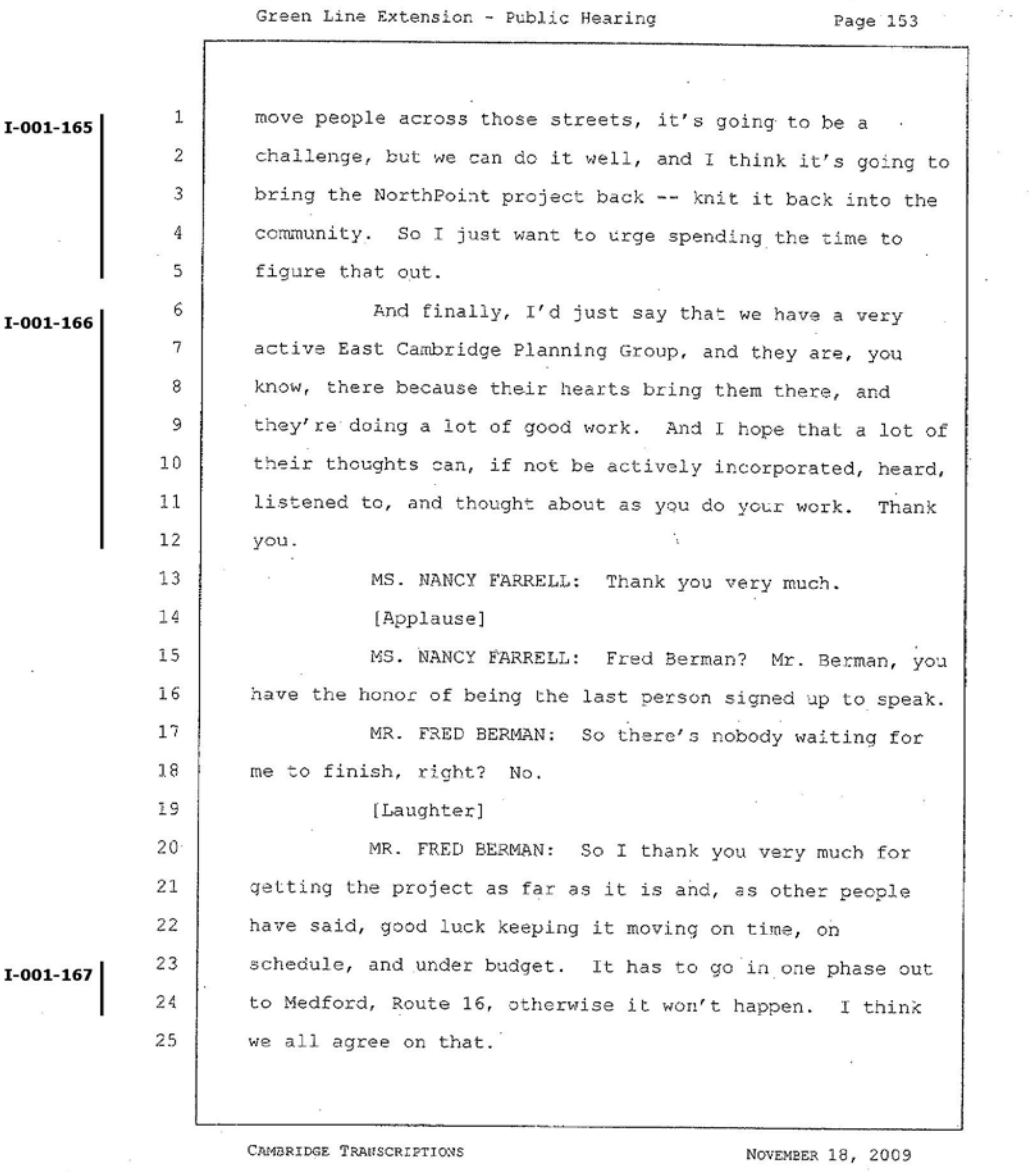
CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-164

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. These stations are designed to be consistent with MBTA standards and compliant with ADA. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-001-165

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. The chapter presents a traffic analysis, a detailed description of pedestrian crossings of O'Brien Highway, and proposed roadway, crosswalk, and sidewalk improvements that are consistent with the NorthPoint development plans. These station and street plans will be further refined in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.



Green Line Extension - Public Hearing Page 153

move people across those streets, it's going to be a challenge, but we can do it well, and I think it's going to bring the NorthPoint project back -- knit it back into the community. So I just want to urge spending the time to figure that out.

And finally, I'd just say that we have a very active East Cambridge Planning Group, and they are, you know, there because their hearts bring them there, and they're doing a lot of good work. And I hope that a lot of their thoughts can, if not be actively incorporated, heard, listened to, and thought about as you do your work. Thank you.

MS. NANCY FARRELL: Thank you very much.

[Applause]

MS. NANCY FARRELL: Fred Berman? Mr. Berman, you have the honor of being the last person signed up to speak.

MR. FRED BERMAN: So there's nobody waiting for me to finish, right? No.

[Laughter]

MR. FRED BERMAN: So I thank you very much for getting the project as far as it is and, as other people have said, good luck keeping it moving on time, on schedule, and under budget. It has to go in one phase out to Medford, Route 16, otherwise it won't happen. I think we all agree on that.

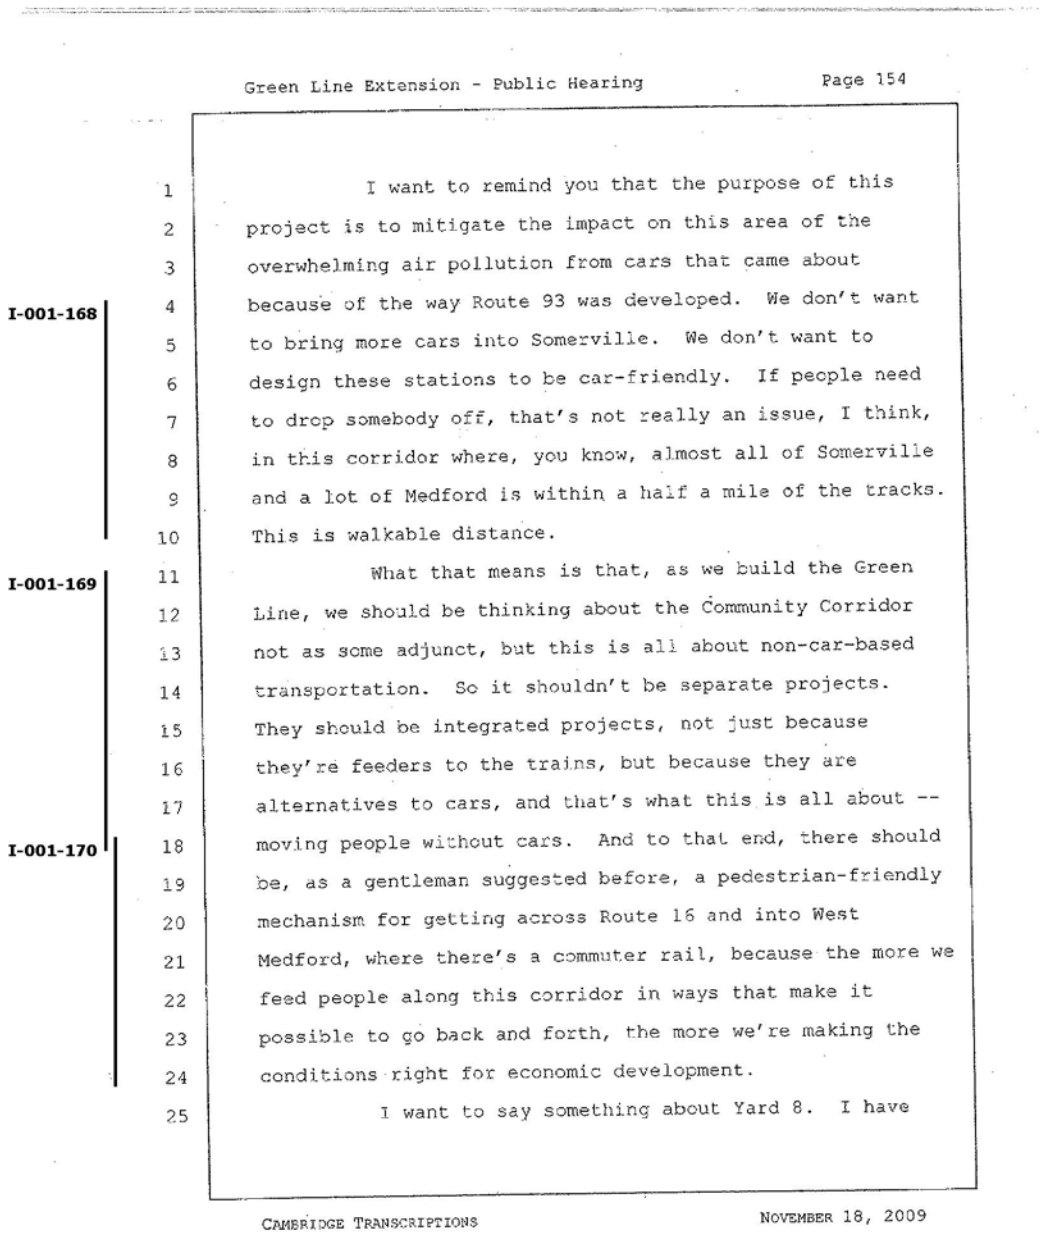
CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-166

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-001-167

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.



Green Line Extension - Public Hearing Page 154

I-001-168 I want to remind you that the purpose of this project is to mitigate the impact on this area of the overwhelming air pollution from cars that came about because of the way Route 93 was developed. We don't want to bring more cars into Somerville. We don't want to design these stations to be car-friendly. If people need to drop somebody off, that's not really an issue, I think, in this corridor where, you know, almost all of Somerville and a lot of Medford is within a half a mile of the tracks. This is walkable distance.

I-001-169 What that means is that, as we build the Green Line, we should be thinking about the Community Corridor not as some adjunct, but this is all about non-car-based transportation. So it shouldn't be separate projects. They should be integrated projects, not just because they're feeders to the trains, but because they are alternatives to cars, and that's what this is all about --

I-001-170 moving people without cars. And to that end, there should be, as a gentleman suggested before, a pedestrian-friendly mechanism for getting across Route 16 and into West Medford, where there's a commuter rail, because the more we feed people along this corridor in ways that make it possible to go back and forth, the more we're making the conditions right for economic development.

I want to say something about Yard 8. I have

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-168

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

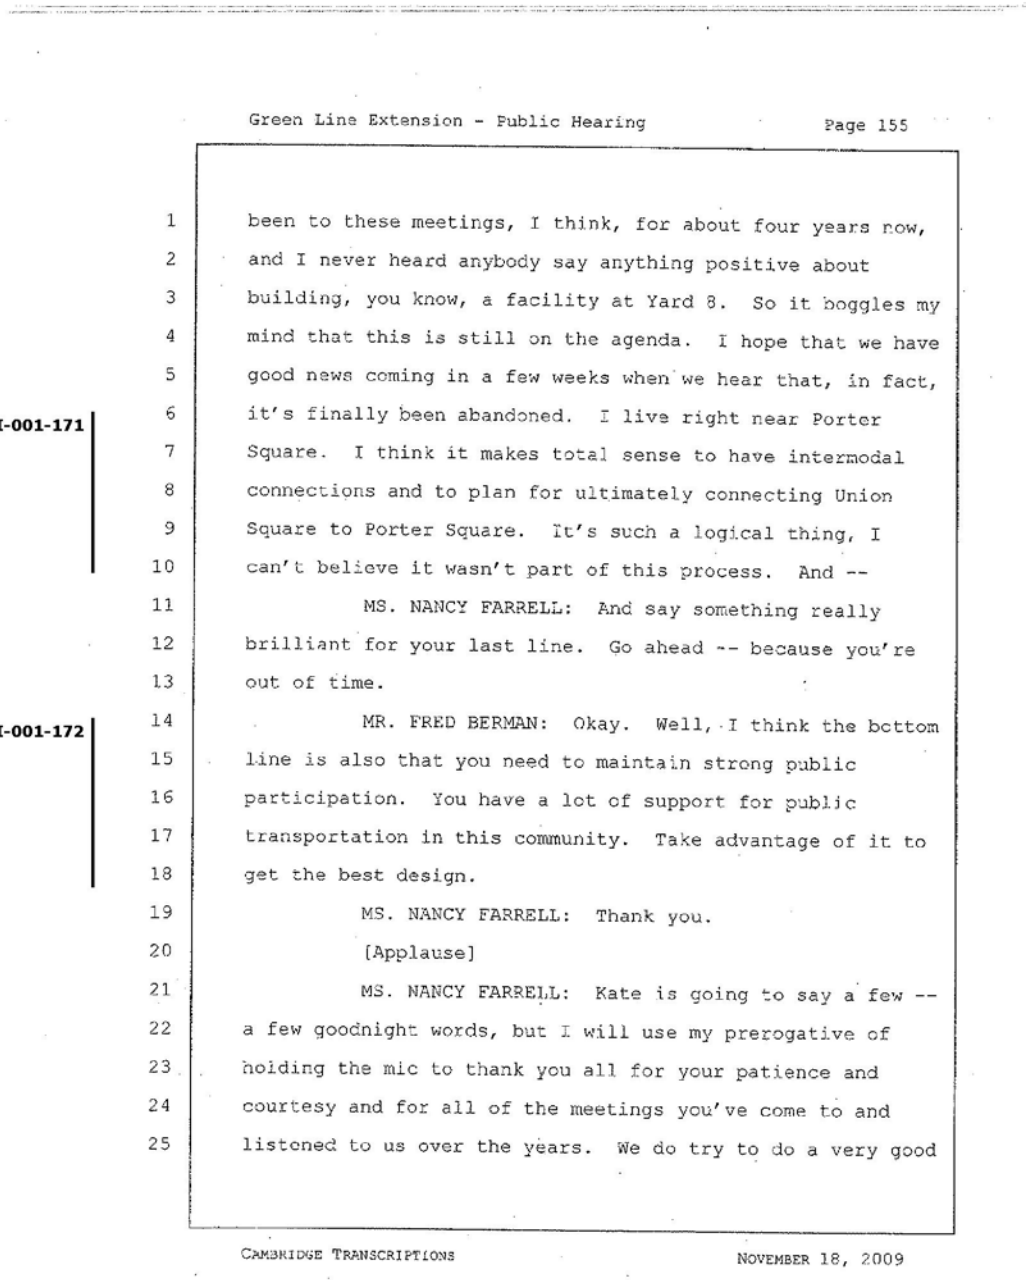
In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-001-169

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-001-170

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the



Green Line Extension - Public Hearing Page 155

been to these meetings, I think, for about four years now, and I never heard anybody say anything positive about building, you know, a facility at Yard 8. So it boggles my mind that this is still on the agenda. I hope that we have good news coming in a few weeks when we hear that, in fact, it's finally been abandoned. I live right near Porter Square. I think it makes total sense to have intermodal connections and to plan for ultimately connecting Union Square to Porter Square. It's such a logical thing, I can't believe it wasn't part of this process. And --

MS. NANCY FARRELL: And say something really brilliant for your last line. Go ahead -- because you're out of time.

MR. FRED BERMAN: Okay. Well, I think the bottom line is also that you need to maintain strong public participation. You have a lot of support for public transportation in this community. Take advantage of it to get the best design.

MS. NANCY FARRELL: Thank you.

[Applause]

MS. NANCY FARRELL: Kate is going to say a few -- a few goodnight words, but I will use my prerogative of holding the mic to thank you all for your patience and courtesy and for all of the meetings you've come to and listened to us over the years. We do try to do a very good

CAMBRIDGE TRANSCRIPTIONS NOVEMBER 18, 2009

I-001-171

I-001-172

proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-001-171

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

I-001-172

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

job. We're not perfect, but we thank you for all your good ideas. Kate?

MS. KATHERINE FICHTER: I wanted to say you guys are the few and the proud to still be here. Forgive me if I'm not quite as peppy as I was four hours ago, but I did have a couple of points I wanted to clarify, a few things to sum up, and just a little bit about next steps. And I was sort of jotting down that people said that really resonated with me that I just kind of wanted to come back to.

The first, actually, was Councilor Seidel, who make a really interesting point and I think a very valuable point, which is I want people to understand that, when we come to these meetings, when we read your letters, when we read your emails, and we see you in the newspaper, and we read you in the blogs, we hear you, we understand you, you influence our thinking. Just because we don't always take suggestions that people make doesn't mean that we don't hear you and doesn't mean that we don't care. It means that there may be other constraints that we're dealing with or other things that we're trying to balance or compromise. So I just wanted to get that point out there.

I also liked the point that Jim, I believe, made about trust and that we also feel that the trust is not what it should be here, and we want to keep working on

that. We try to work on it every single day with every email that we answer and every phone call we take, and we're going to keep doing that as we move into the next phases of this process.

Just a point of clarification about the DEIR, it is true that we have requested that what we have submitted so far be considered as we call a "Single EIR," which essentially means that we would be coming to the end of the process here. We've done this largely because we think we've done a good job and also because we have a schedule that we need to meet, and that helps us to get there. The point I wanted to make is that, even if we are to be granted that, and there's certainly no guarantee that we will be, that doesn't mean that the process stops. We still have responsibility to answer all of the comments we've heard here, answer all the comments that we receive through the mail, and that's not just a yes or no answer. That's a detailed answer. So I don't want anyone to walk away tonight thinking that, if we are granted the SEIR, it means that you'll never hear from us again or we'll never continue to work on what we've about because that's not the case.

A few other just sort of general issues in no particular order, so please be patient. But the issue of mitigation, somebody raised mitigation as a method for

correcting existing problems. Typically, the way we deal with mitigation is we are responsible for mitigating the impact we cause with our project. We are neither able nor really responsible to go in and solve a lot of longstanding problems that may not really have anything to do with the Green Line. Would that we could, and we know municipalities have needs. We wish that we could do those and, where there's an overlap, that's a happy coincidence. But at the bottom, our responsibility is to try to correct the problems we cause, not correct other ones.

We hear you on the buses. We're going to keep working on that. We're going to keep trying to make the bus connections as good as we can to the rail. One point I did want to keep in mind, someone early on had mentioned the importance of having bus pullouts at all of the stations. We are very sensitive to not wanting to take more private property than we need to. The bigger the footprint of the stations, that's something we need to think about. So again, there's just a balance there.

The question of women's jobs, that actually has come up recently on another project we're working on. So we're beginning to try to figure out what we are allowed to do under state and federal law to try to influence how jobs are assigned on the construction level. That's something we're going to keep working on in general, and it's

certainly something we can look at for the Green Line.

The idea of introducing mitigation before we begin construction, that was something we first heard at a meeting at Brickbottom. We think it's brilliant. We're going to try to do it where it's appropriate, where it's possible. You know, if we can put in mitigation that helps to soothe people through the construction process, that's all to the good for us, too.

Somebody said earlier that it seemed like we were designing the stations to be auto-oriented. I could not disagree with that more. These stations are the farthest possible thing from being car-oriented. Everything about this project is the farthest possible thing from being car-oriented. If we are looking to provide a safe place for people to do very quick pickup and drop-off, it does not mean that we are prejudicing cars over transit. This is a transit project. We're coming at this as a bicycle, pedestrian, neighborhood station kind of project, and I don't want anyone thinking that we're doing this to favor cars because we're not

And also on that note, while it is true that DEIR does discuss the analysis that we did more than a year ago now, I think, on the possibility of a parking garage at Route 16, we abandoned that idea a long time ago. We have said that publicly. We are not going to reconsider it.

There is not going to be a big parking garage at Route 16/Mystic Valley Parkway when that station gets built. So please, if you hear anybody saying that, please correct them.

What are some of the other things? Yes, someone asked about doing detours during the construction phase to try to keep traffic off residential streets. That's certainly something we care about, certainly something that we'll be working on.

Someone also mentioned green design. That was something that was actually in the original MEPA Certificate. It's something we've always had in mind and something we're going to be continuing to look at as we move into preliminary engineering and then beyond.

Also, on Option L, which has been talked about a lot tonight, somebody mentioned the property impacts on Option L. I think it was Tom Bent. Our preliminary analysis, which I think will hold true through the end, is Option L would require the taking of two private businesses and one parking lot. I think it was described as a significant impact. That's all relative, but that's what it is. It's two businesses and a parking lot.

Somebody said that I said something about believing that Mirror H blocked -- I don't what. Whatever it was, I didn't say it. I didn't say anything one way or

the other about whether or not one of the maintenance facility locations blocked economic development.

And are the guys who had the eleven principles still here? No? Okay. I wanted to say to them, and I'll say to everybody else, my name, my email address, is on the Fact Sheet. A lot of people know me, and a lot of people have it. If you have a group that wants us to come out and talk to them, if you have a group that's interested in our project who we haven't reached, we've done dozens -- more than dozens -- of meetings, but we always want to do more. So please contact me. Don't sit out there and think that we haven't reached out to you, reach out to us. We'll do whatever we can. I don't think we've ever turned down a request or an invitation, and we don't plan to do it in the future.

And I think that's enough for now. Thank you, everybody. We really appreciate it. We love this project. We want to keep working on it. We want to keep working with you, and please get home safe.

[Applause]

Subject: Medford green line extension: pubic comment

January 1, 2010
Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:
I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.
First of all, I strongly support the Green Line extension, and urge that it be built in the most practical, beneficial and cost-effective manner – that is, to construct the entire project in one phase, with a terminus station at Mystic Valley Parkway (Route 16), by December 31, 2014. The DEIR is encouraging in that it concludes that the Route 16 station would provide the most benefits according to all project criteria, including air quality and environmental justice. However, MassDOT states that it is incapable of building (and funding) the entire "Preferred Alternative," so it only intends to build the extension to College Avenue in the Tufts University area of Medford, by its deadline of December 31, 2014. In my opinion, the DEIR as currently written does not serve the best interests of the project. More importantly for your review, it was not done in a way that "adequately and properly" complies with the state environmental regulations, nor with the December 1, 2006 MEPA certificate that defined the requirements of the DEIR. For the following reasons, I strongly urge you to not accept the DEIR as the Final EIR and require further environmental analysis of the project by MassDOT:

I-002-001

1. A two-phased approach is unacceptable. The Route 16/Mystic Valley Parkway Station should be built as part of a single-phase project to minimize costs and negative impacts and achieve the maximum benefits with regard to ridership, vehicle mile travel reduction, air quality improvements, and service to environmental justice communities. The recommendation as outlined in the DEIR is for the Route 16/Mystic Valley Parkway station to be a separate stand-alone Phase II project with no funding source identified. This means, Route 16 may never be built.

I-002-002

There are many, many problems with the Phase II approach, including:

- Risk. Without an identified funding source there is a very high probability that Route16 will never be built and the implications of this are critical.

I-002-003

- Terminus Impact. Without a Route 16 Station, the College Avenue stop (designed and intended to be an interim station) would become the de facto terminus for the Green Line extension. It is not

I-002-004

I-002-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

I-002-002

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-002-003

MassDOT will continue to work with MAPC and the Legislature to identify funding opportunities for the extension to Mystic Valley Parkway/Route 16.

I-002-004

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-002-004 designed for a terminus and due to the traffic flow and neighborhood density, as well as the lack of opportunity for transit-oriented development at College Ave., it is not a good location for a terminus.

I-002-005 • Cost. The two-phased approach is fiscally irresponsible and by MassDOT's own estimates will inflate the cost by $55 million over a single-phase approach. Severing a single stop (less than one mile of track) from the project as a whole will cost the state, and thus the taxpayers, significant additional money. There are obvious ways to easily reduce costs in the overall project and provide enough additional funds to include Route 16 as part of a single, complete project. This is the most prudent approach, and also would ensure that the project produces the air quality improvements the Commonwealth must achieve to come into compliance with the Clean Air Act.

I-002-006 • Project Management. There are significant efficiencies gained from completing the project in one phase, rather than the starts and stops required to execute on separate, multi-stage efforts for such a small add-on project as a single station stop.

I-002-007 • Environmental Justice: The environmental justice population cited, in part, to justify the project as a whole will largely not be served if the project terminates at College Avenue. The negative aspects of this project will affect them most, while they will receive the least benefit without service to a Route 16 terminus.

I-002-008 • Legal Mandate: The state is legally obligated to provide public transit services to Medford Hillside by December 31, 2014, and stopping the extension at College Ave. fails to meet this legal obligation. At a minimum, this incurs significant mitigation costs required if the obligation is not met.

I-002-009 2. College Avenue should not be a terminus. The College Avenue station is not designed for the additional requirements of a terminus. The neighborhood cannot sustain the impact of a terminus station operations and traffic volume and the potential environmental damage is of serious concern.

I-002-010 3. The Route 16 station design is inadequate. The DEIR offers only a "worst case scenario" (MassDOT's description) for the Route 16 station design, while offering optimized station designs for all other Green Line extension stations. The Route 16 station design must be revisited. The Medford Green Line Neighborhood Alliance, a volunteer citizen group, has offered an alternative station design that prevents two major commercial property acquisitions and the resulting job displacement, preserves $182,000/year in property taxes for the City of Medford, optimizes traffic flow and better serves the integrity of the station's surroundings. MassDOT apparently has been exploring similar improved designs, which should be presented to the public for comment. A $1 billion project deserves a higher caliber design than a "worst case scenario."

To summarize, there is much more work to be done on the Environmental Impact report, and I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis in order to make the Green Line extension the best project it can be, and MUST be.

Thank you,

Michael Adamian
33 Capen St.
Medford, MA 02155

I-002-005

Project cost estimates are based on the current, conceptual level of design, and will be further refined as the Project progresses through preliminary engineering. It is anticipated that Green Line Extension construction would be financed with a combination of funds from federal and state sources. It is worthwhile to note that the College Avenue Station will not need to be rebuilt should the future extension to Mystic Valley Parkway / Route 16 be constructed. Only minor modifications to the Commuter Rail tracks in the area between Brookings and Winthrop Streets would be required. Limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time.

I-002-006

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-002-007

The Proposed Project offers substantial benefits to environmental justice communities and serves the majority of Study Area environmental justice population zones. As described in DEIR/EA Section 5.4, Environmental Justice, impacts to environmental justice populations would be neither severe nor disproportionate with any of the Build Alternatives.

I-002-008

As directed by the Secretary's Certificate on the DEIR/EA, the FEIR includes a limited scope of issues related to the Green Line Extension Project. The Proposed Project, with a Medford Branch terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Although an extension to Mystic Valley Parkway/Route 16 is MassDOT's Preferred Alternative, financial constraints prohibit the Commonwealth from progressing the Project beyond College Avenue at this time.

Since the release of the DEIR/EA, a few stakeholders raised concerns that the proposed College Avenue Station, serving as a terminal station for the Proposed Project, would not adequately serve the Medford Hillside neighborhood. Serving this neighborhood was identified as part of the SIP description. To address and resolve these concerns, CTPS prepared a memorandum demonstrating that the College Avenue Station location does adequately serve the walk market area for the Medford Hillside neighborhood. This memorandum is provided in Appendix C of the FEIR.

I-002-009

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-002-010

All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

Subject: Green Line Extension Public Comments

Dear Secretary Bowles:

Although I support public transportation, I am opposed to the Route 16 terminus proposed in the DEIR for the Green Line Extension Project's Full Build Alternative. Before I discuss the reasons for my objection, I would like to provide you with my comments about the project itself.

I-003-001 At this time, when State money is tight, and the cost of adding State debt is high, I feel the State has an obligation to prudently re-assess the Green Line Extension's Build-Priority; and, more importantly, to re-assess the decision to spend a Billion-Plus dollars on a project that is not an absolute necessity!

I-003-002 I similarly support David D'Allesandro's recommendations (made in his recent independent review of the MBTA) to halt all expansion projects, until the Millions-Worth of MBTA safety and maintenance projects are brought under control. It's irrelevant to the public that funds for expansion and maintenance projects come from different sources because ultimately, expenditures for either type project impact people in their pockets! When we have a pressing need to correct the maintenance and safety issues, it would be irresponsible to continue with expansion projects at this time.

I-003-003 Before this project advances into subsequent phases, and it "chews-up" more money, a realistic look should be taken by the State to see whether the need for the Green Line Extension today, is still the same as it was decades-ago when discussions about this project first began. The question that needs to be answered is: whether demographic changes that have occurred in these elapsed decades have strengthened or weakened the need for this extension to be built! When the following demographic changes are weighed, I think the conclusion is that clearly, the need for this project has significantly deminished!

- Most people today shop at suburban shopping malls instead of commuting into downtown Boston to shop.
- Major Boston hospitals have established additional facilities in communities outside of Boston, so many of their suburban patients no longer need to commute into Boston for their medical care.
- Internet and other technical advances allow many people to work from their homes instead of commuting to their Boston offices every day.

I-003-001

The Project's Purpose and Need is described in DEIR/EA Chapter 2, Purpose and Need. The Project is needed to comply with the State Implementation Plan (SIP), which includes requirements for this Project as well as other transit projects to meet the air quality and transit commitments established as a result of the Central Artery/Tunnel project.

I-003-002

Please see response to Comment I-003-001.

I-003-003

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

- Flex-time has allowed some employees to work a 4-day week, so they now commute 1-day-less than they did in past decades.
- Companies have found more attractive and convenient facilities in suburban office-parks, or industrial-developments located along major highways; so, many employees now work in the suburbs instead of in Boston. (Some manufacturing companies have similarly relocated outside of MA).
- In conjunction with the previous point, more people are moving to suburban communities away from Boston, so they can be closer to their jobs. (See the June 25, 2009 Boston Globe Chart below.) NOTE: The 2 cities along the route of the Green Line Extension have lost population from 1970 to 2007 in the June 25, 2009 chart. Somerville lost (approximately) 16%, and Medford lost (approximatly) 14%.
- Sooner or later, the MBTA will need to raise fares again. This will make public transportation less attractive, and will influence peoples' decisions on whether they will continue to commute into Boston, or seek other alternatives.

I-003-004

Ridership projections and the methodology used in their development are described in DEIR/EA Section 3.4, Ridership Methodology.

I-003-005

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

I-003-006

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

I-003-007

As explained in Chapter 3 of the DEIR/EA, bus alternatives were evaluated for the Green Line Extension. Benefits to air quality, transit service reliability, and transit users were considerably higher with light rail alternatives compared to bus alternatives.

I-003-004 Given the demographic changes noted above, I think the Ridership Estimates in the Green Line Extension Project's DEIR is overstated significantly and should NOT be relied upon as a basis for justifying this project.

I would further add, that in 1970, when the Somerville and Medford population was high (per the 6/25/09 chart above); and, people had more reasons to commute into Boston (vis-a-vis the demographic comparisons above), the MBTA eliminated the (then existing) College Ave. - Medford, and Ball Sq. - Somerville Commuter Rail Stops because the number of riders at these locations was low, and the MBTA wanted to improve the time to and from Boston!!! It appears there were no lessons learned from this past history since the Green Line Extension Plans continue going forward, even though today's population and demographic conditions are opposite to those of 1970! This is not logical, and there is "something wrong with this picture"???

I-003-005 Although the Green Line Extension, as currently planned, was agreed to (years ago) by the State to mitigate (what environmentalists had "anticipated" would be) an increase in pollution resulting from "Big Dig" highway improvements, the question that needs to be asked today is: whether the basis of this lawsuit is still valid? For example: are the Post-Big-Dig pollution, and air quality levels better/worse/same as the Pre-Big-Dig levels? Going forward, I would guess that levels would improve (even with possibly more vehicles in the road) because newer vehicles have better emission standards, and more people own hybrid vehicles now. So, would a challenge to the lawsuit be appropriate, and/or possible?

Expansion projects (like the Green Line Extension) should rise or fall on their own merits, and should not be forced upon us by "political horse-trading", or by a lawsuit filed by a group of "activists" who were not elected to represent me, or a majority of my fellow taxpayers. The question those in authority need to ask themselves is: whether the State would have chosen to move ahead with the Green Line Extension at this time, if the legal commitment, and the potential loss of Federal highway funds, didn't exist? I suspect the answer to this

I-003-006 question is no; so, I feel the State needs to find a way to either re-negotiate, or to get-out of the legal commitment entirely. If this isn't possible, the State should investigate whether the (clean-air, and improvements to public transportation) objectives of the legal commitment can be satisfied with alternatives or substitutions, instead of building the Green Line Extension as described in the DEIR. Some suggestions that come to mind are as follows:

I-003-007
- Hybrid Buses, and Better Bus Service, in and around the Green Line Extension's route. Hybrid Buses would be an investment towards the long-term improvement in air quality, could be implemented quickly, and they would be an easier and cheaper option than building the Green Line Extension.
  NOTE: At public meetings in my community, local commuters cited "Service Problems" (e.g. "bus was late", "buses are not reliable", etc.) as the reason they wanted the Green Line Extension. No one said they currently lacked access to public transportation; so,

I-003-008

Commuter rail shuttle alternatives for the Green Line Extension was evaluated as part of the 2005 Major Investment Study (DEIR/EA Section 5.2.4). These alternatives could conceivably use Federal Railroad Administration-compliant Diesel Multiple Unit (DMU) vehicles. No such vehicle is currently in production. The environmental and transit user benefits of these alternatives were considered inferior to benefits from a Green Line light rail transit extension.

I-003-009

Tunneling alternatives were evaluated but dismissed, as described in DEIR/EA Appendix B, Section 7. MassDOT sees no evidence that a tunnel alternative would be substantially less expensive than the order-of-magnitude costs presented in the DEIR/EA analysis.

I-003-010

Please see response to Comment I-003-009.

I-003-007 to me, spending billions on the Green Line Extension isn't really needed when all people seem to be asking for is better bus service.

I-003-008 • Diesel Multiple Unit (DMU) Trains, "IF" they can run on the existing Lowell Line Commuter Rail Tracks. Some of the DMU operating features are similar to Green Line Trolley's (e.g., DMU's don't need a locomotive, so they are a cleaner running train, they can pull in & out of stations quickly, and they can also run in smaller lengths and at more frequent intervals). All existing Lowell Line Commuter rail trains would be replaced with DMU's, and although they are expensive, they would be a good long-term investment towards improving air quality for the entire Lowell/Boston route and should be an acceptable alternative.

Rather than building a Green Line (light-rail) station at College Ave. - Medford, and at Ball Sq. - Somerville, a DMU station would be built on the commuter rail track instead. Under this modification plan, the Green Line terminus would be located in Somerville (at Ball Sq., Lowell St., or "somewhere" in between). This change to DMU's and to terminus location would resolve many of the more costly issues, concerns, and controversies associated with a Medford Green Line terminus (i.e., abbuters, bridges, drainage, commercial & residential land takings, traffic, parking, pollution, etc.) If it is decided to build a Route 16 - Medford station, it would be built as a DMU station also.
NOTE: Given the past public transit experience at the College Ave. and Ball Sq. locations (as described earlier in my comments regarding demographics), I would recommend the least expensive, least complicted, and the least disruptive option for these two stations be selected, and I think DMU's fits this profile.

I-003-009 • Tunnel to the more challenging, or abutter sensitive portions of the Green Line Extension's route. According to the "Deep Bore Tunnel Union Representatives", who attended several public meetings, tunneling would be a better and cheaper alternative to building the Green Line Extension on the commuter line railbed. Tunneling also provides more flexibility on the route, station locations, expansion options; and, it eliminates costs and resolves issues related to abutters, bridges, land takings, etc. Even though the DOT discounts it as too expensive, I think tunneling deserves another look, and the State should persue this with the Tunnel Borers Union directly, rather than using cost estimates from engineering consultants alone.

I-003-010 NOTE: For decades, Medford has been unsuccessful in their effort to revitalize Medford Square (the center of our town). Therefore, if tunneling can be utilized for the Green Line Extension, perhaps a Green Line Subway station can be located at, or near Medford Sq. which may stimulate the economic growth for us, much like the Red Line Subway Station did for Somerville in Davis Square.

I am against building the Green Line terminus at the Route 16 location as described in the Full Build Alternative for the following reasons:

I-003-011

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-003-012

No parking is proposed or foreseen for future plans at Route 16/Mystic Valley Parkway Station. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-003-013

It is unfortunate that, at the time of the recent bridge reconstructions, accommodations were not made for the future Green Line Extension. However, reconstruction of these bridges is still necessary in order to construct the extension of the Green Line.

I-003-011

- Medford already has sufficient access to many public transit options, and commuters in this area have a number of choices available to them (e.g., express bus, several local buses, a commuter rail station, an orange line station, and a red line station all in close proximity). If the MBTA maintains a good level of service on these transit modes, I don't think extending the Green Line to the Route 16 location is necessary.

I-003-012

- Route 16 is currently a very heavily traveled roadway, and is often in "gridlock" conditions especially during rushhours and on week-ends in summer. In 2009, 30,000 cars a day were clocked according to DOT. In addition to local traffic, Route 16 serves as a pathway for people who pass through Medford from/to Routes 93, 16, 38, 60, 2, & 3, on their way to other destination. A Green Line terminus at Route 16 would bring more traffic onto this roadway as people drop-off commuters, or park and ride themselves. At the same Route 16 location, the "Whole Foods" grocery store also generates customer traffic that adds to the roadway congestion. The DEIR states they do not plan to erect a parking garage at the Route 16 station; but, I fear that at some future date one will be built. The DEIR also states that there are no plans to change bus routes at this time but I can envision that new bus routes will subsequently be created to bring commuters from other suburbs to the Route 16 terminus. More buses will add to the traffic problems as well. We who live in close proximity to the Route 16 roadway will be severely burdened by all of these congession and traffic issues to a road that was originally designed for "pleasure vehicles only". In the future Route 16 will be no pleasure if a Green Line Terminus is located here.

- DOT has identified the following roadway bridges that will need to be re-constructed for the Green Line Extension because they are not high enough, or wide enough, for both the commuter line trains, and Green Line trolleys to pass beneath them. The North St. & Winthrop St. bridges would need to be "re-constructed" in the Full Build Alternative only. The date noted beside each bridge below, is the date each bridge was last re-built (which I obtained from the date-stamped on each bridge's side-wall).

2003	Walnut St. (Somerville)
1983	Medford St. (Somerville)
2001	School St. (Somerville)
2006	Lowell St. (Somerville)
1999	Cedar St. (Somerville)
1973	Broadway (Somerville)
1996	College Ave. (Medford)
1983	Winthrop St. (Medford)
1996	North St. (Medford)

I-003-013

Note that 5 out of these 9 bridges are new (in bridge-life terms) and were already completely rebuilt since 1996! Now, the DEIR says they need to be "re-constructed" again! This is an outrageous dilemma, and taxpayers will now need to pay for these

I-003-014

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-003-015

Please see response to Comment I-003-014.

I-003-016

The Proposed Project will terminate at College Avenue Station and does not require that the North Street Bridge be relocated.

I-003-017

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-003-018

As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has

I-003-013 a second time!!! With nearly 600 MA bridges in serious disrepair, it's unconscionable to delay fixing deteriorating bridges in other MA communities in order to "waste" precious funds "re-constructing" 6 recently rebuilt bridges for the Green Line Extension.

I-003-014 I am against the Route 16 terminus because it will require the North St. bridge "re-construction". I live at 2 North St., Medford, and I know first-hand that the existing North St. bridge is already too steep for both pedestrians and vehicles. If this bridge is re-constructed so it's higher, it will detrementally impact the pedestrians and vehicles that use this bridge. For example: In winter weather, if the existing North St. bridge is not sanded, it is a challenge to drive your car up to the crest (when coming from the direction of my home) without slipping and sliding. I don't have any health issues, yet I get winded when I walk up this bridge from my home. I recently saw an elderly lady, who had a cane, resting against the side of this bridge, about half-way up the incline, because she was having difficulty walking up the steep grade towards Boston Ave!

I-003-015 NOTE: Walkling Court, which is a development (HUD) for seniors & disabled people, abuts the North Street bridge. I therefore think it's fair to assume that the lady I observed with the cane lives at Walkling Court. I also think that there are other Walkling Ct. residents that similarly have difficultly with the steep grade on the North St. bridge, or are unable to walk-up the bridge at all. Although the planned Green Line Terminus is in close proximity to Walkling Ct. the residents would be unable to get to the station easily, as the steepness of the bridge would be an unsurmountable obstacle.

I-003-016 North St. is a well traveled street every day of the week. If it were closed for the period of re-construction, the local traffic would be forced to use Route 16, because all adjacent streets around the North St. bridge are "one-way'. The "one-way" status was implemented years ago to deter drivers stuck in Route 16 traffic from using the surrounding streets parallel to Route 16 as detours. The closing of North St, when the North St. bridge was rebuilt in 1994-1996 was very inconvient for both my neighbor- and for those that otherwise used North St. for local activites.

I-003-017 • I'm opposed to a Route16 Green Line terminus because building it will require commercial and residential land-and/or-property takings along the Medford portion of the Green Line Extension. Land takings, no matter how big, or small, will negatively impact property values, and will negatively impact the visual appearance of this neighborhood. For me, no amount of mitigation can rectify

I-003-018 or compensate for this damage! Although sound barriers have been mentioned as a help with noise issues, they are not, in my view, a visually appealing enhancement to an abutters' property.

I-003-019 The City of Medford does not want to loose any commercial property tax-revenue, so I oppose the taking of any Boston Ave. commercial property to accomodate a Route 16 Green Line terminus. Cummings Foundation, owners of 196-200 Boston Ave., have stated that the

complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds. The stakeholder coordination process for project mitigation is described in FEIR Section 6.3, Public Outreach Strategies. This process will be used going forward when the Mystic Valley Parkway/Route 16 segment is evaluated and designed.

I-003-019

DEIR/EA Section 5.2 describes the Project's potential acquisitions. MassDOT is currently conducting detailed property surveys to obtain more specific data. MassDOT will continue to evaluate opportunities to minimize these property impacts.

I-003-020

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-003-021

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified

I-003-019 taking of their building would "remove 700 jobs from our community", and in all probability, their current occupants would relocate outside of Medford. Area small businesses such as coffee shops, sandwich shops, variety stores, etc. are currently serving the occupants of the Boston Ave. commercial properties, so if the commercial properties were taken for the Green Line terminus the area small businesses would financially suffer the loss of their customers who would no longer be coming to this neighborhood.

I-003-020 • Many abutters along the Medford portion of the Green Line Extension (including the elderly & disabled living at Walkling Court, whose buildings are only a "fire-lane's-- width" away from the railbed) will be exposed to more noise, vibration, and diesel particulates, if the commuter rail tracks are moved closer to their homes to accomodate a Green Line terminus at Route 16. Exposure to particulate pollution causes respiratory and cardiovascular illnesses, and noise pollution, aside from being a constantly disruptive annoyance, causes blood pressure to remain

I-003-021 elevated. Although DOT has mentioned at public meetings that they may be able to mitigate some of the train/trolley noise & vibration with a combination of sound barriers, oiling tracks, and rubber mats under the rails, this may help abutters, but, it is unclear how an effective filter these items will be for those in otherwise close proximity. For example: I live 10 houses away from the train tracks, and I constantly hear the trains roaring by 24/7. Even my 94 year-old mother who is deaf in one ear and has very little hearing in the other says she can hear the train noise, especially at night when she is in bed. I also hear the annoying wistle blasts, that are sounded for safety, each time the northbound commuter rail trains reach North St./ Route 16, to warn the Canal St. & West Medford Sq. street-level crossings that a train is approaching.

I-003-022 Similarly, with what I anticipate will occur, with an increase in Route 16 vehicle traffic, and more frequent buses dropping-off commuters at a Route 16 terminus, my neighborhood will be exposed to higher amounts of "ultrfine" particle pollution from their exhaust fumes. Researchers beleive these ultrafine particles are harmful as they carry toxic chemicals throughout the circulatory system and into the brain.

In closing I would like to say that I realize the pluses & minuses of having a Green Line transportation option close by, as I lived only 5 blocks from the current Lechmere terminus before I moved to Medford in 1958. Five blocks away wasn't at all inconvient, even though I was a child and we always walked to the Lechmere station. Since moving to Medford, I've always lived at 2 North St., so I consider myself to be an "expert" on this neighborhood. I've seen an overgrown barren field and an adjacent coal-dealer, and coal storage bins, be replaced by the Walkling Court development: I've seen Container Corp., a factory that manufactured paper boxes at 196-200 Boston Ave., get transformed into the Cummings Foundation office building we have today: I've seen the Red Line extended from the Harvard Sq terminus to Alewife. But beyond

and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-003-022

The Green Line Extension will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts for the segment to College Avenue Station, but applicable to the future Mystic Valley Parkway/Route 16 segment, are described in the FEIR Chapter 3, Air Quality. As required by the Secretary's Certificate on the DEIR/EA, the FEIR includes a narrative clarifying the relationships of air quality modeling data to MassDEP and EPA requirements for State Implementation Plan (SIP) consistency.

these, I've seen, lived, and experienced the fact that the demand for public transportation today is no where near what it once was in the 1960's, 1970's or even in the 1980's in this area, and this trend, in my opinion, is not likely to reverse itself.

Therefore, for all of the reasons stated above, I am recommending that the Green Line Extension's terminus NOT BE LOCATED AT THE ROUTE 16 LOCATION.

Thank you for your time, and for your consideration of my remarks.

Sincerely,

Mary Anne Adduci

Dear Secretary Bowles,

I am very excited about the Green Line Extension and thinks it's a great improvement for additional access to the T for this area of Somerville.

I-004-001

As an artist/designer at Brickbottom Artist Buildings for the past 3 years, I oppose the placement of the Maintenance Facility in Yard 8. It will dramatically affect the lives of my neighbors and friends on the northeast side of the building with constant noise from trains idling, revving up and down as they are moved around, ringing their warning bells and excessive vibration as they roll by. If their windows are open attempting to allow fresh air in will also allow dust, soot and louder noise in from the train activity Spring/Summer/Fall. I know because I spend long hours working on the south side of the building that overlooks the 4 tracks that service the commuter rail and current maintenance facility and live with it every day. It is not pleasant at all and for them it will 24 hours a day.

There is many other long term environmental impacts with toxic run off, keeping this area of Somerville strictly an industrial zone and cut off from adjacent parts of Somerville.

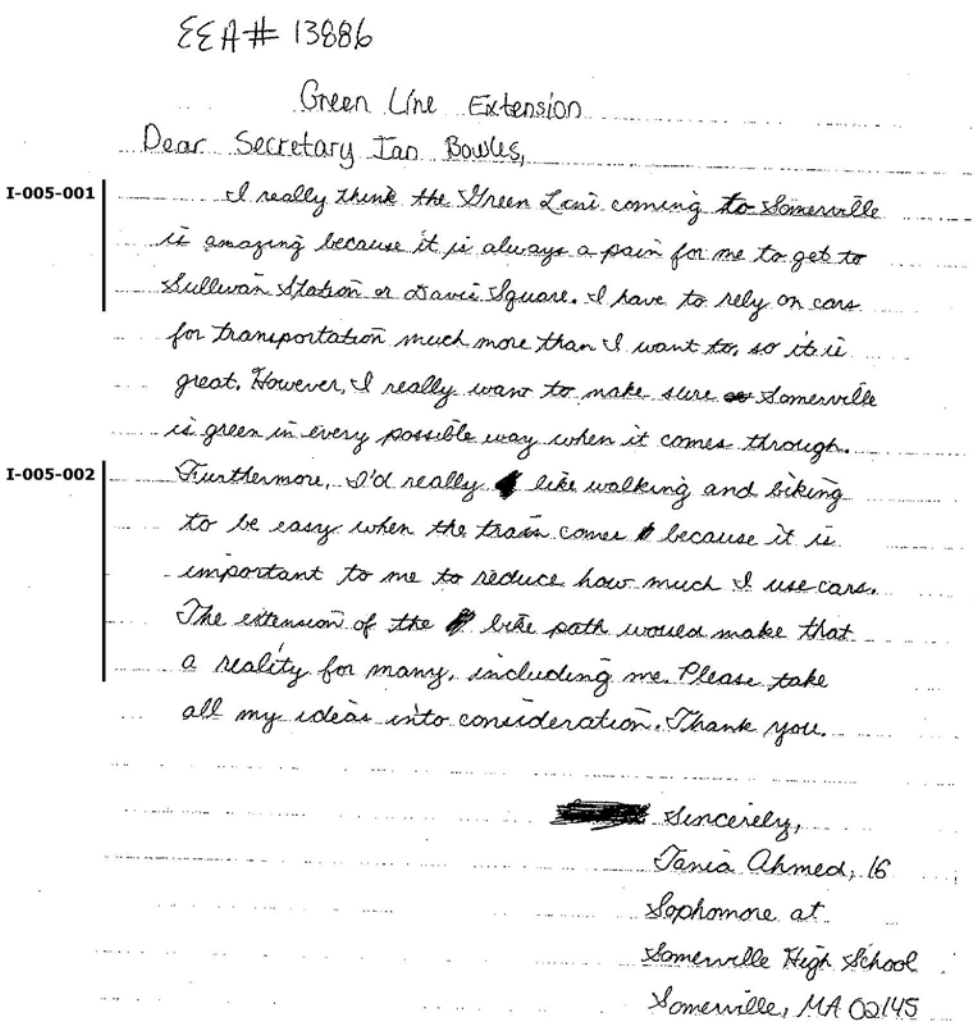
I oppose Yard 8 and support Somerville's Mirror Scheme H proposal. Thank you for your time and consideration.

Best regards,

David Adriaansen

I-004-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.



EEA# 13886

Green Line Extension

Dear Secretary Ian Bowles,

I-005-001 I really think the Green Line coming to Somerville is amazing because it is always a pain for me to get to Sullivan Station or Davis Square. I have to rely on cars for transportation much more than I want to, so it is a great. However, I really want to make sure Somerville is green in every possible way when it comes through.

I-005-002 Furthermore, I'd really like walking and biking to be easy when the train comes because it is important to me to reduce how much I use cars. The extension of the bike path would make that a reality for many, including me. Please take all my ideas into consideration. Thank you.

Sincerely,

Tania Ahmed, 16

Sophomore at

Somerville High School

Somerville, MA 02145

I-005-001

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

I-005-002

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

Subject: green line extension

I-006-001

I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

First of all, I strongly support the Green Line extension, and urge that it be built in the most practical, beneficial and cost-effective manner – that is, to construct the entire project in one phase, with a terminus station at Mystic Valley Parkway (Route 16), by December 31, 2014.

The DEIR is encouraging in that it concludes that the Route 16 station would provide the most benefits according to all project criteria, including air quality and environmental justice. However, MassDOT states that it is incapable of building (and funding) the entire "Preferred Alternative," so it only intends to build the extension to College Avenue in the Tufts University area of Medford, by its deadline of December 31, 2014.

In my opinion, the DEIR as currently written does not serve the best interests of the project. More importantly for your review, it was not done in a way that "adequately and properly" complies with the state environmental regulations, nor with the December 1, 2006 MEPA certificate that defined the requirements of the DEIR.

For the following reasons, I strongly urge you to not accept the DEIR as the Final EIR and require further environmental analysis of the project by MassDOT:

1. A two-phased approach is unacceptable. The Route 16/Mystic Valley Parkway Station should be built as part of a single-phase project to minimize costs and negative impacts and achieve the maximum benefits with regard to ridership, vehicle mile travel reduction, air quality improvements, and service to environmental justice communities.

The recommendation as outlined in the DEIR is for the Route 16/Mystic Valley Parkway station to be a separate stand-alone Phase II project with no funding source identified. This means, Route 16 may never be built.

There are many, many problems with the Phase II approach, including:

- Risk. Without an identified funding source there is a very high probability that Route 16 will never be built and the implications of this are critical.
- Terminus Impact. Without a Route 16 Station, the College Avenue stop (designed and intended to be an interim station) would become the de facto terminus for the Green Line extension. It is not designed for a terminus and due to the traffic flow and neighborhood density, as well as the lack of opportunity for transit-oriented development at College Ave., it is not a good location for a terminus.
- Cost. The two-phased approach is fiscally irresponsible and by MassDOT's own estimates will inflate the cost by $55 million over a single-phase approach. Severing a single stop (less than one mile of track) from the project as a whole will cost the state, and thus the taxpayers, significant additional money. There are obvious ways to easily reduce costs in the overall project and provide enough additional funds to include Route 16 as part of a single, complete project. This is the most prudent approach, and also would ensure that the project produces the air quality improvements the Commonwealth must achieve to come into compliance with the Clean Air Act.
- Project Management. There are significant efficiencies gained from completing the project in one phase, rather than the starts and stops required to execute on separate, multi-stage efforts for such a small add-on project as a single station stop.

I-006-001

Please see Comment Letter I-002.

• Environmental Justice: The environmental justice population cited, in part, to justify the project as a whole will largely not be served if the project terminates at College Avenue. The negative aspects of this project will affect them most, while they will receive the least benefit without service to a Route 16 terminus.
• Legal Mandate: The state is legally obligated to provide public transit services to Medford Hillside by December 31, 2014, and stopping the extension at College Ave. fails to meet this legal obligation. At a minimum, this incurs significant mitigation costs required if the obligation is not met.

2. College Avenue should not be a terminus. The College Avenue station is not designed for the additional requirements of a terminus. The neighborhood cannot sustain the impact of a terminus station operations and traffic volume and the potential environmental damage is of serious concern.

3. The Route 16 station design is inadequate. The DEIR offers only a "worst case scenario" (MassDOT's description) for the Route 16 station design, while offering optimized station designs for all other Green Line extension stations. The Route 16 station design must be revisited. The Medford Green Line Neighborhood Alliance, a volunteer citizen group, has offered an alternative station design that prevents two major commercial property acquisitions and the resulting job displacement, preserves $182,000/year in property taxes for the City of Medford, optimizes traffic flow and better serves the integrity of the station's surroundings. MassDOT apparently has been exploring similar improved designs, which should be presented to the public for comment. A $1 billion project deserves a higher caliber design than a "worst case scenario."

To summarize, there is much more work to be done on the Environmental Impact report, and I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis in order to make the Green Line extension the best project it can be, and MUST be.

Thank you.

#J

December 21, 2009

Dear Secretary Ian Bowles,

I am writing in reference to the Draft Environmental Impact Report on project number EEA#13886.

I-007-001 I am pleased to see the more detailed evaluation of alternatives to the "Yard 8" maintenance facility and train storage yard. And I want to stress my continued support for the Green Line Extension.

I-007-002 However, I am very concerned that the comparative evaluations of the various site proposals for the above mentioned maintenance and storage facility seem to remain inadequate and incomplete.

I-007-003 I live and work at Brickbottom, and have a young child. Obviously I am particularly concerned with the noise and vibration levels as it would impact the Brickbottom Artists Building and our neighbors, but I also recognize the negative impact on my larger community of Somerville as an even deeper problem.

Somerville has long waited for the benefits of public transportation while shouldering an unfair portion of the burden of such projects. We deserve access to the trains we've watched roll past our windows! That is why we support the Green Line Extension. But I find it deeply troubling that our community is being saddled with additional unfair burdens as some sort of "inescapable" part of the package.

I-007-004 I oppose the facility at Yard 8. Regardless of the site of the facility, Brickbottom and Somerville deserve proper mitigation to reduce the impact of the Green Line Extension and I would like to see a more

I-007-005 detailed and clear plan for such mitigation. And finally, it is simply imperative that you listen to the input of the Somerville community and develop an appropriate and fair plan.

Sincerely,

Jeff Altepeter
1 Fitchburg Street B156
Somerville, MA 02143

I-007-001

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

I-007-002

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-007-003

DEIR/EA Sections 5.7, Noise, and 5.8, Vibration, describe the noise and vibration impacts, respectively, expected from the Project. Pursuant to FTA-established guidelines, these impacts have been identified and evaluated for moderate and severe impacts to sensitive receptors. FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments, describes the mitigation measures that would be implemented to eliminate, minimize, or offset impacts above regulatory thresholds.

I-007-004

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it

should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-007-005

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

December 21, 2009

Dear Secretary Ian Bowles,

I am a resident of the Brickbottom Artist Building at 1 Fitchburg St. in Somerville, MA and have owned my condominium for over ten years. I am very excited about the green line coming to our neighborhood but oppose the proposed site for the maintenance facility. Our condo would be directly affected by the noise from Yard 8, as we are located in the rear of the building, closest to the site.

I-008-001

I am opposed to citing the Green Line Storage Yard and Maintenance Facility in Yard 8. In addition to noise and vibration concerns, the Yard 8 location would build a barrier between the Inner belt and the Storage Yard and Maintenance Facility would have a direct impact on future tax revenue as it impacts adjacent property value and future growth potential.

I support the Green Line extension but feel like the Train Storage Yard and Maintenance Facility add an unfair burden to our community.

Thank you for considering alternatives to Yard 8.

Sincerely,

Rebecca Altepeter
1 Fitchburg St. #B156
Somerville, MA 02143

I-008-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

Subject: Green Line extension

Dear Holly,

I assume that the fundamentals surrounding global warming and the need for greater energy efficiency are sound. I believe that the Obama Administration's contribution to jumpstarting high speed rail in the lower forty-eight states could be absorbed by the MBTA's current deficit exactly at a time of shrinking fiscal opportunities for the growth of domestic rail. The MBTA currently provides effective commuter rail to Gloucester/Rockport and Needham by a single line. I read in a Green Line extension e-mail that extending the Green Line one more stop to Route 16 would make light rail accessible to an additional 10,000 people. A single line for the last stop would not affect the flow of traffic on the rest of system in the very unlikely event of engine failure and would significantly lessen construction cost by not requiring taking any private land and possibly avoid construction of several large retaining walls. The cost of widening two two lane bridges would also be lesscned. Please make this work for most number of people and you will be laying the groundwork for solid growth in the future. I-009-001

Respectfully,

David Anderson

I-009-001

Due to constraints in system capacity and operational flexibility, the MBTA has included no single track segments in its rail transit network. The Green Line Extension Project will be constructed entirely with a double-track configuration.
