First and foremost, I would like to applaud the efforts that both you and the State have taken thus far to assure the thoughtful design of the Green Line Corridor. I have been an active member of the Somerville community for over 7 years, and it is refreshing to see so much attention being placed on channeling information to those directly impacted by this development. A sincere thank you for recognizing the importance of this effort - please know, all of your hard work does not go unrecognized.

I-010-001

The main purpose of my letter is to voice my strong support of the Core Community Principles that have been painstakingly generated by Groundwork Somerville, Somerville Transportation Equity Partnership, Somerville Community Corporation, & Community Health Agenda. The principles addressed in this document accurately recognize how the community envisions this project should be and how we propose to maximize the positive impacts it will have on our community. Somerville has waited a long time for this, and the importance of

1

I-010-001

MassDOT has reviewed and considered the “Core Community Principles” for station area land use, presented by Community Corridor Planning. As described in the FEIR, Section 6.2 of the Public Involvement Plan, MassDOT will hold land use workshops to discuss related issues with the community.

I-010-001 getting things done right in every aspect is critical. To be frank, this project will impact families & businesses for generations to come – screwing it up is not an option.

I would like to expand on a couple of specific items within these Principles, to assure proper attention be placed by you, when making decisions in the future. Specifically, are my concerns of station design, community path development & maintenance facility location.

I-010-002 Firstly, the overall designs of each subway station & its seamless connection to the community path, bus routing & existing traffic flow are very critical items to consider. Given the density of our surrounding neighborhoods, the community members adjacent the Lowell Street subway station want to assure that proper care is given to minimize automobile congestion and assure ample transfer points both to the path & all existing bus routes.

I-010-003 There is an extreme ground elevation change at Lowell Street, and while presenting itself as a design challenge, the success of an accessible community path connection point should be well-designed and as compact as possible, given the limited land space available. While this connection point may need to trespass onto the private land known to many as the 'Maxpac' site, it must have 24-hour public access, to assure all residents can

I-010-004 conveniently access the path as needed - not just when permissible by the current land developer. Additionally, the aesthetics of the subway stations should be vetted with the surround community, as well as contain environmentally intelligent design to reflect our societal responsibility to minimize global impact. While the stations should attempt to blend into surrounding context, a strong artistic expression at each station entry point would be congruent to the diverse & creative social fabric of Somerville.

I-010-005 Secondly, without question, the development of the community path should be in conjunction with the Green Line Corridor. Funding for this project needs to be in tandem with the green line expansion, to assure maximum ridership, reduction in automobile traffic/pollution, and minimal financial burden for the State. As evidenced by the overwhelming success of the existing community path, our community would be missing out on a huge environmental opportunity if the community path were not developed beyond its current location into Boston. The tie between the community path and a subway destination point is beyond essential, providing alternative means of transportation as well as a desperately needed community green space. It will not only promote physical activity, it will strengthen our sense of community by providing a much needed space to gather absent of the dreaded automobile. Those of us living within the oppressive densities of Somerville can truly speak with conviction as to why this community path mustn't simply be considered an 'amenity' item, but rather, a non-negotiable element of the Green Line Corridor, critical in maintaining our standard of living. To be fair, I recognize the financial burdens of our economic climate are continually rising. However, based on my professional experience, the financial impact of developing the community path separately to the Green Line Corridor would not capitalize on the State's valiant effort to stretch our limited funding as widely as possible. If the community path were to be developed parallel to the Green Line Corridor, many of the staging & construction cost items would overlap one another – this savings would not be seen otherwise. In addition, consistent with the Maxpac Development, the cleared community path adjacent the rail lines could be utilized as an access point for the construction vehicles used to build the subway stations, which would further minimize the disruption to surrounding neighborhoods. Any attempt to develop the community path after the Green Line Corridor is simply not the best use of our taxpaying dollars, period. We need to maximize what dollars we have in a forward-thinking way.

I-010-006 Finally, I would like to express my strong disapproval for the proposed Yard 8 Maintenance Facility location. Not only for its overwhelming negative impacts on the Brickbottom residents, but for its complete destruction of any successful master-planning solution the surrounding area may achieve. For the amount of effort our city has put into planning the future of Somerville & the creation of developmental solutions to generate desperately needed tax revenue, placing the facility at Yard 8 completely destroys these potentials for success. The location of this facility as currently proposed, along with the physical & visual divide created by the current McGrath O'brien Highway, would provide absolutely no incentive for future developers to invest in the surrounding parcels, due to their adjacency to the facility and their physical isolation to the rest of Somerville. What once

2

I-010-002

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. These stations are designed to be consistent with MBTA standards and compliant with ADA. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-010-003

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-010-004

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green

I-010-006

was considered an under-utilized waterfront area with endless possibility; these parcels would become developmentally stagnant if Yard 8 goes through – a prospect that our city can literally not afford – both economically and morally. I would encourage you and the State to support the proposed Option L design in all future decisions. While falling far from ideal, I believe it would serve as the more tolerable solution with the Somerville community.

I understand the complexity of the Green Line Corridor design exposes the State to many tough decisions in the months and years ahead. However, without question, this development stands as one of the most important developments Somerville will see in my lifetime. Please do your part in representing the Somerville community by assuring these points of concern are properly addressed & considered in all future decisions.

My sincere appreciation for your time, dedication & commitment to serving the Commonwealth of Massachusetts.

KyAnn Anderson RA, LeedAP

Somerville Resident

3

Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-010-005

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-010-006

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

Dear Secretary Ian Bowles,

Since early 2008 the residents of Brickbottom have voiced their objections to the placement of the Maintenance Facility & Storage Yard 8. These concerns continue to go unheeded.

We've lived at Brickbottom since 1998 and have come to value the talents and quirkiness of all who live here. A mixture of concrete and industry, it thrives as a community of artists and creativity. Something that this city sorely needs.

I-011-001

The placement of Yard 8 adjacent to Brickbottom will greatly diminish the quality of life of its residents. Perhaps it will be the death knell. For 220 residents, there will be no escape from the noise and dust and pollution. This is unjust and does not live up to the standards that Mass DOT has promised to deliver.

Please do not accept Yard 8 as a viable Maintenance facility.

Sincerely,

Teri Anderson
C-500

I-011-001

Thursday, January 07, 2010

Dear Secretary Ian Bowles,

We are writing in regards to the Draft Environmental Impact Report on project Number EEA#13886. We are residents of the Brickbottom Community at 1 Fitchburg Street and Professors of English at, respectively, Boston University and Harvard University. We have lived at Brickbottom since 2002. We value Brickbottom in part for its vibrancy as a mixed community of artists, activists, academics, and businessmen and for its proximity to Union Square, an area whose development we have been watching closely. Even though it will affect us at Brickbottom, we strongly support the Green Line extension, for the positive impact it will have on Somerville and Medford, for environmental reasons, and because it will bring Somerville, Medford, and us closer to Boston.

I-012-001

Our main concern with the Green Line extension project is the siting of the Maintenance Facility at 'Yard 8.' We strongly oppose this location for the facility. We are happy to see that some attention is now being given to alternative sites for the maintenance facility, namely Mirror H and Option L, both of which have recently begun to be investigated publicly by MassDOT. This shows to us that MassDOT is open to listening to the concerns of the community, and we are much encouraged to see the process working as it should, given the overwhelming concerns that have been expressed, not just by Brickbottom residents, but by East Somerville and Cambridge residents, about MassDOT's original promotion of Yard 8. However, we want to emphasize again that Yard 8 will have massively detrimental affects not only on Brickbottom but on the development of Union Square, the Inner Belt region, and the city of Somerville as a whole.

I-012-002

The Draft Environmental Impact Report process reckons community impact by building, not individual. However, Brickbottom is a single building that houses some 220 residents, all of whom will be immediately affected by Yard 8 from the moment the first bulldozer arrives to begin work. Indeed, there are signs that property values in the building have already been adversely affected, with potentially significant loss of equity to home owners and of taxation revenue to Somerville.

Financial loss, however, pales into insignificance in comparison to the damage done to our individual and collective lives by environmental degradation, especially through further deterioration of our air quality, and exacerbation of light and noise pollution. We already live in an area heavily polluted in all these respects, not least by the proximity of major roads (Highway 28) and railway lines. Yard 8 will massively increase all these problems and threaten to make life intolerable to many of us.

2

I-012-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-012-002

Please see response to Comment I-012-001.

I-012-003

Despite encouraging signs, we remain deeply concerned that MassDOT did not recognize these problems from the start, but instead has sought to minimize claims that Yard 8 will have any significant impact on residents. Instead, the DEIR makes the absurd claim that because "the proposed maintenance facility site is located in an existing industrial area next to the MBTA Fitchburg and Lowell Lines," there would be "no moderate or severe impacts from noise after mitigation was implemented;" concluding that "there would" therefore "be no disproportionate noise impacts to environmental justice populations from the proposed maintenance facility" (Section 6.5.4-1 Environmental Justice, 6-7). This "existing industrial area" is our home, which does indeed sit between Fitchburg and Lowell lines, making us an "environmental justice population." How the report can comes to the conclusion that this entitles MassDOT to *increase* our environmental burden is hard to see. This disingenuous line of argument weakens our trust in the DEIR itself and, potentially, in MassDOT itself.

I-012-004

We believe that Yard 8 is not a viable option and that whichever of the other two sites, Mirror H and Option L is chosen, MassDOT needs to minimize any adverse impact on economic development and neighborhood connectivity. The Maintenance Facility and the Green Line extension need to be planned in relation to a comprehensive envisaging of economic and neighborhood development of the Inner Belt, Brickbottom and East Somerville areas. This means far more community involvement in the process than has been encouraged to date, specifically the formation of a Citizen Advisory Committee to oversee the rest of the project and ensure that the community has a proper voice.

I-012-005

One of the faults of the DEIR is that it is often insufficiently specific about mitigation. Mitigation, especially for noise and vibration, needs to be in place before construction begins and needs to take into account the environmental effects of construction itself. There needs to be a continuing means of addressing concerns raised in the course of and after construction. It is not fair to insist that East Somerville residents anticipate every contingency that may arise. Our major concerns here at Brickbottom are with the noise and poisonous emissions produced by the diesel engines and the noise and vibrations produced by railway cars, both of which already affect the quality of our lives and, perhaps, our health. Specifically, we ask that MassDOT assign five of the new EPA Level 3 diesel rail engines to the Fitchburg Line and give the Fitchburg Line top priority for the replacement of older diesel engines. We also ask that cars be equipped with fan quieting to decrease the considerable sound made by air conditioning, with acoustical absorption under the cars, and with vehicle skirts over the wheels.

I-012-006

Finally, we ask that the review process itself be revisited. In our view, the DEIR as currently written does not serve the best interests of the project. It has too many flaws, areas of ambiguity, and misleading assumptions. With respect to the siting of the Maintenance Facility in particular, it fails to take seriously any option other than Yard 8. Far more work needs to be done on Mirror H and Option L. More importantly for your review, we believe DEIR was not done in such a way as to comply adequately with the state environmental regulations, nor with the December 1, 2006 MEPA certificate that defined its mandate and responsibilities. We strongly urge you to not accept the DEIR as the Final EIR and require further environmental analysis of the project by MassDOT.

3

I-012-003

Impacts to environmental justice populations are described in DEIR/EA Section 5.4, Environmental Justice. Additionally, the Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes specific outreach efforts to the environmental justice community that will be made as the Project progresses through its next phases.

I-012-004

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-012-005

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in DEIR/EA Chapter 6, Draft Section 61 Findings and Mitigation Measures. The mitigation measures required by the Secretary's Certificate on the DEIR/EA are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments. The stakeholder coordination process for project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

Modifications to MBTA Commuter Rail equipment are outside the scope of the Green Line Extension Project. As presented in DEIR/EA Chapter 6, the Proposed Project has overall air quality benefits for the Study Area. Noise and vibration mitigation measures are proposed on a location by location basis. Noise impacts in the corridor are primarily from the existing MBTA Commuter Rail operations. Noise mitigation measures on rail transit vehicles would not be effective in reducing the total noise generated in the corridor. The proposed mitigation measures would be more effective in reducing noise impacts in the corridor.

Thank you for your attention to our concerns.

Sincerely yours,

Amy Appleford, Nicholas Watson

I-012-006

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA #03886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles:

As a resident of the Glass Factory Condominiums and homeowner in the East Cambridge community, I am extremely concerned about the design and placement of the Green Line Extension and the new Lechmere Station.

I-013-001

TRACKS ARE TOO CLOSE TO OUR BUILDING.
The present design shows the tracks running very close to the rear of our building. We urge your designers and engineers to place the tracks as far to the rear of our building as possible to preserve views & light to the many units that will be severely impacted by the elevated tracks. The design and placement of the tracks and supports should do all it can to minimize the visual impact to those units and also minimize noise & vibration impacts to the whole building as well as the surrounding neighborhood.

I-013-002

LECHMERE STATION.
At present, your designs show the new Lechmere Station so close to the Glass Factory that it appears to be part of our condominium building. Please move the station closer to East Street, where it could be part of the entrance way to the eventual North Point development. The station design needs to be substantially improved so it is not an eyesore but rather an enhancement to this rapidly developing neighborhood. It should reflect the importance of this location as the gateway between Cambridge & Boston.

I-013-003

BUS TRAFFIC.
The many bus lines that converge on Lechmere Station are presently designed to enter at one end of our building, pick up passengers, and emerge at the other end of our condo building. Please do not route bus traffic, directly under our windows. Bus traffic noise, vibrations and fumes are a great concern. Sidewalks where passengers wait, should also be moved farther from our building to

I-013-001

FEIR Chapter 5 describes the revised conceptual plans for Lechmere Station, including station design, track alignment, bus routings, and other elements. Changes to the track alignment depicted in the DEIR/EA were evaluated, but could result in additional impacts on area abutters. Proposed mitigation measures for area abutters are also described in FEIR Chapter 5. During preliminary engineering, specific station design elements will be further developed.

I-013-002

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. These plans will be refined in the preliminary engineering stage of the Project. The public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-013-003

Revised conceptual plans for Lechmere Station, including bus facilities and bus waiting areas, are included in FEIR Chapter 5, Lechmere Station. Bus layover has been shifted further to the east and away from the Glass Factory Condominiums in the revised Lechmere Station design. Signs will be posted to limit idling of buses, in conformance with MBTA standards.

From: 01/07/2010 22:03 #009 P.004

I-013-003 preserve our privacy and minimize impacts from noise, light and smoking. If too close, it will feel like we are living in the bus station.

I-013-004 PRESERVE OUR TREES & GREEN SPACE.
Presently there is a row of mature evergreen trees behind our building. I urge you to preserve all these trees and the entire small green space behind our building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks should be on the far side of the large trees. These trees serve as a natural screen for the tracks and busway.

I-013-005 MAINTENANCE FACILITY.
I strongly oppose the Mirror H location. It is much too close to the Glass Factory and other residential buildings and will effectively destroy further development in North Point. Putting a maintenance facility on prime land in a desirable, developable location that would generate significant tax revenue to Cambridge simply does not make sense. Of the three options proposed, Option L seems to be the best choice however I would prefer there be no maintenance facility in this area but rather it be at the end of the line.

I-013-006 REDUCE SURFACE PARKING.
The present Lechmere Station is at the end of the Green Line. That will no longer be the case with the new Green Line Extension and the number of parking spaces should be substantially reduced. Surface parking is bad urban design and should be minimized in the new North Point neighborhood. One half of our building will overlook the new parking and we request it be carefully designed with this in mind. Ample green space should be included in the design and all lighting should be down lighting that minimizes light pollution to our building.

Thank you for hearing my concerns.

Sincerely,

I-013-004

The revised conceptual plan for Lechmere Station, as shown in FEIR Chapter 5, is entirely on MBTA property. This conceptual design does not require any Glass Factory property or the removal of trees and landscaping from Glass Factory property. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, outlines how MassDOT will involve residents in developing landscape design.

I-013-005

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Mirror H location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-013-006

Although Lechmere Station will no longer function as a terminal station, there is still a demonstrated demand for existing parking. Nonetheless, parking at the relocated Lechmere Station was reduced in the revised conceptual design. These revised plans are included in FEIR Chapter 5, Lechmere Station.

EEA #03886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-014-001 As a resident of the Glass Factory Condominiums, I am deeply concerned about the design and placement of the Green Line Extension and the new Lechmere Station.

TRACKS ARE TOO CLOSE TO OUR BUILDING.
The present design shows the tracks running very close to the rear of our building. We urge your designers and engineers to place the tracks as far to the rear of our building as possible to preserve views & light to the many units that will be severely impacted by the elevated tracks. The design and placement of the tracks and supports should do all it can to minimize the visual impact to those units and also minimize noise & vibration impacts to the whole building as well as the surrounding neighborhood.

LECHMERE STATION.
At present, your designs show the new Lechmere Station so close to the Glass Factory that it appears to be part of our condominium building. Please move the station closer to East Street, where it could be part of the entrance way to the eventual North Point development. The station design needs to be substantially improved so it is not an eyesore but rather an enhancement to this rapidly developing neighborhood. It should reflect the importance of this location as the gateway between Cambridge & Boston.

BUS TRAFFIC.
The many bus lines that converge on Lechmere Station are presently designed to enter at one end of our building, pick up passengers, and emerge at the other end of our condo building. Please do not route bus traffic, directly under our windows. Bus traffic noise, vibrations and fumes are a great concern. Sidewalks where passengers wait, should also be moved farther from our building to preserve our privacy and minimize impacts from noise, light and smoking. If too close, it will feel like we are living in the bus station.

I-014-001

Please see Comment Letter I-013.

PRESERVE OUR TREES & GREEN SPACE.
Presently there is a row of mature evergreen trees behind our building. I urge you to preserve all these trees and the entire small green space behind our building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks should be on the far side of the large trees. These trees serve as a natural screen for the tracks and busway.

MAINTENANCE FACILITY.
I strongly oppose the Mirror H location. It is much too close to the Glass Factory and other residential buildings and will effectively destroy further development in North Point. Putting a maintenance facility on prime land in a desirable, developable location that would generate significant tax revenue to Cambridge simply does not make sense. Of the three options proposed, Option L seems to be the best choice however I would prefer there be no maintenance facility in this area but rather it be at the end of the line.

REDUCE SURFACE PARKING.
The present Lechmere Station is at the end of the Green Line. That will no longer be the case with the new Green Line Extension and the number of parking spaces should be substantially reduced. Surface parking is bad urban design and should be minimized in the new North Point neighborhood. One half of our building will overlook the new parking and we request it be carefully designed with this in mind. Ample green space should be included in the design and all lighting should be down lighting that minimizes light pollution to our building.

Thank you for hearing my concerns.

FROM: Lee Auspitz
RE: DEIR Comment

The writer of this comment is a private citizen who served as a Somerville mayoral appointee on both the Project Advisory Committee of the Beyond Lechmere Northwest Corridor Study (2004-5) and the Citizen Advisory Committee for the subsequent Green Line Extension Project (2006-9). For 35 years, from 1974-2009 he was closely involved in the Davis Square Task Force, set up to address Somerville issues arising from the Red Line Extension from Harvard Square to Porter, Davis and Alewife.

Comment overview

From a transportation planner's point of view, the Green Line Extension is an unusually straightforward and cost-effective project. It makes use of existing commuter (heavy) rail beds to extend light rail through densely populated and under-served neighborhoods of three municipalities—Cambridge, Medford and Somerville. It thus requires minimal land takings and holds great potential for improving air quality, reducing automotive traffic, upgrading existing housing stock and neighborhood business districts, serving handicapped individuals and economic justice communities, and reducing commuting time to employment, shopping, health and educational centers not only for residents of the three municipalities but also for those of the larger metropolitan area.

Yet the Extension has distinctive legal, jurisdictional, funding and phasing complexities that are not adequately dealt with in the current DEIR. Within the context of strong support for the project overall, therefore-- and faith in the corrective power of open discussion-- this comment will concentrate on three issues for which the DEIR provides a timely juncture for review by all the public authorities involved. Each of the three issues is of sufficient weight to justify reconsideration of the DEIR before final approval. A fourth comment on construction and noise-and-vibration mitigation will also be provided on the basis of the Red Line Extension experience, along with a summary treatment of a few other neglected due diligence issues raised in the citizen participation process.

A concluding remark will list some steps toward a reconfigured approach.

The issues in brief

I-015-001

1. State Implementation Plan (SIP) Compliance— There is a documentable discrepancy between the SIP requirement that the Extension go at least as far as Medford Hillside by December 31, 2014, and the foreshortened DEIR plan to make the College Avenue station in the midst of Tufts University the terminus for the 2014 phase. The attempt evident in the Expanded Environmental Notice to bridge this discrepancy by map substitution and geographical invention—re-labeling the College Avenue station as Medford Hillside-- has no place in a transparent public process. The 1993 SIP was specifically amended in the proposal of 2005 of to go beyond a previous alternative range from Ball Square to Tufts University. As the project cannot qualify for federal funding of final engineering studies until all such discrepancies are resolved, the current DEIR provides a timely opportunity for public authorities at every level to address them straightforwardly. Moreover, though it was the intent of the governor and the legislature to provide adequate financial support for SIP compliance in the Transportation Bonding Bill of 2008 (then pegged at $600M for the Green Line Extension), the bill itself contains a proviso that would, as written, reduce dollar for dollar the bonding commitment to the Green Line Extension by the amount of any federal aid received. In effect, this proviso caps the total federal-state commitment at $600M, an amount insufficient to cover the minimal SIP-related elements as presented in the DEIR. Both procedurally and financially, then, the DEIR presents a plan for which key SIP-compliance issues remain unresolved. FTA guidelines anticipate that its regional officials will flag such problems early in the process. It would start the project with a cleaner slate to address them at the draft stage before a final EIR is passed on to FTA.

I-015-001

As directed by the Secretary's Certificate on the DEIR/EA, the FEIR includes a limited scope of issues related to the Green Line Extension Project. The Proposed Project, with a Medford Branch terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Although an extension to Mystic Valley Parkway/Route 16 is MassDOT's Preferred Alternative, financial constraints prohibit the Commonwealth from progressing the Project beyond College Avenue at this time.

2. Refining the Modular Approach— The DEIR gives evidence of a modular approach inadequately suited to the complex and cross-cutting legal, engineering and funding disciplines under which the project operates. The DEIR fails to distinguish adequately elements within the several engineering modules which must be completed by the December 31, 2014, SIP-mandated deadline, from those which can be phased over a longer period in a unified, federally co-funded package. The system-wide northern storage and maintenance facility, for example, is not constrained by legal mandate, engineering logic or operational necessity to be wholly completed within the 2014 deadline. Nor is federal New Starts funding limited to the SIP-mandated deadline. By contrast, state funding under the Transportation Bonding Bill of 2008 is specifically directed toward deadline-constrained SIP compliance. Yet the DEIR appears to assume that modules must either be wholly within or wholly outside the 2014 deadline, and that state and federal funding sources are equally SIP-constrained. An adequately differentiated, systemic approach to the several modules will permit the whole project to become more competitive for federal dollars. In a unified state-federal project 12/31/2014 would be a performance benchmark rather than an endpoint for the federal portion of the funding, and all modules, including the Route 16 terminus, would be phased more efficiently within a comprehensive project.

I-015-002

3. Lechmere Station Relocation-- Currently estimated to cost $160M, the long-planned relocation of the Lechmere Station across McGrath Highway has been shoehorned into a public funding package not designed to accommodate it. From 2004 through the April 2008 passage of the Transportation Bonding Bill, the Lechmere relocation costs were repeatedly represented to public advisory committees, the press and the legislature as covered by private North Point developer commitments. The collapse of the private underwriting plan led the state to assume this burden, then estimated at $70M, in August 2008 four months after the Transportation Bonding Bill was signed. The worldwide credit crisis that began in September 2008 further underlined the fragility of the North Point commercial projections. Six months later in 2009 the relocation item reappeared at more than double its previously announced cost as an abortive trial candidate for "shovel-ready" federal stimulus funding. The resulting $160M price tag has now been loaded into the SIP-constrained part of the Green Line Extension pushing out the Route 16 terminus, stripping the Union Square spur of future connection to Porter Square, and leeching out important mitigation and environmental provisions elsewhere in the project. Its late addition—and the absence of a post-bubble reanalysis of the underlying commercial and demographic assumptions of the North Point project-- raises questions about oversight and public subsidy to (in this case, non-existent) private interests. While provision obviously has to be made for the Lechmere station, MassDOT, the City of Cambridge, the MAPC and the legislature owe the public a more critical look before plunging ahead with this module as currently planned.

I-015-003

4. Mitigation as a Public Process—The DEIR gives evidence of a conscientious professional analysis of potential construction and noise-and-vibration problems from an engineering standpoint. But Section 6 neglects two non-engineering mitigation devices—citizen participation processes during construction and post-construction compensation procedures-- that have proven effective in similar contexts. An account of previously successful MBTA experiences with these devices in the Red Line Extension is provided in the detailed section that follows. Ball Square provides an example of how a public process might work for the Green Line.

I-015-004

The issues in detail

1. SIP Compliance

a) *the "Medford Hillside" issue*

The amended SIP proposal which appeared in the Federal Register of August 10, 2005, stipulated "Medford Hillside" as the required destination point, and this requirement has been properly included in all subsequent official documents, through the final approved SIP which appeared in the Federal Register of August 31, 2008 and the state Transportation Bonding Bill of 2008.

What "Medford Hillside" meant in the August 2005 amendment was "Beyond Tufts." The stated aim of the amended SIP was to extend the environmental reach of a 1993 SIP requirement that Green Line

I-015-002

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-015-003

The relocation of Lechmere Station is a critical and necessary component of the Green Line Extension Project. In the absence of a developer for the NorthPoint Development Project to construct the station within a defined time frame, MassDOT added the relocation of Lechmere Station to the Proposed Project. In order to meet the requirements of the SIP, relocated Lechmere Station will need to be constructed as part of the overall Green Line Extension Project. The extension of Green Line to Mystic Valley Parkway/Route 16 is not a requirement of the SIP, and the Proposed Project as defined has been demonstrated to meet the air quality benefits identified by the SIP. The extension of the Union Square branch to Porter Square has never been considered part of the Proposed Project. Finally, MassDOT has identified mitigation and environmental provisions in both the DEIR/EA and the FEIR and has committed to these measures.

I-015-004

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

terminate at either Ball Square or Tufts. The amendment thus provided for a more distant terminus to serve the dense non-student residential population in the Medford Hillside neighborhood beyond the University.

The geography of all this was laid out clearly in maps in Appendix B of the Beyond Lechmere study that was the point of reference for the amended SIP. Appendix B consists of "locus maps", each with a dotted circle superimposed on standard street maps to show the possible location of eight stations along the Green Line Extension. Photos of the sites were also included in an attractive montage prepared by the MBTA itself. These are reproduced in attachments to this comment.

Figure B-6, labeled "Proposed College Avenue Station Locus Map," shows the dotted circle superimposed in the Tufts University area with the center of the circle at the junction of College and Boston Avenues—the very area now proposed for the provisional terminus. (The map is attached to this comment as Scan 0001.) It was routinely referred to as the "Tufts University station" in the discussions of the advisory group, consultants and MBTA officials.

Figure B-7, labeled "Proposed Winthrop Street Station Locus Map," shows the dotted circle superimposed on an area of the map labeled "Medford Hillside" and with its center at the junction of Winthrop Street and Boston Ave. (This is reproduced as Scan 0002 attached.) It was referred to as the "Medford Hillside" station in the final discussions of the advisory group by both the representative of the City of Medford, who requested that a terminus be considered there, and the MBTA chair of the study, who promised a separate boarding analysis of it.

A blow-up of Figure B-7 is attached as Scan 0003 for convenience of viewing. It makes plain that on the same standard map the geographic center of the Medford Hillside neighborhood is given at Capen and Adams Streets (marked by a small white dot). This also comports with a standard Google walking map search, which places the heart of Medford Hillside at a 13-minute walk (i.e. outside the normal 10-minute catchment area) from the proposed College Avenue (Tufts) Station, versus a 4-minute walk from the Winthrop Street (Medford Hillside) Station.

The labeling of the Winthrop Street station as Medford Hillside was also carried through in sketching a possible heavy rail alternative (figure 4-8) on an MBTA schematic where a possible "Medford Hillside Commuter Rail Station" is placed at Winthrop Street and Boston Avenue.

In other words, Medford Hillside and Tufts University were mapped as distinct and mutually exclusive areas, each to be served by its own proposed station at two Boston Avenue intersections, Winthrop Street for Medford Hillside, College Avenue for Tufts. There was nothing novel about these usages. They corresponded—and still do-- to the MBTA bus route legend for the 94 line which then, as now, served the area and designated Powderhouse Circle, Tufts University, Medford Hillside and West Medford Square as four distinct and mutually exclusive transit zones.

In the 16 months after the advisory committee was discharged, two striking departures occurred from this accepted usage. Their combined effect was to expunge references to Tufts University at the College Avenue site and to change the station name in the heart of that University to read "Medford Hillside," so that a re-named terminus would appear to fulfill the mandate of the SIP that had been amended to go beyond Tufts. The basis for this legerdemain came in the first instance with the novel interpolation into the final report of a description of "Medford Hillside" as stretching from Powderhouse Square to West Medford Square, and including all points in between, much as "New England" includes six distinct states. Had the authors of this catch-all description discovered an ancient Viking map with all of Eastern Massachusetts labeled in runes as Medfjord Hjüllside? Was this a geographical error by some confused out-of-town consultant? Or was someone trying to be clever and keep all options open?

Whatever the cause, in the following year the all-inclusive "Medford Hillside" label was narrowed for the first time to apply exclusively to the College Avenue station. . Newly commissioned maps were drafted for the EOT by a Missouri-based consulting firm. They were at a more schematic level without the detailed street and neighborhood names of the previous MBTA maps. The label "College Ave/Medford Hillside"

was now affixed to the station in the middle of Tufts University. (See Scan 0004). In the accompanying narrative the Winthrop Street station was now explicitly declared to be a merely optional addition to the SIP. This usage was carried through fairly consistently in all subsequent project documents, with the notable exception of an unexpurgated reference in the Secretary's Certificate of 12/1/06 to a possible Green Line-commuter rail link-up at "Tufts University" (i.e. College Avenue). [And of course the executive summary to the DEIR also slips into candor when it reports about the College Avenue station that "Tufts University controls most nearby land" and again that the College Avenue terminus is "surrounded by Tufts University properties."]

I-015-005

While ordinary citizens like this writer and the Mayor of Medford continued to refer routinely to Medford Hillside as the neighborhood beginning at Winthrop Street, the EOT, as successor to the MBTA, stuck firmly to the story that transferring the Medford Hillside name to the College Avenue terminus fulfilled the amended SIP commitment to a Medford Hillside over a Tufts or Ball Square terminus.

The re-labeled schematic replaced the more detailed MBTA station locus maps when the Expanded Environmental Notice (EEN) was issued on October 1, 2006, and presented at public scoping meetings in Somerville and Medford on October 16 and November 15, 2006. During the first of these meetings a professional planner with a long acquaintance with the project as a member of the Beyond Lechmere Project Advisory Group and as chair of the MPO Transportation Planning Advisory Committee, is recorded in the transcript as calling the foreshortening of the Medford Hillside commitment to Tufts "a bit much to take."

From this point onwards, the fictitious relocation of Medford Hillside was frequently criticized in the public process. Residents of Medford Hillside presented the EOT with more than 40 archival and contemporary references testifying to the geographical fact that Medford Hillside was not Tufts and not adequately served by Tufts. The EOT responded with bland assertions that the site was "commonly" seen locally as part of Medford Hillside-- a confusion traceable perhaps to the fact that Tufts does have an area called "the Hillside", a small grassy knoll rising from Professors Row to the President's House where students can be found reading and socializing on sunny days.

Underlying this dispute were substantial planning and financial issues. The Winthrop Street station was widely believed not to be a suitable terminus on technical and traffic flow grounds, whereas a station half a mile beyond at Mystic Valley Parkway and Route 16 had great advantages over it, but at a greater cost. So the implicit and very substantial issue was whether the Extension would under-fulfill the SIP requirement by ending at Tufts (an outcome which the 1993 SIP was actually amended to preclude) or go well beyond Winthrop Street, the gateway to Medford Hillside, to Route 16, the back porch of the neighborhood, so to speak, at an extra cost.

I-015-006

Whether there are merits to a final or provisional university-based terminus is not the question in this section. The issue is whether map substitution and geographical falsification are an acceptable method of complying with a legal mandate. It is worth noting in this respect that the outgoing EOT Secretary pointedly cited the handling of the Route 16 terminus issue in his letter of departure (page 7) as a problem in the "culture of candor."

Independently of how the substantive issues are resolved, therefore, the DEIR should not be rushed to final form on the representation that a Tufts-based terminus fulfills a SIP specifically amended to supersede it.

It would be unfortunate for MEPA and others to use the fact that the misrepresentation was baked into the EEN to dodge the issue. For though there is a segment of the paper trail to explain charitably how honest people could propagate a misrepresentation of which they were unaware, it does not excuse or negate the misrepresentation once one understands that it has occurred. An analogy with counterfeit bills is germane: there is a difference between circulating counterfeit bills unawares and "uttering" (that, is knowingly circulating) them.

I-015-005

As directed by the Secretary's Certificate on the DEIR/EA, the FEIR includes a limited scope of issues related to the Green Line Extension Project. The Proposed Project, with a Medford Branch terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Although an extension to Mystic Valley Parkway/Route 16 is MassDOT's Preferred Alternative, financial constraints prohibit the Commonwealth from progressing the Project beyond College Avenue at this time.

I-015-006

Please see response to Comment I-015-004.

As long as the project entertained a real possibility of going beyond Tufts by the SIP- mandated deadline, it could be argued that the geographical irregularities would have no material effect. But the DEIR has now taken a new step, not previously anticipated, of excluding Route 16 altogether from the federal New Starts application and thus postponing for five years the Green Line extension beyond the Tufts University campus. The DEIR thus makes a material departure from a legal requirement that the governor, legislature and courts have all accepted as binding.

[Sources for this section are all publicly available on the Green Line Extension Project on-line archive. Also worth noting is the DEIR description on page 5-181 of the proposed College Avenue terminus as "surrounded by Tufts University properties" as well as the parallel executive summary statement on ES-47 that "Tufts University controls most nearby land."]

b) Financial compliance

Since the Green Line Extension is among the court-mandated mitigation measures flowing from the Big Dig, the Commonwealth is committed to whatever funding is needed to meet the SIP requirements. The Governor and Legislature indeed acted in a timely and good faith manner on this obligation in enacting the Transportation Bonding Bill of 2008, which authorized up to $775M for three SIP-related projects. Of this sum $600M was the allotment for the Green Line Extension, enough to meet SIP-required elements as they were then understood. But with this proviso:

provided that any federal grants received by the commonwealth or the Massachusetts Bay Transportation Authority for the Green Line to Medford Hillside and Union Square spur project shall be applied to reduce the state authorization by that amount.

The proviso has the effect of capping the combined federal-state budget for the project at $600M. At the time $600M seemed adequate to cover the full cost of the project, so with a hoped-for 50-50 match from federal funds, the state's outlay might be as low as $300M. But now that the SIP-required elements of the project have well exceeded the $600M price tag, the proviso has the unintended effect of blocking adequate funds. By limiting the Commonwealth's ability to leverage federal New Starts funding to $300M, the proviso forces it to seek funding from other state pots, thus increasing the Massachusetts percentage share of the overall budget.

By now the consolidated budget for the project, if one includes $120M for the Route 16 terminus, is roughly double the original $600M allotment, so that costs can be covered only if the state contribution leverages federal funds in an equal amount, without any reduction of the bonding commitment. This will require both legislative action to remove the proviso and an expectation by the executive branch not to borrow less than the full amount of the bonding budget. Of course, in the event federal funding fails or is delayed the Commonwealth will have to make good on the SIP mandated elements.

I-015-007

FTA rules require that federal funds not be approved for final engineering if there are unresolved discrepancies between the SIP and the project, or if local funds are otherwise in jeopardy. The project's increased vulnerability to federal funding decisions counsels prompt attention to identifiable problems. It should also be noted that any improprieties or uncertainties in the resolution of the "Medford Hillside" or other SIP issues not only ripple forward to FTA eligibility, but backward to the state funding authorities, both legislative and executive, as the parties directly responsible for compliance.

[The writer has been informed that the three-member Somerville-Medford legislative delegation—Jehlen, Provost, Sciortino—have this week opened discussions with the relevant legislative and executive leadership on this issue, which was not flagged by EOT in September 2008 hearings on exceeding the $600M allotment.]

2 and 3. Refining the Modules:

At a site visit to the Riverside Light Rail Maintenance Facility members of the citizen advisory committee questioned VHB consultants on the technical relation of the Maintenance and Storage facility to the Green Line Extension overall. Some CAC members also undertook independent inquiries into the Boston Engine

I-015-007

It is anticipated that Green Line Extension construction would be financed with a combination of funds from federal and state sources. MassDEP concluded that the Proposed Project would meet the requirements of the State Implementation Plan (SIP).

Terminal Heavy Rail Facility. This writer has done some due diligence on the federal funding requirements and the Lechmere boarding data. From these and the informative briefings and materials in the public process itself a more differentiated picture emerges than that assumed by the DEIR in pushing the Route 16 terminus outside the federal funding package, putting the entire Lechmere Relocation budget in it, and insisting that the maintenance facility be completed on the same timetable and under the same EIR as the rest of the Extension.

First, there seems no reason to accept the assertion in the DEIR that "federal funding requirements" preclude the Route 16 terminus module from being integrated into the SIP-mandated trunk line. To the contrary, the Route 16 terminus adds mileage depth to the project that improves its rank on the crucial cost-effectiveness ratings used to compare New Start programs nationally. These ratings are based on dollars per ridership mile. They thus reward distance traveled (and auto mileage saved), not merely boardings. All other things being equal, a five-mile trip from Route 16 to North Station is worth five times a one-mile trip from Lechmere to North Station, and 25% more than a four-mile trip from Tufts (whoops, "Medford Hillside") to North Station. By contrast, modules like the Lechmere relocation and the Facility add no miles to the denominator but many dollars to the numerator. They can be loaded into the project only if there are ridership miles to counterbalance them. The maintenance facility can lay claim to "project effectiveness," but the Lechmere relocation budget, stripped post-bubble of its land use rationale, is a drag on the project's viability in competition with other projects nationally. It is impossible to judge all this exactly without having the full numbers, but insofar as the New Starts program is a numbers game the Route 16 terminus is an invaluable asset. It is important to remember in all this that the FTA New Starts program is something of a model of transparency and merit-driven decisions, so that one cannot expect elected officials in Washington to carry water for a project that does not make the grade on the published standards any more than you can get your kid into Harvard with 450 College Board scores.

I-015-008

Second, the DEIR by removing Route 16 has not taken account of the legal risk to the project posed by the "Medford Hillside" substitution. The risk exposure is $600M, the entire amount of a potential federal match for state funds. If, as seems to this writer undeniable, the College Avenue terminus can claim SIP compliance only by virtue of geographical legerdemain, or worse, the inclusion of Route 16 is a clean way to remove the project's legal vulnerability. (Another legally viable and equally straightforward alternative would be to re-amend the SIP to permit a Tufts University endpoint, as in the original SIP of 1993). So, on a second count it is the inclusion of Route 16 that meets "federal funding requirements" and its exclusion that violates them. It is worth underlining what many transportation professionals have observed: the Route 16 terminus would be worth doing without being SIP mandated and without its distinctive contribution to the cost-effectiveness ratings. It can hold its own with any station on the line on standards of environmental justice, air quality control, traffic reduction, handicapped access (the next handicapped accessible rail station to the north of it is the Anderson/Woburn commuter stop, 7 miles away), and regional centrality—serving West Somerville, West Medford, Arlington and Winchester. More than 2000 residents of these towns— a good indication of the ridership base-- have signed a petition urging its inclusion. It is a remarkable feature of this terminus that the plan for it arose from a citizen group. Their plan includes a shuttle and community path over the Mystic River that would further extend the catchment area to West Medford Square, with its commuter rail station and charming business district--the original target of the extension.

I-015-009

Third, there seems strong reason to reject the argument in the DEIR that a fully operating maintenance facility with storage for 80 cars must be completed by 12/31/2014 in order for the Green Line Extension to be operative by that deadline. To the contrary, a northern Facility, which is a desirable thing for the entire Green Line, is not, as we learned from honest engineers at Riverside, under any engineering discipline or operational necessity to be completed by a date certain. Moreover, there are different timetables and locations possible for storage and maintenance, and distinctive environmental considerations that should not further delay the SIP elements. Questioning by many public members established early and repeatedly that the Facility can march to a tune of its own. If one were prorating capital costs, as was the minuted plan in the early Green Line Extension meetings of 2007, one could perhaps justify putting as much as 40% of the maintenance facility into the Green Line Extension budget. The rest is the project's gift to the Green Line.

I-015-008

As directed by the Secretary's Certificate on the DEIR/EA, the FEIR includes the Green Line Extension Project with a Medford Branch terminus at College Avenue Station. MassDEP concluded that this Project alternative would meet the requirements of the State Implementation Plan (SIP). As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. The Proposed Project, with a terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010).

I-015-009

The Green Line Extension storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the Project. Chapter 2 of the FEIR fully describes the environmental impacts of the proposed storage and maintenance facility. In order to maximize operating efficiencies, the facility must be constructed within the same timeframe as the Green Line Extension Project, in the vicinity of the Green Line Extension right-of-way, and north of downtown Boston.

The storage and maintenance facility alternatives include storage for Green Line Extension vehicles and replacement of the existing Lechmere Station vehicle storage. Storage capacity is also provided for vehicles currently stored in trackways between Lechmere Station and Government Center; this storage will be lost due to the Green Line Extension.

I-015-010

Fourth, one must reject flatly the DEIR assumption that a co-funded state-federal project must be completed by the SIP deadline. This deadline binds the state for SIP-related elements. The FTA is bound by SIP through the state's legal obligation to it (that is, it cannot in a rule-of-law society approve a non-compliant project for final engineering drawings). But the FTA is not precluded or discouraged from funding desirable elements outside the SIP, nor for that matter is the state, except insofar as it chooses to limit itself to what is legally required. In other words, it is administratively, financially and legally feasible to stretch the project over a longer period so that Route 16 can be moved up and non-SIP constrained elements can be moved back on the project timeline and still qualify for federal matching funds. Doing this will make the project more competitive for federal dollars and provide time to reassess elements which can become more project-effective if they are not misconstrued as SIP-mandated.

I-015-011

Fifth, there is strong reason to think that the $160M Lechmere Station Relocation project needs a thoroughgoing reconfiguration. This is not for lack of study--the work on Lechmere goes back a decade--but changes in economic reality. The "city within a city" at NorthPoint has been overtaken by events. It will have to be rethought. All over the world--from Dubai to Canary Wharf London to Boston and Allston, Massachusetts—ambitious development projects have been shelved or reconsidered in a post-bubble climate. The Lechmere scheme is weaker than most: its private funding was withdrawn while the bubble was at its height. Yet the commercial and demographic projections behind the North Point/Lechmere relocation scheme have undergone no apparent reappraisal. The relocation has simply been loaded into this project uncritically, relying on employment, demographic and commercial assumptions, well summarized in the DEIR, that are no longer plausible.

I-015-012

Sixth, the two non-SIP modules—the Facility and Lechmere relocation—are the ones most likely to benefit from a longer time horizon. The northern light rail facility discussion would be transformed if a parallel southern heavy rail location were found. As matters now stand, the MBTA is jealously guarding excess acreage in the BET yards for an expansion of heavy rail repair that it really wants to put in the south, for the same reason it needs a light rail repair facility in the north. The Lechmere station, for its part, will benefit from focusing on the vibrant East Cambridge community at its doorstep until a viable economic plan re-emerges for North Point.

I-015-013

Seventh, the project as a whole has suffered from a lack of administrative continuity at the upper echelons; or should we say frankly, it has been the victim of administrative disarray. In the course of five years the jurisdictional focus has shifted from the MBTA to EOT (under two secretaries) to MassDOT, so that it is now doubtful whether anyone can step in from on-high to make the few simple reconfigurations and refinements to enable the Extension to fulfill its considerable promise. On the other hand, there is continuity among the professionals, civil servants and citizen activists. So it is possible that a consensus of reasonable, unglamorous people in many places will reorient one of the more promising transportation projects we shall have the pleasure to shape.

4. Mitigation as a Public Process

In Chapters 4 and 5 of the report, the DEIR does a conscientious job in identifying potential construction, traffic, air quality, and noise and vibration problems, and in summary tables in Section 6 of listing appropriate mitigation measures. It also gives due attention to landscaping, historical and archeological issues, as best practice requires. But it scants two non-engineering mitigation devices: participation and compensation, two words not mentioned.

I-015-014

The rationale for seeing mitigation as a public process above and beyond the engineering problems lies in the unpredictability of human nature and events. Unanticipated problems will always arise, especially in densely populated areas. And with an involved citizenry there will also be opportunities for improvements and adjustments that can only be made on the spot with local knowledge. Moreover, there is an inherently subjective element in what constitutes a mitigation issue. Even quantified noise and vibration standards are founded in perceived tolerance levels.

I-015-010

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. The Proposed Project, with a terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010).

I-015-011

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-015-012

As described in Section 3.3.2 of the DEIR/EA, the Boston Engine Terminal facility is barely adequate for current commuter rail needs. Sufficient space is not available to accommodate the Green Line Extension train storage and maintenance needs. Further, the FTA regulations state that use of both commuter rail and light rail within the same facility is incompatible.

Past experience suggests that making modest advance monetary provision for public processes can be an unusually cost-effective mitigation measure. Two devices from the Red Line Extension experience of three decades ago are worthy of consideration for the Green Line.

a) station-specific task forces

I-015-015

Modest provision for staffing station-specific task forces can be made to deal with construction, development and environmental issues as they arise. These would be unincorporated ad hoc groups that provide a venue for project contractors, local officials, police, businesses and residents to meet from time to time to review station-related issues.

They will work best in a climate of open interchange and reasonable accommodation. They do not require formal officers, dues, budgets, by-laws or votes, merely a facilitating staff presence to announce meetings, circulate minutes, invite guests, follow-up on consensus measures.

The Davis Square Task Force, funded originally in 1974 through the MAPC in connection with Red Line Extension, provides an example that has had continuing durability over a 35-year span, addressing transit-oriented development, traffic, community path, policing and other community issues long after the tunneling and blasting for the Red Line had ceased. Of course, some Green Line stations may have task forces that disband shortly after construction and post-construction issues are resolved, and Tufts may prefer to handle issues relating to the College Avenue station largely as a University-to-MBTA negotiation, since that station, as the DEIR correctly notes, is almost wholly surrounded by University land.

The example of Ball Square presents itself as one that has already shown promise for a task force type approach. In heavily attended public meetings sponsored by EOT there was early consensus in opposition to a proposed station siting outside the business district and in favor of a centrally located stop on Broadway. The consultants responded with plans that met these wishes.

The agreed solution, as presented in the DEIR, has broad support. But it will require bridge reconstruction and takings that will generate further issues during construction, and continuing traffic and parking discussion after the 2014 opening. The disruption of traffic during construction can be fatal to businesses of the kind that have thrived in Ball Square, so early notification of what is in store will be especially useful. This would be the first duty of a staff person shared with other station-specific task forces.

In the case of Ball Square it should be noted that though the actual station is in Somerville, much of the impact will be in Medford, so issues will cross jurisdictional lines. A similar Somerville-Medford situation holds at Route 16, and between Somerville and East Cambridge at Union Square. The sponsoring jurisdiction can thus be a regional agency, a lead municipality, a non-profit contracted for this purpose, or a two-city letter of understanding.

b) *Noise and vibration*

I-015-016

At an EOT public meeting on March 11, 2009, this writer read and submitted in writing the following suggested wording for the DEIR:

"In the event mitigation measures are insufficient to bring noise and vibration within the targeted levels, there will be pre-agreed procedures for compensating affected resident abutters without their having to resort to costly legal action, without abridging their right to such action."

The explanation was that "previous experience suggests that noise and vibration estimates change during construction and operation due to geological, landscaping, equipment, scheduling and other factors."

This, too, draws on a successful device used in the Red Line Extension. Prior to completion of construction, the MBTA agreed that after the subway was in operation there would be an open period for retesting noise and vibration levels for compliance with targeted standards. Any impacted homeowner could request an evaluation. If the original targets had not been achieved, the MBTA had a set period in

I-015-013

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

I-015-014

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-015-015

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-015-016

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

which to remedy the problem at its own cost (e.g. with adjustment of systemic barriers, soundproofing of individual homes). If mitigation measures proved insufficient, there were provisions for monetary compensation.

This procedure successfully held the relevant engineers to their own pre-defined standards. As a result, this writer can recall only two Somerville homes that reached the point of requiring (moderate) monetary compensation for post-construction noise and vibration, and no cases of litigation on these issues—in a project far more expensive, complex, disruptive and fraught with engineering problems than the proposed Green Line Extension.

This forgotten model may compare favorably with the more recent Green Bush Line issuance of $5-50,000 mitigation checks to residential abuttors. But that precedent, too, may have lessons for the Green Line and should be reviewed.

Since the DEIR makes a plausible case for high confidence in its technical noise and vibration solutions, there should be no difficulty in making advance provision for compensation in the unlikely event they fall short.

Conclusion

Here is a checklist of action items that flow from this comment. They are not all appropriate to MEPA, but as this is the only opportunity given us for a formal comment, the writer trusts that others will also consider them:

I-015-017 | 1. Fix the Medford Hillside map substitution problem in a non-defensive way that re-establishes not merely the legality but the integrity of the project.

I-015-018 | 2. Fix the legislative proviso blocking the state from leveraging federal funds.

3. Put the Route 16 Terminus back into the federally funded package.

I-015-019 | 4. Put the storage and maintenance facility on a separate schedule and environmental process

I-015-020 | 5. Encourage (outside the project of course) the identification of a southern heavy rail maintenance facility to supplement the Boston Engine Terminal, so that a vacant 25% of that acreage can house the light rail facility

I-015-021 | 6. Re-assess the Lechmere relocation scheme and withhold its more ambitious features until they are validated by private funding or local bonding.

I-015-022 | 7. Reserve a small percentage of the four-year budget for staff back-up to citizen participation in public mitigation processes

I-015-023 | 8. Ditto for noise and vibration compensation and in-kind mitigation.

I-015-024 | 9. Use any lard cut from the Lechmere scheme or prorated out of the maintenance facility to

- --engineer Union Square for future link-up with Porter Square
- --firmly commit to community paths
- --provide lacking amenities—tool booths, rain cover—to a less grandiose Lechmere station
- --assure that the stations do not skimp on art, landscaping, lighting, bicycle parking, cross walks, emergency telephones, fare machines, rain shelters, cameras, handicapped access.

My thanks for the kind consideration of the reader(s).

Lee Auspitz

I-015-017

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. The Proposed Project, with a terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Additionally, FEIR Chapter 4 includes a detailed description of College Avenue Station functioning as a terminal station.

I-015-018

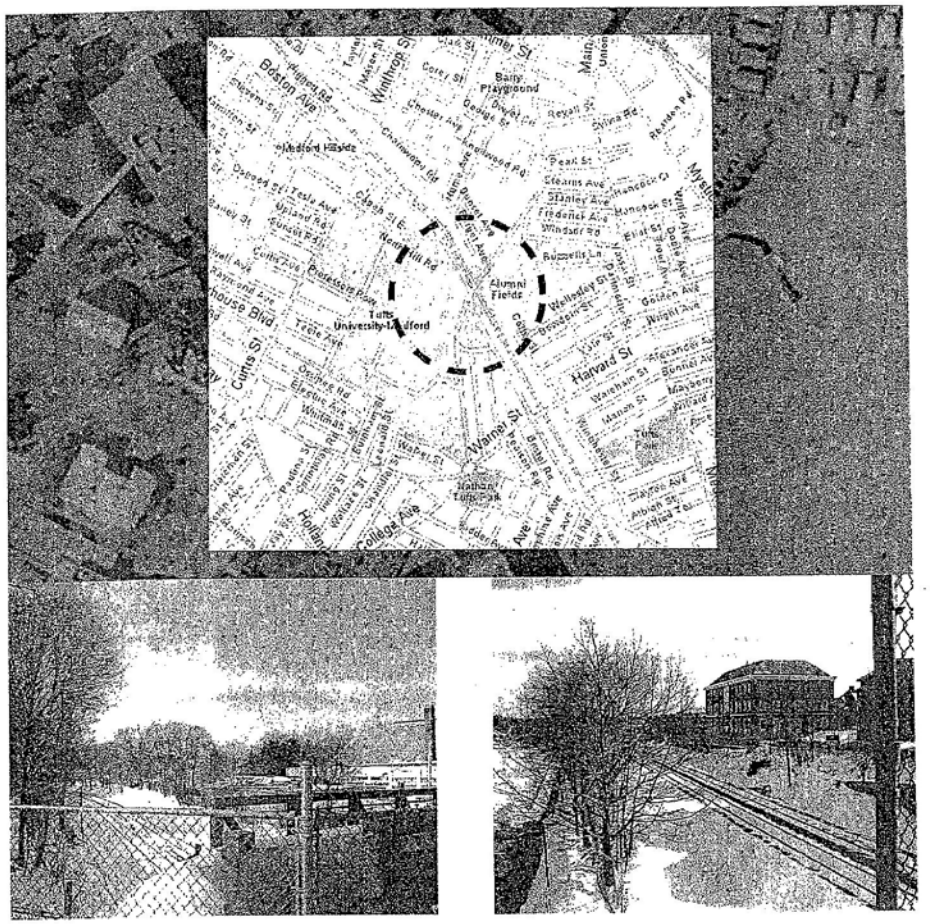
MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

I-015-019

The new Green Line storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the overall Project. Chapter 2 of the FEIR fully describes the environmental impacts of the proposed storage and maintenance facility.

I-015-020

The Boston Engine Terminal (BET) and major modifications to its operations are beyond the scope of the Green Line Extension Project. MassDOT will continue to coordinate with the MBTA to explore possibilities for shared facilities between the Green Line Extension storage and maintenance facility and the BET.



Beyond Lechmere Northwest Corridor Study

Figure B-6

Proposed College Avenue Station
Locus Map

Massachusetts
Bay
Transportation
Authority

I-015-021

Revised conceptual plans for Lechmere Station, including modifications to the station headhouse and entrances, enclosed automatic fare collection, and other amenities are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-015-022

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-015-023

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-015-024

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. These stations are designed to be consistent with MBTA standards and compliant with ADA. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local

communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

Boston MA 02114

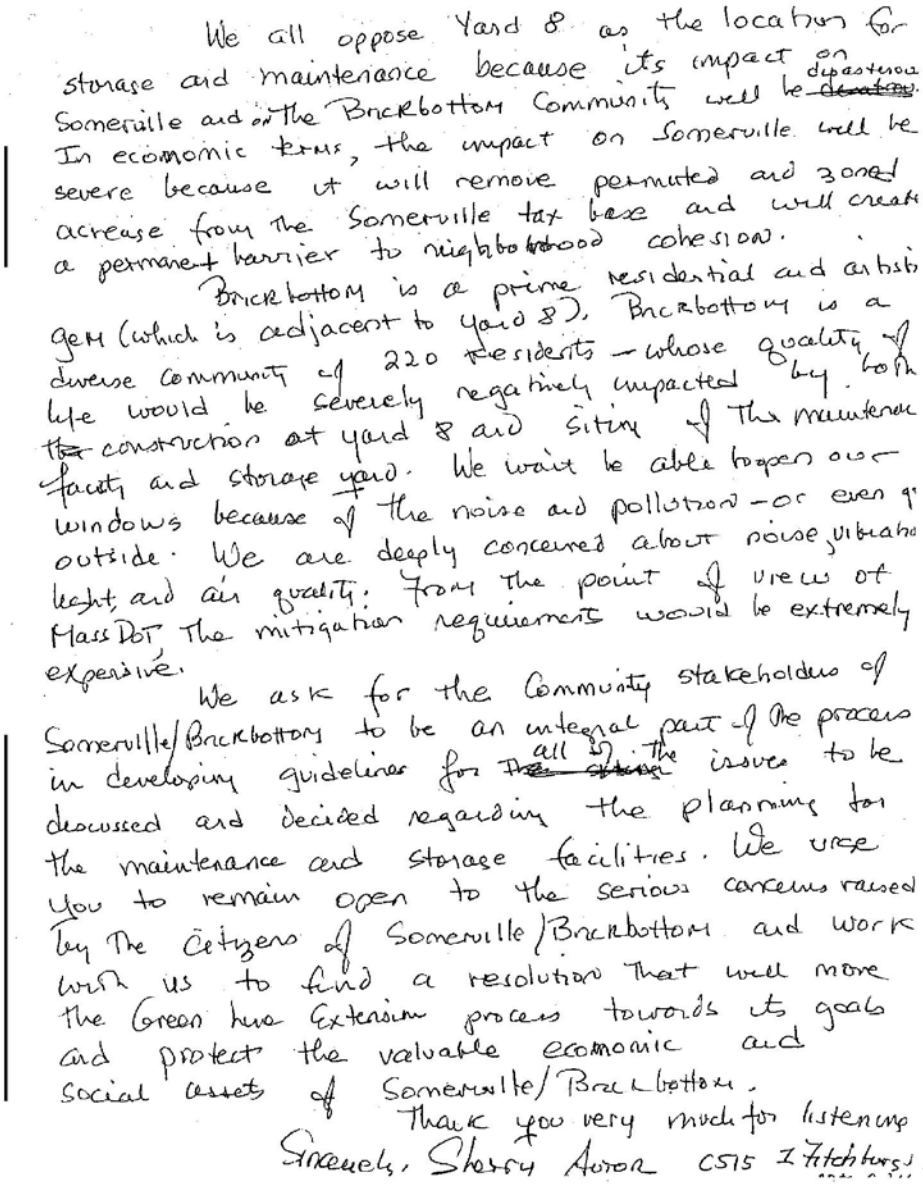
Dear Secretary Bowles:

I attended the two recent DEIR meetings - on ~~Dec.~~ November 18th at Somerville HiS, and on Dec. 15th at the Cambridge Multi-cultural Center. It was very gratifying to find so many of my fellow citizens from our Brickbottom community and from other parts of Somerville speaking out loud and clear - articulating all of the important reasons that the community supports the Green Line Extension, but ~~were~~ is strongly against locating the maintenance facility and storage yard at the Yard 8 location. We are all pleased that MassDOT listened to the Brickbottom and Somerville community and are giving serious consideration to the alternatives Mirror H and Option L. We ask you to please continue to study these and additional alternate sites.

I-016-001

I-016-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.



We all oppose Yard 8 as the location for storage and maintenance because its impact on Somerville and the Brickbottom Community will be disastrous. In economic terms, the impact on Somerville will be severe because it will remove permitted and zoned acrease from the Somerville tax base and will create a permanent barrier to neighborhood cohesion.

Brickbottom is a prime residential and artist gem (which is adjacent to yard 8), Brickbottom is a diverse community of 220 residents — whose quality of life would be severely negatively impacted by both the construction at yard 8 and siting of the maintenance facility and storage yard. We will be able to open our windows because of the noise and pollution — or even go outside. We are deeply concerned about noise, vibration, light, and air quality. From the point of views of MassDOT, the mitigation requirements would be extremely expensive.

We ask for the Community stakeholders of Somerville/Brickbottom to be an integral part of the process in developing guidelines for all of the issues to be discussed and decided regarding the planning for the maintenance and storage facilities. We urge you to remain open to the serious concerns raised by the citizens of Somerville/Brickbottom and work with us to find a resolution that will move the Green Line Extension process towards its goals and protect the valuable economic and social assets of Somerville/Brickbottom.

Thank you very much for listening.

Sincerely, Sherry Aaron 0515 Fitchburg St

I-016-002

I-016-003

I-016-002

Direct and indirect impacts to land use are described in DEIR/EA Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for sustainable land use, which could further reduce automobile traffic congestion and improve air quality.

I-016-003

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA #03886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-017-001 As a resident of the Glass Factory Condominiums, I am deeply concerned about the design and placement of the Green Line Extension and the new Lechmere Station.

TRACKS ARE TOO CLOSE TO OUR BUILDING.
The present design shows the tracks running very close to the rear of our building. We urge your designers and engineers to place the tracks as far to the rear of our building as possible to preserve views & light to the many units that will be severely impacted by the elevated tracks. The design and placement of the tracks and supports should do all it can to minimize the visual impact to those units and also minimize noise & vibration impacts to the whole building as well as the surrounding neighborhood.

LECHMERE STATION.
At present, your designs show the new Lechmere Station so close to the Glass Factory that it appears to be part of our condominium building. Please move the station closer to East Street, where it could be part of the entrance way to the eventual North Point development. The station design needs to be substantially improved so it is not an eyesore but rather an enhancement to this rapidly developing neighborhood. It should reflect the importance of this location as the gateway between Cambridge & Boston.

BUS TRAFFIC.
The many bus lines that converge on Lechmere Station are presently designed to enter at one end of our building, pick up passengers, and emerge at the other end of our condo building. Please do not route bus traffic, directly under our windows. Bus traffic noise, vibrations and fumes are a great concern. Sidewalks where passengers wait, should also be moved farther from our building to preserve our privacy and minimize impacts from noise, light and smoking. If too close, it will feel like we are living in the bus station.

PRESERVE OUR TREES & GREEN SPACE.
Presently there is a row of mature evergreen trees behind our building. I urge you to preserve all these trees and the entire small green space behind our building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks should be on the far side of the large trees. These trees serve as a natural screen for the tracks and busway.

I-017-001

Please see Comment Letter I-013.

MAINTENANCE FACILITY.
I strongly oppose the Mirror H location. It is much too close to the Glass Factory and other residential buildings and will effectively destroy further development in North Point. Putting a maintenance facility on prime land in a desirable, developable location that would generate significant tax revenue to Cambridge simply does not make sense. Of the three options proposed, Option L seems to be the best choice however I would prefer there be no maintenance facility in this area but rather it be at the end of the line.

REDUCE SURFACE PARKING.
The present Lechmere Station is at the end of the Green Line. That will no longer be the case with the new Green Line Extension and the number of parking spaces should be substantially reduced. Surface parking is bad urban design and should be minimized in the new North Point neighborhood. One half of our building will overlook the new parking and we request it be carefully designed with this in mind. Ample green space should be included in the design and all lighting should be down lighting that minimizes light pollution to our building.

Thank you for hearing my concerns.

Sincerely,

Cc: Debra Beard-Bader
Subject: Green Line Extension Draft Environmental Impact Report (DEIR)

Dear Ms. Johnson,

I-018-001 As Medford residents, we urge you to reject the current Green Line Extension Draft Environmental Impact Report (DEIR).

I-018-002 The report does not address any of the issues relating to extending the Green Line to Route 16, as required by law.

Christopher Bader
Debra Beard-Bader
298 High Street
Medford, MA 02155
(617) 417-1226

I-018-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

I-018-002

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. The Proposed Project, with a terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Additionally, FEIR Chapter 4 includes a detailed description of College Avenue Station functioning as a terminal station.

Boston, MA 02114

Dear Secretary Bowles:

As a resident of the Glass Factory Condominiums, I am deeply concerned about the placement of the Green Line Extension and the design of the new Lechmere Station.

TRACKS TO CLOSE TO OUR BUILDING.
Present design shows the tracks running very close to the rear of our building. We urge your designers and engineers to place the tracks as far to the rear of our building as possible, to improve noise abatement and vibration concerns.

LECHMERE STATION.
At present, your designs show the new Lechmere Station so close that it appears to be part of our condominium building. Please place the station closer to the new East Street, where it could be a well designed portal to the eventual North Point development.

ASSOCIATED BUS TRAFFIC.
The many bus lines that converge on Lechmere Station are presently designed to enter at one end of our building, pick up passengers, and emerge at the other end of our condo building. Please do not route bus traffic directly under our windows. Bus traffic noise and fumes are a great concern.

TREES.
Presently there is a row of trees behind our building. We urge you to run the track on the far side of this row of trees to help with screening and noise abatement.

GREEN SPACE AND PARKING LOT
The present Lechmere Station is at the end of the Green Line. That will no longer be the case with the new Green Line Extension. The present large commuter parking lot will not be an amenity for the new North Point, but additional green space would be an enhancement rather than a detraction.

Thank you very much for your public process, listening to our voices and hearing our concerns.

John Baehrend

Boston, MA 02108

RE: Project Number EEA #13886

Dear Secretary Bowles,

I am an occupant in the Brickbottom Artists Building in Somerville and a strong proponent of the Green Line Extension project. I am a frequent user of public transportation and use it to commute to work, get to entertainment venues and get to the airport. I believe the Green Line Extension project is an important step towards increasing accessibility to public transportation.

I-020-001 Although I support the Green Line Extension project, I am highly concerned with the Department of Transportation's position on the placement of the maintenance facility and storage yard in the parcel known as "Yard 8". The residential environment could be destroyed by this proposal. This is especially true because there is significant evidence that other locations such as the Option L location could also meet the facility's need while having much less environmental impact on the surrounding community.

I-020-002 The "Yard 8" location directly abuts the only residences (200+ occupants) in the surrounding area. Selection of that site would have significant noise and vibration impacts on these residences. Even with significant mitigation such as replacement windows to reduce noise, quality of life will be negatively impacted since those mitigation actions would do nothing for occupants when they would open their windows in the warmer summer months. Selection of the Option L location would not have the same impacts and would require far fewer mitigation steps.

I-020-003 In addition as the Commonwealth moves to being more of a service and "clean" economy, it makes no sense to create a new industrial zone located directly adjacent to an existing residential complex when an alternative site offers largely the same potential without the environmental and community impacts. A quick comparison of the options highlights the negative impacts of selecting Yard 8 for the maintenance and storage facility.

	Yard 8	Option L
Impact to residents	**High** – Site directly abuts the only residences in the surrounding area. Noise and vibration impacts will be significant and even with significant mitigation, quality of life will be negatively impacted	**Low** – Site is reasonably far from any residences. Noise and vibration impacts should be minimal and may require little mitigation
Loss of development potential	**High** – Surrounding properties will likely remain industrial rather than converting to higher value office / commercial	**Low** – Area is bounded by I-93 and proposed large-scale mixed use development
Property tax loss – direct	**High** – Currently zoned commercial	**Low** – Currently owned by government agencies
Property tax loss – indirect	**High** – Surrounding commercial and residential areas will likely face reduced valuations	**None** – Location is already industrial train location bounded by I-93 and large-scale mixed use development

I-020-004 Given these facts, I strongly urge you to support the Option L location for the maintenance facility which minimizes the negative impacts on the community.

Thank you for your consideration and time on this extremely important matter.

Cheryl Bakey

I-020-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

MEPA Office
Attn: Holly Johnson, MEPA Analyst
EE#13886
100 Cambridge St, suite 900
Boston, MA 02114

Dear Secretary Ian Bowles,

I write to express my support for the extension of the Green Line but to express my opposition to locating the Maintenance Facility at Yard 8.

I-022-001 As an owner of a unit at Brickbottom, one of the founding members, and an artist, I do not endorse or support having the Maintenance Facility located in such close proximity to Brickbottom. As State Rep and Cambridge City Councilor Tim Tommey was quoted in a Cambridge Chonicle article about the recent meeting at the Cambridge Multicultural Center ," I haven't found one person yet who supports Yard 8." If that is the case, how is it that the state is still considering Yard 8?? What was the purpose for all the meetings, if the state is not going to let public opinion have any influence? Why is it that the state appears to be favoring Yard 8 as the site rather than Option L or Mirror H?

There is no way to describe to you how challenging it was to create this artist building. We have created this thriving art community from a very harsh urban neighborhood. Putting up the facility so close to Brickbottom will negatively affect the Brickbottom community and neighborhood.

I-022-002 Secondly, not only would the Maintenance Facility at Yard 8 cause much noise and vibration to the quality of life at Brickbottom, it would create a barrier between the Brickbottom area and the Inner Beltway. It would negatively impact development connecting those two areas and therefore affect the future tax revenue as the facility impacts adjacent property value and future growth potential.

Union Square was featured several years back in the London Financial Times as having much real estate potential for developers and buyers. East Somerville is in very close proximity to two of the most respected and renowned universities in the world. The neighborhood of Brickbottom is a scant mile or so from these institutions and from Union Square. Why not make the Maintenance Facility a 'win-win' that will build on and add to the very high quality of neighboring public and private urban space of Union Square, MIT, and Harvard? A project of this scale as the Green Line Extension and the Maintenance Facility are a once in a lifetime opportunity to create change in a way that improves the quality of life of all the areas involved and impacted!

I-022-003 This is not an all or nothing situation. The state has alternative sites. Mirror H and Option L would work much better by not negatively impacting a neighborhood, nor would these sites prevent future development and enhanced tax revenues for the Inner Beltway. Do not be tricked into quick fixes that will, in the end, be devolutionary change. Thank you for your consideration of this request and to your response to my questions.

Sincerely,

Sarah Bapst

Why is it that the state appears to be favoring Yard 8 as the site rather than Option L or Mirror H?

There is no way to describe to you how challenging it was to create this artist building. We have created this thriving art community from a very harsh urban neighborhood. Putting up the facility so close to Brickbottom will negatively affect the Brickbottom community and neighborhood.

Secondly, not only would the Maintenance Facility at Yard 8 cause much noise and vibration to the quality of life at Brickbottom, it would create a barrier between the Brickbottom area and the Inner Beltway. It would negatively impact development connecting those two areas and therefore affect the future tax revenue as the facility impacts adjacent property value and future growth potential.

Union Square was featured several years back in the London Financial Times as having much real estate potential for developers and buyers. East Somerville is in very close proximity to two of the most respected and renowned universities in the world. The neighborhood of Brickbottom is a scant mile or so from these institutions and from Union Square. Why not make the Maintenance Facility a 'win-win' that will build on and add to the very high quality of neighboring public and private urban space of Union Square, MIT, and Harvard? A project of this scale as the Green Line Extension and the Maintenance Facility is a once in a lifetime opportunity to create change in a way that improves the quality of life of all the areas involved and impacted!

This is not an all or nothing situation. The state has alternative sites. Mirror H and Option L would work much better by not negatively impacting a neighborhood, nor would these sites prevent future development and enhanced tax revenues for the Inner Beltway. Do not be tricked into quick fixes that will, in the end, be devolutionary change. Thank you for your consideration of this request and to your response to my questions.

Sincerely,

Sarah Bapst

RE: Green Line Extension Draft EIR (EEA #13886)

Dear Secretary Bowles:

I strongly support the construction of the Green Line Extension to Route 16 on the Medford/Somerville line and to Union Square in Somerville and believe its positive environmental impacts greatly exceed the potential negative impacts. However, I cannot support the Draft EIR because of various shortcomings and omissions in the design.

I will be submitting my comments on the design and the Draft EIR in more than one letter, this one concentrating on the extension of the Somerville Community Path and bicycle and pedestrian issues. Thanks you very much for considering these comments.

First the main points on Design, Funding and Construction (followed by details):

I-024-001
- I think that the Community Path design from Lowell St. to Washington St. as shown in Appendix E of the DEIR is excellent. Its implementation will be a great benefit for the Green Line and its ridership as well as an asset to Somerville and the region. As the location of the support facility is finalized, the route of the Community Path from Washington St. to Lechmere in Cambridge should be re-evaluated.

I-024-002
- The DEIR should clearly state that the extension of the Community Path will be designed by MassDOT's contractors as agreed to in a February 24, 2009 letter from the EOT.

I-024-003
- That for cost efficiencies and technical necessities, the Green Line and Community Path extensions will be constructed as one project and must clearly be described as such by MassDOT.

I-024-004
- MassDOT should commit to work with the City and other State and Federal agencies to obtain the necessary funding to build the Community Path extension as part of the Green Line extensions (as was done with the Linear Park as part of the Red Line and the Southwest Corridor path as part of the Orange Line), including applying for Federal New Starts funding for allowed bicycle and pedestrian access costs.

I-024-005
- The planned amount of bicycle parking is insufficient and pedestrian connections to some of the stations could be better designed. Also, the DEIR does not show at all how bus connections will be made to the new stations. I look forward to those improvements during the final design process.

Now the details:

Funding and the Importance of the Community Path – If funding is not available at the right time such that the Community Path can be constructed along with the Green Line, it

I-024-001

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-024-002

Please see response to Comment I-024-001.

I-024-003

Please see response to Comment I-024-001.

I-024-004

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-024-005

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station

likely will never be built as it will cost many times more to construct it as a separate project. The City of Somerville has about $3 million for the $15 - $20 million Community Path extension estimated cost. The reasons that I feels that this request for State and Federal transit funding is reasonable and appropriate are as follows:

I-024-006

- The Community Path will provide desirable off-road bicycle and pedestrian access to the stations, offering superior connections to the neighborhoods (like in Davis Sq. where 60% of the residents use public transportation and thousands walk and bike to the station each day), thereby attracting more riders in a very cost-effective manner. More riders means a greater change of getting federal New Starts funding.
- In the vicinity of Lowell St., Gilman Sq. and Washington St. stations, the Community Path is in integral part of the station access, allowing the Davis Square station success to be replicated.

I-024-007

- The only way the Path can realistically be constructed is together with the Green Line extension.
- Many other amenities not absolutely needed for the Green Line extension have been included (car drop-offs, redundant elevators and escalators, storage for twice as many Green Line cars as necessary, station fare collection rather than on-board, etc.) So its also reasonable that Community Path costs also be included.

I-024-008

- The FTA has recently proposed a policy that "pedestrian improvements located within one-half mile and all bicycle improvements located within three miles of a public transportation stop … may be eligible for FTA funding" http://edocket.access.gpo.gov/2009/E9-27240.htm
- There are at least 2 precedents in the Boston area for community paths constructed and paid for by transit projects:
  - The Linear Path over the Red Line Paths with the Red and Orange line extensions that were part of the overall transit construction project
  - The Southwest Corridor Path alongside and over the Orange Line

There are many recent examples around the country of paths being built together with mass transit expansions:

- The Capital Crescent trail alongside the planned light-rail Purple Line in suburban Washington DC includes trail construction is part of the project and the cost estimates that will be submitted for New Starts funding from the federal government.

  http://purplelinemd.com/images/stories/purpleline_documents/deis/deis/10_chapter5.pdf
  http://purplelinemd.com/images/stories/purpleline_documents/deis/Conceptual%20Plans%2009%202008.pdf

- Bicycle and pedestrian path alongside the light-rail Expo line in Los Angeles:
  http://buildexpo.org/gallery.php
  http://metro.net/projects_programs/exposition/feis.htm
- A world-class bikeway was built alongside and integrated with stations on the 14-mile Orange Line BRT corridor in LA:

  http://www.streetfilms.org/las-orange-line-bus-rapid-transit-plus-bike-path/

concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-024-006

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

I-024-007

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-024-008

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-024-008

The Somerville Community Path is a critical piece of the following regional and State-wide bicycle and greenway plans.

- The Massachusetts Bicycle Transportation Plan (page 30 and 45 and Figure 4): http://www.massbikeplan.org/_docs/Massachusetts%20Bicycle%20Plan%20with%20Links%20to%20Graphics.pdf
- The Somerville Community Path as part of the critical 104-mile east-west Mass Central Rail Trail (Figures 4.1 and 4.2): http://www.masscentralrailtrail.org/
- The City of Somerville's Open Space and Recreation plans list the Community Path
- The Mystic Valley Case Statement for Active Transportation for the Mystic River Communities: http://www.railstotrails.org/resources/documents/whatwedo/case_statements/Vision%20for%20July%2010th%20draft.pdf
- The 2007 MAPC Regional Bicycle Plan - http://www.mapc.org/transportation/trans_alternatives/Bike_plan_PDFs/Bike_Plan_FINAL_version_3-14-07.pdf

I-024-009

Community Path from Lowell St. to Route 16: The MEPA certificate said that the environmental review would include evaluation of continuing the Community Path west of the Lowell St. station to Medford. The study results that were presented (Appendix E of the DEIR) concluded that the width of the ROW was insufficient to provide such a continuous Path. However, since there are some sections where there is enough width; a route, perhaps with connection to local streets, should be studied further.

I-024-010

Community Path from Route 16 to West Medford: Section 3.2.3 of the RFP said that VHB should study *"Using the bikeway/pathway guidelines, consider options for providing pedestrian connections to the West Medford commuter rail station and evaluate the viability and potential impacts of including a community path in this section of the project area."* This seems not to have been done but should be. Such a Path would make a transfer connection from Route 16 to West Medford. Therefore MassDOT should plan for a community path to connect the Route 16 terminus to West Medford via an overpass of Route 16, a bridge over the Mystic River and a route along the Lowell commuter rail tracks.

I-024-011

Access to Route 16 Station - The plans in the DEIR document do not show how Green Line riders will safely access the Route 16 station from Arlington and Medford and from the Alewife Brook paths that are being improved as part of a $3.6 million ARRA stimulus project. A multi-use path for pedestrians and bicyclists to the station should be included in the design from the Alewife paths to the station. Please request that MassDOT perform this design.

I-024-012

Bicycle Parking - The amount of bicycle parking presently described in the plans (270 spaces) is very welcome but will be insufficient for the expected number of bicyclist coming to the stations. 270 spaces is only about 1% of the expected ridership. Based on the present parking at Red line stations, bike parking at 3-5% of ridership will soon be needed. Therefore I request that the amount of bike parking be increased to approximately 5% at the Union Square, Route 16 and Lowell St. (major intersection with Community Path) stations and 3% at the remainder. Also, the location of the bicycle parking (where specifically shown in the plans) are good at some locations but not at others. The bicycle parking locations should be as close to as possible to the entrance and in well lit and safe locations. Lastly, bicycle parking should be covered if at possible.

I-024-009

DEIR/EA Section 3.8.2 and Appendix E include an analysis of this potential community path connection to Medford. As presented in the analysis, a community path along the Green Line Extension Medford Branch corridor north of Lowell Street Station is not viable due to right-of-way constraints. The analysis also concluded that adjacent Boston Avenue has insufficient pavement width for a community path or on-street bicycle lanes.

I-024-010

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. Designing the Community Path for this segment is therefore also not part of the Proposed Project.

I-024-011

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. In the interim, MassDOT proposes a community planning process for the area of a future Mystic Valley Parkway/Route 16 station to cover issues relating to station design and layout, neighborhood impacts, attendant economic development, access for pedestrians and bicyclists, and other area planning issues.

I-024-012

The amount of bicycle storage at each station is based on ridership projections developed by CTPS. DEIR/EA Appendix D includes the

I-024-013

Improved pedestrian and bicycle access – access could be vastly improved at some of the stations by having more than one entrance or access point such as:

- a direct connection from the Gilman Square station to the Somerville High School/Library/City Hall complex)
- the Washington St. station design which seems particularly poor in this regard for riders coming from the west and north. This could be greatly improved by locating the station directly above Washington St. where direct access via elevator would be possible (earlier designs included such a layout).
- station designs (specifically College Ave and Washington St.), where drop-off (kiss and ride) stops are directly in front of the entrance while pedestrian access is a long and involved route.
- Lowell St. station where a direct connection to the platform from the Path coming from Cedar St. would be possible via a safe crossing of one track. MassDOT has said this would not be allowed because of safety concerns even though every light rail system in the US (including in Boston – see the Longwood stop on the Green Line and stops on the Mattapan line) allows crossing of tracks for access. There s Even if MassDOT will not allow this access point at this time, the Lowell St. station platform should be designed for such future access.
- In general, pedestrian and bicycle access should be given higher priority in these "community-based" station designs that motor vehicles connections.

I-024-014

Community Path costs – I understood that the marginal (extra) costs for constructing the Community Path between the stations was to be provided but I don't see them in the DEIR. They should be provided.

I-024-015

Community Path Route from Washington St. to Lechmere - the Somerville Community Path route should connect the Washington St./Brickbottom station, the Brickbottom community and Inner Belt to Lechmere. The present plans do not make these connections. If the proposed Yard 8 location for maintenance and storage facility is "dropped", better routes for the Community Path (such as along the Green Line to Brickbottom and over the former Red Bridge location) that do make these connections are possible. The Green Line extension plans should state that this re-evaluation will be done.

In conclusion, while I realize that a 10% design stage cannot contain all the details everyone would like, I feel that stating these many improvements is necessary for the final EIR and the subsequent final design in order to achieve a first class transit system.

Thank you very much.

Sincerely,

Susanna Barry and Seth Boyd
109 Willow Avenue #2
zanbarry@yahoo.com

methods CTPS used to analyze demand for bicycle parking. Detailed bicycle parking designs will be further developed during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

I-024-013

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-024-014

The preliminary construction costs ($16M) for the Community Path from Central Street to the Inner Belt area are provided in the DEIR/EA Section 3.8.1. This preliminary cost does not include land acquisition, removal of any contaminated soils, or major utility work.

I-024-015

MassDOT is committed to completing all planning, design, and engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community Path between Lowell Street and Inner Belt Road. MassDOT is not able at this point to commit to funding the construction of the Community Path. The limits of the path were predicated on the connections to Lechmere being made through the Inner Belt area via Inner Belt Road and the proposed Urban Ring Bridge into the Lechmere area. However, the cessation of planning for the Urban Ring Project has changed the timing of this anticipated connection. MassDOT is unable to assume responsibility for designing the Urban Ring Bridge as part of the Green Line Extension Project. That being said, MassDOT is committed to working with the City of Somerville, residents and businesses in the Brickbottom and Inner Belt neighborhoods, and Community Path advocates to design the Path to create improved connectivity within the Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension.

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA #03886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-025-001 As a resident of the Glass Factory Condominiums, I am deeply concerned about the design and placement of the Green Line Extension and the new Lechmere Station.

TRACKS ARE TOO CLOSE TO OUR BUILDING.
The present design shows the tracks running very close to the rear of our building. We urge your designers and engineers to place the tracks as far to the rear of our building as possible to preserve views & light to the many units that will be severely impacted by the elevated tracks. The design and placement of the tracks and supports should do all it can to minimize the visual impact to those units and also minimize noise & vibration impacts to the whole building as well as the surrounding neighborhood.

LECHMERE STATION.
At present, your designs show the new Lechmere Station so close to the Glass Factory that it appears to be part of our condominium building. Please move the station closer to East Street, where it could be part of the entrance way to the eventual North Point development. The station design needs to be substantially improved so it is not an eyesore but rather an enhancement to this rapidly developing neighborhood. It should reflect the importance of this location as the gateway between Cambridge & Boston.

BUS TRAFFIC.
The many bus lines that converge on Lechmere Station are presently designed to enter at one end of our building, pick up passengers, and emerge at the other end of our condo building. Please do not route bus traffic, directly under our windows. Bus traffic noise, vibrations and fumes are a great concern. Sidewalks where passengers wait, should also be moved farther from our building to preserve our privacy and minimize impacts from noise, light and smoking. If too close, it will feel like we are living in the bus station.

PRESERVE OUR TREES & GREEN SPACE.
Presently there is a row of mature evergreen trees behind our building. I urge you to preserve all these trees and the entire small green space behind our building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks should be on the far side of the large trees. These trees serve as a natural screen for the tracks and busway.

I-025-001

Please see Comment Letter I-013.

MAINTENANCE FACILITY.
I strongly oppose the Mirror H location. It is much too close to the Glass Factory and other residential buildings and will effectively destroy further development in North Point. Putting a maintenance facility on prime land in a desirable, developable location that would generate significant tax revenue to Cambridge simply does not make sense. Of the three options proposed, Option L seems to be the best choice however I would prefer there be no maintenance facility in this area but rather it be at the end of the line.

REDUCE SURFACE PARKING.
The present Lechmere Station is at the end of the Green Line. That will no longer be the case with the new Green Line Extension and the number of parking spaces should be substantially reduced. Please consider using the under-utilized parking garages that are already in this neighborhood. Surface parking is bad urban design and should be minimized in the new North Point neighborhood. One half of our building will overlook the new parking and we request it be carefully designed with this in mind. Ample green space should be included in the design and all lighting should be down lighting that minimizes light pollution to our building.

Thank you for hearing my concerns.

Sincerely,

Signature

I-026-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

Johnson, Holly (EEA)

From: jbay@gis.net

To: Johnson, Holly S (ENV)
Cc: jbay@gis.net; brickbottomgr@earthlink.net
Subject: opposition to DOT maintenance facility at Yard 8

Dear Secretary Bowles:

I-027-001 I am writing to voice my opposition to building the proposed DOT maintenance facility at Yard 8, directly adjacent to the Brickbottom Artists' Building. (EEA# 13886) Brickbottom is a thriving residential community of 220 residents in 155 live/work condominium units. I am the owner of unit #B450 in the Bakery building.

Some of the primary reasons I oppose siting this facility next to Brickbottom are these:

* it will have negative sound and vibration impacts
* it will have an adverse impact on Brickbottom property values
* it will result in a significant loss of future tax revenue for Somerville
* it would place an unfair, disproportionate burden of environmental impact on the quality of life for Brickbottom's 220 residents
* the project's Citizen's Advisory Group was not included in the evaluation of potential sites for the maintenance facility and storage yard.

I-027-002 This violates the Secretary's Certificate for community involvement in the project. (EEEF, Smart Growth/Land Use, p.5)

I-027-003 I would like to encourage the DOT to focus on alternative sites, including Mirror H and Option L. Also, there should be a process in place to address mitigation problems during construction and after the fact. There must be a way for Brickbottom residents to seek redress if specific project goals are not met.

While I am in support of the Green Line extension overall, I believe it is possible to separate the Extension planning and design from the DOT maintenance facility and storage yard because the facility is not part of the mandated 2014 Green Line Extension completion deadline. I urge you to consider Mirror H, Option L, or some other alternative site for the DOT facility and yard.

Sincerely,

John Bay

1

I-027-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-027-002

As described in the DEIR/EA Section 1.5.3, throughout the development of the DEIR/EA regular coordination with the Advisory Group and local municipalities on various aspects of the Project, including siting of the maintenance facility, occurred. During the Summer of 2008, tutorials on the proposed maintenance facility as well as site visits to existing maintenance facilities were conducted for Advisory Group members. Additionally, in December 2009 a public meeting was held on the various maintenance facility sites.

I-027-003

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in DEIR/EA Chapter 6, Draft Section 61 Findings and Mitigation Measures. Mitigation measures for the College Avenue and Lechmere Stations are further described in FEIR Chapters 4 and 5, respectively. The mitigation measures required by the Certificate are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments. Additionally, the Public Involvment Plan provided in Chapter 6 of the FEIR describes the process that MassDOT will use to obtain community input for mitigation measures.

Re: Comments on Draft Environmental Impact Report/Environmental Assessment (DEIR/EA), EEA #13886

Dear Secretary Bowles:

I'm a homeowner at 34 Emery Street, Medford, in area known as Medford Hillside. I've lived in this house for over 22 years, and before that rented an apartment a couple of blocks away for more than 4 years, so I've been in this area, which is northwest of and adjacent to Tufts University, for about 27 years.

I was thrilled to learn in 2006 that the Green Line would be extended to my neighborhood, so I would have a better alternative to buses for trips into Boston and back.

Since I attended my first meeting about the Green Line extension, an Environmental Impact Report Public Scoping Session held by the EOT at Somerville High School on October 16, 2006, I have followed the project very closely. I have attended every meeting about the Green Line extension that I was able to find out about, including almost every Green Line Extension Project Advisory Group meeting, neighborhood workshops and meetings held by EOT, every public meeting in Medford City Hall (including meetings of the City Council and the Transportation subcommittee) that had content about the Green Line extension, meetings of the Medford Green Line Neighborhood Alliance, meetings of Move Massachusetts and the Conservation Law Foundation, among others.

I have been an enthusiastic proponent of the Green Line extension going to Mystic Valley Parkway / Route 16, since the earliest suggestion of Route 16 being the terminus for the extension. I worked hard for this outcome, believing it essential to serve the goals of the project, and was very pleased at Secretary Aloisi's February 3, 2009 recommendation that the Green Line be extended to Mystic Valley Parkway/Route 16 as the Preferred Alternative. In that announcement, EOT anticipated "starting construction of the preferred alternative by 2012 and completing construction prior to the required December 31, 2014 opening date".

Medford sorely needs this improvement to its public transit, for all the reasons that some version of the project has been in the works for about 40 years: to countermand the declining air quality caused by

automobile traffic, reduce traffic congestion, serve environmental justice populations that have been disadvantaged by the current limited transportation options, open opportunities for transit-oriented development to help those same populations, and more. With our current consciousness about global warming, measures that decrease our use of fossil fuels are even more crucial than previously thought. Tepid support from Medford public officials should not be interpreted as lack of enthusiasm for this project from the residents of Medford. With only one grass-roots publicity drive, a petition to bring the Green Line to Route 16 has garnered over 2,000 signatures: http://www.petitiononline.com/MGNA16/petition.html.

I recognize that a tremendous amount of work has gone into the DEIR. However, I strongly urge you not to accept the Draft EIR as a Final EIR on the following grounds:

I-028-001

1. **The project as laid out in the DEIR DOES NOT extend Green Line Service to Medford Hillside by December 31, 2014, and therefore DOES NOT meet the legal commitment.** As noted in the December 1, 2006 Certificate of the Secretary of Environmental Affairs on the Expanded Environmental Notification Form, "the extension of the Green Line to Medford Hillside remains a part of the Commonwealth's transit commitments developed through the CNT Project permitting. This commitment was codified in the DEP Transit System Improvement Regulations (310CMR 7.36) in 1991 and is included as an element of the Commonwealth's State Implementation Plan (SIP) for ozone. Revised Transit Regulations are being issued today [December 1, 2006] and include a legal commitment for EOT to extend Green Line Service using light-rail vehicles from Lechmere Station to Medford Hillside and a spur to Union Square before December 31, 2014."

   There are two parts to this deficiency:

   a. **Route 16, the only station that serves Medford Hillside, will not be built by 2014** (or, seemingly, ever). Even though Alternative 2 (to Mystic Valley Parkway/Route 16) is the Preferred Alternative, the DEIR claims that the segment from College Ave. to Route 16 cannot be built within the 2014 timeframe mandated by the State Implementation Plan due to insufficient funding, and speculates that the "funds will be available sometime between 2016 and 2020". It notes that the segment in question "is not envisioned to be constructed within the three-year Massachusetts Environmental Policy Act (MEPA) or National Environmental Policy Act (NEPA) time frame and would, therefore, require reassessment at a future date." (Page 3-40). It is not credible that Mass DOT would go through this same arduous two-year process to build one station. The unavoidable conclusion is that the extension from College Ave. to Mystic Valley Parkway/Route 16 and the terminus station at Route 16 will not be built between 2016 and 2020, but sometime next never.
   b. **The proposed College Ave. station is not in Medford Hillside.** EOT (now MassDOT) has continued to wave away a large amount of public input and evidence on this point. While Medford Hillside may not be specifically defined with consistent boundaries in every available source, there is NO source that puts the intersection of College Ave. and Boston Ave. in Medford Hillside. For voluminous research on this point, which was submitted to EOT in September of 2008, see http://www.box.net/shared/bvqletj5yz .

January 8, 2010

I-028-001

As directed by the Secretary's Certificate on the DEIR/EA, the FEIR includes a limited scope of issues related to the Green Line Extension Project. The Proposed Project, with a Medford Branch terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Although an extension to Mystic Valley Parkway/Route 16 is MassDOT's Preferred Alternative, financial constraints prohibit the Commonwealth from progressing the Project beyond College Avenue at this time.

Note: A Winthrop Street station, which would clearly be in Medford Hillside, at a location that previously had a rail station named "Medford Hillside", was dropped early in EOT's evaluation process, for reasons that were never adequately explained. As State Representative Carl Sciortino put it in a September 15, 2009 letter to Kate Fichter at EOT: "... the Certificate made clear that a thorough study of the section between College Avenue and Route 16 be completed. And in particular, stops at Winthrop Street, Route 16, and the possibility of combining a College Ave/Winthrop Street station into one. The 2009 Status Report gives no indication of the status of the Winthrop Street station. I have attended every meeting of the Advisory Group, and I have reviewed all of the public comments submitted during this process. I cannot find justification for removal of the Winthrop Street stop, and believe dropping this location without adequate and verifiable justification is unwarranted, and is in violation of the Secretary's Certificate." EOT staff has stated that community opposition was the reason, but there was a large contingent of support for a Winthrop Street station, and why the alleged (and invisible) opposition was given more credibility is still a matter of consternation and great disappointment.

I-028-002

2. **The proposed College Ave. station is not suitable for a terminus, does not provide many of the benefits the project promised, and does not adequately address mitigation.**
   a. **A College Ave. station terminus will *decrease* the quality of life in Medford Hillside – the opposite effect from the stated project goals.** A terminus at College Ave./Boston Ave. *will not* serve Medford Hillside and *will not* provide the benefits of a Route 16 station, but it *will* cause detrimental impacts in air quality and traffic in Medford Hillside, and a lack of mitigation measures for abutters from College Ave. to Winthrop Street. It will draw more traffic and pollution along Boston Ave. from Route 16 to College Ave., from the many thousands of people who live within walking distance of a Route 16 terminus but too far away to walk to College Ave. The extension of the tail tracks beyond the College Ave. station directly impact residences beyond the station location much more than would be the case if Route 16 were the terminus, but these are not eligible for the mitigation measures that would be required if the extension went to Route 16. The intersection of College Ave. and Boston Ave. is one of the worst in Medford, and will only be exacerbated by the addition of a terminus station.

I-028-003

   b. **There is no opportunity for transit-oriented development at College Ave.** As noted in sections 4.2.2.6 and 4.2.2.7, pp. 4-9 to 4-10, the area around the College Ave. station site is almost entirely owned by Tufts University and occupied by Tufts buildings, playing fields, parking lots, etc. There are also some churches and other school buildings and parking lots. What little commercial development fits in the margins, as noted, mostly serves college students. The opportunities for transit-oriented development are slim to none. Along Boston Ave. to Route 16, by contrast, there are already many commercial buildings providing tax revenue to the City of Medford and services to residents other than college students, including two office buildings, a Whole Foods supermarket, a fitness club, and more, and the densely populated residential neighborhoods nearby could benefit greatly by the further development that convenient transportation would bring.
3. **The Mystic Valley Parkway/Route 16 terminus was not properly evaluated to maximize benefits and minimize environmental impacts.** The design put forward by EOT is acknowledged by them to be a "worst-case scenario", a treatment reserved for this station alone in the stations evaluated for

I-028-002

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-028-003

Direct and indirect impacts to land use are described in DEIR/EA Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for sustainable land use, which could further reduce automobile traffic congestion and improve air quality.

the extension. Probably the most egregious aspect of the design is that it requires taking of two large commercial buildings (at 200 and 222 Boston Ave.) in a city that has an unusual proportion of non-profit entities (i.e., tax-exempt) and protected open space (such as the Mystic River Reservation and the Middlesex Fells Reservation), so feels keenly the loss of such tax revenues. (Medford Green Line Neighborhood Alliance proposed a working meeting with EOT and the property owner (Cummings Properties) in April, 2009 to discuss alternative designs, but after showing initial interest, EOT declined to attend such a meeting and it could not have been meaningful without EOT input.) A private citizen, working on a completely voluntary basis, devoted hundreds of hours to coming up with an alternative that would avoid these takings while following the proper MBTA track specifications, and EOT has acknowledged that it is working on such an alternative itself, but has failed to present it to the public or make it part of the DEIR. The alternative proposed by John Elliott, working with the Medford Green Line Neighborhood Alliance, can be seen at http://medfordgreenline.org/MGNA-EIRA/MGNA_Rt16_Design.pdf. MassDOT should continue analysis of the Route 16 terminus to avoid the taking of these important commercial structures and present it in a Final EIR. Doing so would save at least $50 million in land acquisition and relocation costs, avoid disruption of these businesses that are important to the local tax base and that provide a significant number of jobs, and possibly also avoid sliver takings in residential properties along Piggott Road.

I-028-004

I-028-005

4. **Cost figures that led to dropping the segment from College Ave. to Route 16 need to be re-examined.**
   a. **Medford should not have to sacrifice the major benefit it would get from the extension because of Cambridge's failed deal on Lechmere.** The cost of re-locating the Lechmere station is now borne by the project because a deal with Northpoint developers fell through. Coincidentally, this cost is approximately the same as the cost of extending the Green Line from College Ave. to Route 16.
   b. **The cost of a maintenance facility should be amortized over the entire Green Line, not born solely by the extension budget.** The maintenance facility was originally supposed to be a small support facility, then morphed into a much larger-scale maintenance facility to support more of the Green Line. Costs should be apportioned accordingly.
   c. **Delaying the Route 16 station to a fantasy "Phase II" would, in the extremely unlikely event that Phase II became a reality, add at least $55 million in additional costs to the project.** Reconfiguring College Ave. from a terminus back to an intermediate station, going through the entire approval process for one additional station at Route 16, and adding the disruption and additional construction costs for a second phase introduce unacceptable additional costs and pain to a project that really only makes sense if it is built in one phase, by 2014, as mandated. The Green Line extension project has been in the works for about 40 years. The Beyond Lechmere study investigated bringing the Green Line extension to West Medford, where it would create synergy with the existing commuter rail stop. As stated (ES-3), "The Green Line Extension is urgently needed to improve corridor mobility and livability, particularly in transit-dependent and Environmental Justice communities." Further delays in a project with such widely accepted and obvious benefits are unconscionable.

I-028-004

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues. DEIR/EA Section 5.3 describes the Project's potential acquisitions. MassDOT will evaluate opportunities to minimize the property impacts along the Mystic Valley Parkway/Route 16 segment when this portion is advanced.

I-028-005

Project cost estimates are based on the current, conceptual level of design, and will be further refined as the Project progresses through preliminary engineering. It is anticipated that Green Line Extension construction would be financed with a combination of funds from federal and state sources. Efforts to engage a developer for the North Point development will continue as this Project moves into the next phases of design.

d. **The project's ability to compete for Federal transportation dollars would be impaired by dropping the College Ave.-to-Route-16 segment.** Reducing all of the benefits of the project by ending the extension at College Ave. makes the project significantly less competitive in the areas of air-quality-improvement, ridership, traffic reduction, and service to environmental justice communities, making it more likely that more of the project's costs will need to be borne by the citizens of the Commonwealth.

Throughout this project, I have voiced these points and related concerns in verbal comments in meetings, in emails to staff at EOT and to former Secretary Aloisi, and in letters submitted as public comments at various stages in the project, and I would be happy to make any of this prior correspondence available on request. I will attach only two examples: a public comment on the annual update and status report for transit projects required by 310 CMR 7.36 (2) (f) through (j), as submitted by The Executive Office of Transportation and Construction to MassDEP on July 1, 2008, and an 8/28/08 letter from MGNA to Steve Woelfel at EOT to which I am a signatory.

I-028-006

The opportunity to extend the Green Line extension to Mystic Valley Parkway / Route 16 is one we cannot afford to delay or curtail. Forty years of analysis, planning, and discussion have gone into vetting this project. MassDOT should be required to continue analysis and design modifications and submit a Final EIR that addresses the many outstanding issues in the design and funding of the Green Line extension. It should fix the design of the Route 16 terminus to make unnecessary the commercial land takings at 200 and 222 Boston Ave., vigorously pursue Federal funding for the Preferred Alternative, find other funding for the Lechmere station relocation, and build the Preferred Alternative to Mystic Valley Parkway / Route 16 by the mandated deadline of December 31, 2014. In short, it should go the extra mile, literally, to fulfill a long-standing transit commitment of the Commonwealth that is vital to the health and well-being of thousands of residents.

Thank you for your attention to these comments.

Sincerely,

Elisabeth Bayle

8/28/08 letter from MGNA to Steve Woelfel at EOT

I-028-006

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA. As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. The Proposed Project, with a terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (MassDEP DEIR/EA comment letter, January 8, 2010).

Re: Public comment on the annual update and status report for transit projects required by 310 CMR 7.36 (2) (f) through (j), as submitted by The Executive Office of Transportation and Construction to MassDEP on July 1, 2008.

Dear Ms. Fichter:

I am a 21-year resident of an area of Medford known as Medford Hillside, near the intersection of Winthrop Street and Boston Avenue, and I have been attending as many Green Line meetings as I could get to since the first one I found out about, the Environmental Impact Report Public Scoping Session at McGlynn School in Medford on November 15, 2006.

I have read the Green Line portion of the EOT's annual report (pages 15-19) and respectfully submit the following comments:

1. On Page 15 of the report, there is a list of currently proposed station locations, in which "College Ave./Medford Hillside" is the first item. "College Ave./Medford Hillside" is not *one* possible station site, as the report suggests; it is *two separate* sites:

   a.) College Ave./Boston Ave.
   b.) Winthrop St./Medford Hillside

   The first, College Ave./Boston Ave., is commonly considered to be on the border of Medford Hillside, though many sources place it outside. The second, Winthrop St./Medford Hillside, is clearly within Medford Hillside. You can stand at the intersection of Winthrop Street and Boston Avenue and look at Hillside Hardware, Hillside Liquors, and Hillside Cleaners for a sense of the place, and/or you can consult a raft of contemporary and historical maps and documents for verification. There are plenty of maps that show the previously existing Medford Hillside Station, which was at the intersection of Winthrop Street and Boston Avenue behind the current location of the Danish Pastry House.

   A Green Line Extension terminus at College Ave. **would not** serve the majority of Medford Hillside, which is a densely populated area with a lot of residents who do not own cars and who could benefit enormously from frequent light rail transit service.

2. The EOT's *Green Line Extension Project* newsletter, dated Winter 2008, also lists Winthrop Street and Mystic Valley Parkway as locations for which stations have been proposed. The station workshop EOT held on Thursday, January 31, 2008, focused on "stations proposed for the College Avenue and Winthrop Street neighborhoods" (and there was a separate station workshop on February 6, 2008, focusing on the Mystic Valley Parkway station). We were lead to believe that EOT was studying a College Ave. station, a Winthrop Street station, and an alternative of a combined station that would be located approximately mid-way between these two, in the vicinity of the end of Brookings Street.

   We were told that optimal station spacing was approximately one-half mile, which was a consideration in where to place the stations. Too close, and trains would have to stop too often, slowing the ride; too far apart and too many residents would not be served. College Ave., Winthrop St., and Rte. 16 seem to fit into an almost optimal spacing.

   However, the Winthrop St. station has been dropped without notice or explanation or discussion, and the alternative combined station was dropped supposedly due to neighborhood opposition, leaving us now with College Ave., and a faint possibility of Rte. 16, as station locations. These two are, at best, at the extremities of Medford Hillside, an area the project is mandated to serve, and are one mile apart. There was some mention by the project team that the optimal station spacing is now changed, but this, along with the mysterious disappearance of the Winthrop St. station from the project plans, seems retrofitted to rationalize a decision reached behind the scenes by unknown powers not accountable to the public.

   There should be a much more public and thorough accounting of why there is no longer study of a station at Winthrop St. and why a handful of abutters at Brookings St. could not have been given sufficient mitigation to make a combined station a viable alternative. Large numbers of residents of Medford Hillside will not be served if there are no stations between College Ave. and Rte. 16, and many generations to come will forfeit the benefit of this type of public transportation. This population will probably still have to be served by bus routes, clogging the streets of the Hillside and continuing the pollution and traffic snags caused by buses having to maneuver through narrow streets and intersections, stopping all traffic every time they stop because there is not enough room for cars to pass buses along these routes.

3. Discussion of a Mystic Valley Parkway/Rte. 16 station has devolved so that this proposed station seems doomed to fail. The station now seems burdened with encumbrances that are not being contemplated for other stations along the Extension: a much longer platform, a requirement for 5 tracks, an "Alewife-style" parking facility, and expected taking of a large amount of commercial real estate at and around 200 and 222 Boston Ave. The project was not supposed to include parking garages of any type, and there is huge opposition to this in Medford because of the traffic congestion already experienced along Boston Ave. from College Ave. to Rte. 16 – congestion this project is supposed to alleviate, not worsen. Land-takings of large commercial buildings that contribute to the tax base is obviously undesirable in a city that has so much land devoted to tax-

exempt enterprises such as Tufts University and many churches, and protected open space such as the Mystic River Reservation and the Middlesex Fells Reservation. We had been lead to believe that any land-taking for this project would be minimal – at most, small slices where the rail right of way was not quite wide enough; the only significant building taking that was mentioned in the meetings was that of the U-Haul at Rte. 16.

I strongly request that EOT consider alternative designs and ways to make a Rte. 16 station work without these controversial elements. If there is no Rte. 16 station, I don't see how the project can meet the ridership levels and air quality improvements that have been set for it, and Medford will forfeit not only the transit alternatives that we so sorely need, but also the associated transit-oriented development that could enhance the city's tax base and contribute to a better quality of life.

If Rte. 16 is not a viable station location, EOT needs to explain why publicly, and needs to consider other strategies that were discussed earlier in the project, such as a terminus at North Street.

4. While a good start was made on an open process with the station workshops in early 2008, there have been notable lapses in communication since Spring 2008, such as the following:

    - Promised follow-ups on the station workshops that were to take place in June did not take place, with no explanation, and none are scheduled.
    - The promise to have an MBTA representative come to one of the Project Advisory Meetings so we could ask questions about MBTA station requirements, plans, and mitigation measures has never been fulfilled and is not scheduled.
    - The July meeting that was to have reported on ridership studies was cancelled and no ridership estimates have been provided.
    - The August meeting that was to have introduced conceptual plans and cost estimates did not cover either topic – it covered general methods for assessing noise and vibration and air quality (not any specific remedies).
    - The September meeting that was to have presented environmental analysis has been cancelled.

    EOT is perhaps painfully aware that many Medford citizens are extremely anxious about the subject of land-takings, the ramifications of moving the commuter rail closer to many homes, and possible exacerbation of an already difficult traffic and parking environment. The lack of concrete answers along with many unexplained twists and turns in the process have caused some to believe that this project is being decided with backroom dealing rather than a process the public has any access to or effect upon. I sincerely hope that is not true and hope EOT will proceed in a more open, deliberative manner that will restore public confidence that legitimate questions will be answered and legitimate needs are being taking into account in planning the best possible project for us and for future generations.

The Green Line Extension, with well-designed and well-spaced stations, integrated with other transit options and a community path, has the potential to not only fulfill the air quality and environmental justice requirements that are its mandate, but to provide greater opportunities and a better quality of life for tens of thousands of citizens for many generations. It's too important a project to be cut short at College Ave.

Sincerely,

Elisabeth Bayle

August 28, 2008

Mr. Steve Woelfel
Manager, Statewide Transit Planning
Project Manager, Green Line Extension
Executive Office of Transportation
10 Park Place, Room 4150
Boston, MA 02116

Dear Steve:

We write today to follow up on our meeting with you and your staff at EOT, and representatives of VHB, at the EOT offices on Monday, August 18th, 2008. First, we want to thank the EOT for agreeing to the meeting and having a frank exchange on the status of the Green Line Extension to Somerville and Medford.

As you know, the Medford Green Line Neighborhood Alliance (MGNA) has strongly supported the Green Line project since its inception following the Beyond Lechmere Study completion in August 2004. MGNA has presented several design and demographic studies to support our position that, among the terminus locations being considered, the optimal place to end the Green Line is at Route 16, which provides the greatest transportation and environmental benefits to the largest number of people.

However, we were disappointed by several aspects of discussion at the August 18th meeting. The general impression we got after the meeting is that the Route 16 station is not being seriously investigated, though the EENF certificate required it to be for this next phase of design. All of the markers – ridership, physical configuration, etc. - were presented in what we view as an extremely negative light. We neither saw nor heard any new ideas about how to make the Route 16 station work. We saw no design evolution of any kind from the original Route 16 concept drawing produced in June showing significant land takings. We believe that the inclusion of a parking garage in the design and the major takings being considered are nothing less than "poison pills" ultimately intended to kill the Route 16 terminus altogether.

There appears to be a double-standard being applied to the two possible terminus locations on the table now – Route 16 and College Ave. The latest Route 16 drawings show a 450-foot platform, while College Ave. shows only a 225-foot standard platform as a terminus. But even more glaring for its inconsistency is the inclusion of a 300-car parking garage at Route 16 where none is being studied at College Ave. We asked about this at the EOT meeting and were told that the garage may be needed for ridership. This appears to directly contradict the EENF Certificate, which clearly states on page 10, "Because *parking will not be provided*, the ability to provide good pedestrian and bicycle access will be a critical factor in station locations and designs." For the record, MGNA strongly opposes any Alewife-style parking structure at Route 16 (or at College Ave., for that matter), understanding from demographic study results that the density of the surrounding Medford, Somerville and Arlington neighborhoods (and great connectivity with existing buses and planned Mystic River walking/bike trails) will provide the ridership needed to justify the station terminus at Route 16. In addition, a parking garage would attract more cars to our already overcrowded streets and the DCR's Mystic Valley Parkway, directly subverting one of the major aims of the Green Line project: to reduce traffic congestion and driving.

We would like a written explanation of this double standard: Why has the Route 16 station not been advanced in design? Why is a garage being studied at Route 16 and not at College Ave.? How can a garage be needed at Route 16 for ridership and not at College Ave., which is 1 mile from Route 16 and would presumably have less overall ridership than if the Green Line Extension ended at Route 16? Why are different design standards being applied to each site?

A few other issues arose at the meeting that must be addressed. The EOT was instructed by the Secretary's EENF Certificate to study College Ave., Winthrop Street, a combined station in-between College Ave. and Winthrop, and a terminus at Route 16. The combined station in between College Ave. and Winthrop has been dropped after what we were told was "community opposition"; however, there has been no substantial community opposition to the Winthrop Street station, as noted in Representative Carl Sciortino's August 14th letter to the EOT. Once the combined station was dropped, we believe that the study should have reverted to the original configuration of College Ave., Winthrop St. and Route 16. There is no documented reason to exclude the Winthrop Street station and this portion of the study should be re-opened.

Finally, we were disturbed to learn that the EOT is attempting to redefine the Medford Hillside as the area between College Ave. and Winthrop Street. This is categorically and demonstrably false (see the attached maps). Most modern as well as historic maps show Winthrop Street as the CENTER of the Medford Hillside, the "Main Street" of the neighborhood, which stretches from the Somerville line to the Mystic River. In fact, in terms of population and geographic area, most of the Medford Hillside neighborhood lies north of Winthrop Street, not south. This apparently unilateral attempt to redraw or relabel the map of the Hillside, and redefine terminology that has been in use for a century, appears to be another example of an attempt to end the Green Line Extension at Tufts/College Ave. without doing a thorough and detailed study of the locations called for in the EENF Certificate.

Let us be clear: A Green Line Extension ending at College Ave. would:

- Shortchange the citizens of Medford and become a Somerville-only project, barely entering Medford (the College Ave. site is 200 feet from the Medford-Somerville line)
- Deny the 10,000 residents of Medford, West Somerville and East Arlington who live within a ten minute/half-mile radius of Route 16 direct access to the Green Line
- Neglect five Environmental Justice neighborhoods in West Medford, Somerville and East Arlington that the Green Line Extension project is intended to serve
- Underserve the majority of the Medford Hillside neighborhood, which lies north of Winthrop Street – the very neighborhood it is required to serve
- Forfeit a historic opportunity to improve the transportation infrastructure, environment and quality of life for literally tens of thousands of Medford, Somerville and Arlington residents

For all of these reasons, we strongly urge the EOT to:

- Eliminate the parking garage from the Route 16 station design
- Redouble the effort to make the Route 16 station work as a terminus without a garage
- Reinstate the Winthrop Street station
- Recognize the historic geographic boundaries of the Medford Hillside and design accordingly

Despite a few vocal opponents in Medford, we believe that there is strong community support in Medford, Somerville and Arlington for a Route 16 terminus. That is why we organized a petition in favor of Route 16 and so far have accumulated over 2,100 signatures, with more added every day. You can see our petition and demographic analysis on our website at www.medfordgreenline.org.

We would appreciate a prompt written response to the issues raised in this letter.

Sincerely,

The Medford Green Line Neighborhood Alliance

To: Johnson, Holly S (ENV)
Subject: EEA #13886 Green Line Draft EIR

Dear Ms. Johnson,

Below are my comments on The Green Line Draft EIR, EEA#13886.

I am a life long resident of Somerville, specifically the Union Square area and former Commissioner of The Massachusetts Department. I am writing to support the Green Line extension process and urge the state to expedite this important economic development project. Extending the line will certainly benefit residents and commuters of the area but will also provide a much needed link to the greater Boston multimodal system. Specifically, I would hope that station design incorporate bicycle and zip car facilities as well as links to the existing community path and extension of the path through Somerville.

I-029-001

Sincerely,

Laurinda T. Bedingfield

I-029-001

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

Subject: Comments on Somerville/Medford MBTA Green Line Extension (EEA #13886)

Secretary Bowles:

I strongly support the Green Line extension to Somerville and Medford, which is sorely needed to reduce regional air pollution, greenhouse gas emissions, and traffic congestion. Route 16 in the area near the proposed extension experiences extreme congestion at peak travel times, and traffic in this area contributes to high congestion to the west at the Route 2/3/16 interchange near Alewife Station, and to the east on I-93. The proposed Route 16 Station would be thus be an extremely beneficial capstone to an extension which is already connecting many densely developed neighborhoods with commuter destinations such as Tufts and downtown Boston. I-030-001

The inclusion of a station at Union Square is an excellent feature, given that this major commercial area is off the "mental map" of transit in Somerville due to lack of a rail station. The preferred alternative on the Commuter Rail right-of-way presents an excellent opportunity to redevelop this area and create a continuous pedestrian-friendly zone from Union Square in Somerville to Inman Square in Cambridge.

Preservation of the ability for a future extension to Porter Square is important, as that would provide a much faster rapid transit connection to Union Square, Lechmere, and North Station from the northern Red Line corridor. I-030-002

Several relatively inexpensive improvements to pedestrian, bicycle, and bus access should be made to maximize ridership and thus the positive environmental impact of this project, to get the most from the major investments being made: I-030-003

* A better connection is needed from Gilman Square Station to the area in the direction of Montrose Street and the major bus routes on Highland Ave. A second entrance connecting to School Street, or a connection to the Somerville Community Path from School Street would prevent a long walk around the block.

* The proposed connection between the Somerville Community Path and Lowell Street Station appears to dump pedestrian and bike traffic on a sidewalk on the opposite side of the street from the station entrance, at a point with no crosswalk. A more direct connection would be preferred, putting the path entrance on the same side of the street as the station entrance. If this is not feasible, a well-marked crosswalk should be added to make the direct crossing (which is what people will take, regardless of the presence of a crosswalk) safe.

* The proposed connection between Brickbottom Station and westbound buses on Washington Street is circuitous. The Somerville Community Path could be used to provide a grade-separated crossing of Washington Street which also shortens the walking path to the westbound stop. The additional connection would also improve path access for non-transit users.

* The pedestrian connection from College Ave Station to Burget Ave currently involves either a very long route via George Street, or a poorly maintained pedestrian-only route through Tufts property on College Ave. If the Wrong-headed neighbor objections to a station entrance in this direction prevail, many pedestrians would use the shortcut through Tufts property to access the Green Line station. The project should upgrade this connection to be ADA compliant (it currently involves crumbling concrete stairs) and to separate pedestrian from vehicle traffic more safely (given the route passes through a driveway with limited visibility around corners). In this scenario, a minimal second entrance at the north end of the platform

1

I-030-001

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-030-002

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

I-030-003

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project, including identifying access issues for each station.

I-030-003 connecting to Boston Ave only would reduce walking distance from that direction, provide a better bus connection at Boston Ave, and attract more riders as a result.

* The bus stops on Broadway should be moved to be directly in front of or on the same block as Ball Square Station, instead of on the next block. If reconstructed, the bridge carrying Broadway over the tracks at Ball Square should be widened to accommodate sidewalk bus shelters and bike lanes.

I-030-004 The extension of the Somerville Community Path greatly enhances pedestrian and bicycle access to many of the proposed stations, and will improve ridership. It should be considered an integral part of the environmental remediation this project provides, not an optional add-on to be built as a separate project at some uncertain point in the future.
It would also be inefficient to construct it later, given the major disruptions to the right-of-way that will occur during the construction of the Green Line extension. Given the uncertain future of the Urban Ring project, the bridge necessary to carry the Somerville Community Path from Inner Belt Road toward Lechmere is a vital link which must be included in the Green Line extension project.

I-030-005 The storage yard attached to the Yard 8 option for the maintenance facility would stretch all the way from the Brickbottom Artist Colony to Brickbottom Station. This would prevent future Brickbottom redevelopment from connecting well with the neighborhood on the other side of the tracks, which already includes commercial and residential areas along Washington Street. The yard should be built in a less obtrusive place, against the existing long-term transportation infrastructure in this area, such as the Commuter Rail Maintenance Facility or I-93. From an environmental perspective, it would be beneficial to reduce the size of the huge parking lots in the Inner Belt area through takings to support Option L. Local workers should instead be encouraged to use the new Brickbottom Station for Inner Belt access.

I-030-006 A track-wheel lubrication solution must be designed and implemented to reduce "wheel squeal" in time for operation of the extension. Noise on Green Line segments elsewhere in the system (such as the curves near Park Street, Boylston, and Government Center Stations) is actually severe enough to cause pain in human ears. The MBTA has been studying this problem, but the urgently needed system-wide solution has been slow in coming. Slow progress in this area should not be allowed to result in higher-than-necessary noise levels in the extension corridor.

I-030-007 An agreement should be constructed that clearly defines maintenance responsibilities for the Somerville Community Path extension. A dispute over financial responsibility between the City of Somerville and the MBTA is currently delaying repairs to retaining walls and drainage on the existing path near Davis Square. The environmental and transportation benefits the path provides are lessened when it is not properly maintained, and simply providing clearer language will avoid needlessly expensive intergovernmental disputes.

Thanks for reading.

Christopher Beland
38 Jay Street #1
Somerville, MA 02144

I-030-004

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-030-005

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-030-006

The potential retrofit of Green Line cars with vehicle skirts including acoustical absorption behind the skirt and underneath the car may reduce noise levels from Green Line cars. However, the project corridor is generally dominated by noise from existing commuter trains and such a mitigation measure would not be effective in reducing the total noise generated by both noise sources. Noise barriers proposed for the Project would be more effective in reducing the noise from both Green Line and commuter trains.

I-030-007

As the Community Path project advances into preliminary and final design, maintenance responsibilities will be identified and the MBTA and the City of Somerville will coordinate on the various maintenance and design issues.

Reference to the Project Number EEA #13886

Dear Secretary Ian Bowles,

As a resident of Somerville I want to thank you for the progress we are seeing in the long hoped for Green line extension. I know that this extension will make a positive difference in my life and I am sure it will be positive for thousands of Somerville residents. Somerville is one of the most densely populated cities in the country and certainly in the state. We surely welcome better service from the MBTA.

I am writing to ask a couple of questions. I have read much of the vast materials that have been produced describing the plans and I am concerned about the economic and environmental impact of the placement of the maintenance facility at the proposed Yard 8.

I-031-001 Has there been any study of distributing the work of the proposed maintenance facility to the existing facilities and expanding those so that the new facility could be smaller? A smaller facility would present reduced space needs and thus allow for many more siting options and a smaller environmental and economic impact. I would like to see data that shows the need to build such a large facility rather than expanding the existing facilities.

How many new cars are expected to be needed for this expansion? Surely the expansion will not need the 80 cars. Surely the existing cars are currently stored at existing locations. What is the justification for the need for storage for 80 cars? A smaller storage facility would present many more options for locations.

I-031-002 I am concerned that there has not been adequate study of the environmental noise impact on the open air areas of the Brickbottom residential complex for the yard 8 proposal. What data has been collected on that impact? I know mitigation has been proposed for the inside spaces but what mitigation is being planned for the courtyard at 1 Fitchburg Street?

Thank you.

Sincerely,

Lois B. Bennett, MSEE

I-031-001

The Green Line Extension storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the Project. Chapter 2 of the FEIR fully describes the environmental impacts of the proposed storage and maintenance facility. In order to maximize operating efficiencies, the facility must be constructed within the same timeframe as the Green Line Extension Project, in the vicinity of the Green Line Extension right-of-way, and north of downtown Boston.

The storage and maintenance facility alternatives include storage for Green Line Extension vehicles and replacement of the existing Lechmere Station vehicle storage. Storage capacity is also provided for vehicles currently stored in trackways between Lechmere Station and Government Center; this storage will be lost due to the Green Line Extension.

I-031-002

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

RECEIVED
DEC 23 2009
MEPA

Dear Secretary Ian Bowles,

I'm writing in regards to the Draft Environmental Impact Report EEA#13886.

I-032-001 Like many Somerville residents I believe the extension of Green Line service to Union Square and Medford is desperately needed and long overdue. But the proposed placement of a Maintenance Facility and Storage Yard in Yard 8, only feet away from Brickbottom Artists building where I live, seems a misconceived idea. It would not only have a profoundly negative impact on the quality of life of those adjacent but would also constitute a major obstacle to the city's long-range plans to develop this area.

I-032-002
- Mitigation has not been adequately addressed for the Yard 8 scenario. To name only a few:
  - The DEIR admits that "at some locations… noise barriers may not be a feasible or effective means of mitigation," yet designates only 40 Brickbottom residences for soundproofing. There are 155 residences here.
  - It supposes that only indoor mitigation is at issue, but outdoor mitigation would be required as well because of the building's inner courtyard, which is open at both North and South ends.
  - Noise and vibration measurements were taken without regard to other noise rail noise factors in the vicinity. An adequate baseline has not been established.

I-032-003
- Land takings from Brickbottom are indicated. How much, and with what further detriment to this active and vital arts community?

I-032-004
- The proposed facility abuts and impacts the only residential building in the area, Brickbottom, which is home and work space for over 200 people. The Secretary's Certificate (EENF, *Environmental Justice*, p. 7) states "no segment of the population should…bear a disproportionate burden of environmental impacts." Clearly, the added burden of such a facility operating 24 hours a day constitutes such a disproportionate burden for this community.

I-032-005
- The project's Citizen's Advisory Group was not involved in evaluating sites, and mandated land use planning was not performed. This violates the Secretary's Certificate for community involvement (EENF, *Smart Growth/Land Use*, p. 5).

The above are of immediate concern to Brickbottom residents, but this is hardly a Not In My Backyard issue. The proposed location will thwart the City of Somerville's own long range development plans.

I-032-006
- It will remove 11.5 acres from the City's tax base, much of it privately held and permitted and zoned for development.

I-032-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-032-002

Please see response to Comment I-032-001.

I-032-003

Please see response to Comment I-032-001.

I-032-004

Please see response to Comment I-032-001.

I-032-005

As described in the DEIR/EA Section 1.5.3, throughout the development of the DEIR/EA regular coordination with the Advisory Group and local municipalities on various aspects of the Project, including siting of the maintenance facility, occurred. During the Summer of 2008, tutorials on the proposed maintenance facility as well as site visits to existing maintenance facilities were conducted for Advisory Group members. Additionally, in December 2009 a public meeting was held on the various maintenance facility sites.

I-032-006

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further

I-032-006

- It will place a permanent barrier between Inner Belt and the Brickbottom area, creating a major obstacle to future economic development.

What seems most infuriating about all this is that there is a serviceable alternative in the "Mirror H" location. The MassDOT representatives have indicated, with few if any specifics, that the latter location is "not optimal" for them. But clearly Yard 8 is a lot worse than "not optimal" for Brickbottom residents, or for the City of Somerville, and its impact will last for generations. At the very least, a greater degree of citizen involvement in this whole process is clearly called for. I join my neighbors and my city in requesting that a Citizen Advisory Committee be established to oversee the project and ensure that the community has a voice in the process, so that the mere convenience of MassDOT does not override the quality of life of a whole community and the long range development goals of an entire city.

I-032-007

Sincerely,

William F. Bennett

consideration and Option L is identified as the preferred maintenance facility site. The acquistions described for the Yard 8 site do not apply to the Option L site.

I-032-007

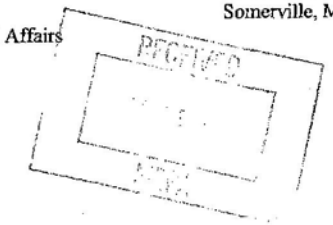
Boston, MA 02114



Dear Secretary Bowles,

My name is Dan Berman and I am a resident of the Brickbottom Community located in Somerville. I've lived in Brickbottom since May of 2009. While I haven't lived here for a long time, I still find it important to express my concerns about the Green Line Extension Project. After looking through the Draft Environmental Impact Report (DEIR) and listening to other residents, it has come to my attention that the Yard 8 Maintenance Facility will negatively impact the quality of life for me and the other 219 residents of Brickbottom.

In general, I am a big fan of extending the Green Line beyond the Lechmere stop. When I chose to purchase a condominium in Brickbottom, I was excited to here that the city was planning on building an extension out towards Davis Square. Since I would be living on the opposite side of Somerville, I thought it was a great idea to create a more convenient commute than having to take a bus to Harvard Square and then switch to head towards Davis Square. Even better was hearing that one of the stops would be very close to Brickbottom.

I-033-001

However, when I heard that the Yard 8 Maintenance Facility (operating 24 hours a day with heavy machinery and materials moving in and out constantly) would be built across the rail from my building, I was very disappointed. Quality of life in Brickbottom would become a serious problem. As is my understanding, the DEIR mentions other options in place of Yard 8 that would have no impact on residents of Brickbottom or any other citizens of Somerville or Cambridge. Included in these alternatives are the proposed "Mirror Scheme H" and "Option L." These locations would help keep life acceptable for me and my neighbors. Why would the city willingly build a maintenance facility next to a residence when they have clear options that affect no one?

I-033-002

In addition, by keeping the Yard 8 site clear of a maintenance facility, it leaves valuable land in Somerville available for future businesses or residents to occupy. These precious 11 acres could be used to help spur the economy in the area and increase quality of life for all residents of Somerville, not just us living at Brickbottom.

Thank you for taking the time to read these brief reflections. Others may have more eloquent words to say, but it comes from the heart when I tell you that construction of Yard 8 will severely impact me and my neighbors in a negative way. I hope you take the time to consider how Mirror Scheme H and Option L can help make our lives just a little easier during the transition to having a wonderful subway extension in our community.

Sincerely,

I-033-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

(the following testimony is also attached as a pdf)

==========

January 8, 2009

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson
100 Cambridge Street, Suite 900
Boston , MA 02114

RE: Green Line Extension Draft EIR (EEA #13886)

Dear Secretary Bowles,

We are writing to express our strong support for the extension of the Green Line to Somerville and Medford and for the extension of the largely coterminous Somerville Community Path to Lechmere.

While many details remain to be worked out, and while we believe there are significant deficiencies in the existing proposal, **we believe that the project should be allowed to move forward to the next (engineering) phase**.

The **as-yet unresolved issues** -- for example, the location/design of the maintenance facility, the location and design of the terminus at Route 16, design considerations that facilitate future extension from Union Square to Porter Square along the Fitchburg Line, etc. -- **should be dealt with via Supplemental EIRs or Addenda to the EIR adopted pursuant to the current MEPA process**.

I-034-002

Given the many design-related issues remaining (e.g., at each station, in conjunction with the siting of the maintenance yard, etc.), and the need to ensure the effective integration of land use, economic, traffic, access, environmental, and aesthetic considerations, **we are asking you to prescribe an ongoing public process, including a representative Citizen Advisory Council, to ensure that our community has input into upcoming decisions**.

==========

We are writing as members and strong supporters of **Somerville STEP** and endorse their recommendations http://www.somervillestep.org/2009/11/steps_speaking.html.

We have participated in the **Community Corridor Planning** process led by STEP, Groundworks Somerville, and Somerville Community Corp., and endorse their **Core Principles** (see http://tinyurl.com/ye7ydea).

I-034-003

And we are avid bicyclists and walkers and support the recommendations of the **Friends of the Community Path** for an **integrated and simultaneous design and construction of the Path alongside the Green Line extension**. http://greenlineextension.info/resources/Friends+CommPath+Ltr+to+EOEA+on+GreenLine+DEIR.pdf

Not only would simultaneous construction of the Community Path and Green Line Extension be more cost effective than treating the two efforts as separate projects, it would also be more consistent with the **Federal Transit Administration's Proposed Policy Statement on the Eligibility of Pedestrian and Bicycle Improvements Under Federal Transit Law** (http://edocket.access.gpo.gov/2009/E9-27240.htm): "For purposes of determining whether a pedestrian or bicycle improvement has a physical or functional relationship to public transportation, regardless of whether

1

I-034-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

I-034-002

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-034-003

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-034-003 it is funded as a capital project or public transportation enhancement, all pedestrian improvements located within one-half mile and all bicycle improvements located within three miles of a public transportation stop or station shall have a de facto physical and functional relationship to public transportation." The Red Line extension and Orange Line re-build represent successful precedents for simultaneous construction of a rail line and bike/foot path.

==========

We appreciate the extensive public process that has allowed Cambridge, Somerville, and Medford residents to help shape planning for the Green Line Extension, appreciate the DOT's commitment to a Route 16 terminus as reflected in the DEIR. **We strongly support inclusion of the extension to the Route 16 terminus as part of Phase 1**, given the uncertainty attendant to future phases.

We deeply appreciate MassDOT's sensitivity to the concerns of residents, businesses, and City officials who argued strongly against a Yard 8 maintenance facility. Although Yard 8 has not been officially withdrawn as an option, and is treated as the likely choice in the DEIR, at the December 16, 2009 public meeting, DOT officials appeared to open the door to alternatives like an "Option L" which would dramatically reduce the adverse impacts on abutters' quality of life and on Somerville's economic development potential. As has been repeated by hundreds of commenters, from elected officials to abutters to concerned residents, **Yard 8 must be eliminated from consideration as the site of the maintenance facility**. It would be a cruel irony if an environmental justice project like the extension of the Green Line were to include development of a maintenance facility in Yard 8 that would seriously compromise the living conditions of as vibrant a community as Brickbottom. (Mirror H would likewise be a poor option, given its adverse impact on Glass Factory residents.) And it would be a travesty if an economic engine like the Green Line Extension were to include a maintenance facility in a location like Yard 8 that would undermine the economic potential of Somerville's last significant parcel of developable land at Inner Belt.

I-034-004

As noted above, we were pleased to see that the DOT considers "Option L" to be a top tier possibility. Unfortunately, the currently proposed version of Option L still compromises street connections to Inner Belt, and still requires the taking of commercial property, which adds to the cost of the project, and which compromises the economic development potential of the site.

We have seen our neighbor **Alan Moore's** proposals for an "**Option L-BET**" which would move the facility so that it is almost entirely on Boston Engine Terminal (BET) property, and we think it has a lot of potential. (See Alan's various comment letters and the Google Maps he has created at http://greenlineextension.info/resources/Mirror+Option+L+BET+satellite+no+legend.jpg or http://greenlineextension.info/resources/Mirror+Option+L+BET+street+map+w+legend.jpg for more details.)

I-034-005

As you and DOT officials have heard from elected officials and residents alike, Somerville has historically borne a disproportionate share of the economic and environmental burden of a rail maintenance facility and miles of polluting diesel rail lines (and highways) running through the City, on land that generates no tax revenues, but that obstructs the kind of development that is critical to the City's financial health. **The EIR process should accord the highest rating to the maintenance facility location which has the smallest adverse impact on the health and wellbeing of residents, and which entails the minimum amount of property taking. We think that Alan's proposed Option L-BET fits those criteria, and we encourage you to strongly consider that amended alternative.**

==========

Many of our concerns and recommendations are incorporated in the STEP testimony, but at the risk of being redundant, we have cut and pasted and added our additional thoughts to some of their points that we feel particularly strongly about:

I-034-006

- Green Line stations must connect as seamlessly as possible with all other clean modes of transportation, including current and re-routed buses **and the Community Path and other pedestrian and bicycle routes**. Station design should accommodate bus drop off and pick-up with maximum integration of transit modes and minimal street disruption. **The terminus/station at Union Square should be designed to facilitate future extension along the Fitchburg line to Porter Square**.

I-034-007

- Station designs should allow for car drop off, but not car parking, and present ease of pedestrian and bicycle access by location of stations on major streets whenever possible, with station access from both sides of the street and in all direction of travel. This will maximize transit use. **Stations should be designed to include truly adequate bicycle parking**.

2

I-034-004

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-034-005

The Boston Engine Terminal (BET) and major modifications to its operations are beyond the scope of the Green Line Extension Project. MassDOT will continue to coordinate with the MBTA to explore possibilities for shared facilities between the Green Line Extension storage and maintenance facility and the BET.

I-034-006

In accordance with the Secretary's Certificate on the DEIR, emphasis will be placed on bicycle, pedestrian, and bus access as station designs are refined during preliminary engineering. Access for environmental justice and disability populations will be carefully evaluated in compliance with federal and state access laws, regulations, and codes. Automobile access, including drop off/pick up areas, station parking, and station area parking policies will also be taken into consideration as they relate to local traffic concerns and station designs. The Public Involvement Plan, Chapter 6 of the FEIR, details MassDOT's plans for public outreach in the next phases of the Project.

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

I-034-008
I-034-009

- Station and station area designs must be developed through a formal community participation process to ensure that they fit into existing neighborhoods and support appropriate future mixed use development. Takings should be minimized to save the state money and to preserve land uses. **We are dumbfounded at the MBTA's refusal to allow the kind of at-grade pedestrian track crossings that are ubiquitous along the above-ground portions of the B, C, and E Green Line routes, not to mention on most light rail lines across the country and internationally. If the MBTA is concerned about pedestrian safety, why not install gates or other safety devices that prevent passengers from crossing the tracks when trains are coming or are stopped in the station**.

I-034-010
I-034-011

- Design for the project terminus at Lechmere Square should pay particular attention to the East Cambridge Planning Teams pedestrian friendly area design ideas and old Lechmere Station re-use suggestions. The terminus at Route 16 should incorporate MGNAs ideas for minimizing takings. **The terminus at Route 16 should include a pedestrian overpass which facilitates safe crossing of the roadway. The extension to Route 16 should happen as part of the first and only phase of this project; delaying it until some future phase two creates a risk that it will never be extended at all**.

I-034-012

- Track, station and Green Line corridor area designs must provide full roadway and community access to Brickbottom Inner Belt and Lechmere Station through **reconstruction of Route 28 as a neighborhood and local business friendly boulevard**. Improved connectivity to both sides of Route 28 is crucial.

Thank you for your thoughtful consideration of these and other comments from interested parties.

Fred Berman and Lori Segall
25 Cherry St.
Somerville, MA 02144
Phone: 617-501-1404
Email: fredlori@rcn.com

Fred Berman

617-776-0503
fredlori@rcn.com

3

I-034-007

The amount of bicycle storage at each station is based on ridership projections developed by CTPS. DEIR/EA Appendix D includes the methods CTPS used to analyze demand for bicycle parking. Detailed bicycle parking designs will be further developed during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

I-034-008

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project. As stated in Section 6.4, MassDOT and the MBTA will convene a Green Line Extension Design Working Group. This group will advise the agencies on design workshops, participate in the workshops and serve as a corridor advisory group during design.

I-034-009

For safety reasons, MBTA, the future owner and operator of the Green Line Extension, has required that this rapid light rail transit corridor to be entirely separated from vehicular, pedestrian, and bicycle traffic. This separation would not allow pedestrian and bicycle crossing of the tracks at any point.

I-034-010

MassDOT has reviewed the suggestions submitted by the East Cambridge Planning Team. Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. These plans, including the pedestrian crossings of O'Brien Highway and associated street, crosswalk, and sidewalk designs will be further refined in the

preliminary engineering stage of the Project. As part of the Green Line Extension, MassDOT intends to demolish the existing Lechmere Station and prepare the site for potential future redevelopment. Based on the current requirements of the O'Brien Highway roadway improvements (as shown in FEIR Chapter 5, Lechmere Station), the existing bus shed must be removed.

I-034-011

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-034-012

DEIR/EA Section 3.9 describes the compatibility of the Green Line Extension with other regional projects, such as the conceptual reconstruction of McGrath Highway and the Urban Ring transit corridor initiative. MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses to ensure, to the extent feasible, consistency with planning and other projects.

MEPA

Dear Secretary Bowles:

I-035-001 I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886. Because I live in Medford Hillside, I will focus my comments on the section of the project around the Mystic Valley Parkway/Route 16 and College Avenue stations. I strongly support the Green Line Extension project, and I urge you to please not accept the DEIR as the Final EIR. The DEIR is incomplete and contains a number of serious flaws.

I-035-002 A fundamental concern is whether the Green Line Extension will actually reach or serve Medford Hillside as required by the 2005 amended State Implementation Plan. The definition of Medford Hillside contained in the DEIR is simply wrong. There are numerous overlapping definitions of Medford Hillside, but none of them include the intersection of College Avenue and Boston Avenue. The definitions of Medford Hillside used by current Medford residents and businesses, by modern and historical maps, by carefully researched books, and by historical evidence all include the area around Boston Avenue from Winthrop Street past North Street toward Route 16. This area is known by everyone who lives here as Medford Hillside, and this area will not be served by a station at College Avenue. Kate Fichter, Project Manager for the Green Line Extension, admitted in an August 2009 public meeting that College Avenue was ill-defined as Medford Hillside. The Preferred, Full-Build Alternative in the DEIR includes a terminus at Route 16, and that alternative would serve Medford Hillside.

Route 16 Terminus vs. College Avenue Terminus

I-035-003 Extending the Green Line to Route 16 would maximize the environmental and economic benefits for local residents as required by the Secretary's Certificate from December 1, 2006. Route 16 would be a station we could access as pedestrians. The DEIR makes it clear that a terminus at Route 16 is far better than a terminus at College Avenue in terms of increased public transit ridership, reduced vehicle miles traveled, service to environmental justice populations, and air quality improvements. A terminus at Route 16 is also far better in terms of access to park land and recreational opportunities around the Route 16 station, access to employment opportunities

I-035-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

I-035-002

The Proposed Project, with a terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (MassDEP DEIR/EA comment letter, January 8, 2010).

I-035-003

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-035-003 adjacent to the Route 16 station, access to grocery shopping adjacent to the Route 16 station, opportunities for transit-oriented development, connectivity to other transit modes and connectivity to the community paths being built along Route 16.

I-035-004 A terminus at College Avenue means more vehicle traffic through intersections in Medford Hillside that are already operating at an F level of service, and it means that Medford Hillside will suffer through increased traffic congestion and reduced air quality without seeing any benefits from the Green Line Extension. The DEIR analysis of potential stations at College Avenue and Winthrop Street (Appendix B, Section 4.5) concludes that area residential neighborhoods are better served by the Winthrop Street site than by the College Avenue site. The rejection of the Winthrop Street station and the rejection of a station between Winthrop Street and College Avenue is excused in the DEIR by claiming that the area residential neighborhoods will be served by a Route 16 station. These residents obviously cannot be served by a Route 16 station that is not built.

I-035-005 MEPA should require that the Proposed Project in the Final EIR extend the Green Line to Route 16 rather than terminate at College Avenue.

Extending the Green Line to Route 16 as a Second Phase

I-035-006 The costs of building the section from College Avenue to Route 16 in a separate second phase are enormous. The neighborhoods surrounding the College Avenue station will suffer through many additional years of construction. The neighborhoods surrounding the Route 16 station will suffer through many additional years without access to the Green Line. Building the College Avenue station as a terminus, even for a small number of years, will involve a larger footprint for the College Avenue station and the trackwork around it. Many of the negative impacts of that larger footprint are irreversible; once you shift the commuter rail closer to people's homes in order to make room for a College Avenue terminus, the commuter rail will not be shifted back when you extend the Green Line to Route 16.

MEPA should require that the Proposed Project in the Final EIR extend the Green Line to Route 16 as a single project.

Design of a Route 16 Station

The DEIR presents no positive design for a Route 16 station. The project designers told the Medford City Council on November 17, 2009, that the Route 16 station design in the DEIR is a "worst case scenario." It certainly appears to be a worst case scenario in terms of inflating financial costs, increasing environmental costs, and reducing environmental benefits far beyond what is necessary. This inclusion of only a worst case scenario for the Route 16 station is unacceptable.

The DEIR admits that the Route 16 station requires further analysis (Appendix B, Section 4.6), even though the Secretary's Certificate requires that the DEIR analyze a station at Route 16. The DEIR includes a detailed analysis in Appendix B of station access, transit operations, land use compatibility, and project cost for other stations, but does not do so for the Route 16 station. The DEIR also fails to provide mitigation for the environmental impacts of the Route 16 station, or even to show the full range of sensitive land around the Route 16 station.

I-035-004

In accordance with the Secretary's Certificate on the DEIR, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments. As described in DEIR Appendix B, Section 4.5, MassDOT's analysis and understanding of the ridership market potential concluded that the Winthrop Street area would be best served by a single station in the vicinity of College Avenue and Winthrop Street. Analysis indicated that the preferred location would be at College Avenue.

I-035-005

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project, extending the Medford Branch to College Avenue Station. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

I-035-006

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model

I-035-007 MEPA should require that the Final EIR include a viable design for the Route 16 station that is as fully developed and as fully evaluated as the designs for the other stations.

Costs of a Route 16 Terminus

The DEIR does not present detailed cost breakdowns sufficient to justify its conclusion that the Green Line Extension should terminate at College Avenue or that the section from College Avenue to Route 16 should be relegated to a second phase of the project. Instead, the DEIR presents plans that clearly inflate the cost of the section and then uses that inflated cost to justify relegating the section to a second phase.

The costs of this section could be far reduced by building this section as part of the initial project; by using a track alignment that does not require taking the commercial properties at 200 and 222 Boston Avenue; by keeping the Green Line tracks at ground level as it approaches the Route 16 station instead of elevating them where the commuter rail tracks are elevated to cross Route 16; and by building a much smaller ground-level station that does not require stairs, elevators, and/or escalators.

I-035-008 MEPA should require that the Final EIR include a plan for extending the Green Line to Route 16 in a cost-effective manner.

Design and Impacts of a College Avenue Terminus

The DEIR presents no realistic design for a College Avenue terminus. The design for the College Avenue terminus in the DEIR has a platform that is half the length that project engineers have stated is required for a terminus platform. A full-length terminus platform will require shifting the commuter rail lines closer to residences over a larger area, will increase potential land takings, will increase the number of trees removed, and will increase the environmental impacts for the neighborhood near the College Avenue station. A longer platform may also require a greater curve in the commuter rail tracks, which could require speed changes by the diesel commuter rail trains passing through that area. Project engineers stated at a public meeting that speed changes in these diesel commuter rail trains can increase air pollution 10-fold. The DEIR does not properly present or analyze those increased impacts, nor does it provide for mitigation for those increase impacts.

The DEIR also presents no realistic analysis of—or planning for—the traffic impacts of a College Avenue terminus. With a Route 16 terminus and a College Avenue mid-route station, the DEIR Peak Hour Trip Summary shows 40 pick-up/drop-off passengers at Route 16 and 35 pick-up/drop-off passengers at College Avenue (for a total of 75 vehicle round trips in these areas). With a College Avenue terminus, the DEIR Peak Hour Trip Summary incorrectly shows a total of 40 pick-up/drop-off passengers rather than 75. Shifting the terminus from Route 16 to College Avenue will add 40 pick-up/drop-off passengers to College Avenue; the total number of pick-up/drop-off passengers at a College Avenue terminus will be 75. This increase is not small when many of the intersections in this area are already operating at an F level of service. Each pick-up/drop-off passenger means two vehicle trips through this area, and there is no design in the DEIR for a safe turn-around at College Avenue. A College Avenue terminus will entail a substantial increase in traffic congestion and air pollution, and the DEIR does not acknowledge that increase.

assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch.

I-035-007

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-035-008

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-035-009 MEPA should require that the Final EIR fully evaluate the differing requirements of a College Avenue mid-route station and a College Avenue terminus, present a design for a College Avenue terminus, fully analyze the increased impacts of a College Avenue terminus, and commit to mitigation for those increased impacts if a College Avenue terminus is chosen.

Environmental Justice Communities

The DEIR presents benefits to environmental justice communities based on an analysis of extending Green Line service to Route 16 (Section 5.4.4 and 5.4.5 of the DEIR). The DEIR presents these benefits as identical for Alternative 1 (terminating at College Avenue) and Alternative 2 (terminating at Route 16), even though a terminus at College Avenue would not increase transit access for the substantial environmental justice population that is to the north and west of the proposed Route 16 Station. The map in Figure 1 of Appendix G shows environmental justice transit analysis zones that were included in the analysis, and includes a substantial environmental justice population that would not be served by a terminus at College Avenue. If this population is going to be used to justify the project, they should receive the benefit of the project by ensuring that the project will actually extend to Route 16 and serve them.

I-035-010 MEPA should require that the Final EIR evaluate the lowered benefits to environmental justice communities of a College Avenue terminus so that the alternatives can be honestly evaluated.

Mitigation Commitments

The Secretary's Certificate requires that the DEIR provide a clear commitment to implement mitigation measures. The DEIR fails to provide that clear commitment, instead proposing mitigation measures "where feasible" and "to the extent practicable." I can stand on my front porch and see and hear the commuter rail trains at the end of my street, so I want those clear commitments to implement mitigation measures.

I-035-011 MEPA should require that the Final EIR provide a clear commitment to implement mitigation measures.

Specific Mitigation Concerns

I-035-012 The DEIR does not include appropriate mitigation measures during construction. MEPA should require that the Final EIR commit to implementing mitigation measures as early as possible in the construction sequence.

I-035-013 The DEIR does not include appropriate noise mitigation measures around the Route 16 station. The proposed station platform is very close to open park land bordering Mystic Valley Parkway and bordering Auburn Street. This park land should be protected from the increased noise of a Route 16 station. In addition, the maps in Figure 4.2-7 and Figure 4.2-8 in the DEIR are missing the open public park land bordering the Mystic River between the Mystic River and West Street/Auburn Street. These maps should be corrected so that mitigation planning is done based on the actual needs of the area. MEPA should require that the Final EIR include robust noise mitigation measures around the Route 16 station.

I-035-009

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-035-010

Impacts to environmental justice populations are described in DEIR/EA Section 5.4, Environmental Justice. Additionally, the Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes specific outreach efforts to the environmental justice community that will be made as the Project progresses through its next phases.

I-035-011

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

I-035-012

As described in DEIR/EA Section 3.7, construction contractors will be required to comply with state regulations and local ordinances to mitigate air quality, noise, and vibration impacts. On-site resident engineers and inspectors will monitor all construction activities to ensure that mitigation measures are properly implemented.

I-035-013

A station at Mystic Valley Parkway/Route 16 and associated alignment

I-035-015
I-035-014

The DEIR does not include a commitment to retrofit the existing diesel commuter rail engines with emission-reduction devices. This simple and comparatively inexpensive step would alleviate many concerns about air pollution increases from shifting the commuter rail tracks closer to people's homes. MEPA should require that the Final EIR commit to reducing the emissions from the commuter rail engines as a necessary mitigation measure.

Poor Analysis of the Station Selection for College Avenue/Winthrop Street

Section 4.5 of Appendix B in the DEIR accurately states that "Two Alternatives were evaluated for the College Avenue Station Site." Bizarrely, neither of those evaluated alternatives was chosen. The first alternative was two separate stations at College Avenue and Winthrop Street, and the second alternative was a single station located by Brookings Street. Those are the only alternatives that were presented at community meetings, and yet both alternatives were thrown out in favor of a new plan in the DEIR. This new plan in the DEIR to have a single station at College Avenue was never presented to the community for feedback. The present plan in the DEIR's Proposed Project to have that station at College Avenue be a terminus was also never presented to the community for feedback.

This section presents two reasons for having no station at Winthrop Street. The first reason is that the area around Winthrop Street is covered by the one-mile walk-catchment areas around the proposed College Avenue and Route 16 stations. However, this reason does not make any sense under the Proposed Project, where there is no Route 16 station. In fact, the analysis admits that the area residential neighborhoods are better served by the Winthrop Street site than by the College Avenue site. Under the Proposed Project (Alternative 1) with no Route 16 Station, much of the area residential neighborhoods are really not served at all.

The second reason for having no station at Winthrop Street is presented under the heading of Transit Operations: "From an operational perspective, having one combined station would reduce delays associated with additional dwelling, accelerations, and decelerations." Those delays only occur for trips that pass through Winthrop Street, so this reason does not apply under the Proposed Project (Alternative 1) where the Green Line Extension terminates at College Avenue. Removing Winthrop Street from the Proposed Project does not remove any delays; it simply limits the population that has access to the Green Line service.

As a tool for choosing among the alternatives for stations around College Avenue and Winthrop Street, the DEIR presents numerical scoring of the alternatives in rating summaries attached to Appendix B. These rating summaries demonstrate a truly bizarre scoring process, where crosswalks at nearby intersections (for example) are weighted equally with ridership projections. Crosswalks and other pedestrian/bicycle crossing enhancements can be added to intersections easily and at little cost. Ridership, on the other hand, is the foundation of every environmental and economic benefit that the entire Green Line Extension can possibly offer.

I-035-016

All of these problems can be remedied by making the Proposed Project be the full-build extension to Route 16. MEPA should require that the Proposed Project in the Final EIR extend the Green Line to Route 16 as a single project.

improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-035-014

As presented in DEIR/EA Chapter 6, it is anticipated that the Green Line Extension will have a positive impact on outdoor air quality within the study area. Modifications to MBTA Commuter Rail equipment are outside the scope of this project. However, new fuel standards from EPA will result in lower emissions from locomotives, automobiles, and buses.

I-035-015

As described in DEIR/EA Appendix B, Section 4.5, MassDOT's analysis and understanding of the ridership market potential concluded that the Winthrop Street area would be best served by a single station in the vicinity of College Avenue and Winthrop Street. As explained in DEIR/EA Section 3.7, the preferred station location is at College Avenue.

I-035-016

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input

Comments from Michael Bernstein on the Green Line Extension DEIR, page 6

Misleading Maps in the DEIR

I-035-017 Figure 4.4-1 in the DEIR purports to be a map of the state-defined environmental justice populations around the Green Line Extension. This map crops out the environmental justice population to the north and west of the Route 16 station by placing the map boundaries directly next to the Route 16 station. Because this map does not show most of this environmental justice population which would benefit from improved transit access, we cannot see the increased environmental benefit of extending the Green Line to Route 16.

I-035-018 Figure 4.2-7 and Figure 4.2-8 are both missing Cummings Park at the intersection of Lyman Avenue and Cotting Street, a city-owned playground. They are also both missing the open park land bordering the Mystic River between the Mystic River and West Street/Auburn Street. Because these maps do not show the full set of parks near the Route 16 station, we cannot see the increased access to park land and recreational opportunities provided by extending the Green Line to Route 16.

I-035-019 Figure 4.2-10 shows primary use zoning around the Green Line Extension. However, no zoning information is given for the section of Arlington that begins less than ½ mile from the Route 16 station. Providing this information would show that a substantial residential community in Arlington would also be directly served by the Route 16 station, and that the Route 16 station would provide access to substantial additional recreational park land extending along the Arlington side of the Mystic River and the Arlington side of Alewife Brook.

I-035-020 MEPA should require that the Final EIR correct these maps so that the EIR shows the full benefits of extending the Green Line to Route 16 rather than to College Avenue. MEPA should also require that the Proposed Project in the Final EIR extend the Green Line to Route 16 in a single phase, so that these potential environmental benefits can become a reality.

Lack of Public Input Before Producing the DEIR

The public input process before producing the DEIR was inadequate. If you accept the DEIR as the final report, public input will have been bypassed on shaping vitally important aspects of the project.

I-035-021 1. The designs presented for the Route 16 station have changed at every public meeting in terms of basic track alignments, property takings, vehicle and pedestrian access plans, and parking facilities. The plans for the Route 16 station have consistently represented what the project designers have described as a worst case scenario, though the details of what they envision as a worst case scenario have shifted over time. The design for the Route 16 station in the DEIR was never presented to the public prior to the release of the DEIR. The public has had no opportunity to comment on reasonable alternative designs for the Route 16 station, because they have only been presented with designs that are worst case scenarios.

I-035-022 2. The public input process included a station workshop for College Avenue and Winthrop Street, at which two possibilities were presented and discussed: (1) two mid-route stations at College Avenue and at Winthrop Street; and (2) a single mid-route station between College Avenue and Winthrop Street. Both of these possibilities are rejected in the DEIR in favor of a single terminus station at College Avenue. Plans for a terminus at College Avenue were never presented

on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-035-017

The Proposed Project offers substantial benefits to environmental justice communities and serves the majority of Study Area environmental justice population zones. Benefits were evaluated based on environmental justice populations within the entire municipalities of Medford, Somerville, and Cambridge. As described in DEIR/EA Section 5.4, Environmental Justice, impacts to environmental justice populations would be neither severe nor disproportionate with any of the Build Alternatives.

I-035-018

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time.

I-035-019

Please see response to Comment I-035-018.

I-035-020

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

I-035-021

A station at Mystic Valley Parkway/Route 16 and associated alignment

I-035-022 to the public prior to the release of the DEIR, even though this is suddenly the DEIR's Proposed Project.

I-035-023 3. The idea of separating out the section from College Avenue to Route 16 into a second project phase was never presented to the public prior to the release of the DEIR, even though this is suddenly the DEIR's Proposed Project.

I-035-024 Earlier in these comments, I have recommended that MEPA should require that the Proposed Project in the Final EIR extend the Green Line to Route 16 in a single phase. If MEPA does so, then the only further public input that I would urge would be a station workshop for a fully developed and viable Route 16 station design. If MEPA does not require that the Proposed Project in the Final EIR extend the Green Line to Route 16 in a single phase, then a public input process is needed on all of these issues. While comments on the DEIR are obviously an opportunity for public input, reading and commenting on 6000 pages of material is intimidating to much of the public and does not provide any opportunity for questions and dialogue.

Conclusion

I want the Green Line Extension to happen, because its environmental benefits can be enormous. I want the project to be the best project it can be, to maximize the benefits and minimize the costs for myself, for my family, for my friends and neighbors, and for my community. This DEIR does not accomplish that.

MEPA has an opportunity to require changes to ensure that the Final EIR does maximize the project benefits for all of us, and ensure that the Final EIR meets the requirements of the SIP from 2005 and the requirements of the Secretary's Certificate from 2006. I urge you not to accept the DEIR as the Final EIR. I urge you instead to require that the Final EIR include the changes I have outlined above.

Thank you for considering my comments.

Sincerely,

Michael Bernstein

improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-035-022

As described in DEIR/EA Appendix B, Section 4.5, MassDOT's analysis and understanding of the ridership market potential concluded that the Winthrop Street area would be best served by a single station in the vicinity of College Avenue and Winthrop Street. As explained in DEIR/EA Section 3.7, the preferred station location is at College Avenue. The alternatives (of which two included as station at College Avenue) clearly were presented to the public before the DEIR/EA.

I-035-023

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-035-024

In accordance with the Secretary's Certificate on the DEIR/EA,

MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

Johnson, Holly (EEA)

To: Johnson, Holly S (ENV)
Subject: Comments re: EEA #13886EEA

January 8, 2010

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886

Dear Secretary Bowles,

The residents of Somerville are incredibly excited about the planned Green Line extension. A *hundred people*, including myself, showed up at the last Somervision event on Tuesday evening, January 5th, to brainstorm around the possibilities for the city arising from the promise of adequate mass transit. The release of the Green Line Extension DEIR is an important step in making the promise a reality, and I'm grateful for the opportunity to give comments.

The website of the Somerville Transportation Equity Partnership (STEP) provides exceptionally well-conceived principles and guidelines for planning the extension. Rather than re-inventing the wheel here, I'd like to comment on four points:

I-036-001 1. **Design for multi-modal access**. Somerville has lots of avid bikers, including my sons and myself, who would welcome well-designed access and storage facilities for bikes. Integration with the Community Path to ensure direct pedestrian and bicycle access to the T is critical.

I-036-002 2. **Making Route 28 a Regional Corridor to enhance economic development and reintegrate Somerville.** It's absolutely critical to the welfare of Somerville that all aspects of the Green line designs support the reconstruction of Route 28 *as a surface boulevard* that promotes the economic development of the Brickbottom-Innerbelt area and serves pedestrians and bicyclists as well as cars. The economic impact of this change would be huge and support even greater ridership on the T.

I-036-003 3. **Siting of the Maintenance Facility and Storage Yards.** Somerville bears huge environmental burdens as a result of poor state transportation planning in the past. The negative results on the city's public health, environment, and economic well-being are overwhelmingly evident. The maintenance facility should be sited so as to allow proposed development in the Brickbottom-Innerbelt area and to minimize environmental burdens.

I-036-004 4. **Project-wide Citizens Advisory Group to work with the T on all stages of the planning.** Wonderful idea! There's so much excitement and energy in Somerville around the Green-Line extension, and such an advisory group could create a valuable synergy with the group working with city officials to generate a comprehensive plan for Somerville.

I do not have a license and rely exclusively on public transportation and walking to get to work and to go around Somerville and Boston. I love the T, but it's amazing how clunky most of the stations are. The renovated South Station is *just dreadful*. The one great piece of news is the renovation of the Charles Street Station, which is quite beautiful and turns the station itself into something of a destination. I agree with the STEP guidelines that escalators should not be
I-036-005 included in the new Green-line T stops and think that the money saved could be used on thoughtful design, fine durable materials and enhancements to access. No parking -- at least at the stations in Somerville!

Thank you again for the opportunity to comment.

Sincerely,
Jane Fair Bestor
50A Lowell Street
Somerville, MA 02143

1

I-036-001

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-036-002

DEIR/EA Section 3.9 describes the compatibility of the Green Line Extension with other regional projects, such as the conceptual reconstruction of McGrath Highway and the Urban Ring transit corridor initiative. MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses to ensure, to the extent feasible, consistency with planning and other projects.

I-036-003

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real

estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-036-004

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project. As stated in Section 6.4, MassDOT and the MBTA will convene a Green Line Extension Design Working Group. This group will advise the agencies on design workshops, participate in the workshops and serve as a corridor advisory group during design.

I-036-005

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. These stations are designed to be consistent with MBTA standards and compliant with ADA. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local

communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

Johnson, Holly (EEA)

From: Jack Beusmans [jbeusmans@comcast.net]
Sent: Thursday, January 07, 2010 9:49 PM
To: Johnson, Holly S (ENV)
Subject: EEA #13886

Dear Secretary Bowles,

I am writing with reference to the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

I-037-001

I urge you to not accept the current DEIR as it does not adequately address the many concerns raised by Medford's Mayor Michael McGlynn and the Medford Green Line Neighborhood Alliance (MGNA), an organization I support strongly. Frankly, I'm rather disturbed that in their recent public comments on the current DEIR, both Mayor McGlynn and MGNA express obvious disappointment and frustration at their interactions with MassDOT. Judging from the DEIR, MassDOT seems to be proud of its outreach efforts and of the many opportunities it provided for public input. However, judging from Mayor McGlynn and MGNA's reactions these efforts at public participation seem to have been pro forma and no constructive dialogue seems to have taken place. I find it rather disappointing that such credible stakeholders as the mayor of Medford and the MGNA, a serious organization representing many citizens in Medford including myself, are essentially ignored. How hard would it be to address their concerns and questions in an open and transparent manner?

I-037-002

I support the green line extension in Medford and would like it to go all the way to Route 16. This alternative should be analyzed more extensively in any final EIR. I urge you to reject the current DEIR and to direct the MassDOT to address the concerns of Mayor McGlynn and MGNA.

Sincerely,

Jack Beusmans
10 Manning St
Medford, MA 02155

1

I-037-001

MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses. This will help ensure compliance with legal requirements and, to the extent feasible, consistency with planning and other projects.

I-037-002

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

Johnson, Holly (EEA)

Dear Ms. Johnson

Please find attached two letters that I would like submitted to Secretary Bowles in response to the DEIR, project number EEA 13886.

I will also send you hard copies of the enclosed letters via USPS.

I would appreciate a returned email to confirm your receiving this email and attached letters.

Thank you

The Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge St, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I am writing in regards to the Draft Environmental Impact Report on project Number EEA #13886.

I-038-001

As a longtime resident of the Brickbottom Artists Building, I am concerned about the proposed Yard 8 location for the maintenance facility and storage yard. It is difficult to understand why the Yard 8 location is still in discussion after it has been outright rejected by the City of Somerville and when it is so clearly violates the principles outlined in your Certificate for the project.

Your Secretary's Certificate (EENF, *Environmental Justice*, p. 7) states that "no segment of the population should be denied environmental benefits, or should bear a disproportionate burden of environmental impacts."

The Yard 8 citing for the maintenance facility and storage yard will place a tremendous burden on the 200+ residents of the Brickbottom Artist Building, rendering its three buildings currently used as both work and live space as unfit to live in.

As one of the oldest artist communities in the Boston area, Brickbottom residents such as myself are not asking for special treatment -- we are simply asking for *fair* treatment in regard to the placement and construction of the maintenance facility and storage yard.

Since its inception in 1988, when a group of determined artists diligently worked to transform an abandoned A&P warehouse into a vibrant artist community, Brickbottom residents have endured a great deal of noise, pollution and vibration from the nearby Fitchburg Commuter Rail line, as well as Amtrak trains and Pan Am trains that idle by Brickbottom as they wait to enter the Boston Engine Terminal.

To ask us to now absorb the Yard 8 location for the maintenance and storage facility that will serve the needs of the entire Green line, not just the Green Line extension trains, is simply unjust. Add the impact of the Green Line extension on both sides of Brickbottom and you will have wiped out our community altogether.

I-038-002

In 1980, prior to the development of the Brickbottom community, Yard 8 was the site of a major industrial disaster that released 13,000 gallons of phosphorus trichloride. The incident was sizeable and required that 600 local residents be sent to local hospitals. The environmental engineers at the scene of the accident sought to monitor the release of the chemical spill into the soil (see attachments).

Given this history at the Yard 8 site, we ask that proper investigation and testing be done now to the soil in that area to assess the level of pollutants at Yard 8, including other chemicals that have accumulated over the last two decades. Such chemical residue has the potential to adversely impact the health of Brickbottom residents with the construction of the proposed Yard 8 maintenance facility and storage yard. This potential impact was not considered in the DEIR.

I-038-003

While there are currently three locations under review as part of the DEIR, the final location for the maintenance facility and storage yard must adhere to the following guidelines in order to fulfill your Certificate's mandate:

I-038-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-038-002

An analysis of hazardous materials potentially present within the Green Line Extension Study Area is provided in DEIR/EA Section 5.14, Hazardous Materials. Additional investigation may be conducted during the next phases of the Project to determine the nature and extent of any contamination and remediate any sites as appropriate. This work would be conducted in accordance with the Commonwealth's Massachusetts Contingency Plan requirements.

I-038-003

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, Option L is identified as the preferred maintenance facility site.

I-038-003

- The location should consolidate near existing rail uses, reconfiguring and resuing the 43 acres of BET land where possible and consolidating MBTA land uses;
- As stated in your Certificate, the site should minimize any adverse impact on economic development and neighborhood connectivity and should support future mixed-use development;
- The site should be planned in conjunction with comprehensive land use and economic development planning of the Inner Belt area -- the last remaining development land within the city of Somerville;
- It is essential that the storage yard be enclosed and covered to mitigate its impact on abutters;
- Ask that the MBTA asess the proposed size of the storage yard which is disproportionately large and places system-wide burdens of the entire MBTA on this one location and thus adversely impacts Somerville's potential future economic development and the quality of life for local abutters;
- The location should minimize the need to switch and reverse rail cars. It should also avoid use of curved railway patterns that will greatly increase the impact of noise and vibration on nearby abutters.
- We ask that the project not go to a final EIR in regards to the maintenance facility and storage yard.

In addition to its adverse impact on the Brickbottom community, Yard 8 as a location for the maintenance and storage yard will create a permanent barrier to neighborhood cohesion by dissecting the Inner Belt from the Brickbottom area and create a barrier to future economic development.

The Option L location is a promising but imperfect location that needs further study.

Mirror H on the Somerville/Cambridge border is one of the sites preferred by the City of Somerville.

I-038-004

We encourage your office to pursue the following steps in relation to the maintenance facility and storage yard:

- More fully look into Option L and Mirror H sites, following the guidelines above
- Consider other alternatives to Option L and Mirror H sites, such as the proposed
- Remove Yard 8 altogether as a potential site.

Thank you.

Connie Blaszczyk
1 Fitchburg St., B151
Somerville, MA 02143

I-038-004

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

The Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EE#13886
100 Cambridge St, Suite 900
Cambridge, MA 02114

Dear Secretary Ian Bowles,

I am a Somerville resident and taxpayer who has lived at the Brickbottom Artist Building in Somerville's inner-belt district since 1995. I am writing in regard to the Draft Environmental Impact Report (project Number EEA #13886) to express my deep concern with the report and the need to better address the impact of the Green Line Extension on the Brickbottom community and the citizens of Cambridge and Somerville.

Green Line Extension: Noise and Pollution Assessment

With the introduction of the Green Line Extension, residents of the Brickbottom Artists Building will live in perpetuity with two Green Line spurs on either side of the building. Many Brickbottom residents will co-exist with the Green Line just 19 feet away.

This impact will have significant impact on the South side of the Brickbottom building and directly affect the residents of 20 condominiums that face this side of the building. The South side of the Brickbottom building is already severely impacted by noise and vibration due to commuter train traffic on the Fitchburg Line and large Amtrak engines, freight trains and commuter trains that idle on the dead-end railhead.

I-038-005 While noise and vibration assessments were done on the North side of the Brickbottom building as part of the DEIR, no testing has been done on the building's South side. This is in direct violation of the Secretary's Certificate (EENF, *Environmental Justice*, p. 7) which states, "no segment of the population should be denied environmental benefits, or should bear a disproportionate burden of environmental impacts." Without complete measurements, it is impossible to make a proper Environmental Justice evaluation of the Green Line Extension's impact.

I-038-006 The collective noise of the commuter rail, the dead-end rail head and the projected Union Square spur on the South side of the Brickbottom building needs to be measured and calculated to assess required noise and vibration mitigation.

I have experienced first hand for 10+ years the daily impact of noise and vibration from the various trains that regularly run on the South side of the Brickbottom

I-038-005

As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds.

I-038-006

Please see response to Comment I-038-005.

building. I feel the shaking of the building from idling Amtrak engines and Pan Am freight cars that idle next to our building countless times a day; my daily life is interrupted by the noise from these trains and the Fitchburg commuter rail line, the smell of diesel exhaust and the high level screeching of box cars and engines that are slowly dragged along the tracks on the way into the terminal, particularly in the late evening hours.

I-038-007

In light of the overall environmental impact of the Green Line and its contribution to the existing environmental impacts of the commuter and freight rail traffic near Brickbottom, we request that MassDOT assign five of the new EPA Level 3 diesel rail engines to the Fitchburg Line to help mitigate the overall environmental impact of existing and new rail traffic in this area. The Fitchburg Line should be prioritized for the replacement of legacy diesel engines.

I-038-008

Additionally, it is essential that a Citizen's Advisory Group (CAG) be formulated at every stage of the project going forward as mandated in the Secretary's Certificate for community involvement in the project. (EENF, *Smart Growth/Land Use*, p. 5)

Proximity of the Green Line Extension to Brickbottom

I-038-009

The DEIR fails to adequately address in detail the exact placement of the Green Line Extension rail lines in proximity to the Brickbottom building. Given its close proximity to the Brickbottom building, moving the Green Line extension as far from the Brickbottom building as possible (even a few feet!) will have a major impact on the quality of life for Brickbottom residents.

I-038-010

On the South side of the building, many Brickbottom residents rely on the road that runs between the building and rail lines for access to the east end of the building and to access the building's underground parking lot. This road is essential as it is used by emergency vehicles to gain access to the east end of the Brickbottom building. The taking of this land will impact access and require the taking of deed parking spaces. The taking of this land for the Green Line Extension has not been studied in the DEIR and its impacts taken into full account.

DEIR Mitigation is Inadequate

I-038-011

The mitigation as outlined in the DEIR is woefully inadequate in how it will address the impact of the Green Line Extension on residents of the Brickbottom building.

The DEIR refutes the use of **sound barriers** due to the height of the Brickbottom building. However, according to the ***Federal government's 2006 Transit Noise and Vibration Impact Assessment*** (FTA-VA-90-1003-06), sound barriers can still provide meaningful sound absorption. "Where the barrier is very close to the

I-038-007

EPA Level 3 locomotives adhere to more stringent air emission requirements but do not have lower noise emission requirements. As presented in DEIR/EA Chapter 6, it is anticipated that the Green Line Extension will have a positive impact on outdoor air quality within the study area. Modifications to MBTA Commuter Rail equipment are outside the scope of the Project. However, new fuel standards from EPA will result in lower emissions from locomotives, automobiles, and buses. FEIR Chapter 8 details the Project's proposed mitigation measures.

I-038-008

As described in the DEIR/EA Section 1.5.3, throughout the development of the DEIR/EA regular coordination with the Advisory Group and local municipalities on various aspects of the Project, including siting of the maintenance facility, occurred. During the Summer of 2008, tutorials on the proposed maintenance facility as well as site visits to existing maintenance facilities were conducted for Advisory Group members. Additionally, in December 2009 a public meeting was held on the various maintenance facility sites.

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-038-009

The precise alignment for the tracks near the Brickbottom Artists Building will be determined during preliminary engineering and final design. The tracks will be located as far from the building as possible. The minimum clearance will probably be about 15 feet.

I-038-011

transit vehicle or where the vehicles travel between sets of parallel barriers, barrier effectiveness can be increased by as much as 5 decibels by applying sound-absorbing material to the inner surface of the barrier." (*2006 Transit Noise and Vibration Impact Assessment*, 6-42.)

This document, which was cited in the DEIR, also recommends that railcars be fitted with **acoustical absorption** under the cars. According to the report, this step has been demonstrated to provide up to 5 decibels of mitigation for wheel/rail noise. The document also recommends the use of vehicle skirts over rail car wheels to provide 5 decibels of mitigation. "By carrying their own noise barriers, vehicles with these features can provide cost-effective noise reduction."

It is a well-regarded fact by noise experts that the greatest source of noise in light rail cars is their air conditioning units. The *2006 Transit Noise and Vibration Impact Assessment* outlines the use of **fan-quieting mitigation** that can be accomplished by installation of quiet, efficient fans. Several new designs are available. We ask that fan-quieting mitigation be implemented on rail cars stored and used on the Green Line Extension. Placement of fans on the Green Line vehicles will make a significant difference in the noise radiated toward all those impacted, including Brickbottom and Glass Factory residents, among others.

Again, these recommendations are included in the 2006 Transit Noise and Vibration Impact Assessment, done by the Federal government. This same document was cited in the DEIR.

The discussion of Green Line Extension proximity to Brickbottom as well as proper mitigation needs to be meaningfully investigated by a Citizen's Advisory Group to be sure that appropriate remediation is taken at every stage of the Green Line Extension's development.

In Summary

I-038-012

In order that the Green Line Extension and the DEIR reflect your own Certificate guidelines, we ask that the following steps be addressed:

- Noise and vibration measurements be taken on the South side of the Brickbottom Artists Building only to adequately assess a baseline of current noise and vibration impacts from existing rail traffic that establish a baseline for current noise, vibration and air quality.

I-038-013

- Exploration of mitigation and changes in practices be done in the use of the dead-ended railhead by AMTRAK, MDOT and PanAm rail.
- Exploration of vehicle mitigation and changes in operations with regard to the Fitchburg Line be carried out.

I-038-010

DEIR/EA Section 5.2 describes the Project's potential temporary and permanent acquisitions. MassDOT will continue to evaluate opportunities to minimize these property impacts.

I-038-011

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-038-012

Please see response to Comment I-038-011.

I-038-013

Operations of the Boston Engine Terminal (BET), Amtrak, and MBTA Commuter Rail are beyond the scope of the Green Line Extension Project. The BET "Drill Track," or the track used to access the BET from the west, will be relocated approximately five feet further from the Brickbottom Artists Building as part of the Green Line Extension Project.

I-038-014 | o More adequate exploration of noise and vibration be investigated to mitigate the impact of the Green Line Extension on Brickbottom residents and other residential communities.

I-038-015 | o A Citizen Advisory Group immediately be established to ensure that the community is involved at every phase of Green Line Extension planning.

As a Massachusetts resident, I am depending on your office and the newly-formed MassDOT to carry out the principles that are outlined in your own Certificate and to do right by the Massachusetts citizenry in the development of the Green Line Extension.

Thank you.

Sincerely,

Connie Blaszczyk
1 Fitchburg St., B151
Somerville, MA 02143

I-038-014

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

I-038-015

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

The Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge St, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I am writing in regards to the Draft Environmental Impact Report on project Number EEA #13886.

I-039-001

As a longtime resident of the Brickbottom Artists Building, I am concerned about the proposed Yard 8 location for the maintenance facility and storage yard. It is difficult to understand why the Yard 8 location is still in discussion after it has been outright rejected by the City of Somerville and when it is so clearly violates the principles outlined in your Certificate for the project.

Your Secretary's Certificate (EENF, *Environmental Justice*, p. 7) states that "no segment of the population should be denied environmental benefits, or should bear a disproportionate burden of environmental impacts."

The Yard 8 citing for the maintenance facility and storage yard will place a tremendous burden on the 200+ residents of the Brickbottom Artist Building, rendering its three buildings currently used as both work and live space as unfit to live in.

As one of the oldest artist communities in the Boston area, Brickbottom residents such as myself are not asking for special treatment – we are simply asking for *fair* treatment in regard to the placement and construction of the maintenance facility and storage yard.

Since its inception in 1988, when a group of determined artists diligently worked to transform an abandoned A&P warehouse into a vibrant artist community, Brickbottom residents have endured a great deal of noise, pollution and vibration from the nearby Fitchburg Commuter Rail line, as well as Amtrak trains and Pan Am trains that idle by Brickbottom as they wait to enter the Boston Engine Terminal.

To ask us to now absorb the Yard 8 location for the maintenance and storage facility that will serve the needs of the entire Green line, not just the Green Line extension trains, is simply unjust. Add the impact of the Green Line extension on both sides of Brickbottom and you will have wiped out our community altogether.

I-039-002

In 1980, prior to the development of the Brickbottom community, Yard 8 was the site of a major industrial disaster that released 13,000 gallons of phosphorus trichloride. The incident was sizeable and required that 600 local residents be sent to local hospitals. The environmental engineers at the scene of the accident sought to monitor the release of the chemical spill into the soil (see attachments).

Given this history at the Yard 8 site, we ask that proper investigation and testing be done now to the soil in that area to assess the level of pollutants at Yard 8, including other chemicals that have accumulated over the last three decades. Such chemical residue has the potential to adversely impact the health of Brickbottom residents with the construction of the proposed Yard 8 maintenance facility and storage yard. This potential impact was not considered in the DEIR.

I-039-003

While there are currently three locations under review as part of the DEIR, the final location for the maintenance facility and storage yard must adhere to the following guidelines in order to fulfill your Certificate's mandate:

I-039-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-039-002

Please see response to Comment I-039-001.

I-039-003

Please see response to Comment I-039-001.

I-039-003

- The location should consolidate near existing rail uses, reconfiguring and resuing the 43 acres of BET land where possible and consolidating MBTA land uses;
- As stated in your Certificate, the site should minimize any adverse impact on economic development and neighborhood connectivity and should support future mixed-use development;
- The site should be planned in conjunction with comprehensive land use and economic development planning of the Inner Belt area -- the last remaining development land within the city of Somerville;
- It is essential that the storage yard be enclosed and covered to mitigate its impact on abutters;
- Ask that the MBTA asess the proposed size of the storage yard which is disproportionately large and places system-wide burdens of the entire MBTA on this one location and thus adversely impacts Somerville's potential future economic development and the quality of life for local abutters;
- The location should minimize the need to switch and reverse rail cars. It should also avoid use of curved railway patterns that will greatly increase the impact of noise and vibration on nearby abutters.
- We ask that the project not go to a final EIR in regards to the maintenance facility and storage yard.

In addition to its adverse impact on the Brickbottom community, Yard 8 as a location for the maintenance and storage yard will create a permanent barrier to neighborhood cohesion by dissecting the Inner Belt from the Brickbottom area and create a barrier to future economic development.

The Option L location is a promising but imperfect location that needs further study.

Mirror H on the Somerville/Cambridge border is one of the sites preferred by the City of Somerville.

I-039-004

We encourage your office to pursue the following steps in relation to the maintenance facility and storage yard:

Rescue Technician: Rope Rescue Certification

Beginning this past fall, the Mass. Firefighting Academy offered, for the first time, certification in *Rescue Technician: Rope Rescue* in accordance with NFPA 1006. The Technical Rescue office has been working closely with the Certification office to develop this certification exam both written and practical.

Photo by: Barry Hyvarinen

The core requirements for the exam are stipulated in *chapter 5 of NFPA 1006 Rescue Technician: Rope Rescue 2003 ed.* Currently, the Mass. Firefighting Academy's two rope programs, *Rope Rescue: Operational Level* and *Rope Rescue: Technician Level* are one of the means to obtain these core requirements. These programs also develop the practical skills to take the rope rescue certification exam practical. If a candidate has the core requirements of training and documentation from another state, they can submit for consideration to the Certification office at the Mass. Firefighting Academy.

This Pro Board certification will examine each candidate's knowledge, skills and abilities to safely deal with rescuing a victim in a precarious position using ropes as the means to get them down or up safely. The student will be challenged in all aspects of rescue techniques: rope rescue, constructing anchors, mechanical advantage systems, and belay devices.

For questions about the rescue technician: rope rescue certification exam please call the Certification office at (978) 567-3223. For questions about the core requirements or Technical Rescue classes, please contact the Technical Rescue office at (978) 567-3214 or check the DFS website at http://www.mass.gov/dfs/mfa/index.shtm for scheduled classes and registration information. ✦

Propane Emergency Response Plan Revised for New England

The Propane Gas Association of New England has revised their Propane Emergency Response Plan/Guide for New England. This guide is available for download at www.pgane.org to provide assistance to federal, state, and local emergency response groups for a quick and effective response to propane related incidents. Once on the website, select the Safety & Training link, which will then give you several selections...click on the E.R. Plan (it might ask you to download an Adobe program if you do not have it...this is free of charge and only takes a couple of seconds to download). ✦

HazMat Training Group Presents at International Conference

The Hazardous Materials Training group presented at the International Association of Fire Chiefs' (IAFC) International Hazardous Materials Response Teams Conference May 31 through June 3 2007 at Hunt Valley Maryland. The IAFC conference is recognized worldwide as the premier conference for the hazardous materials response teams.

Assistant Coordinators Bob Zalewski and Gordon Diotalevi, Program Coordinator Marty Greene, and Hazardous Materials Response Director David Ladd were all in attendance.

DFS staff was invited to share with other first responders from all over the world how the Commonwealth has prepared to respond in a unified fashion to hazardous materials incidents and incidents potentially involving weapons of mass destruction (WMD).

1980 Somerville HazMat Incident

A brief history of the tragic hazardous materials incident in Somerville, MA was reviewed. At 9:05 a.m. on April 3, 1980, a tank car was being pulled through the railroad switching station in Somerville. Inside were 13,000 gallons of phosphorus trichloride. A 38-car freight train creeping along a track sideswiped the tank car, ripping a gash in the half-inch steel skin of the tank car, three inches wide by 20 inches long. The only prior incident known was a 200-gallon spill, which left little information to assist the Somerville Fire Department.

The immediate resource available at the time was the 1978 version of the *Emergency Response Guidebook* (ERG), which recommended:

CONTINUED ON PAGE 10

HazMat Training Group Presents at Conference

Continued from page 9

- Apply water spray
- The ERG (1978) recommended using a fine mist to reduce the vapor, but explicitly precluded direct water spray on a spill.
- It also called for a dike to contain the spill until "removal apparatus" was available.

At 9:30 a.m., officials ordered evacuation of adjacent areas and alerted Boston and Cambridge officials about the growing toxic gas cloud.

At 10 a.m. area hospitals began implementing disaster plans.

At 11 a.m. it was determined that the cloud posed a threat to commuters and transportation and police began evacuating people as far away as Route 93 and the Mystic-Tobin Bridge.

Shortly after 1 p.m. the leak was contained. About 9,500 gallons had spilled. The wind shifted, and evacuation orders expanded.

By 11:30 p.m. the pit was filled with sand and soda ash, while environmental engineers monitored how much, if any, of the chemical was leeching through soil. By 1 a.m., the estimated 17,000 evacuated people were allowed to return to their homes.

In the end, more than 600 victims were seen at 10 area hospitals. At Somerville Hospital, 457 patients exposed to fumes showed a 20 percent liver abnormality rate, suggesting potential liver damage. The incident lasted less than 24 hours, but cost well over $500,000 (1981) to Somerville and at least that much to other participating agencies.

In 1981 the fire service in MA sought to find a solution. The Massachusetts Firefighting Academy (which pre dates the state Department of Fire Services) with the help of the Massachusetts Fire Chiefs' Association & Professional Fire Fighters of Massachusetts, developed what we know now as the Hazardous Materials Response Division within DFS.

DFS and the Hazardous Materials Response Division was one of the first "regional" teams in the nation. Further, Massachusetts is truly a regional hazmat team.

While there are many "regional" teams, Massachusetts is one of the few that maintains statewide response to both large and small incidents.

The unified approach to response in Massachusetts grew out of the regional hazmat response program. The many different agencies that have sought training post 9/11 have all had programs derived out of the hazardous materials technician class that the Massachusetts Firefighting Academy offers. Clearly, it is an example of the benefits of training using a multi-agency approach that has been noted by other states.

With the success of the regional hazmat response teams, other agencies in the state sought assistance from DFS. The foundations of training needs were from the existing Hazmat Technician class.

A standardized hazardous materials program for public safety agencies was established by the Massachusetts Firefighting Academy. Standard operating procedures have been created to provide standardized response techniques, team management, and safety of the team members. A "system approach" has been established for the response and mitigation of incidents through a unified command system.

Development of training for agencies such as the Massachusetts State Police Crime Scene Services and the Department of Public Health Chem/Bio groups (to name a few) were created with the same framework using a needs assessment:

- Objectives & goals;
- Needs based, mission specific;
- Most could not operate independently;
- Training needs determined before equipment needs.

The outcome was a common sense approach to response. The hazmat teams and other public safety agencies must respond to deal with the issues of today. With the baseline training of the hazardous materials technician course given to our firefighters, and the training given to other responding agencies, makes a perfect fit for the "Unified Approach" to training and response. ♦

1980 Somerville HazMat Incident

Boston, MA 02114

Dear Secretary Bowles:

I-040-001 As a resident of the Glass Factory Condominiums, I am deeply concerned about the design and placement of the Green Line Extension and the new Lechmere Station.

TRACKS ARE TOO CLOSE TO OUR BUILDING.
The present design shows the tracks running very close to the rear of our building. We urge your designers and engineers to place the tracks as far to the rear of our building as possible to preserve views & light to the many units that will be severely impacted by the elevated tracks. The design and placement of the tracks and supports should do all it can to minimize the visual impact to those units and also minimize noise & vibration impacts to the whole building as well as the surrounding neighborhood.

LECHMERE STATION.
At present, your designs show the new Lechmere Station so close to the Glass Factory that it appears to be part of our condominium building. Please move the station closer to East Street, where it could be part of the entrance way to the eventual North Point development. The station design needs to be substantially improved so it is not an eyesore but rather an enhancement to this rapidly developing neighborhood. It should reflect the importance of this location as the gateway between Cambridge & Boston.

BUS TRAFFIC.
The many bus lines that converge on Lechmere Station are presently designed to enter at one end of our building, pick up passengers, and emerge at the other end of our condo building. Please do not route bus traffic, directly under our windows. Bus traffic noise, vibrations and fumes are a great concern. Sidewalks where passengers wait, should also be moved farther from our building to preserve our privacy and minimize impacts from noise, light and smoking. If too close, it will feel like we are living in the bus station.

PRESERVE OUR TREES & GREEN SPACE.
Presently there is a row of mature evergreen trees behind our building. I urge you to preserve all these trees and the entire small green space behind our building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks should be on the far side of the large trees. These trees serve as a natural screen for the tracks and busway.

I-040-001

Please see Comment Letter I-013.

MAINTENANCE FACILITY.
I strongly oppose the Mirror H location. It is much too close to the Glass Factory and other residential buildings and will effectively destroy further development in North Point. Putting a maintenance facility on prime land in a desirable, developable location that would generate significant tax revenue to Cambridge simply does not make sense. Of the three options proposed, Option L seems to be the best choice however I would prefer there be no maintenance facility in this area but rather it be at the end of the line.

REDUCE SURFACE PARKING.
The present Lechmere Station is at the end of the Green Line. That will no longer be the case with the new Green Line Extension and the number of parking spaces should be substantially reduced. Please consider using the under-utilized parking garages that are already in this neighborhood. Surface parking is bad urban design and should be minimized in the new North Point neighborhood. One half of our building will overlook the new parking and we request it be carefully designed with this in mind. Ample green space should be included in the design and all lighting should be down lighting that minimizes light pollution to our building.

Thank you for hearing my concerns.

Sincerely,

Jose F. Borges

DEC 23 2009

Dear Secretary Ian Bowles,

I am writing today with regard to the Green Line Extension Draft Environmental Impact Report (DEIR), and in particular the siting of the planned Maintenance Facility and Storage Yard.

As a Brickbottom resident, I strongly support the Green Line extension despite the fact that noise, vibration, and other environmental impacts of the project will directly affect my quality of life in and around my home. However, I oppose Yard 8 as the location of the maintenance and storage facility; the additional negative impacts of locating this facility so close to Brickbottom would place an unacceptable and undue burden on myself and my 220 neighbors in the buildings. Additionally, the negative impacts on tax revenue and future growth of the Inner Belt area further suggest that the Yard 8 site is unacceptable, and should be taken off the table.

I-041-001

I'm encouraged by the DOT's considerations of alternate locations to Yard 8 in response to objections to that site by the city of Somerville and area residents. I urge further analysis and study of not only the proposed Option L and Mirror H sites, but additional alternate locations as well.

I-041-002

I also have two questions about the project that I'm hoping you can answer:

1. Are you able to provide specifics on noise/vibration mitigation plans for Brickbottom units?

I-041-003

2. A strip of land on the south side of the Brickbottom buildings is listed as one of the land takings for the Green Line Extension project – do you have specific info on how much land will be taken?

I-041-004

Thank you very much or your time and consideration, and I look forward to your response and to further public meetings on the project.

Sincerely,

Bonnie Borthwick
1 Fitchburg St. #B159
Somerville MA 02143

I-041-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-041-002

Please see response to Comment I-041-001.

I-041-003

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. An expanded analysis of potential noise and vibration impacts at the Brickbottom Artists Buildings is included in FEIR Chapter 8. These projections take into account the collective impacts of rail uses in the area. During preliminary engineering, MassDOT will conduct further analysis for several individual properties, including the Brickbottom Artists Lofts. As described in FEIR Chapter 8, MassDOT will then be able to identify the specific measures that will be appropriate for mitigating the Project's noise and vibration impacts. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-041-004

DEIR/EA Section 5.2 describes the Project's potential acquisitions. MassDOT is currently conducting detailed property surveys to obtain more specific data. MassDOT will continue to evaluate opportunities to minimize these property impacts.

I-042-001 My husband & I would like to voice our opinion on the Green Line extention to Rt. 16. Both os us our oppossed to it because the North St. bridge and College Ave. Bridge have recently been done over and also too many people would be without their homes.

Thank you

I-042-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

Ms. Johnson,

I-043-001

I am writing to you to extend my fervent support for the extension of the Green Line into Somerville and Medford. Not only is this project long overdue from the standpoint of legal and promised commitments, it's long overdue from the standpoint of environmental and urban needs. That Somerville and Medford have been forced to endure this long wait all these decades is a situation that needs to end. The benefits to both the local communities and the region as a whole are too great to ignore.

Thank you,
Chris Braiotta

RE: EEA #13886 Comments (Green Line Project)

Dear Mr. Bowles:

I-044-001

I have lived in Medford for over 20 years, quite near the Lowell Line. It is clear to me that rail transit is critical to the future of my community. Therefore, I am writing to tell you that I want the new Green Line to go all the way to Route 16 in Medford. To build anything less will miss a huge opportunity to help Medford and our shared environment. Furthermore, if this takes more planning or more paperwork under the MEPA rules, that's fine with me.

Thank you for you time and attention. I look forward to good results here.

Sincerely yours,

Donna M. Brallier

Subject: Green Line extension to Medford

Dear Honorable Ms. Johnson,

I-045-001 As a resident and small businessman operating in Medford, I heartily agree with the evaluation of the Green Line extension project to terminate short of Rte. 16. Extending the Green Line to Rte 16 will cause the destruction of important businesses and a traffic problem near that intersection, which if one is to review the current statistics, is one of the most dangerous intersections in Medford and along the length of Rte 16.

I-045-002 Please do not listen to the Medford Green Line Neighborhood Alliance on this issue. I cannot locate any of these people here in Medford, I don't know who they are or why they think they speak for us. They insist on this extension to the Rte 16 area, but it would be a serious mistake. I speak for many people who live and work in the area and would like to see a Green Line extension to our area, but NOT all the way to Rte 16. It was wonderful to hear that study recommends stopping the project short of the Rte 16 area. Thank you--

Attn: Holly Johnson
Re: EEA#13886

Dear Secretary Bowles:

I-046-001

I have read the DEIR analysis of the environmental effects of a Yard 8 rail maintenance facility and storage yard on the Brickbottom area, and I am appalled. The study is embarrassingly flawed. In fact, it appears--either purposely or incompetently--to ignore problems or miscalculate every potential type of pollution--air, sound, light, noise and soil--that would affect the areas surrounding Yard 8.

Given the environmental catastrophe that would be inflicted on the 155 units within the three buildings of the Brickbottom Artists community, I ask that you eliminate Yard 8 from consideration as a site for the new facility and study instead the feasibility of other sites, such as Mirror H, which would eliminate inevitable hazardous effects on nearby residents and ultimately prove far more economical.

The elimination of Yard 8 from consideration would be significant, too, on additional economic grounds: this area of Somerville had already been on the list designated for community development, something of which the DoT should have been aware and taken into consideration. In fact, it is the new T stop that makes possible the development plans, which would improve a significant area of the city and bring a much needed increase in the Somerville tax base.

I-046-002

It should be noted, too, that while the new T stop is mandated by law to be built by 2014, the maintenance facility is NOT legally required and, in fact, if it were to be placed in Yard 8, would defeat the purpose of the mandate, which was to ameliorate the heavy burden of pollution already suffered by the city of Somerville.

I urge you to end all consideration of Yard 8 as a site for the Green Line maintenance facility and storage yard.

Yours,

Alan Brody

1 Fitchburg St B155
Somerville, MA 02143

I-046-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-046-002

The Green Line Extension storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the overall Project. Chapter 2 of the FEIR fully describes the environmental impacts of the proposed storage and maintenance facility. The facility must be constructed adjacent to the Green Line Extension to maximize operating efficiencies and be constructed within the same time frame as the Project.

Re: EEA #13886

Dear Secretary Bowles:

The DEIR/EA on the Green Line extension project appears both incomplete and misleading in regard to the effects of placing the maintenance and storage facility on the Yard 8 site. I am puzzled and deeply troubled that MASSDoT continues to consider that environmentally unsuitable site when there are others, such as Mirror H, that are clearly safer, more efficient, less costly, and would in addition allow the economic growth foreseen for the Brickbottom neighborhood. Given the available alternatives, I don't understand why DoT continues to consider the one site that would destroy the economic viability of the area as well as the quality of life of the 220 residents of the Brickbottom Artists Studios.

At meeting after meeting, Somerville residents and representatives have unanimously objected to using Yard 8, and yet the DoT does not seem to have listened. Worse, they have presented us with a flawed DEIR that refuses to recognize the impossibility of actually mitigating the appalling effects the Yard 8 plan would have on the entire Brickbottom population.

The Green Line extension was required by law because the city of Somerville was (and is) already suffering the effects of an overburdened environment. We have one of the highest rates of childhood asthma in the country. We are already overrun with trains, tracks, and yards serving other communities. I beg you to honor the EENF statement in the Secretary's Certificate that says "no segment of the population . . . should bear a disproportionate burden of environmental impacts." Please reject Yard 8 as a location for new rail facilities.

I-047-001

Sincerely yours,

Paula Brody

Subject: Comment on Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886

January 7, 2010

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Via email: Holly.S.Johnson@state.ma.us

Dear Secretary Bowles:

I-048-001 I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

As a property owner in West Medford for the past 30 years, and someone who has worked in the Hillside area, Cambridge, and downtown Boston, I appreciate the transportation situation in the area as much as anyone. The roads and highways going to Somerville via Medford Hillside can be clogged with cars, trucks and busses at various times of the day. Having a light rail system will surely mitigate the pollution, noise, waste of time and money, and the potential hazards to life and property which accompany jammed thoroughfares.

To do this, however, it is imperative that no terminus to the Green Line Extension be opened, even temporarily in the College Ave area. This will make the situation worse than it exists today because of feeder traffic.

Far better to plan for and, in one effort, get the terminus built to Route 16 by December 31, 2014, which is the optimal location to handle drop-off traffic and will put thousands more commuters within walking distance of a light-rail stop, keeping their cars off the road.
Neighborhood density remains uniformly high throughout West Medford and, adjoining, in East Arlington and West Somerville; the "Hillside" neighborhood effectively goes right up to Rt 16 and CANNOT be said to be effectively served unless the Green Line goes beyond College Ave.

In my opinion, the DEIR as currently written does not serve the best interests of the project. More importantly for your review, it was not done in a way that "adequately and properly" complies with the state environmental regulations, nor with the December 1, 2006 MEPA certificate that defined the requirements of the DEIR.

For the above and the following reasons, I strongly urge you to not accept the DEIR as the Final EIR andrequire further environmental analysis of the project by MassDOT:
• **Legal Mandate:** The state is legally obligated to provide public transit services to Medford Hillside by December 31, 2014, and stopping the extension at College Ave. fails to meet this legal obligation. At a minimum, this incurs significant mitigation costs

1

I-048-001

Please see Comment Letter I-002 for responses to this form letter.

required if the obligation is not met.

2. College Avenue should not be a terminus. The College Avenue station is not designed for the additional requirements of a terminus. The neighborhood cannot sustain the impact of a terminus station operations and traffic volume and the potential environmental damage is ofserious concern.

3. The Route 16 station design is inadequate. The DEIR offers only a "worst case scenatio" (MassDOT's description) for the Route 16 station design, while offering optimized station designs for all other Green Line extension stations. The Route 16 station design must be revisited. The Medford Green Line Neighborhood Alliance, a volunteer citizen group, has offered an alternative station design that prevents two major commercial property acquisitions and the resulting job displacement, preserves $182,000/year in property taxes for the City of Medford, optimizes traffic flow and better serves the integrity of the station's surroundings. MassDOT apparently has been exploring similar improved designs, which should be presented to the public for comment. A $1 billion project deserves a higher caliber design than a "worst case scenatio."

I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis in order to make the Green Line extension the best project it can be, and MUST be.

Thank you.

Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles,

As a longtime resident of East Cambridge and as President of the East Cambridge Planning Team, I am writing to express the concerns of my neighbors as well as my own about the planned move of the Lechmere T station across McGrath Highway..

I-049-001 Lechmere Square is one of the major gateways to Cambridge and an integral hub of our neighborhood. According to reports from those studying area business potential, more than one million people cross Cambridge Street from the present T stop at Lechmere to shop at the Galleria Mall on First Street every year. That number alone, along with Somerville and Cambridge residents using public transportation, is an inordinate amount of people crossing a major highway.

Our principal concerns is safety. Crossing a major highway and a busy intersection can present problems for those using public transportation as well as for the development of the new station. We want to insure that all crossings at Cambridge Street and Monsignor O'Brien Highway are well designed and offer the utmost protection for everyone using the T.

I-049-002 Another concern is the station design. Riders deserve a station that offers protection from the elements while purchasing Charlie Cards as well as easy access from both sides of the Highway. The preliminary design shown to residents at a recent meeting left much to be desired. More than one entrance and easy access for the handicapped will help to ensure an increase in ridership. Also, we sincerely believe that the Green Line and bus station design need to be properly integrated with the future Northpoint street grid. This will further insure safety for those using the bus service and the T.

I-049-003 Last, but not least, we would like to see the historic station buildings redeveloped around a new public market square. Members of the East Cambridge Planning Team firmly believe that this concept could be done with little or no expense to the T. A lively square/market area will make crossing two busy streets easier for those using public transportation and will add to the value of the area. A plan that members of the East Cambridge Planning Team has shown to Cambridge city staff and elected officials has received enthusiastic support. Make Lechmere a destination not just a transition point.

Thank you for your consideration.

Barbara Broussard

Barbara Broussard, President
East Cambridge Planning Team

I-049-001

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. The chapter presents a traffic analysis, a detailed description of pedestrian crossings of O'Brien Highway, and proposed roadway, crosswalk, and sidewalk improvements that are consistent with the NorthPoint development plans. These station and street plans will be further refined in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-049-002

FEIR Chapter 5, Lechmere Station, includes a revised conceptual design for Lechmere Station. The chapter addresses many of the concerns noted in your letter. A detailed station design will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-049-003

MassDOT has reviewed the suggestions submitted by the East Cambridge Planning Team. Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. These plans, including the pedestrian crossings of O'Brien Highway and associated street, crosswalk, and sidewalk designs will be further refined in the preliminary engineering stage of the Project. As part of the Green Line Extension, MassDOT intends to demolish the existing Lechmere Station and prepare the site for potential future redevelopment. Based on the current requirements of the O'Brien Highway roadway improvements (as shown in FEIR Chapter 5, Lechmere Station), the existing bus shed must be removed.

Boston, MA 02114

Dear Secretary Bowles,

I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

I-050-001 First of all, I strongly support the Green Line Extension and urge that it be built in the most practical, beneficial and cost-effective manner that is, to construct the entire project in **one phase**, with a **terminus station at Mystic Valley Parkway (Route 16)**, by December 31, 2014.

I am a relatively new resident to Medford (having moved to the Hillside neighborhood in June 2009). Having lived in Cambridge for the previous three years, I strongly believe that an effective mass transit system is important and vital for our communities. I moved to Medford under the assumption that the Green Line Extension would be completed in an efficient and effective way. The DEIR makes me think otherwise.

I-050-002 I disagree that a terminus station at College Avenue fulfills the states legal commitment to serve the Medford Hillside neighborhood, as the vast majority of what is generally considered the Hillside area is located from one-half to three-quarters of a mile from where service would terminate.

I-050-003 The DEIR presents what MassDOT describes as a worst-case scenario for the Mystic Valley Parkway (Route 16) station the only element of the project treated in such a fashion in the DEIR. The station analysis is incomplete and its design is flawed, inadequate, and inflicts unnecessary environmental impacts.

To summarize, there is much more work to be done on the Environmental Impact report, and I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis in order to make the Green Line extension the best project it can be.

Sincerely,
Francis Brown
17 Orchard St
Medford, MA 02155
215-205-5555

I-050-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-050-002

Since the release of the DEIR/EA, a few stakeholders raised concerns that the proposed College Avenue Station, serving as a terminal station for the Proposed Project, would not adequately serve the Medford Hillside neighborhood. Serving this neighborhood was identified as part of the SIP description. To address and resolve these concerns, CTPS prepared a memorandum demonstrating that the College Avenue Station location does adequately serve the walk market area for the Medford Hillside neighborhood. This memorandum is provided in Appendix C of the FEIR.

I-050-003

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

Dear Secretary Ian Bowles,

My name is Andrés Bueno, I'm 19 and have been a life long resident at Brickbottom. The expansion of the Green Line into our community may bring benefits to local residents only if the project is overseen properly. In order for this to happen, it is crucial to consider all impacts the expansion may have on us.

I-051-001

In order to assure that our voice is heard during the planning process, I ask you that a Citizen Advisory Committee be created to oversee the rest of the project. This would ensure that the community has a voice in the rest of the process. One of the jobs of the CAC would be to review every contract in the bid process to confirm that agreed to mitigation language is included before contracts related to the Green Line expansion are awarded.

Brickbottom is already situated next to the Fitchburg Line that carries, both commuter and freight trains that already create huge amounts of noise and disturbance for residents. The expansion and a 24-hour maintenance facility will sandwich Brickbottom and further disrupt our lives.

I-051-002

In addition a maintenance facility in Yard 8 will permanently separate Brickbottom from the rest of the Somerville community. It will prevent future development in one of the few remaining areas of undeveloped land, while at the same time lower property value.

I-051-003

To prevent this, I encourage that other options be further explored, such as the Mirror H at the Somerville/Cambridge border and Option L in the Inner Belt area. I also request that proper steps are taken to minimize any disturbances Green Line trains may cause for Brickbottom residents.

Thanks you for your time,

Thank you,

Andrés Bueno

I-051-001

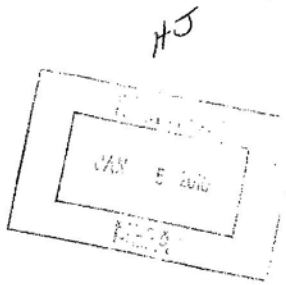
In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-051-002

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-051-003

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in DEIR/EA Chapter 6, Draft Section 61 Findings and Mitigation Measures. The mitigation measures and steps required for implementation and post-construction monitoring required by the Secretary's Certificate on the DEIR are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.



The Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
RE: Project EEA#13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Ian Bowles,

I am 14 years old and have been living at Brickbottom for my whole life. I am writing in regards to the Draft Environmental Impact Report on project Number EE#13886. I think that extending the Green Line into Somerville is a good idea and will not only help many people but also reduce traffic.

I-052-001

But putting the storage yard and maintenance facility right next to our building will be too much for our community. We already live with commuter and cargo trains going by both sides of our building, and the Green Line will also go on both sides of our building. Most of us here support that but having a year round, 24 hour, facility and yard on top is unjust.

I think that you should either consider a different site, or not include it while extending the Green Line. Even without it I am worried about the noise and pollution that will occur due to the new trains running from early morning to late at night, every day and only a short distance from our home.

Thank you,

Joelle Bueno, 8th grader

Joelle Bueno

I-052-001

The Green Line Extension storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the overall Project. Chapter 2 of the FEIR fully describes the environmental impacts of the proposed storage and maintenance facility. The facility must be constructed adjacent to the Green Line Extension to maximize operating efficiencies. An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

#5

The Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
RE: Project EEA#13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Ian Bowles,

I write with regard to the Draft Environmental Impact Report (DEIR) as it relates to the location of the proposed 24-hour maintenance facility and train storage yard for the Green Line extension through Somerville. As a strong supporter of the Green Line extension, I welcomed the DEIR process and the public hearings held to gather feedback. However, along with many of my neighbors I have very serious concerns with (a) Yard 8 remaining the preferred site for the maintenance facility/storage yard, (b) the still inadequate analysis of the noise, vibration and other environmental costs likely to be permanently imposed on our community at Brickbottom. I hope the opinions and suggestions of our community and of the many others in Somerville, including our elected officials, are seriously incorporated as revisions to the plans for the Green Line extension.

I have lived in Somerville for 30 years, and at the Brickbottom Artists Building for the past 22 years where my wife and I have raised a family (we have a 19 year old son and a 14 year old daughter). We have been supporters of the Green Line extension despite the fact that it will mean constant, additional daily train traffic a few yards from our home. I say *additional* because we already have noisy daily train traffic a few yards away -- on the south side of our buildings, the Fitchburg commuter line and the freight train coming from Cambridge; another freight train along the north side of our buildings. Please note that both new branches of the Green Line (i.e., including the Union Square branch) will permanently add more frequent train traffic immediately adjacent to these same southern and northern sides of our buildings (from early mornings to late at night).

Despite it all, most of us recognize the value to Somerville at large and to the region's environmental and economic health from hosting the Green Line extension and support the Green Line extension literally a few feet away from us. This is clearly *not* a case of protesting about our "back yards". However, there must be a line drawn somewhere as to what constitutes and inordinate and disproportionate burden on our community—Yard 8 as the site for maintenance facility/storage yard is precisely that.

"Yard 8" hosting the maintenance facility/storage yard also places an unfair burden on Somerville by compromising the near-future and long-term economic development potential that the city dearly counts on to relieve our residential taxpayers (we have a smaller commercial tax base than most communities...) and those of the Commonwealth of Massachusetts (..and receive proportionately higher state aid). That proposed use for Yard 8 will cripple the combined prospects of the Brickbottom/Inner Belt area, so valuable by virtue of being close to world class universities (MIT, Harvard, Tufts), to leading research and

high-tech centers (from Kendall Square to Massachusetts General Hospital, etc.), to Logan airport, Boston harbor, and so on. Over the decades Somerville has paid a high price in excess traffic and increased exposure to air pollution and other health hazards by decisions of limited local benefit (Route 93, its exit ramp at Sullivan, McGrath Highway, commuter trains with no local stops, etc.). We cannot sustain another permanent transportation imposition such as using Yard 8 as the DEIR suggests.

I-053-001
I-053-002

Along with my neighbors, my family and I support The Green Line extension but definitely not the maintenance facility/storage in Yard 8. We hope the inclusion of the "Mirror H" and "Option L" sites is a serious sign that alternatives are being explored, though each has problems that need further study and redesign to minimize impacts on other communities (such as minimizing parking and land-takings, sharing and consolidating more with existing rail uses). If necessary, the maintenance and storage needs should be considered separately and/or at different stages.

I-053-003

Whatever the resolution of that siting decision, mitigation and other possible remediation solutions are still needed regarding serious noise and vibration concerns at Brickbottom both during the construction phase and permanently once the Green Line extension is operational. So far these have not been adequately addressed, as reflected in the DEIR document; both in terms of noise/vibration studies and proposed remediation strategies. Many positive suggestions have been made regarding improved tracks and engines for existing commuter trains, acoustically advanced railcar designs for the Green Line extension, etc. that we hope are taken seriously.

I-053-004

Finally, many of us feel that only with a working and effective Community Advisory Committee truly involved in all phases of the planning, contracting and construction phases of the Green Line extension can the needs of Somerville and Brickbottom residents be properly heard and incorporated. We hope this is seen not as intrusion into "experts' " territory but rather inclusion of essential locally-grounded expertise on the needs of the people the project is intended to serve and that will continue to live here long after the project is operational and the planners have moved on to other projects. Instead, decisions on station design and access, their connections to buses, pedestrians, cyclists and the Community Path extension will become more relevant and realistic.

Thank you for keeping the process open and inclusive; please continue to do so.

Sincerely,

Ramón Bueno

Ramón Bueno
1 Fitchburg St., B550
Somerville, MA 02143

I-053-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-053-002

The Green Line Extension storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the overall Project. Chapter 2 of the FEIR fully describes the environmental impacts of the proposed storage and maintenance facility. The facility must be constructed adjacent to the Green Line Extension to maximize operating efficiencies and be constructed within the same time frame as the Project.

I-053-003

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. An expanded analysis of potential noise and vibration impacts at the Brickbottom Artists Buildings is included in FEIR Chapter 8. These projections take into account the collective impacts of rail uses in the area. During preliminary engineering, MassDOT will conduct further analysis for several individual properties, including the Brickbottom Artists Lofts. As described in FEIR Chapter 8, MassDOT will then be able to identify the specific measures that will be appropriate for mitigating the Project's noise and vibration impacts. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-053-004

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

Johnson, Holly (EEA)

From: Natasha Burger [natasha.burger@gmail.com]
Sent: Friday, January 08, 2010 2:12 PM
To: Johnson, Holly S (ENV)
Subject: Public Comment on the Green Line DEIR, EEA #13886

Dear Secretary Bowles:

My name is Natasha Burger and I am a Somerville resident. I am writing to comment on the Green Line Draft Environmental Impact Report, EEA #13886. I respectfully request that my comments below be included in the public record.

I speak with Somerville Transportation Equity Partnership (STEP) and agree with their recommendations for the DEIR as outlined below.

Thank you for including in the public record my support of the project as outlined by STEP. I have highlighted in ***bold/italics*** my particular interests and concerns.

Natasha Burger
Somerville, MA

STEP urges strong and considerate support for the efforts of MassDOT to move the Green Line forward with the release of the Draft EIR. The state has committed over $1 billion to the Green Line Extension.

We support a continued "Green Light for the Green Line" AND proceeding with care.
We must "DO IT RIGHT" if this project is to sustainably serve the next three generations.

Somerville and its citizens applaud the release of the Green Line Extension DEIR and offer sincere thanks to MassDOT for committing to a Route 16 terminus, to full design of the Community Path, and to continued analysis of alternate locations for the maintenance and storage facility. The DEIR represents a critical milestone in the public evaluation process and allows for preliminary project engineering to begin. We appreciate the opportunity to comment on MassDOT's work thus far.

Station Design & Siting

I-054-001
- Green Line stations must connect as seamlessly as possible with all other clean modes of transportation, including current and re-routed buses. Station design should accommodate bus drop off and pick-up (for example, using bus pull-out pockets or curb extensions) with maximum integration of transit modes and minimal street disruption. Optimized bus routes connecting to Green Line stations should be implemented simultaneously with the start of Green Line service, as was done for the Red Line northwest extension.

I-054-002
- Station designs should allow for car drop off, but not parking, and present ease of pedestrian and bicycle access by locating station headhouses on major streets whenever possible, with station access from both sides of the street and in all directions of travel. Sidewalks leading to headhouses should be widened and additional crosswalks considered near stations. This will maximize transit use.
    - Mass DOT, working with community representatives should reconsider station designs to maximize ease of access particularly where riders will access stations at overpass bridges to maximize ease of access, efficiency and lower construction costs. Pedestrian and bus access to stations and high station visibility from major streets should be prioritized.

I-054-003
- Stations should provide adequate bicycle storage. This should be calculated based on a percentage of 3 to 5% of boardings at the stations. Bicycle storage should be sheltered from the elements, especially at Route 16, Lowell Street, and Union Square stations, to enable all-weather access.
- The Federal Transit Administration has issued a proposed change to bicycle/pedestrian access to public transportation recognizing the importance of maximizing multi-modal access. The proposed policy states:

I-054-001

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-054-002

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. Designs for each station will be further developed during the Project's preliminary engineering stage. With the exception of replacing the existing parking at Lechmere Station, no station parking is planned at any of the proposed Green Line Extension stations. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-054-003

The amount of bicycle storage at each station is based on ridership projections developed by CTPS. DEIR/EA Appendix D includes the

- For purposes of determining whether a pedestrian or bicycle improvement has a physical or functional relationship to public transportation, regardless of whether it is funded as a capital project or public transportation enhancement, all pedestrian improvements located within one-half mile and all bicycle improvements located within three miles of a public transportation stop or station shall have a de facto physical and functional relationship to public transportation. According to a test of activity and use, pedestrian and bicycle improvements beyond these threshold distances may be eligible for FTA funding if the improvement is within the distance most people can be expected to safely and conveniently walk or bicycle to use that particular transit service. Federal Register: November 13, 2009 (Volume 74, Number 216), http://edocket.access.gpo.gov/2009/E9-27240.htm.

I-054-004 • The new Green Line stations should be designed with elevators and should not include escalators, which are expensive to install and maintain. Wide staircases and ADA elevator access are sufficient. Reallocate the escalator budget for other station elements recommended in this letter.

I-054-005 • Constructing the new station platforms with ADA-compliant level boarding for low-floor Green Line cars that have sliding rather than accordion doors currently used on Green Line cars.

- System-wide accessibility should be the goal of the MBTA. To accomplish this the MBTA should replace accordion-style Green Line car doors with sliding doors that are compatible with level boarding. Raise all other station platforms in the Green Line system for level boarding, and order sliding doors in the new Type 9 rolling stock and retrofit all existing Green Line cars. This system-wide change would eliminate the need for time-consuming wheelchair ramps and mobile wheelchair lifts, while speeding up all passenger boarding.

I-054-006 • ***Station and station area designs must be developed through a formal and interactive community participation process to ensure that they fit into existing neighborhoods and support appropriate future mixed use development.*** Takings should be minimized to save the state money and to preserve land uses.

I-054-007 I-054-008 • Design for the relocated Lechmere Station should pay particular attention to the East Cambridge Planning Team's pedestrian-friendly area design ideas and old Lechmere Station re-use suggestions. The terminus at Route 16 should incorporate MGNA's ideas for minimizing takings.

I-054-009 • ***Station design and siting should involve active participation of knowledgeable transportation accessibility advocates to ensure accessibility requirements are adequately addressed.***

Community Path Integration & Preservation of Corridor Transit Potential

I-054-010 • ***Track design and construction should enable adding future stations between Lechmere and Washington Street / Union Square, between College Avenue and Route 16, and along a future Green Line extension to Porter Square that could serve both Cambridge and Somerville neighborhoods.***

I-054-011 • ***The Community Path and its important station connections must be designed and constructed simultaneously with the Green Line extension in order to facilitate direct pedestrian and bicycle access to the stations and to ensure a safe, attractive, and highly-functional Community Path.***

Economic Development & Regional Corridor Planning

I-054-012 • Track, station and Green Line corridor area designs must provide full roadway and community access to Brickbottom Inner Belt and Lechmere Station through reconstruction of Route 28 as a neighborhood and local business friendly surface boulevard that serves pedestrians and bicyclists as well as cars. Improved connectivity between both sides of Route 28 is crucial for economic development, pedestrian station access, and improved quality of life.

I-054-013 • State and other leading Transit-Oriented Development guidelines should be utilized to promote strategic regional economic development within a mixed use context in the Brickbottom Inner Belt and Union Square Boynton Yard districts. Maintaining diversity in people and businesses while improving the natural environment is critical. Access to open space and greenery promotes health.

2

methods CTPS used to analyze demand for bicycle parking. Detailed bicycle parking designs will be further developed during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

I-054-004

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. Designs for each station will be further developed during the Project's preliminary engineering stage. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. Specific design details and station elements will be further developed during preliminary engineering. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access. The process for stakeholder coordination during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-054-005

The Green Line Extension Project is being designed for fully accessible stations in compliance with ADA requirements. However, the issue of systemwide level boarding on the Green Line and modifications to existing vehicles is beyond the scope of this Project.

I-054-006

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the

I-054-014 • The design and siting of the maintenance facility should not prevent development of a street grid in Inner Belt/Brick Bottom that enables access from North Point, McGrath-O'Brian Highway and Washington St.

Maintenance Facility & Regional Environmental Justice

I-054-015 • More detailed analysis of Mirror H, Option L and Option L alternative is necessary. The siting of the maintenance facility and storage yards should not increase the transportation infrastructure and environmental burdens in Somerville or interfere with proposed economic development in the Brickbottom Inner Belt area.

I-054-016 • Current use of the Boston Engine Terminal for the maintenance of diesel engines serving the commuter rail network south of Boston needs to be phased out and a new facility built south of Boston to eliminate the unsustainable and unjustifiable shuttling of trains through Cambridge.

Public Participation

I-054-017 • A project-wide Citizens Advisory Group should be maintained throughout detailed design, engineering, construction and start-up phases with smaller local advisory groups established to work with the MBTA and consultants to address specific station design, land use, connectivity, and construction and mitigation issues.

I-054-018 • A procedure for determining remedies and/or compensation, incorporating community representation, should be required to handle instances when project mitigation proves insufficient to meet pre-agreed impact standards for noise, vibration, pollution and other environmental burdens.

I-054-019 • MEPA should require collaborative planning, with community involvement and public coordination that should intensify immediately, before this project progresses and require that senior project staff work our of a centrally located field office to maximize access.

Final Comments:
There has been considerable discussion about whether to accept the DEIR as a Final Environmental Impact Report (FEIR) or to require that it be treated as a DEIR and demand that changes be made in a subsequent FEIR.

To avoid the significant delay that a separate FEIR would entail, the most critical issues with the DEIR could either be addressed in a Supplemental EIR, or in Addenda to the FEIR. These issues include:

I-054-020 • ***Eliminate the Yard 8 Option for the Maintenance Facility and require a full analysis of Scheme L and the alternate Scheme L designs.***

I-054-021 • ***Commit to a collaborative public process for the next phase that would provide oversight and station area participation and develop a process for addressing mitigation concerns.***

I-054-022 • ***Integrate the Community Path into the design, planning and funding of the Green Line extension.***

I-054-023 • ***Coordinate the Green Line extension with calming of the McGrath/O'Brien Highway in Cambridge & Somerville.***

I-054-024 • ***Designing and constructing the Mystic Valley Parkway / Route 16 terminus at the same time as the rest of the project.***

Project.DEIR/EA Section 5.3 describes the Project's potential temporary and permanent acquisitions. MassDOT is currently conducting detailed property surveys to obtain more specific data. MassDOT will continue to evaluate opportunities to minimize these property impacts.

I-054-007

MassDOT has reviewed the suggestions submitted by the East Cambridge Planning Team. Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. These plans, including the pedestrian crossings of O'Brien Highway and associated street, crosswalk, and sidewalk designs will be further refined in the preliminary engineering stage of the Project. As part of the Green Line Extension, MassDOT intends to demolish the existing Lechmere Station and prepare the site for potential future redevelopment. Based on the current requirements of the O'Brien Highway roadway improvements (as shown in FEIR Chapter 5, Lechmere Station), the existing bus shed must be removed.

I-054-008

Various community groups have suggested modified concepts for the Mystic Valley Parkway/Route 16 Station. Preliminary evaluation of these concepts showed that the cost of constructing the Green Line Extension to Mystic Valley Parkway/Route 16 would not be reduced sufficiently to be able to be funded at this time. Additional evaluation of the concept as it relates to the MBTA's design standards, operations and other requirements would be necessary in order to determine the full cost savings of a redesigned station. While MassDOT has not been required to revisit the design of this station as part of the FEIR document, further evaluations may consider the redesign options presented by the MGNA in future analyses.

I-054-009

The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), and the MBTA. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement as the station designs are refined. Coordination with local, state, and federal accessibility groups will continue as the Project advances into preliminary engineering.

I-054-010

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

I-054-011

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-054-012

DEIR/EA Section 3.9 describes the compatibility of the Green Line Extension with other regional projects, such as the conceptual reconstruction of McGrath Highway and the Urban Ring transit corridor initiative. MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses to ensure, to the extent feasible, consistency with planning and other projects.

I-054-013

Direct and indirect impacts to land use are described in DEIR/EA Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for sustainable land use, which could further reduce automobile traffic congestion and improve air quality.

I-054-014

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. The evaluation considers land use and connectivity impacts and opportunities associated with each maintenance facility site alternative.

I-054-015

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's

preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-054-016

Major modifications to operations of the Boston Engine Terminal (BET), MBTA Commuter Rail and other railroads, and railroad vehicles are beyond the scope of the Green Line Extension Project.

I-054-017

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project. MassDOT and the MBTA will conduct a series of public workshops to gather input on land use and facility design issues from the communities. The workshops will be organized around facility locations or groups of locations. All will be well-advertised, open to the public and in accessible venues.

I-054-018

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

I-054-019

Please see response to Comment I-054-018.

I-054-020

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-054-021

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-054-022

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-054-023

DEIR/EA Section 3.9 describes the compatibility of the Green Line Extension with other regional projects, such as the conceptual reconstruction of McGrath Highway and the Urban Ring transit corridor initiative. MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses to ensure, to the extent feasible, consistency with planning and other projects.

I-054-024

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

Re: DEIR for the Green Line Extension

Dear Secretary Bowles,

I-055-001

I strongly support the proposed project but feel that a **key shortcoming is the lack of a connection to the red line**. This could be accomplished by extending beyond the proposed Union Square station along the Fitchburg Line right of way to Porter Square.

The following is an exerpt from the Urban Ring study:

1.2.3.2 Inner Core Rapid Transit Congestion Remains a Problem
The high reliance on the radial transit network and the large number of Urban Ring trips that pass through the Boston Inner Core adds to the growing levels of congestion on the central portions of the MBTA rail network. Capacity problems currently exist on the Blue Line and the western leg of the Green Line. Improvements in the central subway system as part of the Long-Range Regional Transportation Plan will provide some additional capacity. However, these improvements only marginally increase Core capacity and do not address a major cause for the congestion – namely a system configuration that forces many transit users to pass through the Inner Core to reach destinations along the Urban Ring Corridor. The rapidly increasing demand placed on the system by this pass-through transit traffic is expected to consume the planned new capacity in the central subway system, particularly on the Green Line.

The proposed green line extension will add additional trips to the already overloaded inner core. With a connection to the red line west of Harvard Square, distribution of added trips between these two lines can take place other than through downtown Boston.

Sincerely,

Donald Burgess

Donald Burgess

I-055-001

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

lee@lbdesign.com

Dear Secretary Bowles,

I am writing to comment on the DEIR/EA for the Green Line Extension project, EEA 13886.

I am pleased that, as a result of the CLF litigation, the Green Line will be extended through Somerville and part of Medford (though it should go all the way to Rt 16). Somerville and Medford have long been overly burdened by the highway, road and rail lines that cut through it to Boston, without actually providing service to those city's residents. As a result, being recognized as environmental justice communities is significant.

I-056-001

However, I am concerned about serious systemic flaws in the DEIR, and I do not want the Final EIR to accept Yard 8 as a viable maintenance facility location, because Yard 8 is immediately adjacent to Brickbottom, the only, and highly populous, existing residential community that could be impacted by any of the three schemes. Additionally, I want the Final EIR to acknowledge the need for enhanced mitigation and a formal Community Advisory Committee with power to both report and forcefully protect the community's needs during and after construction.

I-056-003

I-056-004

Mirror H is one of the sites preferred by the City of Somerville. Option L is a promising but currently imperfect option that needs further study and refinement. I encourage continued study of Mirror H and Option L, and the removal of Yard 8 from consideration. I do not want the project going forward with Yard 8 as the preferred alternative.

Brickbottom residents, the City of Somerville, and other stakeholders in the community support either the Mirror H Scheme or Scheme L over the Yard 8 scheme. Since Scheme L has not been studied to any degree, nor any facility design work undertaken, a Supplemental Environmental Impact Report should be required for the maintenance/ storage facility. This facility is not part of the 2014 mandate, and should proceed on a separate timeline.

EOT/DOT has repeatedly stated through its spokesperson Kate Fincher how important this project is to the department and the T, and how much they believe in it. Well, if it was so important, why did it take a lawsuit to trigger it? Why is the planning so far behind schedule? Why was the state economic development office was not present or involved? Why was transit-oriented development not considered and why was economic development not a factor in the planning? Why has the planning process ignored city and community input? Why are they only now, years after they should have, starting to examine facility sites that the community can actually live with?

The truth is the T can't afford this project, and is only doing it to satisfy narrowly interpreted legal conditions in the cheapest possible way. So the affected communities — environmental justice communities — stand to suffer due to lack of proper funding and lack of proper planning.

Regarding:
EEA 13886

Page 1

I-056-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-056-002

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in DEIR/EA Chapter 6, Draft Section 61 Findings and Mitigation Measures. Mitigation measures for the College Avenue and Lechmere Stations are further described in FEIR Chapters 4 and 5, respectively. The mitigation measures required by the Certificate are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-056-003

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-056-004

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three

DOT, the T, and state government need to find the money to execute this project properly, or it will not bring either the environmental, the quality-of-life or the economic benefits it should.

As part of this poor planning, the imperfect station locations will increase road traffic and emissions rather than reduce them, and the flawed plan to terminate the extension at College Ave — at the heart of a university campus — will create traffic havoc at a busy intersection that already cannot handle the peak auto and pedestrian traffic it suffers under now. If the T wants to maximize ridership, which will increase revenues and help reduce emissions, the station siting and access needs to be more carefully planned, and the community path needs to be integrated into the entire design, and built at the same time.

Lee Busch
1 Fitchburg St. C509
Somerville MA 02143
617 628 2268
lee@lbdesign.com

However, my letter will not focus on station locations or the flawed terminus plan — I'm sure other constituents will cover that. My focus is on the maintenance facility and storage yard location, because I am a longtime resident and owner at Brickbottom.

The Green Line extension to Somerville and Medford is a legal obligation of the Commonwealth of Massachusetts, agreed to in 1991 as mitigation for impact of the Big Dig highway construction project. **In my opinion, the current DEIR does not serve the original goals or the legal mandates.**

Somerville is an environmental justice community, and as such, should have a say in the project. To date, both Somerville's stated goals and actual needs have been ignored.

I-056-005

This project is about environmental justice, not T operations — it exists because of a mandated and legal need for environmental justice. The siting and design of stations, and the preferred location of the storage yard and maintenance facility demonstrates a fundamental lack of concern for environmental justice on the part of the EOT.

T operations have been prioritized too far above community needs.

The EOT/DOT has forgotten that this project serves environmental justice, not the needs of the T. The needs of the T should be subordinate to serving and satisfying the legal obligations the Commonwealth of Massachusetts, agreed to in 1991 as mitigation for impact of the Big Dig highway construction project.

In order to be accepted as an FEIR, the DEIR must provide a "reasonably complete and stand-alone description and analysis of the project, project alternatives and environmental impacts, and adequately address mitigation." Yet despite being filed 10.5 months after the Dec. 1, 2008 deadline, the DEIR is materially deficient in almost every category.

I need to state for the record that this entire process has been flawed from the beginning. The community engagement consisted EOT spokespeople bringing scrubbed and simplified presentations to stakeholder groups with a brief question and answer period afterwards. And the "answers", most of the time were "we'll deal with that after the project is approved, because we're only doing 10% of the design now." I know because I attended nearly all of these meetings.

The process to date is and has always been completely unacceptable. There was no real dialogue. It was clear to me the meetings were held because they were mandated, not because the EOT was interested in what residents had to say. If the EOT/DOT had actually been listening, they would know that the Yard 8 plan, and the plan to terminate the extension at College Ave, are both completely against the wishes of every neighborhood community and city government involved.

maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-056-005

The Project's Purpose and Need is described in DEIR/EA Chapter 2, Purpose and Need. The Project is needed to comply with the State Implementation Plan (SIP), which includes requirements for this Project as well as other transit projects to meet the air quality and transit commitments established as a result of the Central Artery/Tunnel project.

The EOT informed us in only the most cursory way, with little to no background information about how decisions were made, or how alternatives were examined or rated.

Instead, dedicated groups of citizens in all affected communities have come together and taught themselves about civil engineering and planning, or involved experts at their own expense. This has taken time, money and energy, and we have valuable input to provide, but there is no provision in the process for us to help improve the plan.

This project is supposed to strengthen communities, promote growth, and answer longstanding environmental justice issues — it should not further burden the communities it is supposed to be helping.

Lee Busch
1 Fitchburg St. C509
Somerville MA 02143
617 628 2268
lee@lbdesign.com

I-056-006

Regarding Community Involvement:

- I request that a citizen advisory committee (CAC) be established to oversee the rest of the project and to ensure that the community has a voice in the process.
- The formulation of a CAC is part of an optional MEPA Special Review Process (Regulation 301 CMR 00 MEPA which is cited on the MEPA website.) Adoption of MEPA Regulations calls for a special review process based on a citizen advisory committee (CAC) that is enabled to review the project, address community concerns, drive issue redress and implement remedies through the entire process.

I-056-007

- The CAC should be empowered to review every contract in the bid process to confirm that proper and agreed to mitigation language is included before contracts related to the project are awarded.

Regarding Maintenance Facility Requirements:

I-056-008

Regardless of the final choice of site, a maintenance facility and storage yard should adhere to the following guidelines:

- Consolidate location near to existing rail uses: reconfigure and reuse BET land (43 acre commuter rail maintenance facility) where possible and consolidate other MBTA land uses in Inner Belt area
- Minimize any adverse impact on economic development and neighborhood connectivity
- Plan site in conjunction with comprehensive land use and economic development planning
- Minimize the site's footprint: don't include a separate employee parking lot for MBTA workers when an existing one can be shared; minimize on-site lots; look to share lots with other facilities; only include car storage required for the Green Line Extension itself. System-wide storage needs should be evaluated system-wide and not be part of this project.
- Enclosing and covering the storage yard is essential to mitigate its impact on abutters
- Choose forward-thinking planning and design for the facility and storage yard that will blend with future mixed-use development, not the area's current industrial character.
- Rail traffic patterns, including switching and reversal of cars, as well as curvature in the railway tracks, should be carefully evaluated and planned to minimize noise and

I-056-006

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-056-007

Please see response to Comment I-056-006.

I-056-008

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-056-008

vibration impacts on nearby residences. Current designs and plans have been proven to be flawed by outside (community-sourced) consultants

- I request that the project not go to a Final EIR in regards to the maintenance facility.
- It is entirely possible to decouple the Green Line Extension planning and design from the maintenance and storage facility because the facility is not part of the mandated 2014 Green Line Extension completion deadline.

Lee Busch
1 Fitchburg St. C509
Somerville MA 02143
617 628 2268
lee@lbdesign.com

Why I Oppose "Yard 8":

- It will take 11.5 acres of land from the city of Somerville, much of it privately held, land that is already permitted and zoned for development, and remove it from the city's commercial tax base.
- It creates a permanent barrier to neighborhood cohesion by dissecting the Inner Belt from the Brickbottom area, creating a barrier to future economic development that will last for generations to come.
- It derails future development potential our neighborhood, which is one of the last remaining areas developable land in Somerville
- It creates a second distinct rail maintenance facility in a small area of Somerville
- It will result in significant loss of future tax revenue for the city of Somerville
- It will have a direct adverse impact on adjacent property value
- It abuts and impacts the only residential building in the area that serves as home and work space for 220 people
- Since it was first proposed, Yard 8 has been opposed by the City of Somerville, community groups, and residents. At the recent DEIR public and hearing and meeting on maintenance facility alternatives held at the Cambridge Multicultural Arts Center on December 16th, with Cambridge, Somerville and Medford residents in attendance, opposition to Yard 8 was unanimous.
- Brickbottom is a diverse community of 220 residents — many of whom both work and live in the building. For these residents, there will be no escaping the impact of the Yard 8 facility and storage yard and the green line. We will become locked in our homes, with air tight windows, without air conditioning in most units, unable to go outside or get away from the sound. This future is unjust and does not live up to the standards that Mass DOT has promised to deliver.
- The Secretary's Certificate (EENF, *Environmental Justice*, p. 7) states "no segment of the population should be denied environmental benefits, or should bear a disproportionate burden of environmental impacts." While we accept the value of the Green Line extension, the added burden of a maintenance and storage facility operating 24 hours a day constitutes a disproportionate burden of environmental impact on the quality of life for Brickbottom's 220 residents, including noise, vibration, light and air quality.
- Asking the Brickbottom area of Somerville to absorb all of the sound from a commuter line, two freight lines, two MBTA-lines and the maintenance facility and storage yard is unjust.

I-056-009

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

I-056-010

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-056-011

MassDOT will comply with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. The stakeholder coordination process for project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

As presented in DEIR/EA Chapter 6, it is anticipated that the Green Line Extension will have a positive impact on outdoor air quality within the study area. Modifications to MBTA Commuter Rail equipment are outside the scope of this project. However, new fuel standards from EPA will result in lower emissions from locomotives, automobiles, and buses.

- The project's Citizen's Advisory Group was not involved in evaluating potential sites for the maintenance facility and storage yard. Additionally, mandated land use planning was not performed. This violates the Secretary's Certificate for community involvement in the project. (EENF, *Smart Growth/Land Use*, p. 5)
- If Yard 8 is not used for the Maintenance facility, moving the Green Line Extension tracks farther away from Brickbottom should be investigated. Even a few feet's distance will make a big difference as far as noise and vibration impacts.

Lee Busch
1 Fitchburg St. C509
Somerville MA 02143
617 628 2268
lee@lbdesign.com

Why I like "OPTION L" and want it improved

- Option L is a promising compromise location. Its specifics need to be further studied, in conjunction with the 2010 Somerville master planning process for the Brickbottom/Inner Belt area.
- There are areas in which Option L can be improved: minimize parking; share parking facilities with BET; move storage farther away from residences; minimize the amount of train storage required; reduce track curvature and western end (closest to Brickbottom)
- Work to consolidate with the BET commuter rail maintenance facility and other rail uses in the area wherever possible to minimize the footprint required.
- The amount of parking in the current Option L plan pushes the train storage closer to Brickbottom and forces a severe curve in the lead track. We believe that reconfiguring the parking and train storage would significantly reduce the impacts on all abutters.

Regarding Mitigation:

I-056-009

- The DEIR mitigation measures are often described with caveats such as "to the extent practicable" and "where feasible." Before construction begins, the EOT should be required to enter into written agreements with each affected city, defining the mitigation obligations and deadlines for fulfillment. As part of that, we need 24-hour availability to deal with construction impacts.
- Mitigation discussion in the DEIR is both vague and insufficient. DEIR Section 5.4.7-3 *Noise Mitigation*, p. 5-118, states: "At some locations projected to be exposed to noise impact, noise barriers may not be a feasible or effective means of mitigation" yet only 40 residences in Brickbottom are designated for soundproofing. Brickbottom has 155 residences.

I-056-010

- Additional mitigation measures must be specified, including **new windows for ALL of Brickbottom**, which will be surrounded on three sides by 20- to 24-hour-a-day activity, not just the insulting 40 windows currently in the draft which would represent less than 3% of windows in the complex.

I-056-011

- Retrofitting the existing commuter rail diesel locomotives with noise- and emission-reduction devices would also help satisfy the intent of the project and help to mitigate longstanding noise and air-quality impacts that residents have lived with for decades.

I-056-012

- The DEIR further states (Section 6.5.4-1 *Environmental Justice*, p. 6-7): "The proposed maintenance facility site is located in an existing industrial area next to the MBTA Fitchburg and Lowell Lines. There would be no moderate or severe impacts from noise

Regarding EEA 13866

I-056-012

Impacts to environmental justice populations are described in DEIR/EA Section 5.4, Environmental Justice. Additionally, the Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes specific outreach efforts to the environmental justice community that will be made as the Project progresses through its next phases.

I-056-012

after mitigation was implemented. Therefore, there would be no disproportionate noise impacts to environmental justice populations from the proposed maintenance facility." This language is misleading, disingenuous, and contrary to the report's own findings.

I-056-013

- MBTA policy is to commit at least 2% of project cost to noise mitigation. With an overall cost estimate of $1 billion, the Green Line noise mitigation commitment should be at least $20 million; the DEIR estimates only $15.8 million.

I-056-014

Lee Losch
1 Fitchburg St. C509
Somerville MA 02143
617 628 2268
lee@lbdesign.com

- The DEIR focuses on mitigation for indoor spaces at Brickbottom, based on changes to the building's exterior. However, outdoor mitigation is also needed, including the only outdoor green space in the area, the award-winning Brickbottom Courtyard, which will be severely impacted by noise and vibration. The courtyard is open at both ends from the North and South and will reverberate with noise from both the proposed Yard 8 maintenance and storage facility and from both sides of the Green line. We encourage additional study of outdoor mitigation, including barriers.

I-056-015

- There needs to be a process in place to address mitigation problems during construction and after the fact; there must be a way for residents to seek redress if specific goals are not met.
- Mitigation, especially mitigation for noise and vibration, must be in place **before** construction begins and measures to avoid or eliminate these impacts should be identified and implemented.

I-056-016

- With the introduction of the Green Line Extension, Residents of the Brickbottom Artists Building (a community whose development has anchored and encouraged economic development in its neighborhood) will live in perpetuity with two Green Line spurs on either side of the building. Many Brickbottom residents will co-exist with the Green Line just 19 feet away. This proximity needs to be acknowledged, investigated to see if it is necessary, and be redressed and thoroughly remediated.

I-056-017

- The railroad tracks on the South side of the Brickbottom Building are already noisy due to commuter train traffic on the Fitchburg Line and large Amtrak engines, freight trains and commuter trains that idle on the dead-end railhead. The collective noise of the commuter rail, the dead-end rail head and the projected Union Square spur need to be measured and calculated to assess required noise and vibration mitigation to properly assess the added noise and vibration introduced by the Union Square Spur.

I-056-018

- In light of the overall environmental impact of the Green Line and its contribution to the existing environmental impacts of the commuter and freight rail traffic near Brickbottom, we request that MassDOT assign five of the new EPA Level 3 diesel rail engines to the Fitchburg Line to help mitigate the overall environmental impact of existing and new rail traffic in this area. The Fitchburg Line should be prioritized for the replacement of legacy diesel engines.

I-056-019

- One of the greatest sources of noise in the system is the air conditioning of the light rail cars. We request that fan-quieting mitigation* be implemented on cars stored and used on the Green Line Extension. This can be accomplished by installation of quiet, efficient fans, several new designs are available. Placement of fans on the vehicle can make a significant difference in the noise radiated toward residents closest to the tracks, especially, on the Union Square spur.

Regarding:
I-056-020

- Additionally, Green Line railcars should be fitted with acoustical absorption* under the cars. This has been demonstrated to provide up to 5 decibels of mitigation for wheel/rail noise. Similarly, vehicle skirts* over the wheels can provide 5 decibels of mitigation. By

I-056-013

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-056-014

See response to Comments I-056-012 and I-056-013.

I-056-015

As described in DEIR/EA Section 3.7, construction contractors will be required to comply with state regulations and local ordinances to mitigate air quality, noise, and vibration impacts. On-site resident engineers and inspectors will monitor all construction activities to ensure that mitigation measures are properly implemented.

I-056-016

The precise alignment for the Green line Extension tracks near the Brickbottom Artists Building and neighboring structures will be determined during preliminary engineering and final design. The Medford Branch tracks will be located as far from the building as possible, with a minimum clearance between building and tracks of about 15 feet. The Fitchburg Branch will be further from the building, with a minimum clearance between building and tracks of about 25 feet.

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in DEIR/EA Chapter 6, Draft Section 61 Findings and Mitigation Measures.

I-056-020 | carrying their own noise barriers, vehicles with these features can provide cost-effective noise reduction.

I-056-021 | • MassDOT should clearly define procedures for further mitigation if stated noise and vibration targets are not reached. Additionally, a procedure for determining compensation, incorporating community representation, should be included for instances where mitigation proves insufficient.

These recommendations are included in the 2006 Transit Noise and Vibration Impact Assessment, done by the Federal government. This same document was cited in the DEIR.

Lee Busch
1 Fitchburg St. C509
Somerville MA 02143
617 628 2268
lee@lbdesign.com

Regarding the Community Path

I-056-022 | • As currently designed, Brickbottom will only have access to the community path at Washington St. We must have more direct access to it.

I-056-023 | • The Community Path should be designed and built in conjunction with the Green Line Extension.

• The entire project needs clear Community Path and Bicycle Connections. In order to ensure direct connections at each station and a safe, attractive, and highly-functional Path, and to increase ridership to improve air quality and revenue, both projects should be designed and constructed simultaneously.

Regarding the Brickbottom/Washington St. Station

I-056-024 | • It is currently sited just south of Washington St, it should be directly at Washington St to better connect to East Somerville neighborhoods.

• It should have access from both sides of Washington St.

• It should not have a kiss and ride

• It should directly connect to bus stops

I-056-025 | • It, like all proposed stations, needs more bicycle storage

I-056-026 | • The extension should be designed so that it doesn't preclude the possibility of future stations between Lechmere Station and Washington St on the main line or between Lechmere and Union Sq on the spur

Regarding Land Takings

I-056-027 | A strip of land on the south side of Brickbottom is listed as one of the land takings for the project. How much land will be taken? This has not been clarified in the DEIR and has the potential to significantly impact the Brickbottom community.

The mitigation measures required by the Secretary's Certificate on the DEIR are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-056-017

Please see response to Comment I-056-13.

I-056-018

EPA Level 3 locomotives adhere to more stringent air emission requirements but do not have lower noise emission requirements. As presented in DEIR/EA Chapter 6, it is anticipated that the Green Line Extension will have a positive impact on outdoor air quality within the study area. Modifications to MBTA Commuter Rail equipment are outside the scope of the Project. However, new fuel standards from EPA will result in lower emissions from locomotives, automobiles, and buses. FEIR Chapter 8 details the Project's proposed mitigation measures.

I-056-019

While noise from fans in auxiliary equipment such as air-conditioners on transit cars is a significant noise source for stationary trains, the greatest source of noise on moving trains is generated at the wheel-rail interface. Installing quieter fans could be effective in reducing noise emissions from Green Line cars while stationary, such as when they are in the maintenance yard being prepared for revenue service. However, this mitigation measure would not be effective in reducing the noise generated by moving Green Line cars or the total noise generated by both Green Line and commuter trains. Noise barriers proposed for the Project would be more effective in reducing the noise from both Green Line and commuter trains.

Specific modifications to existing Green Line vehicles would be a systemwide effort and may be beyond the scope of the Project. As

Conclusion

Yard 8 should not be considered. **Yard 8 should be a non-starter.**

The entire DEIR study and public engagement process has been flawed. The DEIR cannot be taken at face value without significant evaluation in light of intense public outcry and public-sourced study and comment.

The DEIR should be evaluated against the principles set forth in the CLF lawsuit and the agreement, not the T's operational needs. **This is the citizens' project, not the T's project.**

The MEPA certificate should require DOT to enter into written agreements with the cities of Medford, Somerville and Cambridge regarding **mitigation commitments** to each community.

The MEPA certificate should **require a public process framework** for the remainder of the project that will ensure collaboration with the community and local governments to set project mitigation standards and remedies, to accomplish better station and area designs and minimize environmental impacts.

The maintenance and storage facility locations and designs require **thorough scrutiny and reevaluation** with respect given and attention paid to the intense public outcry and public-sourced study and comment. The proposed locations and plans must not be taken at face value.

The new Massachusetts Department of Transportation is committed to make "investments and decisions that strengthen communities, support economic growth and improve public health." Please be mindful of the state's mandate in carrying our your duties.

Most sincerely,

Lee F Busch

Regarding:
EEA 13886

described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes proposed mitigation measures and next steps pertaining to mitigation.

I-056-020

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-056-021

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-056-022

MassDOT is committed to completing all planning, design, and engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community

Path between Lowell Street and Inner Belt Road. MassDOT is not able at this point to commit to funding the construction of the Community Path. The limits of the path were predicated on the connections to Lechmere being made through the Inner Belt area via Inner Belt Road and the proposed Urban Ring Bridge into the Lechmere area. However, the cessation of planning for the Urban Ring Project has changed the timing of this anticipated connection. MassDOT is unable to assume responsibility for designing the Urban Ring Bridge as part of the Green Line Extension Project. That being said, MassDOT is committed to working with the City of Somerville, residents and businesses in the Brickbottom and Inner Belt neighborhoods, and Community Path advocates to design the Path to create improved connectivity within the Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension.

I-056-023

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-056-024

The conceptual plan for the Brickbottom Station will be refined during the preliminary engineering stage, taking into consideration municipal, neighbor, and other stakeholder concerns to the extent practical. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

I-056-025

The amount of bicycle storage at each station is based on ridership

projections developed by CTPS. DEIR/EA Appendix D includes the methods CTPS used to analyze demand for bicycle parking. Detailed bicycle parking designs will be further developed during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

I-056-026

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

I-056-027

DEIR/EA Section 5.2 describes the Project's potential acquisitions. MassDOT is currently conducting detailed property surveys to obtain more specific data. MassDOT will continue to evaluate opportunities to minimize these property impacts.

I-056-028

MassDOT has noted and considered your comments. Thank you for your interest in the Green Line Extension Project.

Boston, MA 02114

Dear Secretary Bowles,

I-057-001

I am writing because I feel it is very important that MassDOT construct the Preferred, Full-Build Alternative for the
Green Line extension to Medford with a terminus station at Route 16 in one phase by Dec. 31, 2014.

I am a resident of Medford. My husband and I purchased our house 3 years ago assuming the Green line extension would run to Rt. 16, which is near our home. I am sure you can imagine the convince to us of green line access near our home. I would be so lovely for us to take the greenline into Boston or even to run errands around Medford and Somerville. In addition, this extension to Rt. 16 will serve the most people and encourage more people to ride the MBTA rather than drive, thus freeing up traffic and parking issues. Encouragement of subway commuting will provide the most and best environmental benefits for Medford, Somerville, and Arlington.

Therefore, in order to achieve the maximum environmental and community benefits of the project the project should extend the green line to Rt 16 by 2014 and not wait for a second round of construction. In other words, the Draft Environmental Impact Report should not be accepted as the Final Environmental Impact Report.

Please consider the residence of Medford and how long we have waited for this green line extension.

Samantha Butler
resident of Medford, MA

I-057-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

RECEIVED
JAN 8 2010
MEPA

Dear Secretary Ian Bowles,
Many of my neighbors have written to you regarding Project Number EEA #13886 encouraging you to explore alternatives to the siting of the Green Line Maintenance Facility at Yard 8. I would like to add my voice to theirs and express my concerns.

Public transportation has the potential to improve the mobility and quality of life of many people who would otherwise be restricted to their own neighborhoods but the way it is implemented has the potential to cause inconvenience, health hazards, property damage and economic hardship for many others.

I-058-001

The siting of the Green Line Maintenance Facility at Yard 8 would negate the efforts of the Brickbottom community to develop that area of Somerville into a viable area suitable for residential habitation. It would effectively throw a disproportionate burden on the City of Somerville by reducing its tax base and preventing the improvement of large areas of land which are now occupied by tow lots and parking yards for trucks and busses.

It is ironic that even though state agencies have allotted a T stop to Brickbottom, the placement of a monumentally disruptive 24 hour industrial facility directly adjacent to the areas largest residential development will negate the reason for its existence by driving out the people who would benefit from it. Taxpayers do not want to live in the kind of area that the Maintenance Facility would create. If the yard 8 site is approved it will assure the demise of any community that might develop around Brickbottom. Truck & bus drivers, sanitation workers, utility workers & cab drivers will continue to use the area but they have little need of a T stop.

Mitigation is surely a euphemism. Short of building entirely underground there is no possible way to mitigate the unconscionable location of the Maintenance Facility practically on top of a 220 person residential development. Residents are already aware of the destructive quality of trains and large vehicles; and any rhetoric addressing "mitigation" is patently absurd. The only equitable mitigation would be for the state to buy out the residential owners at their market value and rezone the building for industrial use. That would at least settle the matter of the future of that area of Somerville.

I've been an urban pioneer for the last 35 years, being forced out of neighborhoods as they improved beyond my renter's price range. Brickbottom was an opportunity for permanent settlement and I've put 20 years of hard work into improving a building that was only a shell when I came here, all the time hoping that my efforts and those of my dedicated neighbors would result in making this corner of the city a desirable location. We've suffered through rude and dangerous tow truck drivers, triple parked trash vehicles, piercing back-up alarms, and a never-ending stream of blowing trash and illegal dumping. Will this area realize its potential as a place people will someday want to come? If the Green Line Maintenance and Storage Facility is located at Yard 8 it will not.

Sincerely,

Charles W. Cameron

I-058-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

Subject: Green Line Extension Project

Dear EOEA,

I am writing about the Green Line Extension project. As a resident of the Medford Hillside neighborhood, I am deeply concerned that this project should be completed to its final extent, with a terminus at Route 16. With over 200,000 square feet of existing and/or redevelopable commercial space, two affordable multifamily developments immediately adjacent to the site, and additional high density affordable housing and a public school within a half mile, this location offers the greatest pedestrian accessibility to potential riders from several communities. Moreover, the location at Route 16, Boston Ave, and North Street, along the Mystic River, and less than mile from the West Medford commuter rail station provides more alternatives for passengers using various modes of transportation to arrive at the train station, while reducing over all car trips. The DEIR notes that this location has high potential for Transit Oriented Development. For these reasons, the Mystic Valley Parkway terminus station with no parking was determined to be the Preferred Alternative.

I-059-001 The Draft EIR unfairly describes the impacts of the Route 16 station assuming worst case displacement of commercial properties which can be avoided through alternative station design. A best case scenario for the Route 16 station, minimizing impacts and costs, and fully representing the bicycle and pedestrian accommodations should be presented in a Final EIR, and the funding for completion of the entire project should be dedicated in one phase. Completing the extension to Route 16 in a single phase by Dec. 31, 2014 will maximize the benefits of the project, alleviate impacts, significantly minimize costs, and increase the competitiveness of the project for Federal funding. Moreover, the additional cost and review project necessary for completing the project in two phases makes it unlikely that the second phase will be feasible.

I-059-002 Given the uncertainty of completion of a future phase, the Draft EIR does not adequately evaluate the detrimental effects on the Hillside neighborhood from a College Avenue terminus, rather than a through station. Traffic between Route 16/North Street and the proposed College Avenue terminus is already challenging because of the limitations of the roads in the Winthrop Street vicinity combined with the commercial activity on Boston Avenue which lacks off-road space for parking or loading. A College Ave terminus could have severe traffic impacts from people driving to the terminus, affecting Medford Hillside residents disproportionately without improving our transit access. By contrast, a terminus at Route 16 would alleviate the current traffic conditions and will do more to reduce auto trips in our neighborhood.

I-059-003 I feel that The Secretary of Environmental Affairs should require MassDOT to continue the Environmental Impact analysis in the form of a Final Environmental Impact Report that fully evaluates the completion of the project versus the full cost and impact of delaying completion or stopping short.

Sincerely,

Roberta Cameron, AICP

resident of 12 North Street, Medford, MA

1

I-059-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-059-002

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-059-003

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

We are writing in regards to Project Number EEA#13886.
We are residents of The Brickbottom Artists Building at 1 Fitchburg Street, Somerville, MA, and we are very concerned about the noise, vibration levels, and overall negative impact of the storage yard on the quality of life here at Brickbottom.
I-060-001 We are in support of The Green Line Extension, and feel that progress is always a good thing, but we are concerned that the Train Storage Yard and Maintenance Facilty will add an unjust burden to The Brickbottom Residential District, and to Somerville.
We appreciate your continued thoughtful consideration of alternatives to Yard 8.

Sincerely,

Irving S. Camiel
Lawrence E. Johnson

I-060-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. Attn: Holly Johnson, MEPA Analyst
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles,

We are writing in regards to the Draft Environmental Impact Report (DEIR) on project Number EEA#13886. First of all, we would like to express our support for the Green Line Extension, and our gratitude to you for allowing citizens of Somerville, Cambridge and Medford to voice their concerns about recently released DEIR, and for looking for alternatives (such as Mirror Scheme H and Option L) to placement of maintenance facility and storage yard.

Our family has been living and enjoying the Brickbottom community for the past 10 years. We are very concerned about the community's well-being if Yard 8 is ever used for building a maintenance facility and storage yard.

For the last several years our small business has been housed in our unit. As business owners and residents, it would be absolutely devastating to us to have a continuous noise and vibration pollution. If the maintenance facility and storage yard are placed next door, we will be forced to move at least the business. We know that many of our neighbors would have to start looking for ways to move their successful businesses and residences as well. The city of Somerville will lose revenue from these businesses. Lack of the Innerbelt area economic development will compound the problem further.

I-061-001

We would like to encourage you to continue investigating alternate sites for the project and completely remove Yard 8 from the list of sites discussed. Currently, there are 220 residents, many of whom live and work in the Brickbottom Artists Building full-time. This community serves as an amazing example of wise investment by a group of artists. We continuously try to improve our neighborhood through many projects and active participation in the life of Somerville and, of course, by offering numerous shows and special events. Our community is praised by many colleagues, friends, media and politicians. We are hopeful that you will help us to preserve our quality of life and work.

Sincerely,

1

I-061-001

Dear Secretary Bowls:

I am writing in regard to the Draft Environmental Impact Report on project No. EEA#13886.

I-062-001 | Although I reside in Cambridge, I am a property owner at the Brickbottom Artists Building in Somerville where my wife has a studio.. The detailed evaluation of alternative sites for the Green Line maintenance facility and train storage yard has shown three options. Of the three proposed sites, Mirror H. is the most preferable. This is the preferred site of the City of Somerville and the residents of the Brickbottom Artists Building. Option L will need further study and refinement, but might work.

I-062-002 | I strongly oppose siting the Green Line Train Storage Yard and Maintenance Facility in Yard 8. This site is immediately adjacent to the Brickbottom Building, with 220 residents, and would have serious negative effects on their quality of life. I am particularly concerned about the noise and vibration levels as it impacts our building and surrounding businesses

In addition to noise and vibration concerns, the Yard 8 location would build a barrier between the Inner Belt and the Brickbottom areas and would impact the potential for future development in the region. The Storage Yard and Maintenance Facility would have a direct impact on future tax revenue as it impacts adjacent property value and future growth.

I-062-003 | I support the Green Line Extension and hope to see continued community involvement as plans proceed. In this spirit, I am voicing my strong objections to the Yard 8 site for the Storage Yard and Maintenance Facility. The Yard 8 location would unjustly punish the residents of Brickbottom and does not live up to the standards that Mass DOT has promised to deliver.

Thanking you in advance for your consideration.

Sincerely yours,

James T. Campen

I-062-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Mirror H location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-062-002

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration.

I-062-003

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114
Via email: Holly.S.Johnson@state.ma.us

Dear Secretary Bowles:

I-063-001 I am a near-lifelong resident of Medford writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Cambridge, Somerville and Medford, EEA #13886.

First of all, I strongly support the Green Line extension, and urge that it be built in one phase, with a terminus station at Mystic Valley Parkway (Route 16), by December 31, 2014. I ask that you reject the DEIR as written because it does not comply with the December 1, 2006 MEPA certificate, does not satisfy the legal mandate to serve the Medford Hillside neighborhood, and contains a Station design for Route 16 that is literally "designed to fail".

The DEIR concludes that the Route 16 station would provide the most benefits according to all project criteria, including air quality and environmental justice. However, MassDOT states that it is incapable of building (and funding) the entire "Preferred Alternative," so it only intends to build the extension to College Avenue in the Tufts University area of Medford, by its deadline of December 31, 2014. The extension to Route 16 in a Phase II will simply never be built.

In my opinion, the DEIR as currently written does not serve the best interests of the project. More importantly for your review, it was not done in a way that "adequately and properly" complies with the state environmental regulations, nor with the December 1, 2006 MEPA certificate that defined the requirements of the DEIR. For the following reasons, I strongly urge you to not accept the DEIR as the Final EIR and require further environmental analysis of the project by MassDOT:

• **A two-phased approach is unacceptable.** The Route 16/Mystic Valley Parkway Station should be built as part of a single-phase project to minimize costs and negative impacts and achieve the maximum benefits with regard to ridership, vehicle mile travel reduction, air quality improvements, and service to environmental justice communities. The recommendation as outlined in the DEIR is for the Route 16/Mystic Valley Parkway station to be a separate stand-alone Phase II project with no funding source identified is simply ridiculous and makes no planning sense whatsoever.

• **Terminus Impact.** Without a Route 16 Station, the College Avenue stop (designed and intended to be an interim station) would become the de facto terminus for the Green Line extension. It is not designed for a terminus and due to the traffic flow and neighborhood density, as well as the lack of opportunity for transit-oriented development at College Ave., it is not a good location for a terminus.

• **Cost.** The two-phased approach is fiscally irresponsible and by MassDOT's own estimates will inflate the cost by $55 million over a single-phase approach. Severing a single stop (less than one mile of track) from the project as a whole will cost the state, and thus the taxpayers, significant additional money. There are obvious ways to easily reduce costs in the overall project and provide enough additional funds to include Route 16 as part of a single, complete project. This is the most prudent approach, and also would ensure that the project produces the air quality improvements the Commonwealth must achieve to come into compliance with the Clean Air Act.

• **Environmental Justice:** The environmental justice population cited, in part, to justify the project as a whole will largely not be served if the project terminates at College Avenue. There are five separate Environmental Justice sites within walking distance of the Route 16 terminus that will simply not be served by a College Ave terminus.

I-063-001

Please see Comment Letter I-002.

• **Legal Mandate:** The state is legally obligated to provide public transit services to Medford Hillside by December 31, 2014, and stopping the extension at College Ave. fails to meet this legal obligation. There has been a lot of goal-post moving by the State to try to redefine the geographic boundaries of Medford Hillside, but facts are stubborn things, and the fact is that the closest Medford Hillside resident (other than Tufts) is at least ¼ mile walk from the proposed College Ave. Station. The Medford Hillside stretches a full mile beyond College Avenue to the Mystic River and the vast majority of the Medford Hillside neighborhood will not be served by a College Ave terminus. No amount of geographic gerrymandering can change this fact.

• **The Route 16 station design in the DEIR is "Designed to Fail".** The DEIR offers only a "worst case scenario" (MassDOT's description) for the Route 16 station design, while offering cohesive and workable station designs for all other Green Line extension stations. As an architect and planner, I can plainly see that no serious effort was ever made to make the Route 16 terminus work in the DEIR "design" for Route 16. On the contrary, it was literally designed to fail by wiping out existing buildings and looking like what is was: a bad-faith effort. For this reason alone, the DEIR should be rejected and a real design explored in a final EIR. And such a design will realize the fantastic potential of a Route 16 terminus: Transit-Oriented-Development opportunities, pedestrian connections to the nearby West Medford Commuter Rail Station, excellent bus service opportunities, and bike/walking trail connections that will stretch five miles from the Alewife Red Line Station to the Wellington Orange Line Station, and much more. Route 16 is a near-perfect example of "Smart-Growth" that Massachusetts is now encouraging and is superior in every facet to College Ave as a terminus.

The Medford Green Line Neighborhood Alliance, a volunteer citizen group, of which I am a member, has offered an alternative station design that prevents two major commercial property acquisitions and the resulting job displacement, preserves $182,000/year in property taxes for the City of Medford, optimizes traffic flow and better serves the integrity of the station's surroundings. MassDOT apparently has been exploring similar improved designs, which should be presented to the public for comment. A $1 billion project deserves a higher caliber design than a "worst case scenario."

Finally, I would like to make a few comments about the City of Medford's overall response to the Green Line Extension project. To be blunt, my city government has failed me and the thousands of Medford residents who will be better served by the Green Line Extension project. For the past four years, the City of Medford has done the following in regards to the Green Line Extension Project:

- Refused to engage the Green Line project in any meaningful way
- Taken no official position on the project
- Provided zero planning resources devoted to the project
- Failed to provide Medford residents with even the most basic information on the project, which to this day - four years later - is still not mentioned on the City of Medford website.

It has been a shameful performance. My larger point is that I do not feel that the citizens of Medford should be penalized or lose an opportunity to have a once-in-a-generation opportunity to gain a new piece of transportation infrastructure that will improve our quality of life because we have an incompetent city government with absolutely no planning capacity or vision to deal with a project as complicated as the Green Line Extension project. While our so-called leaders have sat on the sidelines for the past four years, Medford residents spoke loud and clear when over 1,100 of us signed an online petition supporting the Route 16 terminus in 2008. Over 1,000 Somerville residents also signed the petition.

To summarize, I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis to go to Route 16 to serve the largest possible population, achieve the maximum ridership, take the most cars off the road and provide the maximum air quality and environmental benefits to the residents of Cambridge, Somerville, Medford and Arlington.

Thank you for your time and consideration.

MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA #03886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-064-001 I am a resident & owner at the Glass Factory Condominiums. I have the following concerns about the Green Line Extension Project; which I feel that if not addressed in the proper manner, will have a negative impact not only in the quality of life of the residents of the Glass Factory Condominiums, but could also be detrimental to the value of the property in an economy where homeowners really can't afford to lose equity and be under water in their mortgages. Noise, smoke, garbage, and all the general issues associated with a public subway station would be brought to our doorsteps and we ask that you please address these issues plus the ones below to prevent impact to owners and residents.

TRACKS ARE WAY TOO CLOSE TO OUR BUILDING.
In the present design the tracks run very close to the rear of our building. We urge your designers and engineers to place the tracks as far away from the rear of our building as possible to preserve views & light to the many units that will be severely impacted by the elevated tracks. The design and placement of the tracks and supports should do all it can to minimize the visual impact to those units and also minimize noise & vibration impacts to the whole building as well as the surrounding neighborhood.

LECHMERE STATION.
At present, your designs show the new Lechmere Station so close to the Glass Factory that it appears to be part of our condominium building. Please move the station closer to East Street, where it could be part of the entrance way to the eventual North Point development. The station design needs to be substantially improved so it is not an eyesore but rather an enhancement to this rapidly developing neighborhood. It should reflect the importance of this location as the gateway between Cambridge & Boston.

BUS TRAFFIC.
The many bus lines that converge on Lechmere Station are presently designed to enter at one end of our building, pick up passengers, and emerge at the other end of our condo

I-064-001

Please see Comment Letter I-013 for responses to this form letter.

building. Please do not route bus traffic, directly under our windows. Bus traffic noise, vibrations and fumes are a great concern. Sidewalks where passengers wait, should also be moved farther from our building to preserve our privacy and minimize impacts from noise, light and smoking. If too close, it will feel like we are living in the bus station.

PRESERVE OUR TREES & GREEN SPACE.
Presently there is a row of mature evergreen trees behind our building. I urge you to preserve all these trees and the entire small green space behind our building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks should be on the far side of the large trees. These trees serve as a natural screen for the tracks and busway.

Sincerely,

Krogen Carreno

To whom it may concern,

I-065-001

This brief note is to express my support for the expansion project for the green and Orange line. I truly believe on the benefits to the economy the environment and the betterment of the communities that surround both lines.
As gas prices rise and our country's dependency on foreign oil increases we need to find ways to decrease such dependency and to improve the quality of the air.
In the history of mankind easy access to public transportation has always been a key element for the healthy growth of the communities. Good luck in your project.

Sincerely,

Somerville home owner since 2007

To Whom It May Concern:

In reviewing the DEIR for the proposed Green Line extension project I find many objections to this document and suggest that the agency revisit the document so that it better serves as an Environment Impact Statement for the project so that the project better serves the needs of the community.

I-066-001

1. A two-phased approach (as currently outlined in the DEIR) is unacceptable. The Route 16/Mystic Valley Parkway Station should be built as part of a single-phase project to minimize costs and environmental impact and achieve the maximum benefits with regard to ridership, VMT (reduction, air quality improvements, and service to environmental justice communities.

The recommendation as outlined in the DEIR is for the Route 16/Mystic Valley Parkway station to be a **separate** stand-alone Phase II project with no funding source identified. **This means, Route 16 may never be built.**

There are many, many problems with this approach, including:

I-066-002

- **Risk.** Without an identified funding source there is a very high probability that Route 16 will never be built and the implications of this are critical to the community and to the population this project is meant to serve.
- **Terminus Impact.** Without a Route 16 Station, the College Avenue stop (meant to be an interim station) would become the de facto terminus for the Green Line extension. It is not designed for a terminus and due to the traffic flow and neighborhood density, it is not a good location for a terminus.

I-066-003

- **Cost.** The two-phased approach is fiscally irresponsible. Having a single stop (just over one mile of track) be severed from the project as a whole will cost the state and thus the taxpayers, significant additional money, whereas finding ways to reduce costs in the overall project could easily provide enough additional funds to include Route 16 as part of a single, complete project. This is the most prudent approach. And If Route 16 is never built the costs for College Avenue will be significantly higher because first it will be built as an interim station, then it will have to be re-built as a terminus station later in the project.
- **Project Management.** From a project management perspective, there are significant efficiencies gained from completing the project in one phase, rather than the starts and stops required to execute on separate, multi-stage efforts for such a small add-on project such as a single station stop.

I-066-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

MassDOT is working with MAPC and the Legislature to identify funding for the extension to Mystic Valley Parkway/Route 16.

I-066-002

MassDOT is working with MAPC and the Legislature to identify funding for the extension to Mystic Valley Parkway/Route 16. In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-066-003

Project cost estimates are based on the current, conceptual level of design, and will be further refined as the Project progresses through preliminary engineering. It is anticipated that Green Line Extension construction would be financed with a combination of funds from federal and state sources. It is worthwhile to note that the College Avenue Station will not need to be rebuilt should the future extension to Mystic Valley Parkway / Route 16 be constructed. Only minor modifications to

I-066-004

- **Environmental Justice:** The environmental justice population used in part, to justify the project as a whole will not be served if the project terminates at College Avenue. The negative aspects of this project will affect them most, while they will receive the least benefit without service to a Route 16 terminus. The Green Line extension needs to go all the way to Route 16 and it needs to be a single-phase project, rather than having a single stop relegated to a distant, separate (and unlikely) phase II project.

I-066-005

2. College Avenue should not be a terminus. If the proposed Phase II is not funded (a very high probability), the College Avenue stop becomes a de facto terminus station. This station is not designed for the additional requirements of a terminus. The neighborhood cannot sustain the impact of a terminus station and the damage in terms of traffic flow and environmental damage is unfathomable.

The DEIR does not address the high probability that the line will terminate at College Avenue due to the precariousness of the proposed Route 16-as-a-separate-phase-project, with no identified funding source. I think the Route 16 terminus should be a guaranteed as part of this project so that College Avenue is not at risk of becoming a terminus by default. The only way to do that is to make Route 16 part of the project, not a Phase II.

I-066-006

3. The Route 16 station design (included in the DEIR) is a poor attempt to fulfill the project requirements. The DEIR offers only a "worst case scenario" (as stated in the document) for the Route 16 station design, while offering optimized station designs for all other Green Line extension stations. The Route 16 station design must be revisited. Even MGNA, a community organization comprised of ordinary citizens has offered a better station design approach than what is included in the DEIR. MGNA has proposed a station design that protects significant property taxes for the City of Medford, optimizes traffic flow and better serves the integrity of the stations surroundings. Surely, the agencies involved in the DEIR can produce a better design.

I-066-007

I implore you to revisit this document and make it right. So many people have taken time to provide feedback on this project and to attend meetings and to provide comments along the way. It would be an insult to their efforts and to the community at large if this document is allowed to stand as the final EIR for the project. And a bigger insult would be for this project to proceed in a manner that is not the most beneficial and responsible, as it will impact not just the community today, but the community for generations to come.

Please do the right thing.

Patty Caya
1 Monument Street
Medford, MA 02155

the Commuter Rail tracks in the area between Brookings and Winthrop Streets would be required. Limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time.

I-066-004

The Proposed Project offers substantial benefits to environmental justice communities and serves the majority of Study Area environmental justice population zones. As described in DEIR/EA Section 5.4, Environmental Justice, impacts to environmental justice populations would be neither severe nor disproportionate with any of the Build Alternatives.

I-066-005

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

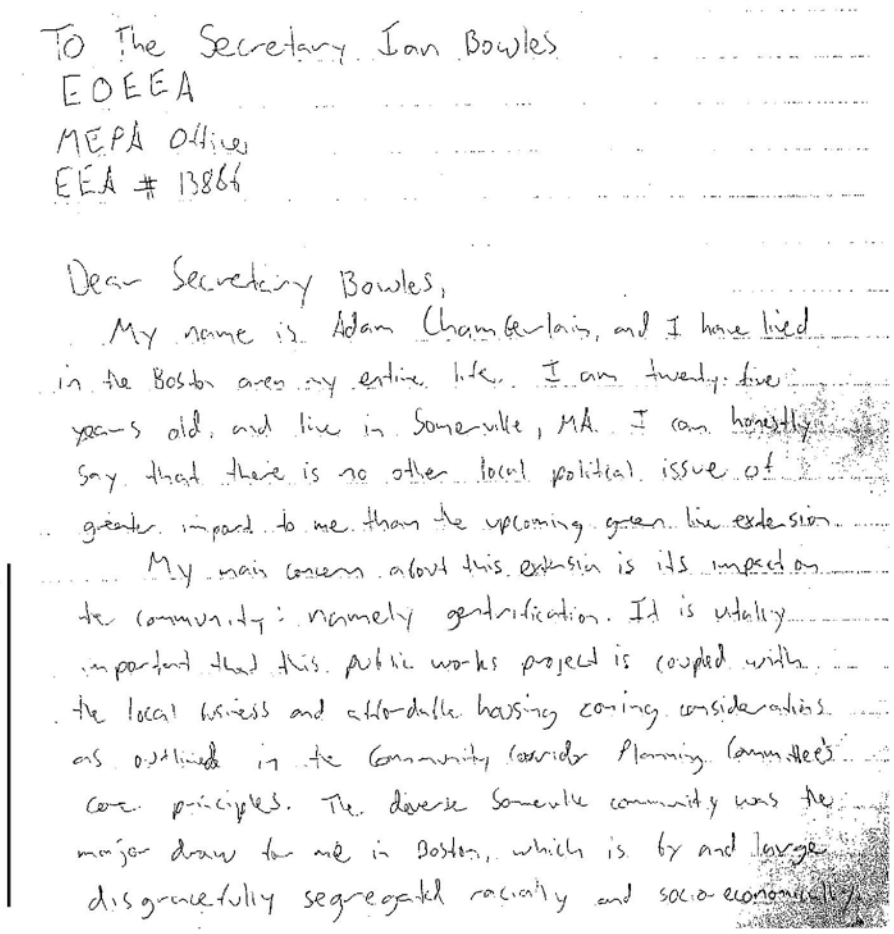
I-066-006

All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley

Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-066-007

As directed by the Secretary's Certificate on the DEIR/EA, the FEIR includes a limited scope of issues related to the Green Line Extension Project. The Proposed Project, with a Medford Branch terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Although an extension to Mystic Valley Parkway/Route 16 is MassDOT's Preferred Alternative, financial constraints prohibit the Commonwealth from progressing the Project beyond College Avenue at this time.



To The Secretary Ian Bowles
EOEEA
MEPA Office
EEA # 13864

Dear Secretary Bowles,

My name is Adam Chamberlain, and I have lived in the Boston area my entire life. I am twenty-five years old, and live in Somerville, MA. I can honestly say that there is no other local political issue of greater import to me than the upcoming green line extension.

My main concern about this extension is its impact on the community: namely gentrification. It is vitally important that this public works project is coupled with the local business and affordable housing zoning considerations as outlined in the Community Corridor Planning Committee's core principles. The diverse Somerville community was the major draw for me in Boston, which is by and large disgracefully segregated racially and socio-economically

I-067-001

I-067-001

Socioeconomic impacts, including projected effects on businesses, jobs, tax revenues, and community disruptions, are described in DEIR Section 5.3, Socioeconomic Impacts. Effects on land use and transit access are discussed in DEIR Section 5.2, Land Use, and Section 5.15, Indirect and Cumulative Effects. A series of Project workshops will provide opportunities to discuss broader impacts of the Project on job creation, economic development, housing affordability, and other community impacts.

MassDOT has reviewed and considered the “Core Community Principles” for station area land use, presented by Community Corridor Planning. As described in the FEIR, Section 6.2 of the Public Involvement Plan, MassDOT will hold land use workshops to discuss related issues with the community.

I-067-002

I would also like to use this opportunity to strongly advocate in favor of a community path linking Boston with the metro northwest. This sort of ease of public transit is incredibly important for drawing, and keeping young, educated people in the area. I grew up in Lexington, MA and have seen the transformative power of the Minuteman Commuter Bikepath.

Thank you for your consideration of my opinion.

Regards,

Adam Chamberlain

Community Health Worker, BWH

I-067-002

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

Boston, MA 02114

Dear Secretary Bowles:

I-068-001

I am currently a resident at the Glass Factory Condominiums. I am deeply considered with the Green Line Extension Project. My wife and bought in the Glass Factory in the summer of 2006. At the time of our purchase we were told that the train station was going to be enclosed in a glass tunnel, at least 50 feet from our building. As it stands the current plans are completely different and not at the level of our satisfaction.

TRACKS ARE TOO CLOSE TO OUR BUILDING.
The present design shows the tracks running very close to the rear of our building. We urge your designers and engineers to place the tracks as far to the rear of our building as possible to preserve views & light to the many units that will be severely impacted by the elevated tracks. The design and placement of the tracks and supports should do all it can to minimize the visual impact to those units and also minimize noise & vibration impacts to the whole building as well as the surrounding neighborhood.

LECHMERE STATION.
At present, your designs show the new Lechmere Station so close to the Glass Factory that it appears to be part of our condominium building. Please move the station closer to East Street, where it could be part of the entrance way to the eventual North Point development. The station design needs to be substantially improved so it is not an eyesore but rather an enhancement to this rapidly developing neighborhood. It should reflect the importance of this location as the gateway between Cambridge & Boston.

BUS TRAFFIC.
The many bus lines that converge on Lechmere Station are presently designed to enter at one end of our building, pick up passengers, and emerge at the other end of our condo building. Please do not route bus traffic, directly under our windows. Bus traffic noise, vibrations and fumes are a great concern. Sidewalks where passengers wait, should also be moved farther from our building to preserve our privacy and minimize impacts from noise, light and smoking. If too close, it will feel like we are living in the bus station.

I-068-001

Please see Comment Letter I-013.

From: 01/07/2010 21:27 #007 P.002

I-068-001

PRESERVE OUR TREES & GREEN SPACE.
Presently there is a row of mature evergreen trees behind our building. I urge you to preserve all these trees and the entire small green space behind our building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks should be on the far side of the large trees. These trees serve as a natural screen for the tracks and busway.

MAINTENANCE FACILITY.
I strongly oppose the Mirror H location. It is much too close to the Glass Factory and other residential buildings and will effectively destroy further development in North Point. Putting a maintenance facility on prime land in a desirable, developable location that would generate significant tax revenue to Cambridge simply does not make sense. Of the three options proposed, Option L seems to be the best choice however I would prefer there be no maintenance facility in this area but rather it be at the end of the line.

REDUCE SURFACE PARKING.
The present Lechmere Station is at the end of the Green Line. That will no longer be the case with the new Green Line Extension and the number of parking spaces should be substantially reduced. Surface parking is bad urban design and should be minimized in the new North Point neighborhood. One half of our building will overlook the new parking and we request it be carefully designed with this in mind. Ample green space should be included in the design and all lighting should be down lighting that minimizes light pollution to our building.

I-068-002

Lastly, since this whole community has been waiting for this train station for a very long term I strongly urge to listen to our concerns. This is an extremely important part of Cambridge and as a resident I would like to see it done the proper way. I think if done in a proper way this train station can really enhance this particular section of Cambridge.

Thank you for hearing my concerns.

Sincerely,

Samir Charnalia

I-068-002

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office, Attn: Ms. Holly Johnson re: EE#13886
100 Cambridge St. Suite 900
Boston, MA 02114

Dear Secretary Bowles,

I am writing to add my comments and concerns to the DEIR for the Green Line extension. I strongly support the long-promised extension of the Green Line, having considered said improvements in public transportation as a major asset when I first moved to Somerville 20 years ago. It is exciting to think that dream, along with improvements in pedestrian and bicycle access around and through this section of the city, will at last be realized.

I am very aware of the magnitude of such a project, especially the environmental impacts and protections. I am a Landscape Architect, with heavy background in environmental science as well as planning and restoration I have been a member of the Brickbottom Community for 20 years, and have seen babies take their first breath and elders take their last in that facility. It is a whole village/neighborhood, surrounded by remnants of Somerville's earlier manufacturing age. It is the environmental (both ecological and sociological) impact of the location of the Maintenance Facility for the Green Line that concerns me most. The Brickbottom Artists Building is not just another structure among old industrial buildings: it is a residential property—equivalent to a whole street of detached houses. Proposing tracks, storage, and a large 24-hour repair facility within 10 yards of a multi-family residential building ["Yard 8"] seems like a bad [planning] joke, especially when there are two or more viable alternative sites that would not impact citizen/residents so severely. This whole project should be celebrated for its vision, it's civilized fit to the communities, and it's favoring of the public over special development and political interests. It would be tragic to have it show up in an MIT or Harvard planning class as a case study in oppressive civic planning. Environmental honor is at stake here.

I-069-001

Please give extra consideration to some of the issues and conditions that are not well covered in the Draft DEIR, including:

- 1. Comparable impacts *to residential facilities and quality of life* for alternative sites.
- 2. Brownfield disturbance impacts for the three alternative sites, including extensive soil testing for entire disturbance areas for each, and mitigation estimates for soil/dust controls and removals, and for stormwater quality and drainage changes.
- 3. Noise/vibration control and required setbacks for construction use and completed use of each facility alternative.

I-069-002

This is the biggest piece of the whole extension puzzle, and also has the largest single impact on a neighborhood. It will be much easier to revise or correct mistakes in station design or even pedestrian access than to change the location and impacts of the maintenance facility. It is imperative that adequate time and care be taken in selecting the best site.

Onward, as they say, and with due diligence.

Sincerely,

Patrick Chassé, MEd, MLA

I-069-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-069-002

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

January 8, 2010

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA #03886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-070-001 As a resident of the Glass Factory Condominiums, I am deeply concerned about the design and placement of the Green Line Extension and the new Lechmere Station.

TRACKS ARE TOO CLOSE TO OUR BUILDING.
The present design shows the tracks running very close to the rear of our building. We urge your designers and engineers to place the tracks as far to the rear of our building as possible to preserve views & light to the many units that will be severely impacted by the elevated tracks. The design and placement of the tracks and supports should do all it can to minimize the visual impact to those units and also minimize noise & vibration impacts to the whole building as well as the surrounding neighborhood.

LECHMERE STATION.
At present, your designs show the new Lechmere Station so close to the Glass Factory that it appears to be part of our condominium building. Please move the station closer to East Street, where it could be part of the entrance way to the eventual North Point development. The station design needs to be substantially improved so it is not an eyesore but rather an enhancement to this rapidly developing neighborhood. It should reflect the importance of this location as the gateway between Cambridge & Boston.

BUS TRAFFIC.
The many bus lines that converge on Lechmere Station are presently designed to enter at one end of our building, pick up passengers, and emerge at the other end of our condo building. Please do not route bus traffic, directly under our windows. Bus traffic noise, vibrations and fumes are a great concern. Sidewalks where passengers wait, should also be moved farther from our building to preserve our privacy and minimize impacts from noise, light and smoking. If too close, it will feel like we are living in the bus station.

PRESERVE OUR TREES & GREEN SPACE.
Presently there is a row of mature evergreen trees behind our building. I urge you to preserve all these trees and the entire small green space behind our building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks should be on the far side of the large trees. These trees serve as a natural screen for the tracks and busway.

I-070-001

Please see Comment Letter I-013 for responses to this form letter.

MAINTENANCE FACILITY.
I strongly oppose the Mirror H location. It is much too close to the Glass Factory and other residential buildings and will effectively destroy further development in North Point. Putting a maintenance facility on prime land in a desirable, developable location that would generate significant tax revenue to Cambridge simply does not make sense. Of the three options proposed, Option L seems to be the best choice however I would prefer there be no maintenance facility in this area but rather it be at the end of the line.

REDUCE SURFACE PARKING.
The present Lechmere Station is at the end of the Green Line. That will no longer be the case with the new Green Line Extension and the number of parking spaces should be substantially reduced. Please consider using the under-utilized parking garages that are already in this neighborhood. Surface parking is bad urban design and should be minimized in the new North Point neighborhood. One half of our building will overlook the new parking and we request it be carefully designed with this in mind. Ample green space should be included in the design and all lighting should be down lighting that minimizes light pollution to our building.

Thank you for hearing my concerns.

Sincerely,

Reference to Project No. EEA# 13886

Dear Secretary Bowles:

I support the "Commonwealth's commitment to the **principles and practice of smart growth**" as stated by the Secretary of Environmental Affairs on the Dec. 2006 notification form regarding the Green Line Extension. As a long time citizen of Massachusetts, I can envision the Green Line Extension as an opportunity for growth and improved quality of life for the residents of Greater Boston, Cambridge, Somerville and Medford.

As a resident of Brickbottom Condominums, I have lived and worked daily along side of the MBTA Fitchburg rail line for the past 15 years. Over these years, I've witnessed the **practice** of the MBTA, which has often fallen short of its stated policies. (Just 2 nights ago, a diesel commuter rail engine stood idling with its engine roaring outside my window at 2:30 am—I believe that is against both the FTA's and MBTA's stated policy—though in practice it has happened frequently.)

I-071-001
I-071-002

I have grave concerns as I review MassDOT's (or EOT and MBTA's) DEIR for the Green Line Extension. The proposed conceptual plan shows disregard for the abutters along MBTA's existing railroad ROW. For instance, little detail is given about how the new Green Line will be integrated into the existing Fitchburg Line and what sort of mitigation efforts will be in place before, during and after construction of the Green Line Extension. I urge you to require specific plans for mitigation and accurate measurements of noise, vibration, hazardous waste, air and water quality impact on residences and businesses along the Green Line Extension corridor. I believe, from having lived next to the Fitchburg rail line during construction of a switch box and bulkhead, that construction of the Green Line Extension will cause significant negative impact to the quality of life of Brickbottom residents. Though the DEIR mentions mitigating the impact to residences by limiting night time construction, that was not the practice during the previous construction along the Fitchburg Line--construction frequently started at midnight and ended at 4 am with no efforts to mitigate noise, dust and light pollution. Which agency would oversee the EOT/MBTA's compliance to mitigate the negative environmental impact to the abutters of the project? What recourse would we as citizens have if EOT/MBTA does not follow the guidelines set forth by MEPA and NEPA? Will a field office be set up where citizens can interact with an oversight agency during construction? I request that a citizen advisory committee be established to address community concerns and the project is permitted to go forward only with sincere effort by MassDot and its contractors to involve and respectfully address the concerns of the abutters and citizens effected by the Green Line Extension.

I-071-003

I oppose the choice of "Yard 8" as "the most practicable" site for the maintenace facility and storage yard for the Green Line Extension. A maintenance facility at "Yard 8" would prevent future development of the Brickbottom/Inner Belt area and permanently sever Brickbottom from the possibility of becoming part of a larger neighborhood that links Union Square to Charlestown. Building the maintenance facility at "Yard 8" goes against the stated goals of the Green Line Extension project, which is to spur economic growth and development and improve the quality of life for all residents along its corridor. Taking 11.5 acres of land, which has been zoned and permitted for development deprives the City of Somerville and the State of needed tax revenues. I believe further study of "Mirror H" and "Option L" as alternate sites is required.

I-071-004

During these difficult economic times, it only makes sense to move forward with a plan that brings about **smart** growth. The State and Federal government cannot afford to underwrite a plan that has the potential to bring disproportionate distress to an established, thriving community of artists, professionals, academics, small businesses, all of whom contribute significantly to the value of this area. I believe it is possible to come up with revisions to the DEIR for a Green Line Extension that will promote growth and benefit all along its route. I ask that your office take into consideration the needs of the citizens the Green Line Extension is designated to serve.

Sincerely,

Lucy Chen

I-071-001

As described in DEIR/EA Section 3.7, construction contractors will be required to comply with state regulations and local ordinances to mitigate air quality, noise, and vibration impacts. On-site resident engineers and inspectors will monitor all construction activities to ensure that mitigation measures are properly implemented.

Additionally, MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in DEIR/EA Chapter 6, Draft Section 61 Findings and Mitigation Measures. Mitigation measures for the College Avenue and Lechmere Stations are further described in FEIR Chapters 4 and 5, respectively. The mitigation measures required by the Certificate are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-071-002

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-071-003

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it

should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-071-004

Direct and indirect impacts to land use are described in DEIR/EA Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for sustainable land use, which could further reduce automobile traffic congestion and improve air quality.

RECEIVED
JAN 7 2010
MEPA

Dear Secretary Bowles:

I have been resident of the Glass Factory Condominiums several years and have many concerns regarding the Green Line Extension/Lechmere Station.

I-072-001 The first issue is the proximity of the new station to the Glass Factory. Specifically the tracks run far too close the rear of the building. There is simply no way trains can run so close to our building without have a substantial negative effect.

I-072-002 Second the current design of the new Lechmere Station is frankly sub-par and will only detract from the neighborhood. The Lechmere neighborhood is home to a large mall, several hotels, a world-class museum and is close by to the Banknorth Garden. Needless to say, tourists flock to the area. Lechmere should be a centerpiece station that incorporates modern facilities but also a pleasing aesthetic design. Additionally, an effort must be made to preserve as much green space as possible. As Lechmere will no longer be an endpoint of the Green Line, there will be no need for substantial parking spaces. This will improve the landscape of the area and reduce traffic and noise pollution. The reclaimed space can be put to better use.

I-072-003

I-072-004 Finally I strenuously object to the Mirror H location of the maintenance facility. That location makes little sense as it is far too close to residential property, and is prime land that can be developed in the future. I urge you to reconsider placing the facility here and move it to the end of the Green Line.

Thank you for taking to time to review my suggestions.

Sincerely,

Adam Chiavoli

I-072-001

FEIR Chapter 5 describes the revised conceptual plans for Lechmere Station, including station design, track alignment, bus routings, and other elements. Changes to the track alignment depicted in the DEIR/EA were evaluated, but could result in additional impacts on area abutters. Proposed mitigation measures for area abutters are also described in FEIR Chapter 5. During preliminary engineering, specific station design elements will be further developed.

I-072-002

Revised conceptual plans for Lechmere Station, including modifications to the station headhouse and entrances, enclosed automatic fare collection, and other amenities are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-072-003

Although Lechmere Station will no longer function as a terminal station, there is still a demonstrated demand for existing parking. Nonetheless, parking at the relocated Lechmere Station was reduced in the revised conceptual design. These revised plans are included in FEIR Chapter 5, Lechmere Station.

I-072-004

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Mirror H location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-073-003

Hi Holly, my name is Theodora (Dorie) Clark and I'm a resident of East Somerville and Vice President of East Somerville Main Streets, a local civic group. I am writing to express my strong support for the Green Line extension. Specifically, I would like to request that there be a stop at both Brickbottom and one at Washington and Joy Streets, which will provide important transportation options for residents in the area. Additionally, I would like to urge EOT to site the maintenance facility at Mirror H, rather than next to Brickbottom. This will allow Somerville to develop underutilized land and create jobs, which will in turn create tax benefits for the state. Finally, I strongly support extension of the Green Line all the way to Route 16, and believe this should also be done by 2014, as I worry that without a firm commitment, it will be put permanently on the backburner. Thank you.

Best regards,
Dorie Clark

I-073-001

Based on the analysis conducted during development of the DEIR/EA, it was determined that only one station would be warranted in the vicinity of the Brickbottom neighborhood and Washington Street. This analysis can be found in Appendix A of the DEIR/EA.

I-073-002

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Mirror H location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-073-003

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

Subject: Comments on the Green Line DEIR

Dear Mr. Ian Bowles,

Thank you for your work on the Green Line/Community Path extension.
Both aspects of the project will go a long way towards reducing automobile dependence and increasing the quality of life for thousands of area residents. I fully support the Green Line and Community Path extensions and can't wait to see the positive effects the extension has on the community. The most critical piece of the success of this project lies in how well the extension is tied into the surrounding community.

I-074-001

That is why I was so glad to hear the state agreed in a February 24, 2009 letter to design and build the community path extension as part of the same project as the green line extension. In addition to increasing the connectivity, health and vitality of area residents, the community path extension will serve to funnel riders to the green line stations and could not be a better complement to the Green Line extension. As such, I fully expect that the community path extension will be given the same resources and consideration and timeline as the Green Line extension. This includes providing any and all necessary support to allow for as much funding as possible from every possible source.

I-074-002

I-074-003

It is also critical for the state to design the project in such a way as to not preclude future extensions. First, the project should be built Rt. 16 to begin with, to best take advantage of the current momentum. Second, extending the Union Square extension to Porter Square is an obvious and very promising possibility for the future.
The Union Square station needs to be designed to best facilitate this future extension.

I-074-004

Finally, the extension project needs to be designed to best support and accommodate economic vitality and growth in the surrounding areas.
The Yard 8 option needs to be dropped, as this piece of land is possibly the most promising area for future development within the city of Somerville, particularly given its proximity to the Charles River and to Boston. Train maintenance facilities are a neccessary evil, and as such the new Green Line maintenance facility needs to be sited as close as possible to the existing Boston Engine Terminal via the Mirror H option, Option L or Option L-BET.

Thank you for your time, hard work and consideration.

Scott Clark
Somerville, MA

I-074-001

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-074-002

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. The Proposed Project, with a terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), “Determination of Air Quality Emission Reductions.” These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010).

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

I-074-003

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

Dear Secretary Bowles,

My name is Fernando Colina and I am a Medford homeowner. I am also the parent of three children, two of whom are in the Medford public schools.

I-075-001

I am concerned that the Commonwealth is not fulfilling its obligations by not extending the green line through to route 16. I am perfectly aware of the concerns of some West Medford residents regarding property values but see no merit to their fears.

I grew up using public transportation in Brookline, (the B, C and D lines) and know that the ability for my children to make use of the train system will expand their cultural lives. The Commonwealth has the obligation to taxpayers and its citizens to invest in sensible public transportation.

Sincerely,

Fernando Colina

Dear Secretary Ian Bowles,

I-076-001

I am a resident owner of "Brickbottom", 1 Fitchburg Street, Somerville since 1994 and strongly opposed to the Green Line Maintenance and Storage Facility (GLEMF) on YARD 8 acreage adjacent to my home. The alternate site proposals – Mirror H and Option L – are far less detrimental to me, my Brickbottom Community and Somerville.

I "bought in" to this community's ambiance and the civic involvement and pride of it's residents, all positives in spite of being adjacent to McGrath and Obrien Highway, an already active T line to the suburbs, and a waste transfer station. The residents here suffer more noise and odor/pollution than 99% of any other resident from Somerville or surrounding towns. I do not oppose the Green Line Extension that will be built adjacent to my building (on the opposite side from the present T suburban line) even though the noise pollution will increase significantly. Proposed noise and glare mitigation is a pallative and will not work.

Secretary Bowles, since the beginning of this project, your committee has ignored all reasoned opposition to YARD 8 from city officials and other groups. The first tacit recognition was the 12/16/09 "Alternative Sites Meeting" in Cambridge where I got the feeling your committee is still set on YARD 8. For example, your mathamatical "in-house" study of the best of the three sites and it's conclusion leaves me suspect . In addition, I have the feeling that the committee accepted the T administration's initial requirements for the Green Line Extension and the GLEMF carte blanche with no outside professional consult on these requests.

Again, the alternative site to YARD 8 must be determined,so that your committee can move on to other problems presented by the Green Line Extension project.

Yours Truly,

November 18,2009
Reference: Greenline Extension & Yard 8 Maintenance & Storage Facility

TO: Executive Office of Transportation and Public Works

I-077-001

As a resident owner at "Brickbottom" (BB) 1 Fitchburg Street since 1994, I'm strongly against the building of a Green Line Extension Maintenance and Storage Facility (GLEMF) on "yard 8" acreage right adjacent to my home.

I "bought in" to the ambiance of the of the community here, the residents' civic involvement with the city, and it's positive political activism - all these positives in spite of the negatives of being adjacent to Mcgrath and O'Brien Hwy, an active "T" line to the suburbs, and a Waste Transfer Station. The first two are of varying noise levels 24/7 and the the third can be very odorous, depending on the wind. I have more noise here than 99+% of the other Somerville residents so please let someone else take the "hit" for this new very noisesome and bright glare maintenance facility on Yard 8. MIRROR SCHEME H is a much better location for both the maintenance facility and storage yard for many reasons.
One might say that "Those Brickbottom residents don't want GLEMF in THEIR backyard". Well, us BB residents already have more than enough in our backyard. There are other sites available. Please knock "Yard 8" off your list for GLEMF.

Thank you in advance for your consideration.

Sincerely,

W. Scott Cooledge "BRICKBOTTOM"

December 30, 2009

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs -- MEPA Office
Attn: Holly Johnson, MEPA Analyst --EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-078-001 I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

First of all, I strongly support the Green Line extension, and urge that it be built in the most practical, beneficial and cost-effective manner – that is, to construct the entire project in one phase, with a terminus station at Mystic Valley Parkway (Route 16), by December 31, 2014. The DEIR is encouraging in that it concludes that the Route 16 station would provide the most benefits according to all project criteria, including air quality and environmental justice. However, MassDOT states that it is incapable of building (and funding) the entire "Preferred Alternative," so it only intends to build the extension to College Avenue in the Tufts University area of Medford, by its deadline of December 31, 2014. In my opinion, the DEIR as currently written does not serve the best interests of the project.

More importantly for your review, it was not done in a way that "adequately and properly" complies with the state environmental regulations, nor with the December 1, 2006 MEPA certificate that defined the requirements of the DEIR. For the following reasons, I strongly urge you to not accept the DEIR as the Final EIR and require further environmental analysis of the project by MassDOT:

1. **A two-phased approach is unacceptable.** The Route 16/Mystic Valley Parkway Station should be built as part of a single-phase project to minimize costs and negative impacts and achieve the maximum benefits with regard to ridership, vehicle mile travel reduction, air quality improvements, and service to environmental justice communities. The recommendation as outlined in the DEIR is for the Route 16/Mystic Valley Parkway station to be a **separate** stand-alone Phase II project with no funding source identified. **This means that the Route 16 terminus may never be built – and placing the terminus at Route 16 is of absolute paramount importance to achieving the project's overall goals and fulfilling its overall obligations.**

There are many, many problems with the Phase II approach, including:

- **Risk.** Without an identified funding source there is a very high probability that Route 16 will never be built and the implications of this are critical.
- **Terminus Impact.** Without a Route 16 Station, the College Avenue stop (designed and intended to be an **interim station**) would become the de facto terminus for the Green Line extension. It is not designed for a terminus and due to the traffic flow and neighborhood density, as well as the lack of opportunity for transit-oriented development at College Ave., it is not a good location for a terminus.

I-078-001

Please see Comment Letter I-002 for responses to this form letter.

• **Cost.** The two-phased approach is fiscally irresponsible and by MassDOT's own estimates will inflate the cost by $55 million over a single-phase approach. Severing a single stop (less than one mile of track) from the project as a whole will cost the state, and thus the taxpayers, significant additional money. There are obvious ways to easily reduce costs in the overall project and provide enough additional funds to include Route 16 as part of a single, complete project. This is the most prudent approach, and also would ensure that the project produces the air quality improvements the Commonwealth must achieve to come into compliance with the Clean Air Act.

• **Project Management.** There are significant efficiencies gained from completing the project in one phase, rather than the starts and stops required to execute on separate, multi-stage efforts for such a small add-on project as a single station stop.

• **Environmental Justice:** The environmental justice population cited, in part, to justify the project as a whole will largely not be served if the project terminates at College Avenue. The negative aspects of this project will affect them most, while they will receive the least benefit without service to a Route 16 terminus.

• **Legal Mandate:** The state is legally obligated to provide public transit services to Medford Hillside by December 31, 2014, and stopping the extension at College Ave. fails to meet this legal obligation. At a minimum, this incurs significant mitigation costs required if the obligation is not met.

2. **College Avenue should not be a terminus.** The College Avenue station is not designed for the additional requirements of a terminus. The neighborhood cannot sustain the impact of a terminus station operations and traffic volume and the potential environmental damage is of serious concern.

3. **The Route 16 station design is inadequate.** The DEIR offers only a "worst case scenario" (MassDOT's description) for the Route 16 station design, while offering optimized station designs for all other Green Line extension stations. The Route 16 station design must be revisited. The Medford Green Line Neighborhood Alliance, a volunteer citizen group, has offered an alternative station design that prevents two major commercial property acquisitions and the resulting job displacement, preserves 182,000/year in property taxes for the City of Medford, optimizes traffic flow and better serves the integrity of the station's surroundings. MassDOT apparently has been exploring similar improved designs, which should be presented to the public for comment. A $1 billion project deserves a higher caliber design than a "worst case scenario."

To summarize, there is much more work to be done on the Environmental Impact report, and I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis in order to make the Green Line extension the best project it can be, and MUST be.

Sincerely,

Kevin Costello & Bethany Morris
34 Kilgore Avenue
Medford, MA 02155

Cc: William Deignan and Beth Rubenstein City of Cambridge Community Development
Subject: Green Line Extension Draft Environmental Impact Review.

Dear Secretary Bowles,

I am one of the two Cambridge representatives on the Community Participation Committee for the Green Line Extension project. I appreciate the thoroughness and patience of your staff and your consultants throughout the DEIR development and review process. The documentation and the web site are – with very few reservations -- commendable. I am a huge supporter of this project in general, along with the community path which in the fullness of time should be an integral part of the transportation solution for Somerville, Medford and Cambridge residents. I especially appreciate the opportunity to offer these comments to the Draft Environmental Review with the expectation that they will be considered as design moves into the next phases -- and I look forward to my continued participation in this process.

I live in East Cambridge, I am a lecturer in Urban Planning and Design at the Harvard Graduate School of Design, and I have been active with members of my neighborhood group – the East Cambridge Planning Team in evaluating and devising proposals for the new Lechmere station and associated arrangements to get people safely to the new station once it is moved to the other side of the McGrath O'Brien Highway. This letter represents my own findings– but this has been shaped by a substantial amount of collaborative work with my neighbors – who will probably also be submitting comments as individuals or as a group.

My comments and questions are organized under the following four headings:

1. Design of the Lechmere station and its entrances.
2. Design of the vehicular circulation around the Lechmere station
3. Overall impact on the Lechmere Square area.
4. Maintenance Facility

1. Current Station Design is Unfair to East Cambridge

I-079-001

The design of the new Lechmere station as it appears in the DEIR is the worst of any of the stations proposed along the extension. It is the only station design that features outdoor turnsylyes and fare machines. It is the only station that does not include landscaping. The station design has a very unsafe pedestrian accommodation. This is a shame, since the users of the Lechmere stop are the only

I-079-001

Revised conceptual plans for Lechmere Station, including modifications to the station headhouse and entrances, enclosed automatic fare collection, and other amenities are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-079-001

constituents along the green line extension who are actually sacrificing T access. Although this oversight probably results from the hurried design process as the Lechmere station was an unexpected addition, many people in East Cambridge see this lack of consideration as an insult, and I don't blame them. We all went through a long process of participation and collaboration during the Northpoint permitting process, and it is very discouraging to see the new station design completely ignores the accommodation that is in this plan and the future possibility of making a graceful connection with the pedestrian oriented Northpoint street plan.

1.a Provide an Indoor lobby for the Lechmere station

If you examine all of the other station designs proposed for Somerville and Medford, you will see that each of them has an indoor lobby that includes fare machines and turnstyles and room for queuing passengers. The Lechmere station is the only one proposed for which the turnstyles and Charlie card machines are outside the station. Please review this design and use the room that is available to make a more generous and attractive station.

1.b Provide Adequate Pedestrian Access to the Station Entrance

It is not uncommon for trains stopping at Lechmere to release as many as 75 passengers at a time – many of them headed toward the Galleria Mall. The current station design provides a very narrow 5 foot sidewalk that is hard against a cute that is designed for high-speed egress of busses from the lay over area. This sidewalk is not wide enough for the normal queue of departing passengers when you consider that some of them will be lining up to buy Charlie tickets at the outdoor machines,, as others try to push past them to get to the turnstyles. When you consider that this will be happening as crowds of arriving passengers pushing the other direction. The design of the Lechmere station should have a much wider sidewalk as was accommodated in the Northpoint plan, see Figures 1, 2 and 3.

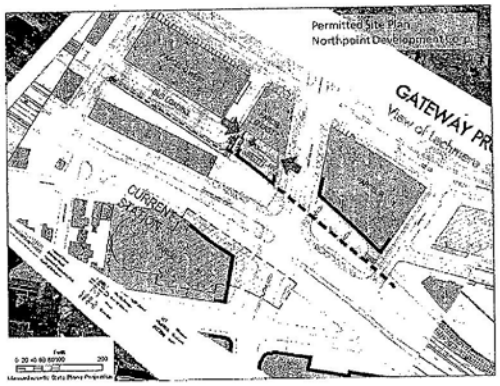

Figure 1: Street Grid as Permitted in Northpoint

I-079-002

Please see response to Comment I-079-001.

I-079-003

The revised conceptual plan for Lechmere Station, as shown in FEIR Chapter 5, is entirely on MBTA property. Landscaping elements will be considered as the design advances.

I-079-004

Although Lechmere Station will no longer function as a terminal station, there is still a demonstrated demand for existing parking. Nonetheless, parking at the relocated Lechmere Station was reduced in the revised conceptual design. These revised plans are included in FEIR Chapter 5, Lechmere Station.

I-079-002

1.c Allow for passengers entering at eastern end of station Platform

The current station design provides an exit, but not an entrance at the eastern end of the platform. There are several hundred built dwelling units in the Sierra, Tango and Archstone Developments, as well as Museum Towers and the Canal Park Residences who would be saved hundreds of steps if they could enter the station with their Charlie cards without walking all the way past the platform to enter at the head house. This accommodation could be made with the simple addition of a Charlie Card reader at this end.

I-079-003

1.d Provide Landscaping for Lechmere Station

Each of the other stations in the Greenline extension provides for trees and planted areas around the station, except for Lechmere. Why is this? It is not like there is a lack of T owned property.

I-079-004

2. Redesign Vehicular Circulation Around Station in Keeping with Urban Pedestrian Environment

The design of the bus and automobile circulation around the proposed Lechmere Station is not in keeping with a pedestrian oriented district such as East Cambridge and Northpoint. The wide radius curves and lack of consideration for pedestrian crossings and pick-up and drop of areas, as well as the excessive amount of parking and lack of landscaping provided at this station will make this an unpleasant place to be for users who are already having to accept the fact that their station will be relocated across a six lane highway. The design will be very difficult to integrate with the Northpoint street grid if it should be built, and the maintenance of so much parking at this station is not justified since the Lechmere station will no longer be the end of the line.

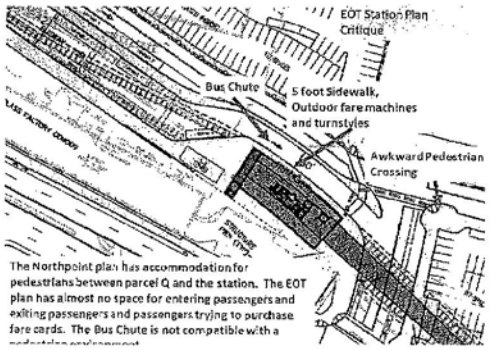

Figure 2: MassDOT Station Plan has many problems

I-079-005

Revised conceptual plans for Lechmere Station, including bus facilities and bus waiting areas, are included in FEIR Chapter 5, Lechmere Station. Bus layover has been shifted further to the east and away from the Glass Factory Condominiums in the revised Lechmere Station design. Signs will be posted to limit idling of buses, in conformance with MBTA standards.

I-079-006

Please see response to Comment I-079-004.

I-079-007

Although Lechmere Station will no longer function as a terminal station, there is still a demonstrated demand for existing parking. Nonetheless, parking at the relocated Lechmere Station was reduced in the revised conceptual design. These revised plans are included in FEIR Chapter 5, Lechmere Station.

I-079-005

2.a Eliminate the Bus Chute that Pinches up against the Pedestrian Access to Station

The proposesdstation design provides a dedicated egress for busses leaving thre layover area. The radius on this egress appears to be designed to let the busses sail past the pedestrians crouded between the station and the chute on a 5 foot sidewalk. Please see figure 1 for an idea of how the egress for busses should be integrated more gracefully with the street grid of Northpoint.

I-079-006

2.b Improve Pedestrian Crossings of First Street for Northpoint Residents

The proposed circulation pattern around the station is not very considerate of the pedestrians who would be approaching the station from the Archstone and Tango, Sierra and Museum Towers properties. Because of the aforementioned bus chute, these pedestrians have a very complicated crossing as shown in figure 1a. Figure 1b shows how an improved alignment of the circulation will improve pedestrian access.

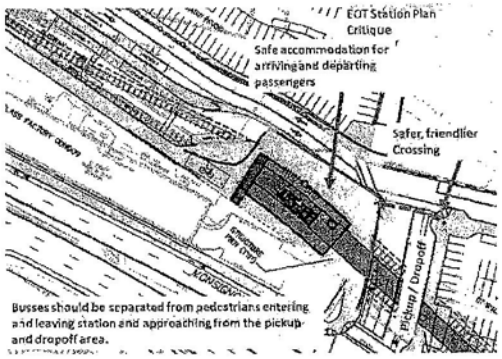

Figure 3: Improved Station Design

I-079-007

2.c Reduce Parking and Improve Parking Lots at Lechmere

One of the biggest down sides of the displacement of the Lechmere station across McGrath highway is the fact that the area on the the other side is extremely unwelcoming in all seasons. The station design as proposed in the DEIR accommodates a large number of parkng places, which is not appropriate for a transit oriented development. The prioritization of parking (which is surrounded by fences) is going to make this a very unattractive area to be as a human being. The number of parkng places should be reduced substantially, and the lots if they remain should not be fenced off and should have grassy areas and trees.

I-079-008

MassDOT has reviewed the suggestions submitted by the East Cambridge Planning Team. Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. These plans, including the pedestrian crossings of O'Brien Highway and associated street, crosswalk, and sidewalk designs will be further refined in the preliminary engineering stage of the Project. As part of the Green Line Extension, MassDOT intends to demolish the existing Lechmere Station and prepare the site for potential future redevelopment. Based on the current requirements of the O'Brien Highway roadway improvements (as shown in FEIR Chapter 5, Lechmere Station), the existing bus shed must be removed.

I-079-009

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, Option L is identified as the preferred maintenance facility site.

I-079-008

3. Work with community to Avoid Blight in Aftermath of Station Relocation

By moving the Lechmere station across a 6 lane McGrath Obrlen Highway, the Lechmere square area will be negatively impacted. Not only will access to the green line be reduced, but the abandonment of the old station and the uncertainty of how this will be redeveloped will potentially create a lasting negative impact on this gateway to East Cambridge. The community has come together to come up with proposals for the old station parcels that allow for all of the development potential that is currently permitted in the Northpoint PUD, and will also provide for civic space and a welcoming approach to the new Lechmere station. These proposals have been favorably reviewd by the Cambridge City Manager and the Assistant Manager for Design and Development.

3a. Stabilize and Preserve the Historic Lechmere Station Buildings

The civic uses in community vision for the future of Lechmere Square call for the development of a public market that utilizes the historic Lechmere Trolly Stop pavilions. MassDOT should provide for the stabilization of these buildings aftewr the station is moved. By no means should these buildings be demolished. The Northpoint square proposal will be submitted win another comment letter.

3b. Consider Community Vision in the Disposal of the Old Lechmere Station Property

The disposition of the land under the current Lechmere Station is complicated because of the original deal to swap the property with the developers of Northpoint in exchange for the building of the new station. Whatever happens in thei regard, we hope that MassDOT will work with the community to find a buyer or a developer of these parcels who will be willing to work with the community to build a development that fits the vision of the community.

4. Develop the Maintenance Facility According to Option L

The Green Line extension is, by and large, a boon to the neighborhoods that it passes through . A key factor in this is the promotion of transit oriented development – high density residential and commercial development along the corridor. Considering this, the location of the maintenance facility in such a way as to adversely impact the development of the Inner Belt Industrial area and the residential development at Brickbottom – as the Yard 8 proposal would, detracts from the benefits of the Extension. Likewise for the Mirror H proposal, as it would constrict the area of the NorthPoint plan that has been permitted for residential development and as a sound buffer of parking structures between NorthPoint and the Engine Terminal.

I-079-009

Even though it will cost a little more to develop the maintenance facility according to Option L, MassDOT should consider that the other schemes subtract frm the overall goal og promoting transit oriented development – which is a cost that should be weighed more heavily than the simple one-time outlay of funds.

This is the end of my comments. I look forward to seeing these responded to in the final EIR. Thank you for your consideration.

Green Line Extension
January 4, 2010

Dear Secretary Ian Bowles,

JAN 4 2010

Yard 8: NO

In 1977, as Class President at Arlington Catholic High School, I led the charge against the extension of the Red Line to Arlington Center. With great political fanfare, our efforts succeeded, and the Red Line was re-routed to Davis Square. At the time, little did I know that leading this campaign would be the worst decision of my life, for I eventually opened a business in Arlington Center, and found that Davis Square had flourished with the Red Line at a time when many businesses in Arlington Center failed, and my business and livelihood struggled. Against the wishes of local commerce, bad decisions were made by the Town of Arlington and by the local parish; lives and quality of life were profoundly changed, some for the better, many unknowingly, for the long-term, worse.

30+ years later, we are again faced with a decision that will change lives. That decision involves the quality of life of the residents of Brickbottom that can be forever negatively impacted by the verdict to build at the Yard 8 site. We should not allow History to repeat itself when feasible opportunities and obvious, balanced options are readily available. I therefore urge you to consider the better options for the maintenance facility, to build in the Mirror H or the Option L site and NOT build on the Yard 8 site.

I-080-001

Emergency Track Crossover: NO

I-080-002

Additionally, according to the plans revealed at a recent Public Forum, an Emergency Track Crossover is being installed between Central Street and Sycamore Street in Somerville. For the record, I am vehemently opposed to this plan for the following reasons:

1. The use of this stretch of track will be used for emergency drills at night, when the neighbors will be sleeping, making it impossible to sleep. We urge you to relocate this Emergency Crossover.
2. The noise from Commuter and Freight Trains changing engines, blowing horns and practicing at night at this location have caused great stress and anxiety for the neighbors, and we have voiced our complaints to the companies. We urge you to relocate this Emergency Crossover.
3. Because of the low elevation of track, and the cavernous nature of the surroundings, the sound from train activity is both concentrated and amplified in this area, making it impossible to sleep at night. Without effective sound abatement between these two streets, our quality of life and property values will suffer.

I-080-003

Public Voice in Planning: YES

As with all successful civic projects such as the Minuteman Bike Path in Arlington, the key to project success was in the collaboration of citizenry, governance, and industry. We demand that you keep the planning process open to the public beyond January 8 and through to project completion. This project has the greatest impact to the abutters along the tracks, and our quality of life will deteriorate as permanent decisions are made without our voice. We urge you to include the input of the people who stand to be impacted the most during the entire design process.

Thank you for your time and consideration to make this a well thought out legacy.

Gerard M. Cronin
19 Willoughby Street
Somerville, MA 02143
617 776 7206

I-080-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-080-002

The proposed crossover between Central and Sycamore Streets is for Green Line trains. It allows the Green Line trains to move from one track to another during normal hours of operation. It is needed to enable continued operation in the case of a disabled Green Line rail vehicle. There will be no emergency drills or practicing, late night or otherwise, that will involve the crossover. The crossover will have no impact on commuter, Amtrak, or freight rail operations and will requite no additional railroad horn soundings. Additionally, noise walls and vibration mitigation measures are proposed in this area to offset impacts resulting from the Project.

I-080-003

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

RE: Green
Line Extension Draft EIR (EEA #13886)

Dear Secretary Bowles:

I am writing on behalf of the Friends of the Community Path, a local community group with over 2,000 supporters of the existing and proposed Somerville Community Path. We strongly support the construction of the Green Line Extension to Route 16 on the Medford/Somerville line and to Union Square in Somerville and believe in its positive economic and environmental impacts.

However, because of shortcomings and omissions in the design, we cannot support this Massachusetts Department of Transportation (MassDOT) Draft Environmental Impact Statement (DEIR) becoming the Final EIR, unless a Supplemental EIR or Addendum is performed to correct the deficiencies.

We urge you to:
1) Request that MassDOT incorporate the revisions outlined below into the EIR and the subsequent final design
2) Request that MassDOT seek state and federal funding for the Community Path extension as an integral part of the Green Line Extension
3) ensure that a Citizens Advisory Committee public process be instituted to help guide these necessary design improvements.

I-081-001

I-081-002

I-081-003

Although a 10% design stage cannot contain all the details everyone would like, now is the time to ensure that the Community Path extension is incorporated into the final EIR and the subsequent final design. Notably, the Community Path is good for the Green Line, and the Green Line is good for the Community Path. There are many local and national examples of successful rail-and-path projects (a few are cited near the end of this letter), and now is the right time to garner state and federal funding for such projects.

The Somerville Community Path (also known regionally as an extension of the Minuteman Trail) provides the logical connection to the City's neighbors to the east and west. Every improvement to the Community Path extension in its co-design with the Green Line extension maximizes the potential of our regional transportation

1

I-081-001

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-081-002

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-081-003

Please see response to Comment I-081-001.

I-081-003 resources.

We appreciate your consideration of these revisions to both the EIR and the subsequent final design:

REVISIONS TO Funding and Construction(followed by details):

I-081-004 · The DEIR should clearly state that the extension of the Community Path will be designed by MassDOT's contractors as agreed to in a February 24, 2009 letter from the EOT.

· That to take full advantage of cost efficiencies and technical necessities, the Green Line and Community Path extensions will be funded and constructed together as a single project and must clearly be described as such by MassDOT.

I-081-005 · MassDOT should commit to work with the City of Somerville and other State and Federal agencies to obtain the necessary funding to build the Community Path extension as an integral part of the Green Line extensions - as was done with Boston's 4.7mile long Southwest Corridor path as part of the Orange Line, and with the mile-long Linear Park as part of the Red Line from Davis Square to Alewife. (By comparison, the Community Path extension is about 2.5 miles.) Applications for funding should include Federal New Starts funding for allowed bicycle and pedestrian access costs

· As the location of the support facility is finalized, the route of the Community Path from Washington St. to Lechmere in Cambridge should be re-evaluated.

Details

Funding and the Importance of the Community Path extension – By acquiring federal funding for the Community Path in conjunction with the Green Line extension, both transit projects will benefit tremendously, with the added perk of creating additional design and construction jobs in the Commonwealth. By contrast, if funding for both transit projects is not sought concurrently, it will cost many times more to construct the Community Path as a separate project, in turn yielding the grim possibility that the Community Path extension may never get built.
We understand that the City of Somerville has about $3 million of the reportedly $15 - $20 million Community Path extension estimated cost.

The request for State and Federal transit funding is reasonable and appropriate, as follows:

· The Federal Transportation Act (FTA) has recently proposed a policy that "pedestrian improvements located within 1/2 mile and all bicycle improvements located 3 miles of a public transportation stop ... may be eligible for FTA funding" http://edocket.access.gpo.gov/2009/E9-27240.htm

· The Community Path - a mere 2 miles from Boston at it's current Cedar Street terminus - will provide desirable off-road bicycle and pedestrian access to the T stations, offering superior connections to the surround neighborhoods, especially in East Somerville - as in Davis Square, where 60% of the residents use public transportation and thousands walk and bike to the station each day. The Community Path will attract more T-riders in a very cost-effective manner. More T-riders means enhanced opportunities for getting federal New Starts and other federal funding.

· In

2

I-081-004

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-081-005

Please see response to Comment I-081-004.

MassDOT is committed to completing all planning, design, and engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community Path between Lowell Street and Inner Belt Road. MassDOT is not able at this point to commit to funding the construction of the Community Path. The limits of the path were predicated on the connections to Lechmere being made through the Inner Belt area via Inner Belt Road and the proposed Urban Ring Bridge into the Lechmere area. However, the cessation of planning for the Urban Ring Project has changed the timing of this anticipated connection. MassDOT is unable to assume responsibility for designing the Urban Ring Bridge as part of the Green Line Extension Project. That being said, MassDOT is committed to working with the City of Somerville, residents and businesses in the Brickbottom and Inner Belt neighborhoods, and Community Path advocates to design the Path to create improved connectivity within the Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension.

I-081-005

the vicinity of Lowell St., Gilman Sq. and Washington St. stations, the Community Path is designed as an integral part of the station access. This will allow the public transportation success of the Davis Square station to be repeated in parts of Somerville that really need it.

REVISIONS TO DESIGN

Community Path from Lowell St. to Route 16: The MEPA certificate said that the environmental review would include evaluation of continuing the Community Path west of the Lowell St. station to Medford. The study results that were presented (Appendix E of the DEIR) concluded that the width of certain sections right-of-way was insufficient to provide such a continuous Path. However, since there are some sections where there isenough width, a route, path connections to local streets, can be studied further.

I-081-006

Community Path from Route 16 to West Medford: Section 3.2.3 of the RFP said that Vanasse Hangen Brustlin, Inc. (MassDOT / EOT's consultant)should study "Using the bikeway/pathway guidelines, consider options for providing pedestrian connections to the West Medford commuter rail station and evaluate the viability and potential impacts of including a community path in this section of the project area." This seems not to have been done but should be. Such a Path would make a transfer connection from Route 16 to West Medford. Therefore MassDOT should plan for a community path to connect the Route 16 terminus to West Medford via an overpass of Route 16, a bridge over the Mystic River and a route along the Lowell commuter rail tracks.

I-081-007

Access to Route 16 Station - The plans in the DEIR document do not show how Green Line riders will safely access the Route 16 station from Arlington and Medford and from the Alewife Brook paths that are being improved as part of a $3.6 million ARRA stimulus project. A multi-use path for pedestrians and bicyclists to the station should be included in the design from the Alewife paths to the station. Please request that MassDOT perform this design.

I-081-008

Community Path Route from Washington St. to Lechmere - the Somerville Community Path route should connect the Washington St./Brickbottom station, the Brickbottom community and Inner Belt to Lechmere. The present plans do not make these connections. If the proposed Yard 8 location for maintenance and storage facility is "dropped", better routes for the Community Path (such as along the Green Line to Brickbottom and over the former Red Bridge location) that do make these connections are possible. The Green Line extension plans should state that this re-evaluation will be done.

I-081-009

Bicycle Parking

- The amount of bicycle parking presently described in the plans (270 spaces) is welcome but will be insufficient for the expected number of bicyclist coming to the stations. 270 spaces is only about 1% of the expected ridership. Based on the present parking at Red line stations, bike parking at 3-5% of ridership will soon be needed. Therefore, we request that the amount of bike parking be increased to approximately 5% at the Union Square, Route 16 and Lowell St. (major intersection with Community Path) stations and 3% at the remainder.
- Also, the location of the bicycle parking (where specifically shown in the plans) are good at some locations but not at others. The bicycle parking locations should be as close to as possible to the entrance and in well lit and safe locations.
- Lastly, bicycle parking should be covered parking if at possible.

Improved pedestrian and bicycle

3

I-081-006

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16 and related station access issues. Connections to West Medford and the existing commuter rail station can be specifically evaluated at that time. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-081-007

Please see response to Comment I-081-006.

I-081-008

MassDOT is committed to completing all planning, design, and engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community Path between Lowell Street and Inner Belt Road. MassDOT is not able at this point to commit to funding the construction of the Community Path. The limits of the path were predicated on the connections to Lechmere being made through the Inner Belt area via Inner Belt Road and the proposed Urban Ring Bridge into the Lechmere area. However, the cessation of planning for the Urban Ring Project has changed the timing of this anticipated connection. MassDOT is unable to assume responsibility for designing the Urban Ring Bridge as part of the Green Line Extension Project. That being said, MassDOT is committed to working with the City of Somerville, residents and businesses in the Brickbottom and Inner Belt neighborhoods, and Community Path advocates to design the Path to create improved connectivity within the

I-081-010

access
Pedestrian connections to some of
the stations could be better designed. Access to some of the stations could be vastly improved by having more thanone entrance or access pointsuch as:

· a
direct connection from the Gilman Square station to the Somerville High School/Library/City Hall complex)

· the
Washington St. station design which seems particularly poor in this regard for riders coming from the west and north. This could be greatly improved by locating the station directly above Washington St. where direct access via elevator would be possible (earlier designs included such a layout).

· In
general, pedestrian and bicycle access should be given higher priority in these "community-based" station designs that motor vehicles connections.

· station
designs (specifically College Ave and also Washington St.), where drop-off stops ("kiss and ride"), directly blocks the front of the T-station entrance and will congest entrance to the station. Paradoxically, pedestrian access to the station entails a long, complicated route.

· Lowell St. station, where a direct connection to the
platform from the Path coming from Cedar St. would be possible via a safe pedestrian crossing of one track. MassDOT has said this would not be allowed because of safety concerns even though every light rail system in the US (including in Boston: Longwood stop on the Green Line and Milton and Butler stops on the Mattapan line) allows crossing of tracks for access. Even if MassDOT will not allow this access point at this time, the Lowell St. station platform should be designed for such future access.

We look forward to seeing these revisions incorporated into the EIR and the subsequent final design.

Here are just a few local and national precedents for successful rail-with path projects:

PRECEDENTS FOR RAIL-WITH-PATH PROJECTS
There are at least two precedents
in the Boston area for rail transit with community paths with both constructed by MBTA and funded with state and federal funding:
Ø The
Linear Path over the Red Line Paths with the Red and Orange line extensions that were part of the overall transit construction project
Ø The
Southwest Corridor Path in Boston alongside and over the Orange Line

Additionally, there are many recent examples of paths being
built together with mass transit expansions around the nation:
· The
Capital Crescent trail alongside the planned light-rail Purple Line in suburban Washington DC includes trail construction is part of the project and the cost estimates that will be submitted for New Starts funding from the federal government.
http://purplelinemd.com/images/stories/purpleline_documents/deis/deis/10_chapter5.pdf
http://purplelinemd.com/images/stories/purpleline_documents/deis/Conceptual%20Plans%2009%202008.pdf

4

Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension.

I-081-009

The amount of bicycle storage at each station is based on ridership projections developed by CTPS. DEIR/EA Appendix D includes the methods CTPS used to analyze demand for bicycle parking. Detailed bicycle parking designs will be further developed during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

I-081-010

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

- Bicycle
and pedestrian path alongside the light-rail Expo line in Los Angeles:
http://buildexpo.org/gallery.php
http://metro.net/projects_programs/exposition/feis.htm
- A
world-class bikeway was built alongside and integrated with stations on the
14-mile Orange Line BRT corridor in LA:

The Somerville Community Path is a critical piece of the
following regional and State-wide bicycle and greenway plans.
Ø The
Massachusetts Bicycle Transportation Plan (page 30 and 45 and Figure 4):
http://www.massbikeplan.org/_docs/Massachusetts%20Bicycle%20Plan%20with%20Links%20to%20Graphics.pdf
Ø The
Somerville Community Path as part of the critical 104-mile east-west Mass
Central Rail Trail (Figures 4.1 and 4.2).http://www.masscentralrailtrail.org/
Ø The
City of Somerville's Open Space and Recreation plans list the Community Path
Ø The Mystic Valley Case Statement for Active
Transportation for the Mystic River Communities:
http://www.railstotrails.org/resources/documents/whatwedo/case_statements/Vision%20for%20July%2010th%20draft.pdf
Ø The
2007 MAPC Regional Bicycle Plan -
http://www.mapc.org/transportation/trans_alternatives/Bike_plan_PDFs/Bike_Plan_FINAL_version_3-14-07.pdf

In summary, we encourage you to:1) request that MassDOT incorporate these revisions into
the EIR and the subsequent final design, 2)request thatMassDOT seek federal funding for the Community Path extension
as an
integral part of the Green Line Extension, and 3) ensure that Citizens a
Advisory Committee public process be instituted to help guide these necessary
design improvements. These crucial
revisions relating to the Community Path as it is co-designed with the Green
Line extension will help bring our regional transportation resources closer to
their full potential.

Thank you.
Gerry Cronin.

Dear Holly

I understand that you are looking for comments on the DEIR plan.

I live in Somerville very close to the proposed Ball Square Station and will be directly affected by a significant increase in motor traffic caused by people coming and going from the station.

I-082-001

The only way to reduce this undesired side-effect is to encourage bicycle useage, so I am a strong proponent of extending the bike path to Cambridge as an integral part of the Green Line Project both cost and technical reasons (building a set of stations is only , and ask that MassDOT clearly state this in their project documentation.

Yours sincerely

RECEIVED
JAN 8 2010
MEPA

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA #03886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles,

I am writing as a unit owner and resident of the Glass Factory Condominiums at 169 Monsignor O'Brien Hwy, Cambridge. I am concerned with the current design and location of the new Lechmere Station and extension of the Green Line and its proximity to my residence.

My unit is on the 3rd floor, facing what is to be (hopefully) North Point Development. If this design is not handled with the proper care, the quality of life of myself and all residents facing this direction will be negatively impacted both financially and mentally. Noise, vibration, light pollution, and limited daylight views are of great concern if the tracks and station are not held as far back as possible from our building. These tracks should and could be designed to be on the far side of the current fence separating the glass factory from the existing maintenance facility. Also making the elevated tracks with as small a profile, and as low to the ground as possible through this section would help alleviate some issues.

I-083-001

I ask that additional attention be paid to the needs of the current residents of our building and that as much 'green' buffer space as possible between the building and new facility is maintained. If designed the right way, with the needs of the area's impacted population taken into consideration, this project could be a boon to North Point and the whole area. There is no reason for this project to not increase our quality of life, not to mention property values, if our concerns are listened to and adequately incorporated into the project development.

I-083-002

Thank you for your consideration.

Sincerely,

Sam Crosbie
169 Monsignor O'Brien Hwy
Unit 308
Cambridge, MA 02141

I-083-001

FEIR Chapter 5 describes the revised conceptual plans for Lechmere Station, including station design, track alignment, bus routings, and other elements. Changes to the track alignment depicted in the DEIR/EA were evaluated, but could result in additional impacts on area abutters. Proposed mitigation measures for area abutters are also described in FEIR Chapter 5. During preliminary engineering, specific station design elements will be further developed.

I-083-002

The revised conceptual plan for Lechmere Station, as shown in FEIR Chapter 5, is entirely on MBTA property. This conceptual design does not require any Glass Factory property or the removal of trees and landscaping from Glass Factory property. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, outlines how MassDOT will involve residents in developing landscape design.

Subject: Regarding EEA #13886 Green Line extension DEIR

Secretary Ian Bowles/Holly Johnson
MEPA Analyist

Dear Secretary Ian Bowles,,

The community members engaged with CCP would like to see all decisions related to the planning of the Green Line and the land use in the ¼ mile areas around the 7 proposed stations to reflect this list of Corridor Core Principles. Please see third paragraph for list of Core Principles and corresponding suggested changes to Draft Environmental Impact Report (DEIR).

The Community Corridor Planning project, a grassroots effort to engage community members in the land use planning along the Green Line extension, has brought together hundreds of people to frame a list of core principles to guide their recommendations for land use along the extension in upcoming months. We ask that these principles be taken into consideration as the Mass. Department of Transportation finalizes its Environmental Impact Report.

Core Community Principles for
Neighborhood Development Along the Green Line Corridor

I-084-001 ? More Local Jobs: We want a fixed percentage of respectable jobs of all types with good wages and benefits for Somerville residents, from construction to permanent.

I-084-002 ? Increase Commercial and Economic Development: We want to see the creation of squares as destinations, with careful attention to mixed use of commercial/residential, reuse of buildings, and economic development to increase the tax base.
o Draft Environmental Impact Report (DEIR) does not address Department of Transportation (DOT) commitment to economic development
o New MA DOT is supposed to work with Secretary of Economic Affairs to promote station location and design that promotes economic development and the community needs to show MA DOT how to do this ? to change the paradigm pro-actively.

I-084-003 ? Improve the Green Environment: We want a safe, environmentally friendly neighborhood with more green space, trees, and gardens; reduction of noise; avoidance of light pollution; and prevention of toxic chemicals in the air.
o Response to DEIR: Given this principle, it is important that more attention be given to:
I-084-004 o Noise of operations
I-084-005 o Mitigation during construction for noise, vibration, etc.
I-084-006 o How close the tracks will be to the Brickbottom Building and other buildings along the right of way
I-084-007 o The need to involve neighborhoods affected regarding noise and vibration
I-084-008 o Recommendation that testing be done immediately after project begins to determine if estimates for vibration and noise done for the DEIR are accurate.
I-084-009 o Possibly transfer at Ball Square but only if Commuter rail is electric not diesel because of the pollution it would create for neighbors
o Rep. Provost noted in comments made that diesel trains should not stop in Somerville. This should only be permitted if trains are electrified

1

I-084-001

Socioeconomic impacts, including projected effects on businesses, jobs, tax revenues, and community disruptions, are described in DEIR Section 5.3, Socioeconomic Impacts. As required by the Secretary's Certificate on the DEIR, additional analyses of the socioeconomic effects of the maintenance facility alternatives are described in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. A project workshop series will provide an opportunity to discuss broader impacts of the project on job creation, economic development, housing affordability, and other community impacts.

I-084-002

Anticipated indirect and cumulative effects of the Project, including impacts on corridor transportation and traffic, growth, property values, land use, transit-oriented and economic development are described in DEIR/EA Section 5.15, Indirect and Cumulative Effects. As stated in FEIR Section 6.4, MassDOT and the MBTA will conduct a series of public workshops to gather input on land use and facility design issues from the communities. These workshops will offer an opportunity to discuss how facility design can influence indirect and cumulative effects. The stations have been designed to meet MBTA standards, as well as to be ADA-compliant.

I-084-003

Direct and indirect impacts to land use are described in DEIR/EA Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for sustainable land use, which could further reduce automobile traffic congestion and improve air quality.

I-084-010 o Consider dual-mode conversion of existing commuter trains

I-084-011 ? Encourage Walking and Biking: We want to encourage walking and cycling, through safe, bike/pedestrian friendly design of streets and paths around and between stations.

I-084-012 o Pedestrian accessibility is poor for the station designs in the DEIR
o The design required in the MEPA Scope (EENF) does not sufficiently address the detailed concerns and requirements for each station.
o In the DEIR design and engineering is insufficient for moving the project to a final EIR because of a range of unaddressed issues (i.e., station design, siting, bike parking, community path integration)

I-084-013 o Bike access and bike parking at all stations needs to be improved.

I-084-014 o New Light Rail Vehicles (LRVs) should be designed to accommodate bicycles (like Portland LRVs)

I-084-015 o The Community Path and its important station connections must be designed and constructed simultaneously with the Green Line extension in order to facilitate direct pedestrian and bicycle access to the stations and to ensure a safe, attractive, and highly-functional Community Path.

I-084-016 ? Create Community Gathering Spaces: We want both indoor and outdoor safe, public gathering spaces for community members.

I-084-017 ? Improve Access: We want above standard, safe access to and between stations for people with disabilities, strollers, and pedestrians in general

I-084-018 ? Community Involvement: We want to make sure residents are included on an ongoing basis in the planning, design, and zoning changes to the stations and areas around them. Youth, artists, and others should help design stations, with attention to amenities. We need an easy and clear process for residents to address problems as they come up, with ways of immediately resolving unseen impacts.
o Ongoing Community participation in the next phase (presumed to be done as a design/build project) is necessary
o Public involvement will help to keep decision-making public (transparency)
o Need to have a field office that residents can go to with concerns on an ongoing basis
o Need neighborhood based community groups to be involved in planning around each station,

I-084-019 ? Connecting Buses and Trains: We want to ensure inter-modal access between neighborhoods and stations, for new train service to be adequate and speedy, and for existing bus lines to continue to serve areas not connected by train.

I-084-020 o Need opportunity for future connection with other lines, such as Red Line at Porter Square.
o Several stations do not show bus stops, or nearest bus stop is located outside of station. Would be helpful to design station and alter bus route to allow for stops at the stations.

I-084-021 ? Keep and Add Local Businesses: We want locally owned, culturally diverse, clean businesses in commercial areas with employees who live in Somerville.

I-084-022 ? Keep Somerville Affordable: We want to make sure people of all economic means have the ability to afford housing and living costs, so that Somerville residents, such as child care workers, cab drivers, local business employees and others can stay here affordably.

? Maintain Our Diversity: Preserve and encourage economic and ethnic diversity of residents and businesses.

I-084-023 The state needs to plan all transportation projects on the basis of guiding principles for Transit Oriented Develoment (TOD), smart growth and quality of live impacts. For example, TOD and land use are the planning and organizing focus of the South Coast Rail project, but

2

As stated in DEIR/EA Section 3.7, the Project will emphasize low-energy, low-impact, "green" design. The process for coordinating with the local communities during Project design is described in the Public Involvement Plan, Chapter 6 of the FEIR. Project mitigation measures required by the Secretary's Certificate on the DEIR/EA Certificate are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-084-004

DEIR/EA Sections 5.7, Noise, and 5.8, Vibration, describe the noise and vibration impacts, respectively, expected from the Project. Pursuant to FTA-established guidelines, these impacts have been identified and evaluated for moderate and severe impacts to sensitive receptors. FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments, describes the mitigation measures that would be implemented to eliminate, minimize, or offset impacts above regulatory thresholds.

I-084-005

As described in DEIR/EA Section 3.7, construction contractors will be required to comply with state regulations and local ordinances to mitigate air quality, noise, and vibration impacts. On-site resident engineers and inspectors will monitor all construction activities to ensure that mitigation measures are properly implemented.

I-084-006

The precise alignment for the Green line Extension tracks near the Brickbottom Artists Building and neighboring structures will be determined during preliminary engineering and final design. The Medford Branch tracks will be located as far from the building as possible, with a minimum clearance between building and tracks of about 15 feet. The

I-084-023 have been ignored in the Green Line extension planning despite the requirement by the Secretary to address these concerns in the EENF.

Courtney Croteau
7 Craigie Terrace
Somerville, MA 02143

Fitchburg Branch will be further from the building, with a minimum clearance between building and tracks of about 25 feet.

I-084-007

As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds. FEIR Chapter 8 describes specific proposed mitigation measures, plans for monitoring after construction, and next steps pertaining to mitigation. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-084-008

FEIR Section 8.1 discusses the plan for noise and vibration monitoring once the Green Line Extension is operational. As was done for the Greenbush Line, the MBTA will monitor noise and vibration after service starts to determine the actual noise levels caused by the Green Line Extension and the relocated commuter rail. If the actual levels are found to be higher than the projections, the MBTA will investigate the cause and take appropriate corrective action. It is worthwhile to note that when conducted for the Greenbush Line, projections were based on measurements of actual MBTA commuter rail trains. Measurements conducted after the Greenbush Line began operating showed that there were no locations where actual noise levels exceeded the pre-construction modeled levels.

I-084-009

Opportunities for a shared station between the Green Line Extension (on the Medford Branch) and MBTA Commuter Rail were evaluated for the Project. This connection was ultimately dismissed, as described in DEIR/EA Section 3.3, and Appendix B. While the potential for a joint

station at Union Square would need to be studied further, it is not currently part of the Proposed Project. A connection currently exists between the Green Line and Commuter Rail at North Station; this connection would remain. However, as the Project advances into preliminary engineering, opportunities for future additions and extensions of service will be considered.

I-084-010

The potential future electrification of MBTA Commuter Rail lines in the Study Area is beyond the scope of the Green Line Extension Project. However, the conceptual plans in the DEIR/EA and FEIR do not preclude future electrification of commuter rail.

I-084-011

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary’s Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT’s plans for public outreach in the next phases of the Project.

I-084-012

The DEIR/EA and FEIR include conceptual Project designs. Designs for each station, the storage and maintenance facility, and the entire project alignment will be refined during the Project's preliminary engineering stage. The process for coordinating with local communities during Project design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-084-013

The amount of bicycle storage at each station is based on ridership projections developed by CTPS. DEIR/EA Appendix D includes the methods CTPS used to analyze demand for bicycle parking. Detailed bicycle parking designs will be further developed during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

I-084-014

As stated at http://www.mbta.com/riding_the_t/bikes/, only folding bicycles are authorized on the existing Green Line. MBTA bicycle access policies will apply to the Green Line Extension. Secure bicycle parking will be provided at each Green line Extension station to promote convenient bicycle access.

I-084-015

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-084-016

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

I-084-017

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-084-018

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-084-019

To the extent possible, Green Line Extension stations will be designed

for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

I-084-020

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

I-084-021

Projects impacts on locally-owned businesses would be considered indirect and cumulative impacts. Anticipated indirect and cumulative effects the Project, including impacts on corridor transportation and traffic, growth, property values, land use, transit-oriented and economic development are described in DEIR/EA Section 5.15, Indirect and Cumulative Effects.

I-084-022

Socioeconomic impacts, including projected effects on businesses, jobs, tax revenues, and community disruptions, are described in DEIR Section 5.3, Socioeconomic Impacts. Effects on land use and transit access are discussed in DEIR Section 5.2, Land Use, and Section 5.15, Indirect and Cumulative Effects. A project workshop series will provide an opportunity to discuss broader impacts of the project on job creation, economic development, housing affordability, and other community impacts.

I-084-023

Direct and indirect impacts to land use are described in DEIR/EA Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for sustainable land use, which could further reduce automobile traffic congestion and improve air quality.

Re:
* Draft Environmental Impact Report/Environmental Assessment (DEIR/EA).
* Draft Section 4(f) Statement for the Green Line Extension Project.
* Additional Maintenance Facility Alternatives Analysis.

Dear Secretary Bowles:

I wish first to thank the Commonwealth for extending the Green Line into Somerville, a project long overdue. I believe that a Final Environmental Impact Report should be produced in order to deal with the following issues, among others:

I-085-001

1. The current DEIR does not present enough details about the stations' designs to allow readers to evaluate the stations' compliance with the Americans with Disabilities Act (ADA). This is a major concern, because the MBTA has been ordered by the courts to retrofit existing stations to meet ADA requirements.

I-085-002

2. The Executive Summary takes the position that the presence of the Green Line in Somerville will not increase economic activity, only change the location of infill development. The history of Harvard Square, Porter Square, and Davis Square suggest that this is short-sighted. The areas around all of these Red Line T-Stops enjoyed significant increases in property value and economic activity in the years after the Red Line came in.

Somerville has little undeveloped land, and much of the developed land is residential. Residential land is difficult to repurpose without disrupting the neighborhood. However, some of the proposed T-stops, such as the Lowell Street and Brickbottom stops, are near old industrial sites that could be easily converted into high-value office and R&D development. The MBTA should include in the Final EIR an assessment of the economic development potential of each proposed T-Stop, including the implications for each city's tax base.

I-085-003

3. The proposed Maintenance Facility should not be placed at Yard 8. In that position it would not only disrupt the lives of the Brickbottom residents, it would permanently cut off significant parts of the Inner Belt area and make economic development there very difficult, to the sure detriment of the Somerville tax base. Please consider placing the Maintenance Facility in a location detached from all future development, such as under the I-93 right-of-way. If this is not feasible, the Facility should be placed at the better of Option L and Mirror H (see #4).

I-085-004

4. The Maintenance Facility Alternatives Analysis presented by the T is significantly flawed.

a. Ability to Meet Project Schedule: The analysis gives a +1 to Yard 8 because design work has already been done. This is misguided for two reasons.

I-085-001

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. Designs for each station will be further developed during the Project's preliminary engineering stage. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. Specific design details and station elements will be further developed during preliminary engineering. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access. The process for stakeholder coordination during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-085-002

Direct and indirect impacts to land use are described in DEIR/EA Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for sustainable land use, which could further reduce automobile traffic congestion and improve air quality.

Socioeconomic impacts, including projected effects on businesses, jobs, tax revenues, and community disruptions, are described in DEIR/EA Section 5.3, Socioeconomic Impacts. Effects on land use and transit access are discussed in DEIR/EA Section 5.2, Land Use, and Section 5.15, Indirect and Cumulative Effects. As required by the Secretary's Certificate on the DEIR/EA, additional analysis of the socioeconomic effects of the maintenance facility alternatives are described in FEIR

I-085-004

First, it sets a bad precedent. The MBTA should have informed the community and listened to their response before making a decision as important as placing the Maintenance Facility at Yard 8. By this precedent, any project, no matter how poorly conceived, could be forced through simply by investing in design work before informing the community.

Second, this analysis assumes that the Brickbottom residents are complaisant, which they obviously are not.

I am not a lawyer or a Brickbottom resident, but it seems to me that if this issue went to court, the Brickbottom residents would have a strong case. They would have legal standing as direct abutters, they would be uniquely damaged by the Yard 8 development, and they would have opposed the development at every opportunity.

Statements I have heard in public meetings imply that the Brickbottom residents have already sought legal advice. If the MBTA went forward nonetheless, the residents would almost certainly go to court to block the development and would almost certainly win the case on its merits.
Yard 8 should be given a -1 for this reason. It would be very optimistic even to give it a 0.

b. Operational Impacts: According to the analysis, Option L (and Yard 8) would affect Pan Am Railway's operations, but only to the extent that the railway would have to start using the seldom-used, but existing, Yard 10 lead. This minimizes the operational impact of both, which should have 0 instead of -1.

c. Future Vision Transportation Access: According to the analysis, Option L provides a direct connection to the Union Square branch, which neither Yard 8 nor Mirror H provide. This is important for future transportation access. It has been proposed that the Union Square spur be extended through South Somerville to Porter Square, which along with the Medford branch would place a T-stop within a quarter mile of almost every part of Somerville, as well as parts of northeast Cambridge.
Option L should be given a +1 for this unique advantage.

The updated scores are:

* Yard 8 = -1
* Mirror H = -3
* Option L = +2

I-085-005

5. In public meetings I have attended as part of the Green Line Community Corridor process, a consistent theme has been apprehension that the Green Line extension would harm existing Somerville neighborhoods. To mitigate this problem, the MBTA should support public advisory committees for each T-Stop that could work with the T and residents to meet neighborhood concerns. Later, these advisory committees could also coordinate economic development around each T-Stop, as was done by the Davis Square Task Force after the Red Line came into Davis Square.

I-085-006

6. A long-standing problem with the Commuter Rail service is that the trains are diesel powered. Diesel engines produce large amounts of fine particulates that pollute the air in nearby, densely-populated neighborhoods, damaging the hearts and lungs of residents. Converting commuter rail trains to dual-mode diesel and overhead electric would significantly reduce this burden.

To support the Green Line Extension, the T is already required to erect pylons and catenaries. Please consider placing the pylons so that they will span both the Green Line and Commuter Rail tracks, or at the very least consider moving the Commuter Rail tracks to a location that would allow room for a pylon between them and the wall. Doing this would make

Chapter 2, Maintenance Facility Alternatives Analysis. A series of Project workshops will provide opportunities to discuss broader impacts of the Project on job creation, economic development, housing affordability, and other community impacts.

I-085-003

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-085-004

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-085-005

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-085-006

The potential future electrification of MBTA Commuter Rail lines in the Study Area is beyond the scope of the Green Line Extension Project. However, the conceptual plans in the DEIR/EA and FEIR do not preclude future electrification of commuter rail.

I-085-006 it much easier to add catenaries over the Commuter Rail tracks and electrify the Commuter Rail trains at a later date.

I-085-007 7. Many of the stations seem to be accessible only from one side of the street and thus do not adequately integrate with the adjoining neighborhoods. This has implications for ADA compliance as well as for conformity with urban design principles. Apparently this is because the standard station design consists of a large enclosed space at street level connecting to a center platform below. This large enclosed space would be very expensive to provide on both sides of the street.

A less expensive alternative design could consist of 2 columnar enclosures, one on each side of the street. Each enclosure could contain an ADA-compliant elevator surrounded by a stairway down to platform level. At platform level, these could be connected by a heated enclosure passing under the street. The heated enclosure could change to a semi-enclosure with infrared heating extending away from the street in both directions along the platform. This design would allow vulnerable riders to stay in the heated enclosure under the street and less vulnerable riders to move away from the center as more riders arrived.

I-085-008 8. Somerville and Medford are densely-settled inner suburbs, not sparsely-settled, car-oriented outer suburbs. The majority of the riders will be reaching the T-stops on foot. It is neither necessary nor appropriate to provide parking or extensive drop-off facilities for these T-Stops, particularly those not termini. The resources saved should be diverted to the Community Path and to neighborhood integration.

Despite my concerns, I feel that the Green Line Extension is an exciting development and I look forward to the day it is complete. Thank you for providing this opportunity to comment.

Sincerely,

David Dahlbacka

25 Hancock Street
Somerville MA 02144
home: 617-776-0945
cell: 617-852-3522
web: www.whyisthisimportant.net

I-085-007

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. Designs for each station will be further developed during the Project's preliminary engineering stage. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. Specific design details and station elements will be further developed during preliminary engineering. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access. The process for stakeholder coordination during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-085-008

The only Green Line Extension station that will provide parking is Lechmere Station. Drop-off and pick-up areas will be provided at at several stations. These will accommodate expected kiss-and-ride activity.

Johnson, Holly (EEA)

Email: Holly.S.Johnson@state.ma.us

Dear Secretary Bowles,

I am writing to comment on the DEIR for the Green Line Extension, EEA #13886. I live on West Street in Medford Hillside.

The College Avenue station would not serve my neighborhood. The Route 16 station would serve my neighborhood, and would have many more environmental benefits in reducing car traffic and reducing air pollution.

I-086-001 I am very disappointed with the decision in the DEIR to put a terminus at College Avenue for any length of time, with the decision in the DEIR to delay the extension to Route 16 to a later phase. Instead of serving Medford Hillside, these decisions will burden Medford Hillside with increased traffic congestion, increased pollution, and more years of construction impacts. These decisions are at odds with the requirement in the Secretary's Certificate to maximize the benefits of the project. Please reject this version of the DEIR and require MassDOT to build the full Green Line Extension to Route 16 by December 2014.

I-086-002

Thank you,
Maria Daniels
617-331-7331

1

I-086-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-086-002

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. The Proposed Project, with a terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Additionally, FEIR Chapter 4 includes a detailed description of College Avenue Station functioning as a terminal station.

Dear Secretary Bowles,

The Green Line Extension Project holds much promise. The people of Somerville deserve to have a considerate, [illegible] that enhances the potential for economic development within the Inner Belt and Brickbottom Districts and the rejoining of the neighborhoods already divided by the intrusion of the McGrath and O'Brien Hgwy access to Rt 93.

I-087-001 The placement of the Heavy Maintenance Facility and storage of 80 trolley cars (accommodating the ENTIRE Green Line, not just the Extention) in the Yard 8 location does NOT do that. As a resident artist at the Brickbottom Artists Building for 15 years I strongly urge a far more creative resolution to the placement of those entities than to put them directly by our community. All the citizens of Somerville deserve better.

Please give genuine, VISIONARY consideration to '…a complete analysis of both alternatives ' including Mirror Scheme H and Option L, that…'will be performed over the next several weeks.' (ES-22/23, 10-15-09).

I-087-002 I have a particular concern regarding the toxic brown fields within the entire Extension landscape, and the potentially severe health impact of the disruption of that soil. Before one piece of excavation equipment begins its work, I request that specific mitigation plans be presented, discussed with the communities involved, and IMPLEMENTED. In the Executive Summary (Hazardous Material and Solid Waste, ES-51) reference is made to 'Procedures should protect both workers and nearby receptors.' Would we, the people living in the area, be the 'receptors'?

I-087-003 Could the space required for 100 Green Line Extension employee cars be placed in a garage built to accommodate both the Commuter Rail Maintenance Facility and Green Line Extension employ parking on land already used for parking? This would then accommodate a realignment of the proposed Option L, to avoid dislocation of existing businesses in that area (inner Belt). It would also allow for a reconfiguration of the trolley storage area.

With due appreciation for the vast amount of work that has been done in preparation for the Green Line Extension, I do hope that the long term social, economic, and health impacts of the final decisions will reflect the best technology, thinking, planning, and execution that this new century can offer, and not the scattered remains of the last.

Regards,

M Susanna Darling
1 Fitchburg St #C505

617-625-7587

I-087-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-087-002

An analysis of hazardous materials potentially present within the Green Line Extension Study Area is provided in DEIR/EA Section 5.14, Hazardous Materials. Additional investigation may be conducted during the next phases of the Project to determine the nature and extent of any contamination and remediate any sites as appropriate. This work would be conducted in accordance with the Commonwealth's Massachusetts Contingency Plan requirements.

I-087-003

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, Option L is identified as the preferred maintenance facility site. Consideration of employee parking options for the Option L site maintenance facility will be made during preliminary engineering.

Reference to the Project EEA #13886

Dear Secretary Ian Bowles,

I want to thank you for encouraging residents of Somerville, Cambridge and Medford to state their opinions in regards to the Draft Environmental Impact Report, particularly the report on the Maintenance Facility and Storage Yard alternatives.

I-088-001

As a longtime Somerville resident of the Brickbottom Artist Buildings and parent of a 13 year old, who has grown up here, I am very concerned about the proposed Yard 8 site for the Maintenance Facility. I feel that it is unacceptable as it does not meet any of the three criteria developed by the City of Somerville (quality of life, transportation access, economic development) and would have severe negative impacts on my home and workplace – namely noise, vibration and pollutants. As a parent, my concern extends to the other families as well, especially those with children – who have a wonderful and unique upbringing here. I am in favor of more consideration of the Mirror H and Option L plans, which have been presented in recent open meetings. Both of these have merit and designs should be made available for public review and input as soon as possible. I feel that is very important that the community involvement continues, and that a project-wide advisory group should be maintained through construction and additional advisory groups should be created for each station for the design, land use and construction issues.

I-088-002

While I support the Green Line Extension to Medford and think it will have many positive outcomes for the three cities, I feel that the negative impact of the issues referred to above must be addressed, and look forward to the project's success and satisfaction for all those who will be affected as well as the benefits from increased public transportation, which is so needed as we look to the future of our cities, our communities, and our citizens.

Sincerely yours,

Deborah Davidson

I-088-001

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-088-002

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project. As stated in Section 6.4, MassDOT and the MBTA will convene a Green Line Extension Design Working Group. This group will advise the agencies on design workshops, participate in the workshops and serve as a corridor advisory group during design.

Subject: Green Line to Medford

I-089-001

Dear Secretary Bowles,
I strongly believe that the Green Line terminus at College Ave. does not satisfy the obligation by the state to the residents of Medford Hillside. This is not a compromise solution but rather a dramatic cutting back of an already scaled-back project. The alternative, a terminus at Rt. 16, as proposed by, among others, the MGNA would have a much better cost to benefit in terms of environmental impact and increasing ridership on the T. Please reconsider the parts of the DEIR that limit the extension of the Green Line to College Ave.
Regards
Marc Davidson
63 West St.
Medford

I-089-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-090-001

Please see Comment Letter I-002.

RECEIVED
JAN 8 2010
MEPA

Dear Secretary Bowles:

I-090-001

I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

I strongly support the Green Line extension, and urge that it be built in the most efficient and cost-effective manner – that is, to construct the entire project in one phase, with a terminus station at Mystic Valley Parkway (Route 16), by December 31, 2014.

For the following reasons, I strongly urge you to not accept the DEIR as the Final EIR and to require further environmental analysis of the project by MassDOT:

A two-phased approach is not the most efficient. The Route 16/Mystic Valley Parkway Station should be built as part of a single-phase project to minimize costs and negative impacts and achieve the maximum benefits with regard to ridership, vehicle mile travel reduction, air quality improvements, and service to environmental justice communities. The recommendation as outlined in the DEIR is for the Route 16/Mystic Valley Parkway station to be a **separate** stand-alone Phase II project with no funding source identified. **This means, the Route 16 station may never be built.**

Without a Route 16 Station, the College Avenue stop (designed and intended to be an **interim station**) would become the de facto terminus for the Green Line extension. It is not designed for a terminus and due to the traffic flow and neighborhood density, as well as the lack of opportunity for transit-oriented development at College Ave., it is not a good location for a terminus.

- **Cost.** The two-phased approach is fiscally irresponsible and by MassDOT's own estimates will inflate the cost by $55 million over a single-phase approach. Severing a single stop (less than one mile of track) from the project as a whole will cost the state, and thus the taxpayers, significant additional money.
- **Project Management.** There are significant efficiencies gained from completing the project in one phase, rather than the starts and stops required to execute on separate, multi-stage efforts for such a small add-on project as a single station stop.
- **Environmental Justice:** The environmental justice population cited, in part, to justify the project as a whole will largely not be served if the project terminates at College Avenue. The negative aspects of this project will affect them most, while they will receive the least benefit without service to a Route 16 terminus.
- **Legal Mandate:** The state is legally obligated to provide public transit services to Medford Hillside by December 31, 2014, and stopping the extension at College Ave. fails to meet this legal obligation. At a minimum, this incurs significant mitigation costs required if the obligation is not met.

The Route 16 station design is inadequate. The DEIR offers only a "worst case scenario" (MassDOT's description) for the Route 16 station design, while offering optimized

station designs for all other Green Line extension stations. The Route 16 station design must be revisited. The Medford Green Line Neighborhood Alliance, a volunteer citizen group, has offered an alternative station design that prevents two major commercial property acquisitions and the resulting job displacement, preserves $182,000/year in property taxes for the City of Medford, optimizes traffic flow and better serves the integrity of the station's surroundings. MassDOT apparently has been exploring similar improved designs, which should be presented to the public for comment. A $1 billion project deserves a higher caliber design than a "worst case scenario."

To summarize, there is much more work to be done on the Environmental Impact report, and I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis in order to make the Green Line extension the best project it can be, and MUST be.

Thank you.

Please see Comment Letter I-013.

January 6, 2010

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA #03886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-091-001 As a resident of the Glass Factory Condominiums, I am deeply concerned about the design and placement of the Green Line Extension and the new Lechmere Station.

TRACKS ARE TOO CLOSE TO OUR BUILDING.
The present design shows the tracks running very close to the rear of our building. We urge your designers and engineers to place the tracks as far to the rear of our building as possible to preserve views & light to the many units that will be severely impacted by the elevated tracks. The design and placement of the tracks and supports should do all it can to minimize the visual impact to those units and also minimize noise & vibration impacts to the whole building as well as the surrounding neighborhood.

LECHMERE STATION.
At present, your designs show the new Lechmere Station so close to the Glass Factory that it appears to be part of our condominium building. Please move the station closer to East Street, where it could be part of the entrance way to the eventual North Point development. The station design needs to be substantially improved so it is not an eyesore but rather an enhancement to this rapidly developing neighborhood. It should reflect the importance of this location as the gateway between Cambridge & Boston.

BUS TRAFFIC.
The many bus lines that converge on Lechmere Station are presently designed to enter at one end of our building, pick up passengers, and emerge at the other end of our condo building. Please do not route bus traffic, directly under our windows. Bus traffic noise, vibrations and fumes are a great concern. Sidewalks where passengers wait, should also be moved farther from our building to preserve our privacy and minimize impacts from noise, light and smoking. If too close, it will feel like we are living in the bus station.

PRESERVE OUR TREES & GREEN SPACE.
Presently there is a row of mature evergreen trees behind our building. I urge you to preserve all these trees and the entire small green space behind our building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks should be on the far side of the large trees. These trees serve as a natural screen for the tracks and busway.

MAINTENANCE FACILITY.
I strongly oppose the Mirror H location. It is much too close to the Glass Factory and other residential buildings and will effectively destroy further development in North Point. Putting a maintenance facility on prime land in a desirable, developable location that would generate significant tax revenue to Cambridge simply does not make sense. Of the three options proposed, Option L seems to be the best choice however I would prefer there be no maintenance facility in this area but rather it be at the end of the line.

REDUCE SURFACE PARKING.
The present Lechmere Station is at the end of the Green Line. That will no longer be the case with the new Green Line Extension and the number of parking spaces should be substantially reduced. Surface parking is bad urban design and should be minimized in the new North Point neighborhood. One half of our building will overlook the new parking and we request it be carefully designed with this in mind. Ample green space should be included in the design and all lighting should be down lighting that minimizes light pollution to our building.

Thank you for hearing my concerns.

Sincerely,

Signature

To: Fichter, Katherine (DOT)
Cc: Johnson, Holly S (ENV)
Subject: Fwd: Green Line Extension - 616-624 Boston Ave, Powderhouse Condos Green Line Extension Concerns

Note - apologies for the bounceback - I misspelled Ms Fichter's name.

Dear Secretary Bowles, Ms Ficher, and Ms Johnson,

I-092-001 This email (and forthcoming letter) is to express my concerns along with the other occupants at the Powderhouse Condos at 616-622 Boston avenue in Medford. The DEIR cannot be the final draft - it is too inadequate. I am asking by law that the MEPA process continue until a acceptable final draft with futher analysis has been completed.

My concerns are noted as follows:

I-092-002 Firstly, there are no proposed sound barriers at the Powerhouse complex. I can see one is to be setup on the other side of the tracks, how can only one side get this treatment? There trains will run approximately 20 feet or less outside our back door and having no sound barrier in place on our side of the track is unacceptable! I am not sure how the surveyors would overlooked this complex. Sound barriers absolutely need to be provided.

I-092-003 Secondly, the traffic at the Boston Ave/Harvard Street and Boston Ave/ Broadway Street intersections is bad enough as it is, therefore no parking should be built and allowed at the Ball Square station nor any other interior station. The current conditions cannot withhold any more traffic and this also undermines the purpose getting the local communities to use public transportation. Davis, Porter and Harvard Squares. Located closeby do not have dedicated parking facilities and these stations function very well.

I look forward to hearing from you.

Kind regards

Keelin Deasy

622 Boston Ave, Apt 7E, Medford, MA 02155.

::.Caoileann.::

I-092-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

I-092-002

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies. During preliminary engineering, MassDOT will conduct further analysis for several individual properties. As described in FEIR Chapter 8, MassDOT will then be able to identify the specific measures that will be appropriate for mitigating the Project's noise and vibration impacts.

I-092-003

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. Designs for each station will be further developed during the Project's preliminary engineering stage. With the exception of replacing the existing parking at Lechmere Station, no station parking is planned at any of the proposed Green Line Extension stations. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

To: Johnson, Holly S (ENV)
Subject: Greenline DEIR

Dear Secretary Bowles,

I am writing to you with comments about the DEIR for the Green Line Extension Project. I would ask that you not accept this draft statement as a final EIR and ask MassDOT to further analyze several points which I believe are incomplete.

I-093-001 1. I support the Greenline continuing all the way to Route 16 in one Phase and building it without a parking structure. I believe Route 16 is the best location for a terminus stop and would serve the largest number of people. The two phase process proposed seems likely to result in an incomplete project and is likely to cost significantly more than if it was completed in one step.

I-093-002 2. The present DEIR presents a station design for Route 16 which is titled as a "Worst Case Design". MassDOT has acknowledged that there are better designs available, but for some unexplained reason they are not contained in the DEIR. A better design which does not take large amounts of commercial property should be included in the Final EIR. There are several ways to do this and not evaluating them is unacceptable. An alternative design would maintain the tax commercial base of the city, reduce the cost of the project, and result in a better end product.

I-093-003 3. The proposed temporary use of College Ave as a terminus must be evaluated. Without any assurance that the second phase of this project will ever get completed we would be left with a terminus station in a location which is not appropriate, and which has not been planned for in the EIR. The present DEIR does not describe how College Ave would function as a terminus location or what the impact of this station would be. I live very near to this station and if it is going to be the terminus on either a temporary or (more likely) permanent basis, it should be planned and evaluated in that manner so that proper mitigation can be done.

I appreciate your consideration. Again, I would encourage you not to accept this DEIR as Final until these significant considerations are dealt with.

Thank you.

Christopher DesAutels
21 Knollwood Rd

I-093-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-093-002

All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-093-003

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch.

Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

Johnson, Holly (EEA)

The Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Ian Bowles,

Before 1950, the Brickbottom district of Somerville was a vibrant community of immigrants. It was a close-knit family atmosphere. Then the McGrath Highway overpass was built, and it choked off the neighborhood from the rest of the city. Slowly, the neighborhood died, and row houses gave way to warehouses and a garbage transfer station.

When I moved in to Brickbottom in 1994, the last remaining brick building from that era was still standing. Sadly, a few years later, it was torn down. Now the only reminder of the old Brickbottom district is a map that is hanging in the Brickbottom Artists building showing the names and locations of all the families that lived here.

This area is prime location, very near downtown Boston, and the City of Somerville would benefit from a revitalization. The Brickbottom Building was the pioneering step for this effort. The new Green Line Station will be the huge push that will set it in motion.

I-095-001

So why, on the cusp of a new vital era, would you needlessly put a maintenance facility so near where the growth potential lies? It makes much more sense to cluster the new facility near where the existing facilities are located.

As far as I can tell, the only justification for locating at Yard 8 is to make it easier for trains to pull in and out without having to back up. I am sure that there are engineers and planners salivating over this, and they will fight to the end to get it. But please scrutinize their arguments carefully. Is this advantage really worth al the mitigation and resistance that will be mounted against Yard 8? How much time do you really save if an off-line train can just pull in? Why is it so important to have this when backing up is standard practice in all the other facilities?

I am asking you to locate elsewhere for the benefit of Somerville. It just makes sense.

Please don't choke us, just when we are getting a real chance to breathe life in to this area.

Best Regards,

Tom Devlin
Brickbottom Building

I-095-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

RECEIVED
JAN 6 2010

Dear Secretary Ian Bowles,

I am writing in regards to the Project Number EEA #13886.

I have been a resident of the Brickbottom Artist Community for 21 years, part of the original group of artist that transformed a derelict A&P warehouse into a remarkable arts community that has greatly enhanced the cultural life of Somerville, and the entire Boston Arts Scene. Brickbottom has one of the longest traditions of "Open Studios" in the country and a Art Gallery that has proved itself an important venue in keeping the Arts alive in the greater Boston area.

I believe our extraordinary community is threatened by the "Yard 8" siting of the maintenance facility and storage yard immediately adjacent to Brickbottom's northeast façade. Brickbottom Artist Community, consisting of 3 buildings, is already surrounded by transit activity, with major commuter and freight lines rumbling by within a few feet of the buildings south facing façade. I have direct experience of how such proximity effects quality of life issues. We live on the second floor of the "Bakery", which is south facing. Trains from the Fitchburg line roar past us spewing toxic diesel particulates in the air and causing the entire building to vibrate. Immediately beneath our 44 foot expanse of windows, trains from the Boston Engine Terminal rail head, used by Amtrak, commuter rail and PanAm freight, shuttle back and forth and stop and idle outside our windows causing serious vibration and air pollution. The vibration is palpable and over time has caused every one of our 9 windows to have broken insulation seals. We can barely see out of them.

I-097-001 It is my understanding that the current DEIR has serious flaws. Noise and vibration measurements were only taken on the north side of Brickbottom and not on the south side where we are currently severely impacted by the existing situation. With the addition of the Green line extension into Union Square, the frequency of Green line train traffic will be added to this mix of noise , vibration and pollution. These measurements must be

I-097-002 taken. Exploration of sound and vibration mitigation on the south side of Brickbottom and changes in practices in use of the dead-end railhead by AMTRAK, MDOT and PanAm must be investigated. The number of Brickbotttom residences slated for soundproofing must be increased to include residences on the south facing façade. I believe all Brickbottoms's 220 residents will experience some diminution of their quality of life. Our property values will drop. Our health will be affected.

I-097-001

Potential noise and vibration impacts were assessed for the southwest facade of the Brickbottom Artists Building, which abuts the existing MBTA Fitchburg Commuter Rail line. Because the northeast façade represents the location of the building with a potential for more severe noise impact, findings for the southwest façade were not originally reported in the DEIR/EA. These findings have been included in FEIR Chapter 8. All noise projections take into account proposed changes to the topography of the alignment, including things such as retaining walls and grading.

During preliminary engineering, MassDOT will conduct further analysis for several individual properties, including the Brickbottom Artists Lofts. As described in FEIR Chapter 8, MassDOT will then be able to identify the specific measures that will be appropriate for mitigating the Project's noise and vibration impacts. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-097-002

Please see response to Comment I-097-001.

I-097-003

The "Yard 8" site will negatively impact commercial and residential development in the City of Somerville as it seeks to increase its commercial and residential tax base. Location of the maintenance and storage facility to Option L or Mirror H will help reduce some of the impact of locating all these facilities in the city of Somerville and certainly demonstrate respect and consideration to the residence of Brickbottom who pioneered development in this area of the city.

Sincerely,

Damien DiBona

RECEIVED
JAN 6 2010

3 January 2010

Dear Secretary Bowles,

As a member of the Brickbottom Artists Community with a lifelong affiliation with Union Square and its surroundings, I was thrilled to learn that the Green Line Extension was indeed intended to go forward in the near future. I can appreciate the myriad benefits the area will soon know, and look forward to seeing the related changes take effect, just as I hope the "genuine" Union Square (and points further) can be preserved.

I-098-001

Unfortunately, the coveted "T" stop comes hand-in-hand with a proposal to situate the necessary Maintenance Facility and Storage Yard in the so-called "Yard 8," directly adjacent to the buildings in which I live with my husband and 10-month-old child. We have felt blessed to have had our son in the same three-year-span as four other Brickbottom couples, as it promises playmates and companionship as he grows within this community. However, I am now haunted by the worry that a childhood here would be polluted by the light, noise, and exhaust that will be associated with the maintenance facility—and I am certain the other parents at Brickbottom feel the same.

In addition, my home here is my "office" (it should be taken into account that many of the residents of our buildings also work from home), so not only will my family and personal life be disrupted by the proposed positioning of the maintenance facility, but my livelihood, as well. This negates all benefits once offered by the Green Line Extension, and indeed makes me wish it would not happen, at all.

It has not yet been made clear to us as a community why the DOT is determined to marginalize the residents of the Innerbelt and Brickbottom areas of Somerville, and saddle our city with a facility it has clearly stated, on many occasions, it does not want. There are at least two other viable options for the positioning of the Maintenance Facility and Storage Yard, which would offer the DOT the resources that it needs without depleting a community of its will and ability to thrive, grow, and improve.

I appreciate your willingness to consider our position before proceeding further and humbly request you remove Yard 8 from your list of possible maintenance facility locations.

Best regards,

Rebecca Didier

I-098-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. RE: Green Line Extension Draft EIR (EEA #13886)

Dear Secretary Ian Bowles:

I am a resident of Somerville and use my bike and public transportation to travel around the city and into Boston. My work and much of my thinking is directed toward sustainable community development and community health. I am writing today to recommend that the Draft EIR be approved, with a few modifications.

I eagerly anticipate the extension's completion by December 31, 2014 and therefore hope design and construction proceed in a thoughtful manner with a few important changes. Some issues that I think are especially important include incorporation a meaningful public input process in all planning and construction phases, opposition to the Maintenance Facility site at Yard 8, the full integration of the Community Path into the extension process, a route 16 terminus, synchronization of bus routes with the new T corridor, investment in sufficient bike racks at all stations, and integration of green building techniques in newly constructed buildings and stations along the route.

I-099-001

I believe that community involvement is the only way to ensure a successful Green Line extension project. A project-wide Citizens Advisory Group should be maintained throughout the entire project, including detailed design, engineering, construction and start-up phases. Smaller local advisory groups should be established to work with the MBTA and consultants to address specific station design, land use, connectivity, and construction and mitigation issues.
Additionally, MEPA should require collaborative planning, with meaningful community involvement and public coordination that should intensify immediately, before this project progresses and require that senior project staff work out of a centrally located field office to maximize access. Community Corridor Planning is willing to work with state staff to assist with the creation of such advisory groups.

I-099-002

I am in strong opposition to the Maintenance Facility site at Yard 8.
I strongly urge you to eliminate this Option and to require Mass DOT to carry out a full analysis of the Option L alternatives and Option H for siting the Maintenance Facility. These other two options have much more support in the Somerville and Cambridge communities. Yard 8 is opposed by the cities of Somerville and Cambridge and has been vocally rebuked by community residents and business owners at numerous public meetings. It would impose an

1

I-099-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project. As stated in Section 6.4, MassDOT and the MBTA will convene a Green Line Extension Design Working Group. This group will advise the agencies on design workshops, participate in the workshops and serve as a corridor advisory group during design.

I-099-002

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-099-002 onerous transportation infrastructure burden on the city that would negatively impact quality of life and preclude economic development of Brick Bottom/Inner Belt. Placing such a structure in Yard 8 would not only negatively impact current residents and businesses, but it would put Somerville at a significant disadvantage for future economic development in this optimal area.

I-099-003 As a year-round bicycle commuter, I eagerly await the extension of the community path. The Community Path must be fully integrated into the design, planning, and construction of the Green Line extension. The Path exemplifies the Federal Transit Administration's new policy on bicycle/pedestrian access to public transportation recognizing the importance of maximizing multi-modal access. The DEIR should state specifically that the extension of the path will be designed by MassDOT as agreed to in February of 2009. It is essential that the Community Path and the Green Line extensions be built as one project.

I-099-004 The Mystic Valley Parkway / Route 16 terminus should be designed and constructed at the same time as the rest of the project.

I-099-005 I-099-006 Green Line station designs should effectively accommodate bus drop off and pick-up with much attention given to the ease of intermodal connections. Bus routes in Somerville must be aligned to optimize connections to Green Line stations simultaneous to the start of Green Line service. Community input must be gathered regarding the re-routing of bus lines and bus stops before this can happen.

I-099-007 The number of bike racks currently proposed does not meet the needs of the community. The number of riders in and around Somerville, and the increase in riders due to closer proximity to the new T stops

I-099-008 Lastly, it is imperative that the DEIR state clearly how the Maintenance Facility, Storage areas and stations will be sustainable structures. It is our belief that the environmental impact of extending the Green Line should also encompass the use of "green" technology that can be included in the construction of the new structures. This should include creating green roofs on all storage facilities, and utilizing renewable energy technology to power the buildings. Such technology, especially green roofs, will add insulation, sound proofing, mitigate stormwater issues and decrease the urban heat island effect, not to mention add to the asthetics of the area. One final note on creating green structures, the act of jumping on the "green revolution" bandwagon will also allow for a certain degree of bragging rights by the state and the MBTA. Let us be leaders for the Commonwealth, and maybe even the country in this regard.

Thank you for taking the time for considering my opinions. Sincerely,

Tai Dinnan
Somerville Resident

2

I-099-003

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-099-004

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-099-005

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-099-006

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

I-099-007

The amount of bicycle storage at each station is based on ridership projections developed by CTPS. DEIR/EA Appendix D includes the methods CTPS used to analyze demand for bicycle parking. Detailed bicycle parking designs will be further developed during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

I-099-008

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual designs. Detailed designs for each station, the maintenance facility, and the entire Project will be refined during the preliminary

engineering phase. As stated in DEIR/EA Section 3.7, the Project will emphasize low-energy, low-impact, "green" design. The process for coordinating with the local communities during Project design is described in the Public Involvement Plan, Chapter 6 of the FEIR.

AJ

January 1, 2010

Ian A. Bowles, Secretary
Executive Office of Energy and Environmental Affairs
MEPA Office
Attention Holly Johnson MEPA Analyst
EEA # 13886
100 Cambridge Street Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I would like to submit my comments regarding the Draft Environmental Impact Report/Environmental Assessment; I am a direct abutter to the railway in Medford and one of the Medford Advisory Group Members.

I would like to start out saying that I am not opposed to this project and that I believe in public transportation as well as improving the air quality for the region and Medford. I am the mother of three sons ages 23, 21, and 19, none of my sons has a car and utilize the public transportation system. My 23 year old has attended Salem State commuting by subway and commuter rail and works in the State Street area of Boston commuting via the Red Line, the 21 year old attended Ben Franklin Institute in Boston commuting by the Orange line, and had taken the Downeaster to visit friends at UNH and the 19 year old currently attends Middlesex Community College in Lowell commuting via commuter rail, they have also attended many sporting events and entertainment venues in Boston via subway. As you can see my family is very well versed in the public transportation options in our area and utilizes many of the options available to us.

I-100-001

I-100-002

I understand the legal commitment to under take such a project as this and believe that light rail access to Medford and Tufts University is a good thing. At the same time I am concerned that the my neighborhood and community will be greatly impacted with little benefit. The December 1, 2006, Certificate of the Secretary of Environmental Affairs letter on the Expanded Environmental Notification Form states: "The project should be designed to maximize benefits for local residents while preserving the integrity and character of existing neighborhoods." I do not believe that we have sufficient information or the correct information in this report to accept it as the final version. At a recent City Council meeting I attended DOT/EOT admitted that the information was only 10% complete and that more work needs to be done. I also believe that the numbers regarding air quality, noise and vibration and impact to the neighborhood are now incorrect as the commuter rail tracks have been reconstructed (raised) due to flooding and now the top of the trains are above ground exposing the neighborhoods to a higher level of diesel particulate matter, noise and vibration.

As I attended the advisory group and public out reach meetings I asked several times what impact the on air quality would this project have on the abutters and I was told none that the Green Line trains were very clean. When I asked why the foliage along the current rail line was dying I was told that this was a natural progression. I did not know that trees in a healthy environment had a

I-100-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

I-100-002

The Green Line Extension will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality. As required by the Secretary's Certificate on the DEIR/EA, the FEIR includes a narrative clarifying the relationships of air quality modeling data to MassDEP and EPA requirements for State Implementation Plan (SIP) consistency. Additionally, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors.

life span of only 10 years. When I challenged this answer by saying that moving the commuter rail closer to the neighbors would have no impact, I was then told that yes there was some impact and that maybe we could get filters installed on the trains. Imagine my surprise that the trains did not already have these filters installed, I spoke to Mayor Mc Glynn and I believe that the trains now have the filters installed but for how long as the DOT/EOT has repeatedly stated the commuter rail does not fall under their control. These reports also state that the commuter rail trains will be 50 feet from the neighboring houses I believe that this is an incorrect statement. Although I do not have the sophisticated equipment the state has my little tape measure has the commuter rail tracks at forty feet from my property currently and moving them 13 to 18 feet toward my property will put them inside the 50 feet in the studies.

I-100-003

I would like to call to your attention a report "The Massachusetts 2002 Diesel Particulate Matter Inventory" issued by Massachusetts Department of Environmental Protection, September 2007, page 1, paragraph 1.2 Health Effects of Diesel $PM_{2.5}$ states:

"Exposure to PM has been causally linked with increased mortality from cardiopulmonary diseases and lung cancer. Studies show that heart attacks may be linked with very brief exposures of less than 24 hours. Other health effects include lung damage, respiratory distress, and exacerbation of bronchitis and existing allergies. Population groups that are especially susceptible to the health effects associated with PM exposure include the elderly, children and people with existing heart disease, lung disease and diabetes."

"In Massachusetts, $PM_{2.5}$ is also a serious public health concern because it is thought to be associated with the state's high rate of asthma.[3] The Asthma Regional Council, in the most comprehensive examination of asthma in New England to date, recently found that one in ten children in Massachusetts has asthma.[4] Children are more vulnerable to air pollution than healthy adults because their respiratory systems are still developing and they have a faster breathing rate. Other factors that may also increase vulnerability to pollution-related effects include reduced access to health care and specific exposure pathways, such as the proximity of residences to PM sources (e.g., roadways and construction sites)."

I-100-004

Now I must share additional personal information that I would prefer to keep private but in the best interest of my neighbors and my family I am compelled to include. I am a breast cancer survivor who has had a mastectomy, after I had surgery I had a very difficult time healing, my doctors repeatedly asked me if I smoked to which I replied that I have never smoked. They could not explain why I was not healing and told it was very puzzling as my overall health appeared good. Recently I was diagnosed with asthma, after repeatedly going to my doctor with complaints of not being able to breathe and now have two inhalers (Advair and Albuterol); while I am not saying that the commuter rail is the cause of my health woes I do wonder if they have exacerbated my conditions. Again I have no proof that this is the case but after reading the above mentioned report it does make me wonder.

As to the claim of improvements in the regional air quality - This may improve at the expense of my community as people from other communities drive through Medford to access the Green Line instead of taking transit options already available to them.

I-100-003

The effects of moving the diesel commuter rail trains closer to homes was evaluated in the DEIR/EA. As stated in that document, in the vicinity of Charnwood Road, the commuter tracks are not expected to be within 50 feet of houses, although they would be less than 50 feet from the property line as the commentor observes.

I-100-004

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

I-100-005 I believe that tunneling options should be explored to a greater extent and believe that it is very short sighted to be looking at Mystic Valley Parkway/Rte 16 as the terminus, with the tunneling option eventually the terminus could be Arlington Center, Lexington Center or even the Anderson Station in Woburn were there is plenty of parking and room for a maintenance facility North of Boston. A terminus at the Woburn location would ease traffic on Rte 93 thus improving the air quality for the overall region without impacting the community and the health and well being of my neighborhood. We had several people from the Tunnel Workers Union come to speak about the innovations that have been made over the years and how if it is done right the neighborhoods would not even know they were there. I am disappointed that the report has come up with cost tunneling but did not provide a cost breakdown. I would have like to see what the actual cost of recent and ongoing projects such as the Deer Island Tunnel and the tunneling project in South Boston that the tunnel workers mentioned at several meetings included in the DEIR.

I-100-006

I-100-007 I also want to reinforce the City of Medford's assertion that this report does not sufficiently identify the impacts on property and businesses in our city. Our City is largely residential with pockets of commercial areas, many of the businesses are small family owned that have been around for a long time. There may not be other locations in our community to accommodate date them. During re-construction of bridges traffic will be re-routed making it difficult to access these businesses and once completed the Hillside business area will lose several parking spaces.

I-100-008 It was very disheartening to hear at the same City Council meeting that when questioned about the number of jobs and tax dollars lost DOT admitted that there were some mistakes in the report. How are we to trust the rest of the information is accurate or did we just not ask the right questions to get the true impact of this project as in my question above concerning the air quality impacts of the project to abutter it was only when I specifically asked about the effects of moving the commuter rail closer to the abutters that DOT conceded there would be an impact.

This is the first time I have participated in a process such as this, I do not understand how MEPA can sign off on a project that is only 10% completed and brings a known carcinogen as sited in your own report listed above closer to the population.

Best Regards,

Rita Donnelly

Rita Donnelly
35 Charnwood Road
Medford, MA 02155
Tel. 781-391-4601
Email: radonnelly28@aol.com (home)
rdonnell@lytron.com (work)

I-100-005

Tunneling alternatives were evaluated but dismissed, as described in DEIR/EA Appendix B, Section 7.

I-100-006

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

I-100-007

DEIR/EA Chapter 6 and FEIR Chapter 8 list the traffic and parking measures to which MassDOT has committed to mitigate impacts. These mitigation measures address pedestrian and roadway traffic signal improvement needs, impacts during construction, and parking enforcement coordination. These measures will be further advanced during preliminary engineering.

I-100-008

The Green Line Extension will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality. As required by the Secretary's Certificate on the DEIR/EA, the FEIR includes a narrative clarifying the relationships of air quality modeling data to MassDEP and EPA requirements for State Implementation Plan (SIP) consistency.

Subject: Green line extension in Somerville

Dear Ms. Johnson:

I wanted to write to you to express my support for the Green Line extensions through Somerville. I understand that there is some question regarding funding. As you know, Somerville is a very densely populated city that is also in the midst of a major commuter path into the city. Extension of public transportation has a number of long-term benefits. Not only does it serve to ease traffic congestion, it also encourages the reduction of greenhouse gas emissions, thus contributing to the amelioration of global warming and reducing American dependence on foreign oil. Further, it can foster a sense of community among residents of the Boston metro area.

As a former resident of Cambridge and a current resident of Arlington, I am a big fan of any improvements to the public transportation system that will enable me to leave my car at home, or to spend more time driving and less time idling in backed up traffic.

A recent STEP mailing has also alerted me to some issues with the current implementation plan. Please remember to listen to the residents of the neighborhoods where these improvements are being made. They are the people most directly impacted by the construction and long-term designs of your improvements and I believe they can best speak to how these improvements can be made. It's not enough to simply extend a rail line: the Green Line needs to be well integrated with other parts of the public transportation system and bike and commuter paths. Only a well-design system will actually encourage people to leave their cars at home or give them up altogether. I-101-001

I also hope that you and the other members of the planning committee will resist the temptation to look only at short-term solutions and consider how you make this part of the T scalable for the long term. I-101-002

Thank you for your service to the citizens of the Boston metro area. I trust that you will continue to devote your energies and attention to creating a solution that best serves the public good.

Sincerely,

Frances Donovan
7 Bates Road #4
Arlington, MA 02474

I-101-001

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. Boston, MA 02114

Dear Secretary Ian Bowles,

I am writing about the Draft Environmental Impact Report on project EEA #13886.

I-102-001

A maintenance and storage facility placed at Yard 8 will damage the environment of the residents of Somerville, who already absorb a disproportionate percentage of transportation infrastructure for metropolitan Boston.

Here at 1 Fitchburg Street our environment will be bombarded with yet more noise, more vibration, more artificial light, and more pollution from facility workers' cars and maintenance vehicles.

Option L and Mirror H at least would not be placed directly next to a vibrant community of 200 people, including a number of families with young children, my own family included.

The residents of Somerville must be listened to, in our unanimous opposition to the placement of this facility at Yard 8.

I-102-002

Regarding the environmental impact of the Green Line extension, a tunnel taking the trains underground, out of sight and decreasing the noise and vibration impacts on residents, should be seriously considered. Somerville is a dense urban area which, like most other areas of it same density, needs more, and more convenient, public transportation. However, Somerville deserves not more trains seen, heard, and felt by residents 20 hours a day, but landscaped open spaces like those created above the Big

I-102-001

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-102-002

Tunneling alternatives were evaluated but dismissed, as described in DEIR/EA Appendix B, Section 7.

I-102-002 Dig in Boston; spaces that can improve our physical environment instead of decreasing our quality of life.

I-102-003 1) Prior to any construction , mitigation should be planned and constructed for the light, noise, air, and vibration pollution that will ensue.

I-102-004 2) The Community Bike Path must be fully planned and should be completed
I-102-005 along with plans for the Green Line Extension. Access from Brickbottom Studios should be planned & constructed, as another alternative to mass transportation. There are many daily bicycle riders at Brickbottom, who would use this access.

I-102-006 3) There is a vague reference to a land taking at the South end of Brickbottom. As this "need" is vague and unsubstantiated, it's hard to know what it refers to. Any plans for any land takings must be fully described and the reasons given.

I-102-007 4) Community involvement is key to the success of this project. The DEIR does not include a CAC to be established. This should be a given. MassDOT has systematically avoided this issue. An example is the community opposition to Yard 8, which has been unanimous since the beginning of the project. Yet MassDOT has included Yard 8 option in the DEIR. It is another example of stonewalling on this important issue, and a source of mistrust by the community in MassDOT's ultimate intentions.

I-102-008 5) Be clear on this: Yard 8 is unacceptable. Decouple the timeline for completion of the Green Line Extension from the building of the Maintenance Facility wherever it is sited.

I appreciate your continued serious consideration of alternatives to Yard 8 and to building a transportation infrastructure that will not only help thousands of people each year, but hundreds of Somerville residents every day.
The use of existing rail lines for this Extension is understandable, yet it must be done in a way that will improve the quality of life, not damage that quality of life. Forward looking design, using the latest technology is needed, not the easiest solution without regard to the Communities through which this project runs. There are precedents. Japan and Sweden have built quiet forward looking rail design. Why can't MassDOT do the same?
Sincerely,

David H. Douglas
1 Fitchburg St. B454
Somerville, MA 02143
vidlsm@mindspring.com

I-102-003

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

I-102-004

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-102-005

MassDOT is committed to completing all planning, design, and engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community Path between Lowell Street and Inner Belt Road. MassDOT is not able at this point to commit to funding the construction of the Community Path. The limits of the path were predicated on the connections to Lechmere being made through the Inner Belt area via Inner Belt Road and the proposed Urban Ring Bridge into the Lechmere area. However, the cessation of planning for the Urban Ring Project has changed the timing of this anticipated connection. MassDOT is unable to assume responsibility for designing the Urban Ring Bridge as part of the Green Line Extension Project. That being said, MassDOT is committed to working with the City of Somerville, residents and businesses in the Brickbottom and Inner Belt neighborhoods, and Community Path advocates to design the Path to create improved connectivity within the

Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension.

I-102-006

DEIR/EA Section 5.2 describes the Project's potential acquisitions. MassDOT is currently conducting detailed property surveys to obtain more specific data. MassDOT will continue to evaluate opportunities to minimize these property impacts.

I-102-007

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-102-008

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-103-001 I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

First of all, I strongly support the Green Line extension, and urge that it be built in the most practical, beneficial and cost-effective manner – that is, to construct the entire project in one phase, with a terminus station at Mystic Valley Parkway (Route 16), by December 31, 2014. The DEIR is encouraging in that it concludes that the Route 16 station would provide the most benefits according to all project criteria, including air quality and environmental justice.

However, MassDOT states that it is incapable of building (and funding) the entire "Preferred Alternative," so it only intends to build the extension to College Avenue in the Tufts University area of Medford, by its deadline of December 31, 2014.

In my opinion, the DEIR as currently written does not serve the best interests of the project. More importantly for your review, it was not done in a way that "adequately and properly" complies with the state environmental regulations, nor with the December 1, 2006 MEPA certificate that defined the requirements of the DEIR.

For the following reasons, I strongly urge you to not accept the DEIR as the Final EIR and require further environmental analysis of the project by MassDOT:

1. A two-phased approach is unacceptable. The Route 16/Mystic Valley Parkway Station should be built as part of a single-phase project to minimize costs and negative impacts and achieve the maximum benefits with regard to ridership, vehicle mile travel reduction, air quality improvements, and service to environmental justice communities.
The recommendation as outlined in the DEIR is for the Route 16/Mystic Valley Parkway station to be a **separate** stand-alone Phase II project with no funding source identified. **This means, Route 16 may never be built.**
There are many, many problems with the Phase II approach, including:
• **Risk.** Without an identified funding source there is a very high probability that Route 16 will never be built and the implications of this are critical.
• **Terminus Impact.** Without a Route 16 Station, the College Avenue stop (designed

1

I-103-001

Please see Comment Letter I-002.

and intended to be an **interim station**) would become the de facto terminus for the Green Line extension. It is not designed for a terminus and due to the traffic flow and neighborhood density, as well as the lack of opportunity for transit-oriented development at College Ave., it is not a good location for a terminus.

- **Cost.** The two-phased approach is fiscally irresponsible and by MassDOT's own estimates will inflate the cost by $55 million over a single-phase approach. Severing a single stop (less than one mile of track) from the project as a whole will cost the state, and thus the taxpayers, significant additional money. There are obvious ways to easily reduce costs in the overall project and provide enough additional funds to include Route 16 as part of a single, complete project. This is the most prudent approach, and also would ensure that the project produces the air quality improvements the Commonwealth must achieve to come into compliance with the Clean Air Act.
- **Project Management.** There are significant efficiencies gained from completing the project in one phase, rather than the starts and stops required to execute on separate, multi-stage efforts for such a small add-on project as a single station stop.
- **Environmental Justice:** The environmental justice population cited, in part, to justify the project as a whole will largely not be served if the project terminates at College Avenue. The negative aspects of this project will affect them most, while they will receive the least benefit without service to a Route 16 terminus.
- **Legal Mandate:** The state is legally obligated to provide public transit services to Medford Hillside by December 31, 2014, and stopping the extension at College Ave. fails to meet this legal obligation. At a minimum, this incurs significant mitigation costs required if the obligation is not met.

2. College Avenue should not be a terminus. The College Avenue station is not designed for the additional requirements of a terminus. The neighborhood cannot sustain the impact of a terminus station operations and traffic volume and the potential environmental damage is of serious concern.

3. The Route 16 station design is inadequate. The DEIR offers only a "worst case scenario" (MassDOT's description) for the Route 16 station design, while offering optimized station designs for all other Green Line extension stations. The Route 16 station design must be revisited. The Medford Green Line Neighborhood Alliance, a volunteer citizen group, has offered an alternative station design that prevents two major commercial property acquisitions and the resulting job displacement, preserves $182,000/year in property taxes for the City of Medford, optimizes traffic flow and better serves the integrity of the station's surroundings. MassDOT apparently has been exploring similar improved designs, which should be presented to the public for comment. A $1 billion project deserves a higher caliber design than a "worst case scenario."

To summarize, there is much more work to be done on the Environmental Impact report, and I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis in order to make the Green Line extension the best project it can be, and MUST be.

Thank you.

"One thing I want to be very clear about: I have recommended to the Governor ... I'm putting a report together for him that I'll send him as I'm leaving office ... I'm very clear, that the Green Line extension really doesn't make any sense unless it goes to Route 16. I think it has to go to Route 16 and we've got to find a way to make it go to Route 16."
outgoing Secretary of Transportation James Aloisi, October 29, 2009.
http://blip.tv/play/AYGq91kC (seventeen-second comment at 9:58 - 10:15)

Dear Secretary Bowles:

The Draft EIR that MassDOT has submitted is not satisfactory. It fails to meet the minimum requirements for the Draft EIR and surely cannot preclude the need for a Final EIR. Notwithstanding being nearly a year overdue, the Draft EIR has glaring holes in it and MassDOT must be required to complete this critical planning document, either with a Final EIR or by supplementing or amending the Draft EIR prior to approval as an EIR.

Inadequacies in the DEIR abound and I trust others will collectively cover most, if not all of them. My objections are in three areas:

I-104-001

1) **The Green Line Extension described in the DEIR does not meet its legal obligation to provide service to Medford Hillside by the end of 2014.** One can label a station at College Avenue "Medford Hillside", but it *still is not* Medford Hillside. One can claim that the catchment area for a station stop is a radius of a mile or some other arbitrary size, but too many people farther away than about a third of a mile are going to drive, rather than walk, and once they get into their cars, they will probably drive to their destination rather than to the station. One can insist that the final Route 16 leg, which does, indeed, serve Medford Hillside, will be constructed at some later date, but unless that later date is prior to the end of 2014, the obligation to serve Medford Hillside by 2014 has not been met. In the pages that follow, you will find a graphical demonstration of what does and does not constitute Medford Hillside.

I-104-002

2) **The DEIR, in its current form, fails to meet the requirements of the 2006 EENF Certificate in that it does not demonstrate satisfactory analysis of the Route 16 Terminus Alternative as the Certificate mandates.** Scant effort seems to have been made to develop a viable option for a terminus at Route 16. Inadequate assessment has been made of the negative consequences of postponing the Route 16 Terminus until a decade later or, more likely, neglecting to ever to build it. The DEIR includes land takings of substantial commercial properties resulting in inflated build costs and diminished tax revenue despite the existence of practical alternatives that avoid the takings. These takings demonstrate superficial, if any, effort to advance a workable design for a Route 16 terminus. The DEIR reports the tax losses caused by the takings but fails to report the offsetting tax revenue *increases* the city would enjoy from elevated values for properties that are *not* taken. Later in this document is a drawing of an alternative track alignment – one which eliminates the need

I-104-003

I-104-001

As directed by the Secretary's Certificate on the DEIR/EA, the FEIR includes a limited scope of issues related to the Green Line Extension Project. The Proposed Project, with a Medford Branch terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Although an extension to Mystic Valley Parkway/Route 16 is MassDOT's Preferred Alternative, financial constraints prohibit the Commonwealth from progressing the Project beyond College Avenue at this time.

Since the release of the DEIR/EA, a few stakeholders raised concerns that the proposed College Avenue Station, serving as a terminal station for the Proposed Project, would not adequately serve the Medford Hillside neighborhood. Serving this neighborhood was identified as part of the SIP description. To address and resolve these concerns, CTPS prepared a memorandum demonstrating that the College Avenue Station location does adequately serve the walk market area for the Medford Hillside neighborhood. This memorandum is provided in Appendix C of the FEIR.

I-104-002

All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can

I-104-003

to take two of the three commercial properties that are threatened by a Route 16 terminus. This track alignment was developed by a citizens' group working independently of EOT / MassDOT but with design guidelines provided by EOT. Had adequate analysis of a Route 16 terminus been done as required by the EENF, MassDOT would have discovered a similar track configuration and included it in the DEIR instead of the one they did include.

I-104-004

MassDOT has described the design for the Route 16 terminus as "worst case" and stated that they have been exploring a design that is similar to the alternative that avoids the commercial takings. This effort must be taken to its conclusion and included in the EIR.

I-104-005

3) **In its preparation for the DEIR submission, EOT neglected to adequately consider the concerns of the affected communities.** EOT did expend substantial time and effort in community outreach and met with many citizens' groups. However, there is precious little evidence that they acted on input from the public except in cases where the opinions they heard supported a conclusion that they had already arrived at. They left unanswered the questions in a June 11, 2008 letter from a four-member Massachusetts Legislative Delegation representing the areas surrounding the Route 16 station (Sen. Jehlen, Rep. Sciortino, Rep. Garballey, Rep. Donato). Meanwhile, EOT squandered precious time and resources exploring an outlandish tunneling proposal that was clearly and obviously outside the scope of the project. They claimed local opposition in order to discontinue consideration of a Winthrop Street station. The opposition to a Winthrop Street station was muted at its loudest. They silently ignored nearly fifty pages of research on the extent of Medford Hillside neither offering rebutting evidence nor raising questions of relevance. This research was submitted in conjunction with a public comment to the 2008 SIP and their response was essentially, "Well, that's your opinion." More recently, in the summer of 2009, they were unable to find time to meet with a citizens' group that was attempting to identify more fiscally-conservative design options for Route 16. The citizens' group subsequently independently developed an alternative alignment using information previously provided by EOT and following accepted design principles.

Please see the supporting materials and related attachments on the following pages concerning these three inadequacies in the DEIR.

I-104-006

Nearly a year ago I was pleasantly surprised to learn that EOT had concluded that Route 16 was the preferred terminus for the Green Line Extension. I was relieved that courage, wisdom and foresight had prevailed over parochialism, fear mongering and ennui. MassDOT needs the opportunity to repeat EOT's success of a year ago. Please do not accept the DEIR as it is currently written, in particular, with a terminus (even a temporary one) at College Avenue, as the Final EIR.

Regards,

John Roland Elliott
34 Emery Street
Medford, MA 02155-5307

be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-104-003

Socioeconomic impacts, including projected effects on businesses, jobs, tax revenues, and community disruptions, are described in DEIR/EA Section 5.3, Socioeconomic Impacts. Effects on land use and transit access are discussed in DEIR/EA Section 5.2, Land Use, and Section 5.15, Indirect and Cumulative Effects. As required by the Secretary's Certificate on the DEIR/EA, additional analysis of the socioeconomic effects of the maintenance facility alternatives are described in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. A series of Project workshops will provide opportunities to discuss broader impacts of the Project on job creation, economic development, housing affordability, and other community impacts.

I-104-004

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

Supporting material regarding inadequacies in the DEIR

1) College Avenue at Boston Avenue is not Medford Hillside.

EOT and later MassDOT has repeatedly asserted that "Medford Hillside" is an inconsistently-defined term and that opinions differ as to what is and is not included in "the Hillside". They have insisted that not only does a station at College Avenue and Boston Avenue *serve* the Hillside but that such a location *is* the Hillside. That claims is in contradiction to more than a century of history.

The attached document, *In Search of Medford Hillside 1891-2008*, locates Medford Hillside well north of College Avenue and closer to Mystic Valley Parkway / Route 16. Here is the table of contents for the document:

Pages	*Section*	*Abstract*
2-5	*Historical Maps from the Medford Public Library Map Collection.*	Places named Hillside are consistently at Winthrop Street or north of it.
6-7	*Modern Maps from the Medford Public Library Map Collection.*	One map showing Medford Hillside north of North Street; one showing Medford Hillside between College Avenue and Winthrop Street northeast of Boston Avenue.
8-11	*Historical Excerpts from the Medford Public Library General Reference Holdings.*	A definition of Medford Hillside as the northwesterly slope of College Hill. Mention of Winthrop Street and North Street as the two "rangeways" through the Hillside territory. Mention of Capen Street, Quincy Street, 286 Boston Avenue (all north of Winthrop) and Harold Street and Pinkham Road (both north of North Street) as Medford Hillside.
12-16	*Germane Content from Various Government Agencies.*	Excerpts and maps from the EOT's Beyond Lechmere Study; data and maps from US Geological Survey (USGS) Geographical Names Information System (GNIS); a map from EPA; all showing Medford Hillside situated north of Winthrop Street and closer to North Street than to Winthrop.
17-19	*Contemporary Photographs of locations with "Hillside" in their names.*	Seven photos of landmarks and businesses, all at, or north of Winthrop Street.
20-34	*Modern Maps from Internet Mapping Web Sites.*	Ten maps, all supporting placement of Medford Hillside north of Winthrop Street. A map showing the locations of 127 Hillside businesses, churches and organizations clustering north of Winthrop Street. A table of those businesses with distances from each to a possible station at Mystic Valley Parkway, Winthrop Street and College Avenue. Average distance to College Avenue is roughly twice either Winthrop Street or Mystic Valley Parkway.
35-44	*Newspaper References (Articles, Obituaries, Real Estate Transactions, Classified Ads) Locating Medford Hillside.*	37 excerpts from newspapers from 1889 to 2006 mentioning neighborhood streets and overwhelmingly placing Winthrop Street as the de facto southern boundary of Medford Hillside.

I-104-005

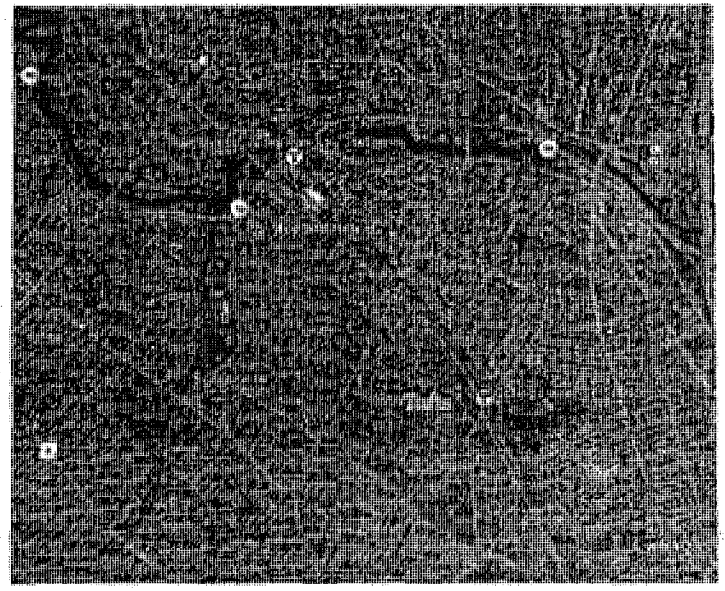
In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-104-006

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

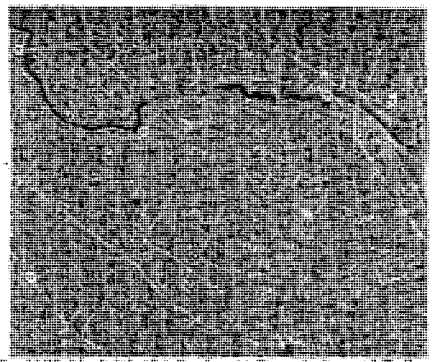
Supporting material regarding inadequacies in the DEIR

Consolidation of information from the sources in that document results in the following:

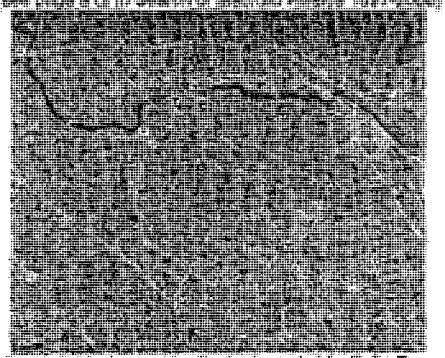


- Locations of businesses that self-identify as serving Medford Hillside (see pages 22-27 in *In Search of Medford Hillside 1891-2008*)
- Locations of addresses mentioned in conjunction with Medford Hillside in historical references and newspaper clippings (see pages 10-11 and 35-44 in *In Search of Medford Hillside 1891-2008*)
- Approximate location of Medford Hillside according to a majority of Internet mapping resources (see pages 15-16, 20, 27-32, 34 in *In Search of Medford Hillside 1891-2008*)
- Location of Medford Hillside Station c. 1900 (see pages 2-3, 5 in *In Search of Medford Hillside 1891-2008*)

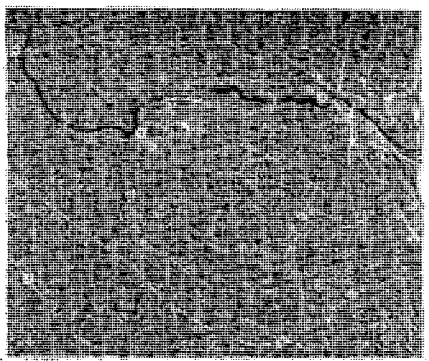
MassDOT correctly observes that opinions differ on the precise boundaries of the Medford Hillside. However, as shown in the following four drawings, sources that put boundaries on the Hillside consistently *exclude* the site where MassDOT intends to locate the terminus, and which they have variously called College Avenue or Medford Hillside or a combination of the two.



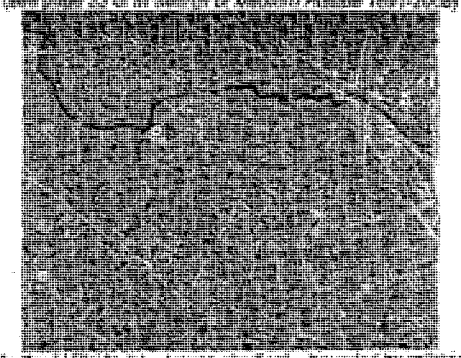
Medford Hillside (pink shading) – northwest slope of College Hill
per The Medford Historical Register Vol. XX 1917, p.5
(see page 8 of *In Search of Medford Hillside 1891-2008*)



Medford Hillside (green shading) – bounded by Tufts Campus
per Boston Herald Sep 2, 2005 page 43
TUFTS NEIGHBORHOOD MAKES GRADE
(see page 36 of *In Search of Medford Hillside 1891-2008*)



Medford Hillside (yellow shading) – bounded by Winthrop Street
per NeighborhoodScout.com
(see page 33 of *In Search of Medford Hillside 1891-2008*)



Medford Hillside (chartreuse shading) – bounded by railroad
per Dee Morris "Medford: A Brief History",
Chapter 8, "Medford Hillside"
(not included in *In Search of Medford Hillside 1891-2008*)

Supporting material regarding inadequacies in the DEIR

2) The DEIR does not represent adequate analysis of the Route 16 Terminus Alternative.

In the two years leading up to the DEIR, EOT went through several iterations of configurations for the Route 16 terminus. Unfortunately, at least from the standpoint of impact on existing revenue-generating commercial property, the designs got progressively worse over time and culminated with plans to acquire properties at 200 and 222 Boston Avenue, increasing the initial build cost, negatively affecting the employment situation for hundreds of people and reducing Medford's tax base. This intent was first revealed in June 2008 and, though perhaps not downplayed, the radical change was discovered through the scrutiny of the alert public – EOT made no announcement that these properties were at risk. The intent to take these properties survived into the DEIR despite more than a year to arrive at a design that preserved the threatened properties.

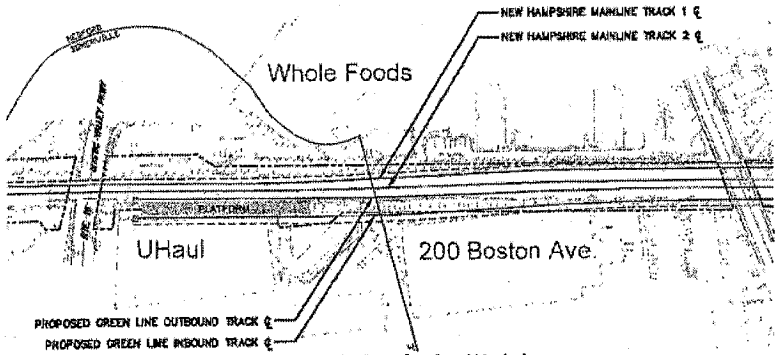
It is easy to envision a track alignment that conforms to accepted design practice but avoids radical impact on the properties previously mentioned. At the November 17, 2009 Medford City Council meeting, MassDOT / VHB personnel indicated that they have, indeed, been exploring such a configuration but that it was not complete. MassDOT has, on several occasions, described the configuration that they included in the DEIR as "worst case" from the perspective of land takings in the Route 16 area.

With an admittedly-suboptimal design in place and a better design underway but incomplete, MassDOT should be required to explore this critical piece further before they are released from the obligation to produce an FEIR.

As background to this whole discussion, consider the sequence of drawings that appears on the following pages.

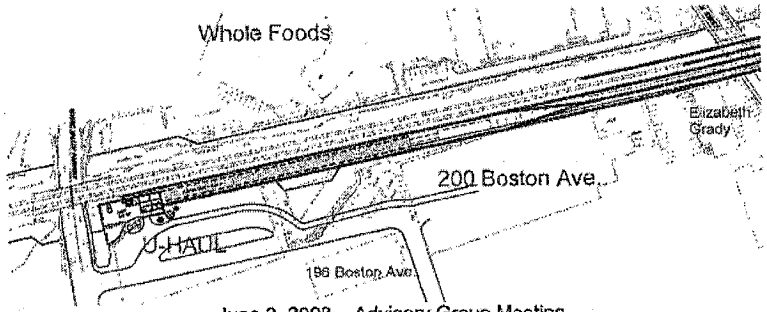
Supporting material regarding inadequacies in the DEIR

The track alignment presented at the February 6, 2008 Station Workshop conducted by EOT (http://www.greenlineextension.org/currentmaterials.asp?area=mls *Workshop Summary (2/6/08)*) shows track placement that 1) successfully avoids commercial properties at 200 and 222 Boston Avenue and 2) seems to have been chosen to preserve the bridge at North Street. It does so by moving the tracks to the north-east (the top of the drawing) and spacing them to avoid the existing bridge supports.



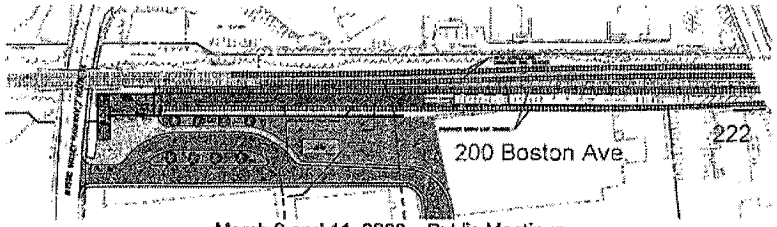
February 6, 2008 - Station Workshop

Four months later, at the Advisory Group Meeting of June 2, 2008, EOT quietly debuted a plan that ignored the existence of structures at 200 Boston Avenue and 222 Boston Avenue, Elisabeth Grady. (http://www.greenlineextension.org/currentmaterials.asp?area=mls *Mystic Valley/ Rt. 16 Station – draft.*) Unlike the previous drawing, the tracks have not been shifted to avoid existing structures and an additional (fifth) track has been introduced, effectively *increasing* the impact and requiring the reconstruction of the North Street bridge.



June 2, 2008 – Advisory Group Meeting

Nine months later, in the public meetings in Medford (March 9, 2009) and Somerville (March 11, 2009) EOT presented another version of the plan for Route 16 (*Mystic Valley Parkway / Route 16 Station* at http://www.greenlineextension.org/currentmaterials.asp?area=mls). In this drawing the shift in the Commuter Rail tracks away from the threatened properties has returned and the additional Green Line trackwork has been eliminated. However, corresponding shift in the Green Line trackwork is not included and the placement of the inbound Green Line track does not capitalize on the elimination of the fifth track. This is essentially the configuration that became Figure 3.7-27 in the DEIR. It has much of the trackwork adjustments of the original but none of the benefits in terms of commercial property and bridge preservation.

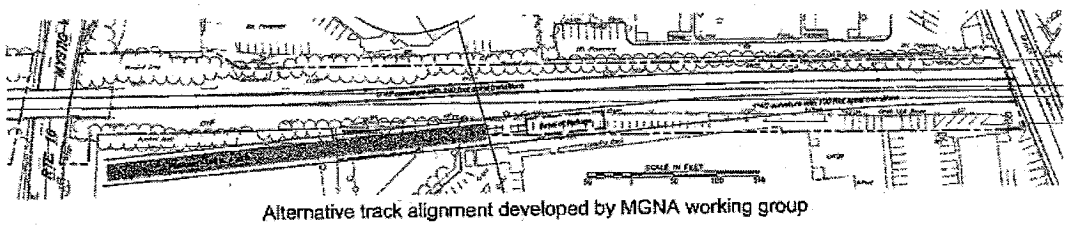


March 9 and 11, 2009 – Public Meetings

Supporting material regarding inadequacies in the DEIR

In the summer of 2009, unconvinced that EOT was devoting adequate effort to maximize the chance of a successful Route 16 terminus, a working group of interested citizens began to explore what constraints and options came to bear on the track configuration surrounding that locus. Armed with EOT-provided *Draft Schematic Design Guidelines – Green Line Extension Project*, FTA-sponsored *Track Design Handbook for Light Rail Transit* and other relevant references, the working group identified an approach to trackwork at Route 16 with the following desirable characteristics:

1. It is wholly confined within the existing railroad right-of-way except for a sliver taking from a commercial parking lot (Medford), one vacant commercial lot (Somerville) and one commercial building and lot (Somerville).
2. It uses curve radii well within the *Schematic Guidelines'* specifications, typically double the minimum and sometimes triple the minimum, thereby improving passenger comfort, reducing risk of excessive noise and decreasing the torque on rolling stock that arises in approaches to banked trackwork.
3. Where conflicting constraints appear, it uses the more stringent specification, taking a conservative approach.
4. It achieves all spiral and tangent track goals including a tangent 450-foot platform and tangent platform approach, in order to avoid wheel squeal.
5. It eliminates the need to place trackwork on the very locations where the northeast walls of 200 and 222 Boston Avenue stand today.



Alternative track alignment developed by MGNA working group

Please refer to attachments *Proposal for alternative track alignment at the Route 16 terminus station for the Green Line Extension* and *Alternative Route 16 Track Alignment* for a more thorough treatment of this alternative.

Supporting material regarding inadequacies in the DEIR

The 2006 EENF requires analysis of, among other things, the Route 16 Terminus Alternative. The analysis embodied in the DEIR is woefully inadequate. By MassDOT's own assessment, the design included in the DEIR for the Route 16 terminus is "worst case". The design is congenitally flawed in ways that virtually guarantee its rejection. Independent analysis has identified methods to eliminate the grossest defects (arising from commercial land takings) and MassDOT / VHB has admitted that it has been exploring similar configurations. MassDOT must be required to pursue the Route 16 Terminus Alternative more earnestly and to its natural conclusion – inclusion in an FEIR.

Supporting material regarding inadequacies in the DEIR

3) EOT and subsequently MassDOT have inadequately considered community / neighborhood input.

Questions from elected state officials, expressions of public opinion, reports of relevant historical research, and offers of *pro-bono* assistance have been ignored in the lead-up to the submission of the DEIR, sometimes citing resource shortages. At other times, expansive investigation and reporting by EOT has been prompted in response to demands that were well beyond the scope of the project as defined in the EENF. EOT has, on occasion, used undocumented claims of public opposition to justify a course of action.

Failure by EOT to respond to questions from elected officials representing affected communities:

June 11, 2008

Secretary Bernard Cohen
Executive Office of Transportation
10 Park Plaza, Suite 3170
Boston, MA 02116

Dear Secretary Cohen:

Over the past several months, there have been numerous Neighborhood Station Planning Meetings, Project Advisory Group meetings, and general information meetings about the Green Line Extension (GLE) through Somerville and Medford. As a delegation, we have stood unified in support of improving public transportation in our communities, with a commitment to respecting the integrity of existing neighborhoods, and to the utmost inclusion of local residents and officials.

Many of the recommendations and suggestions made by the neighborhoods have been taken into account, which we appreciate. And having been involved in the public process, and hearing from numerous constituents, it appears we have made progress in getting closer to a consensus within our community about where stations should be sited, and what concerns and mitigations should be taken into account and planned for.

Nevertheless, the question of where the terminus is to be located remains unanswered. We advocated for studying the potential of Rt. 16 as a terminus. This study was included in the Secretary's Certificate for the Environmental Impact Review. The Certificate also called for looking at stops at College Ave, Winthrop Street, or a combined station between College and Winthrop.

In order to make a complete and informed decision as a delegation about our own recommendations of a terminus location, we would like to request a comparative evaluation of 1) a single track alternative for the stretch leading up to Route 16, 2) the two track version that was included at prior meetings, 3) the three track version as recently presented, and 4) tunneling in the final stretch of the extension, an option that has often been asked about. Specifically, we would like to see a comparison of the four variations in the following areas:

- Impacts on the North Street and Winthrop Street bridges
- Specifics of any possible takings or impacts on both residential and commercial properties, including information about where such impacts are the result of encroachment onto the MBTA's right of way versus the extension encroaching on private property
- The estimated cost differences
- The operations benefits or drawbacks

This information may provide insight as to whether Winthrop Street or College Ave would be the next stop. As such, we would also like an update on ridership estimates, including a comparison of what the ridership would be at all three locations, and how that changes if any of these stops were not to be included in the final recommendation.

Supporting material regarding inadequacies in the DEIR

As we have made clear from the beginning, we are looking to see this project bring the most benefit to our community, and have the fewest negative impacts. We believe a thorough explanation of the above matters will be helpful in our being able to support any final plans drawn up by your office.

We would appreciate a response as soon as possible, considering the application for New Starts funding is expected to occur some time in early fall. We appreciate all of the work that is going into this project, and look forward to continuing to build on the community to let me know whether these recommendations will be adopted.

Sincerely,

Patricia D. Jehlen, State Senator; Carl Sciortino, State Representative; Sean Garballey, State Representative; Paul Donato, State Representative

cc: Mayor Michael McGlynn
Mayor Joseph A. Curtatone
Steve Woelfel, Project Manager, EOT
Kristine Wickham Zimmerman, Vanasse Hangen Brustlin, Inc.

As of February 4, 2009, from one of the signatories:

> I just wanted to clarify one thing, which is that we never did get a formal response from our letter last summer about 1, 2, or 3-track options. The answer I got back, verbally, was 'it will be in the DEIR when we get to that stage.'

EOT did, however, in November 2008 release a 35-page Technical Memorandum representing a substantial effort to evaluate a tunneling option that was obviously outside the scope of the EENF in that it did not follow the existing Lowell Line right-of-way.

EOT's disregard for public opinion:
Surprised by the plan revealed at the June 2, 2008 Advisory Group meeting that demonstrated intent to take (or at least require some radical structural changes to) 200 Boston Avenue, and after confirming our interpretation of the plan at the August 4, 2008 Advisory Group meeting, MGNA requested a meeting with EOT to understand the then-current plan for Route 16. EOT granted us that meeting and it transpired on August 18, 2008.

In the meeting, our fears of commercial property takings were confirmed. EOT repeated some outright misrepresentations, advanced some outlandish propositions, evaded some obvious questions, denied some previously-made statements but presented no evidence that an earnest effort was being made to design a practical viable terminus at Route 16.

In preparation for the meeting I made the following notes to help me steer the meeting, if I could.

The subjects I want them to address are:
1) What are they up to at Mystic Valley?
   a. If their plans involve taking 200 and 222 Boston Avenue, what design elements dictate that?
   b. Does the plan involve multi-level parking? How many vehicle spaces?
   c. What other possibilities did they reject that wouldn't have required

taking 200 and 222?
   d. What other properties are jeopardized? On Piggott Street? On Orchard Street?
2) If (when) their MVP plan is nixed, how will they change the College Avenue stop design?
   a. What terminus-specific facilities will be required and how will they be accommodated? (Parking for employees, staging/layover tracks, larger pick-up / drop-off lanes, ...)
   b. What evidence do they have that College Avenue can be reasonably construed as Medford Hillside?
   c. How will satisfactory ridership levels be achieved without MVP?
3) What is the party line about the unceremonious elimination of Winthrop Street stop?
4) Are there other possibilities beyond College Avenue?

I can't promise that I managed to raise all those issues at that meeting, however, I made these notes and sent them to the other MGNA attendees that same day (text in brackets *[thus]* has been edited for clarity):

Here are points that I remember:
1) The Mystic Valley Parkway plan does (as suspected since the beginning of June) involve radical intrusion on 200 and 222 Boston Avenue.
   a. The *[redacted emotional adjective]* claim, which I first heard from McArdle, was repeated that even without the "indisposed train" track (the fifth track at MVP), the rail widening for the platform mandates it.
   b. The *[area of refuge]* is a Federal requirement (although I think there was some *[redacted emotional gerund]* that made me think that there are other possibilities to give pedestrians an escape without effectively lengthening the widened section of track.)
   c. They admitted that the first *[property]* on Piggott was at risk. (Perhaps this was not for discussion outside the meeting room?)
   d. They did not dismiss the possibility of relocating the "indisposed train" track to other positions on the ROW (just not too far from the end). Some false claims were made (By Wickham) that the ROW wasn't wide enough elsewhere. When pressured, she admitted that there was room. *[Or perhaps she just didn't see anything to gain by continuing the discussion.]*
   e. They acknowledge that, in addition to the purchase price of the property, the expense of relocating the businesses there would be part of the cost.
   f. They doubt that mitigation to the City for lost tax revenue is a cost to be borne by the project. When we met with McGlynn, he indicated that he expected otherwise.
   g. They assert that they are not in the business development business and didn't discuss what would be done with the surplus land after they built their station and parking garage. (Is this true or did I just zone out at this point?)
   h. <There are more comments on MVP after the College Avenue remarks.>
2) They acknowledged that multi-tier parking was under consideration for the MVP station.
   a. They mentioned a 300-car capacity. (For calibration, the existing two-tiers at 200 Boston accommodate roughly 200 cars by my count so this is a pretty small car-park. Can anyone estimate the size of the garage at the Medford Harvard-Vanguard building for comparison?)
   b. They had no comment about road capacity needed to fill and empty

the parking. *[Another MGNA affiliate]* says it'll be full by 6:30. If so, it wouldn't contribute much to traffic.

c. Woelfel denied that he ever used the dreaded "Alewife-style" terminology; Ken assured him that he did. *[A video of Woelfel using the words "One of the things that we're considering if we would do a Route 16 station is perhaps having a parking facility similar to Alewife so we'd probably look at it in a couple of ways to see it with a garage / without a garage and see what kind of impacts that has." can be found at http://www.vimeo.com/809573 about fifteen minutes in.]*

d. They recognized the need for building the structure in a way that can be expanded (presumably up) should the need arise.

e. There is no explanation how car contents amounting to a few busloads are going to make or break the ridership figures for this station.

3) EOT unabashedly insists that College Avenue is the Medford Hillside.
   a. Woelfel informs us that, in every discussion that they have had with state agencies, College Avenue was construed as the Hillside.
   b. He steadfastly believes that, current usage and historical usage to the contrary notwithstanding, EOT is at liberty to define "the Hillside" as they see fit.
   c. <How do you argue with that kind of logic?>
4) The College Avenue station as planned:
   a. Would not require much in the way of changes if MVP is not built (per Wickham).
   b. Does not require a parking facility to justify its cost (per Woelfel).
   c. Mysteriously,
      i. is cost-justified without a parking facility, even though MVP needs one to be cost-justified,
      ii. can get by with its feeble little drop-off lane as shown,
      iii. requires no employee parking (which I remember being a characteristic of termini. Wait ... "terminus" might be a third declension noun which would make its plural "termina" ... I'll look this up and get back to you.)
5) *[This item does not describe something that transpired at the meeting but rather later reflection.]* I think what this says is, to get MVP built without a parking facility, the cost needs to be contained.
   a. I suggest NOT taking 200 and 222 and residential property on Piggott. That ought to reduce the cost quite a bit.
   b. I suggest
      i. finding a more real-estate-stingy emergency egress from the platform. (The egress could probably be to the north, perhaps a pork chop shaped refuge to the west onto the roof of the lobby.) *[I subsequently recognized the folly in this one.]*
      ii. resurrecting the track plans of the 6-Feb Workshop, which crowd the CR tracks to the east going under North Street allowing the GL tracks to clear 200 and 222 before they bend west to approach the platform.

   However, I wasn't quick enough to offer all of this in the meeting.
6) When I charged outright that the design for MVP was intended as a poison pill to avoid the trouble of building it *[and the unpleasantness of dealing with some of Medford's resistant elements]*:
   a. Woelfel denied it emphatically.
   b. He said that there were other communities that were worse than Medford.

Supporting material regarding inadequacies in the DEIR

A pattern of EOT's lapses in communication:

- Promised follow-ups to the station workshops that were to have been convened in June 2008 never occurred.
- Promises to have an MBTA representative at Advisory Group meetings were broken.
- The July 2008 which was to have included ridership studies was silently never convened.
- The August 2008 which was to have included conceptual plans and cost estimates covered neither.
- The September 2008 meeting with environmental analysis was cancelled.

EOT's contempt for historical imperative and indifference to public comment:
As a Public Comment to the 2008 SIP, I submitted 44 pages reporting the findings of some research I had done attempting to ascertain what does and does not constitute "Medford Hillside". The conclusion was pretty clearly that College Avenue was not part of Medford Hillside and that the Hillside's center of gravity is well north of College Avenue. Here is the extent of EOT's response to that research (the "C" is one sentence from the comment's cover letter, the "R" is the extend of the response to the entire comment):

C: *If, as I fear, your current plans for a Mystic Valley Parkway station are imperiled due to expense, I urge you to undertake whatever redesign is necessary to render that station viable. Whether you do that or not, if you intend to satisfy your mandate to extend the Green Line to Medford Hillside, you must take it as far as Winthrop Street.*

R: The SIP does not require that the Green Line Extension serve the full extent of what residents may consider to be the Medford Hillside neighborhood; rather the Green Line is required to be extended to Medford Hillside, and College Avenue is commonly considered to be within the boundaries of the Medford Hillside neighborhood. Therefore, we believe that terminating the Green Line Extension at College Avenue would meet the minimum requirements of the SIP. All of that being said, EOT has not yet made a final decision on the terminus of the Green Line Extension.

Another commenter to the 2008 SIP, and the dismissive and condescending response:

C: *The SIP requires that the Green Line extension serve "Medford Hillside." A station at College Avenue/Boston Avenue, which is being considered as a terminus for the extension, would sit at the extreme southern boundary of "Medford Hillside" and would be nearly a mile away from portions of what is considered the "Medford Hillside" neighborhood.*

R: EOT understands and appreciates that some segments of the Medford Hillside community believe that a Green Line station at College Avenue wouldn't fully serve the Medford Hillside neighborhood. Nevertheless, we believe that terminating the Green Line Extension at College Avenue – a decision in no way finalized – would meet the requirements of the SIP.

EOT / MassDOT have never provided evidence to support their contention that College Avenue is part of Medford Hillside. Their claims have been disproved that one particular source (Medford Community Development Plan (2004), The Cecil Group, Inc., planning consultants) supports their definition. They have never offered rebuttal to the preponderance of the evidence that Medford Hillside is well north of College Avenue. They have never contested the relevance of the fact that College Avenue is outside Medford Hillside. Instead they have stubbornly, imperiously and repeatedly pronounced that College Avenue is Medford Hillside, which is patently, demonstrably and incontrovertibly untrue.

In the summer of 2009, MGNA assembled a group of engineers, architects, commercial property managers and other stakeholders, and approached EOT, attempting to convene a charrette-style

meeting to improve the quality and outcome of the Route 16 terminus section of the DEIR. Here is a digest of the ensuing email conversation:

MGNA April 2, 2009:

> The Medford Green Line Neighborhood Alliance is planning to hold a charrette-style workshop this spring to discuss issues and ideas related to the proposed Route 16 terminus station on the Green Line extension.
>
> The purpose is to bring together all stakeholders and interested parties to discuss issues, ideas, concerns, challenges, obstacles and solutions to creating a successful station at this location.
>
> Invitees will include public officials, property owners, representatives of government agencies, architects, local urban and transportation planners, citizen groups and others. The public will also be invited to attend.
>
> First and foremost, we would like to have a representative from EOT (and VHB and the MBTA, if possible) attend so we can from the start understand the requirements for the project from the standpoint of those who will design, build and operate it. It would also be useful if we could borrow EOT's latest aerial map and Route 16 station schematics for reference.
>
> Would you or a representative from EOT be willing to commit to attending such a workshop, if not for the entire time but at least for say the first hour, to provide the information we need? (Presumably the DEIR will have been filed by the date of our charrette, which would likely be some time in May.)
>
> Ideally, we would like to have the event on a Saturday morning when more people from the community can attend, but we know that is an imposition on the professional agencies. Other options would be a weeknight (say, 6 to 9 p.m.) or a weekday afternoon (say, 3 to 6 p.m.).

EOT April 2, 2009:

> Yes, we would be happy to participate in this. A Saturday wouldn't work, but either an afternoon or an evening slot should be fine (Mondays and Wednesdays work for me). This is actually my last day in the office before vacation - I'm back on April 15th - but perhaps you could send along a few suggested timeslots? We can nail it down once I'm back.
>
> Would you be looking for the project team to give an overview presentation? Also, we'll need to be very clear with participants about the limits of what we do and do not know at this point about potential property acquisition.

MGNA April 16, 2009:

> Welcome back. I hope you had a nice vacation.
>
> I wanted to follow up with you on possible dates for the Route 16 charrette that we discussed. Can you provide your availability or preference for the following dates:
>
> Monday, May 4
>
> Wednesday, May 6
>
> Monday, May 11
>
> Wednesday, May 13

EOT April 16, 2009:

> Before we move too much further on the planning about this, can we have a phone conversation about your expectations of us for the event? Please give me a call next week so that we can chat.

MGNA April 21, 2009:

> Thanks for speaking with me about the charrette idea.

EOT April 21, 2009:

> Please keep me posted on the charrette idea.

MGNA April 30, 2009:

> Thanks for posting the Green Line design guidelines. I think they will be helpful.
>
> We are still trying to get our ducks in a row regarding the Route 16 charrette. It turns out, May 6 doesn't work for many people, so we're looking at other dates.

EOT May 6, 2009:

> You're welcome for the guidelines. Please let us know if you have any questions.
>
> On the charrette, given everything - particularly limited staff availability - I think it's best if we don't participate. We look forward to hearing about any ideas or suggestions that come out of it, though.

EOT's charade at involving the public:

In addition to the numerous public meetings, EOT established information channels for them to communicate with the general public. These channels had provisions to submit comments and questions to EOT with the promise of consideration and reply. Sadly, based on my experiences, these were little more than feel-good efforts. The responses to my comments and questions were so delinquent that I had difficulty remembering submitting them in the first place. The responses demonstrated that little, if any, attention had been paid to the comment.

Here is a May 26, 2009 message to a public affairs consulting firm retained by EOT. I received a nice reply the same day, promising a more thorough reaction to my concerns "next week":

> At the end of the 20-May Cambridge Community Meeting, you suggested to the audience that they could get answers to their questions if they submitted them at the Green Line Extension web site. After the meeting, I approached you and took issue with that claim, citing the disappointing response time that I had experienced using that vehicle.
>
> My (faulty) memory was that questions got answered in sixty days – no more, no less.
>
> In fact, I have submitted three comments through the Contact Us link at the web site and I received replies as follows:
>
> The response to an 8-May-2008 comment was received on 8-Jul-2008. (61 days)
> The response to a 6-Jul-2008 comment was received on 18-Aug-2008. (43 days)
> The response to a 7-Feb-2009 comment was received on 4-May-2009. (86 days)
>
> So, my (paranoid) suspicion – that responses were being deliberately delayed then sent to meet a hard deadline of sixty days – was obviously unfounded. I have worked for companies that had an order fulfillment policy along those lines (always deliver in a week to ten days even if you could deliver sooner) and I think the policy was based on the belief that people prefer consistent response to occasionally fast, occasionally slower. I suspected that a similar situation existed here.
>
> I will leave to you to decide whether an average time of 63 days meets your company's goals ... it did not meet my expectations. For comments/questions that are particularly complicated or involved a response could reasonably take a while. But, in those cases, I think it's fair to expect an acknowledgement of the comment/question although if it read something like "Thank you for your feedback. Your input is important to us and we are spending our every waking hour composing an answer." that would probably do more

harm than good.

Besides the speed of the responses, in two cases I was disappointed with the *content* of the responses. The 8-May comment included six points that I put a significant amount of thought into. It was nine paragraphs and 677 words. The response was two sentences long (27 words) and content-free. The 6-Jul question asked about the scheduling for a July meeting and the minutes for the June meeting. The 18-Aug answer referenced an upcoming September meeting (as if July and August had never existed), promised a project schedule (which appears never to have been posted) in advance of a September Advisory Group meeting (which never occurred).

I appreciate, *[person's name]*, that *[company name]* is not in a position to manufacture and deliver answers unilaterally to every cockamamie question that we, the general public, can dream up. I hope you recognize though, that when you offer to answer questions but then don't do so in a timely fashion (for whatever reason), it is *you* who appears to be delinquent.

[closing comment immaterial to this discussion]

Regards,
JRE

July 30, 2009, two months later, without receiving any further communication on this subject, I reopened the discussion. After a few messages back and forth, I concluded with this:

Y'know *[person's name]*, the important matter is not whether someone like me gets, in a timely fashion, the information he thinks he needs and insists that he is entitled to ... someone like me *will* get what he wants one way or another. The more important matter is the damage it does to the reputation and appearance (perhaps illusion) of trustworthiness of your client when, in a public forum, the attendees are invited and encouraged to raise their concerns and submit their questions. But then, by the time the flaccid tepid reply arrives, the citizen who spoke up has (understandably, if not justifiably) arrived at an indelible impression that whatever supremely imperious government agency is running this show, it hasn't the slightest interest whatsoever in hearing from the people whose lives are affected. It's things like this that lend credence to the oft-repeated accusations by the Green Line Extension detractors that the community is being ignored and excluded from the process. They're going to level unfair criticisms enough ... no need to give them fair ones as well.

Notwithstanding the suspicion I have that some of the EOT/VHB people *[unsupportable accusation redacted]*, I naïvely believe that the things they are trying to do on this project have some overlap with what I think should be done. For that reason, I'm disappointed when I witness behavior that gives ammunition to the opponents to the project. I have seen herculean efforts (in no small part RVA's doings, I suppose) to reach out to the host communities' populations and I have been repeatedly astounded by claims that publicity for the project is inadequate. (What planet have these people been vacationing on for the last three years?) But you could hold a half-dozen neighborhood workshops interspersed with monthly meetings like clockwork for eighteen months then have the benefit entirely negated by the idiotic handling of the AG meetings of July, August and September last year. It would have been bad enough if they had been canceled with cause; it would have been worse if they had been unceremoniously *canceled*; they just didn't happen – no explanation, no announcement, no nothing. (Sheesh.)

I don't know if it's practical to hand-carve a prompt, well-considered reply to every crackpot who manages to stumble across the *Contact Us* link on the web site but if you're not prepared to do that, what's the point? I doubt you can expect much cure from the placebo effect.

Regards.

Proposal for alternative track alignment at the Route 16 terminus station for the Green Line Extension

One of the primary objectives of the Medford Green Line Neighborhood Alliance (MGNA) is to ensure that the Green Line extension is designed, constructed, and ultimately operated in a manner that provides maximum benefit to the city and its residents. Over the last four years, MGNA members have been diligently involved in the process, engaging citizens, researching best practices, collecting data, and providing constructive input to the project team.

We have been heartened that MassDOT has embraced many of our recommendations, including selecting a Route 16 terminus station as its Preferred Alternative for the project; providing for no parking at any of the new Green Line stations, in particular at Route 16, where a 300-car garage was considered; and designing the project so that no residential properties need to be acquired.

However, over the last 18 months, MGNA has expressed concern to MassDOT regarding the designs presented for the Route 16 station, which indicated the likely removal of two commercial buildings to accommodate the Green Line tracks and platform.

The Draft Environmental Impact Report (DEIR) affirmed MassDOT's intention to remove the buildings at 200 and 222 Boston Avenue – to the detriment, in our opinion, of both the project and all stakeholders.

The removal of these buildings would displace numerous private businesses, Tufts University departments and laboratories, and a least 224 employees. It would also result in a decrease of at least $164,487 in annual property tax revenue to the city of Medford, and add at least $15.5 million to $20 million to the project cost.

Consequently, while the Preferred Alternative – with the terminus station at Route 16 – is shown to provide the greatest air quality improvements, ridership gains, traffic reduction, and benefit to environmental justice populations, the negative impacts of the commercial property takings make the station less feasible and have created opposition among Medford government and its taxpayers.

Cognizant of these issues, for the last several months an MGNA working group, using technical information provided by MassDOT, has explored alternative track alignments for a Route 16 station. The goal was to develop an alignment that has smaller property acquisition needs. By adjusting the track curvatures between North Street and Route 16 and changing the angle of the station platform itself, MGNA has developed an alignment

that accommodates the Green Line station without the need to remove or substantially alter the buildings at 200 and 222 Boston Avenue.

MGNA's interest in this undertaking is entirely for the benefit of the Green Line Extension and the communities it serves. The members of the working group have volunteered their time, have received no compensation from anyone and do not expect to. Specifically, MassDOT gave us information as we requested it but did not support us in any other way. The manager of some of the threatened structures and tenants housed therein have indicated that they would prefer not to lose the properties to the Green Line Extension; however, they have not provided any material support to the working group in its efforts. Likewise, even though the populations of Medford, Somerville, and Arlington are affected by the prospect of a station at Mystic Valley Parkway, the working group operated independently of any local government.

The Process

In order to understand the MBTA design constraints, the working group began by requesting the *Draft Schematic Design Guidelines – Green Line Extension Project*, which MassDOT provided in April 2009. These guidelines detailed the design characteristics that facilitate the following objectives:

- Safe operation
- Maintainable infrastructure
- Fair treatment of abutters
- Comfortable rides for both Commuter Rail and Green Line passengers

Further, in order to better understand the sensitivities of rail design, the working group also consulted publications of the Transit Cooperative Research Program sponsored by the Federal Transit Administration.

And to supplement our understanding of applicable principles, we referred to materials generously posted at the University of Denver website by Dr. James B. Calvert, emeritus engineering faculty member. Dr. Calvert's explanations made it possible for us to apply the constraints of the *Schematic Guidelines* using the tools that we already owned without incurring prohibitive expense.

Using these materials, the MGNA working group identified an alternative track alignment between North Street and Mystic Valley Parkway that eliminates the need to take the commercial buildings at 200 and 222 Boston Avenue, while observing the constraints of the *Schematic Guidelines*.

Essentially, in our proposed alignment, the constellation of tracks (two Commuter Rail, two Green Line) is relocated closer to the northeast boundary of the existing right-of-way, rather than being approximately centered in the right-of-way, as the trackwork is situated in other stretches of the extension corridor. This avoids the excessive track proximity to the east corner of 200 Boston Avenue and to the northeast walls of 200 Boston Avenue and 222 Boston Avenue.

More specifically, our alternative has these characteristics:

1. It is wholly confined within the existing railroad right-of-way except for a sliver taking from a commercial parking lot (Medford), one vacant commercial lot (Somerville) and one commercial building and lot (Somerville).
2. It uses curve radii well within the *Schematic Guidelines'* specifications, typically double the minimum and sometimes triple the minimum, thereby improving passenger comfort, reducing risk of excessive noise and decreasing the torque on rolling stock that arises in approaches to banked trackwork.
3. Where conflicting constraints appear, it uses the more stringent specification, taking a conservative approach.
4. It achieves all spiral and tangent track goals including a tangent 450-foot platform and tangent platform approach, in order to avoid wheel squeal.
5. It eliminates the need to place trackwork on the very locations where the northeast walls of 200 and 222 Boston Avenue stand today.

A fully detailed description of the alignment is provided below, and conceptual drawings are attached.

Conclusion

MGNA put forward our alternative alignment for the tracks between North Street and Mystic Valley Parkway, and the reorientation of the station platform, in hopes that it can contribute to a design for the Route 16 terminus that does not necessitate taking the commercial properties at 200 and 222 Boston Avenue in Medford. There are doubtless other solutions that qualified engineering personnel could discover to achieve the same objectives, and we ask that one of these be included in the Final EIR/EA for the Green Line extension project, rather than the worst-case scenario that is presented in the DEIR/EA.

Details

Relocation of Commuter Rail tracks to shift them away from the threatened properties:

- 900-foot compound curve ("S" curve) comprising two 200-foot circular curves with spiral transitions separated in the center with a 100-foot tangent.
- Heading south, the compound curve begins at the south bridgehead of the Mystic Valley Parkway Bridge and completes approximately even with the east corner of 200 Boston Avenue.
- Shifts tracks 22 feet to the north-east (away from 200 Boston Avenue and 222 Boston Avenue) instead 13 feet, which the DEIR alignment achieves.
- Conforms to design standards as follows:
  - Limits circular radius to 7640 feet (corresponding to 0°45'00" degree of curvature) compared to a preferred minimum of 4297 feet (corresponding to 1°20'00" degree of curvature) – [1] § *1.2.9.1 Commuter Rail Geometric Design*
  - With 0°45'00" curves, meets 60 miles per hour design speed with <½ inch superelevation – [2] extrapolation from *Table 3.2.2b Desired Superelevation and Minimum Spiral Curve Length (English Units)*
  - Includes four 100-foot spiral transitions (into and out of each of the two opposed circular curves) – [1] § *1.2.9.1 Commuter Rail Geometric Design*
  - Includes 100 foot tangent track at spiral reversal – [1] § *1.2.9.1 Commuter Rail Geometric Design*
  - Minimum clearance from right-of-way property line to centerline of closest track is 12½ feet *vs. Guidelines'* 8½ feet minimum and 10 feet preferred clearance to retaining wall – [1] *Figure 1-8 Typical Section*
  - Centerline clearances between adjacent tracks on tangents is 13 feet (greater on curves) as per *Guidelines* – [1] *Figure 1-8 Typical Section*
- Not shown in this drawing, between North Street and Winthrop Street, additional curved trackwork returns the track constellation to an alignment roughly centered in the railroad right-of-way, the position it occupies for most of the extension corridor.

Placement of Green Line tracks to clear the affected preexisting structures:

- 400-foot simple curve comprising one circular curve with spiral transitions
- Heading north, the outbound track curve begins 125 feet north of North Street bridge; inbound track curve begins just south of North Street bridge
- Adheres to design standards as follows:
  - Minimum clearance from adjacent pre-existing structures at 200 Boston Avenue and 222 Boston Avenue to centerline of closest track is 13¼ feet vs. *Guidelines'* 8 feet preferred and 6½ feet allowed with niches – [1] § *1.2.9.2 Light Rail Geometric Design*, [1] *Figure 1-8 Typical Section*
  - Includes a single 200-foot circular curve with minimum radius of 3274.3 feet (corresponding to 1°45'00" degree of curvature) compared to minimum preferred 1000 feet (corresponding to 5°43'00" degree of curvature) – [1] § *1.2.9.2 Light Rail Geometric Design*

- Includes two 100-foot spiral transitions (into and out of circular curve) – [1] § *1.2.9.2 Light Rail Geometric Design*
- Includes the 450-foot platform required for terminal stations – [1] § *1.2.11 Table 1-5 Station Requirements*
- Provides a 20 foot wide platform, consistent with the DEIR (this dimension is unspecified in [1] without ridership forecasts – see [1] § *1.2.11.3 Access*)
- An Area of Refuge (point of safety) is located at the south end of the platform – [1] § *1.2.11.3 Access*
- Provides a tangent-track (0°00'00") platform even though curves as tight as 2°00'00" are allowed – [1] § *1.2.9.2 Light Rail Stations*
- Includes 100-foot tangent track approaching platform – [1] § *1.2.9.2 Light Rail Stations*
- Centerline clearances between adjacent Green Line tracks on tangents is 13 feet, consistent with preferred spacing (although 12-foot spacing is allowed) – [1] § *1.2.9.2 Light Rail Geometric Design Minimum distance between centerline of tracks*

- Not shown in this drawing, between North Street and Winthrop Street, additional curved trackwork returns the track constellation to an alignment roughly centered in the railroad right-of-way, the position it occupies for most of the extension corridor.

Alternative Route 16 Track Alignment

In Search Of Medford Hillside 1891 – 2008

Pages	Section	Abstract
2-5	*Historical Maps from the Medford Public Library Map Collection.*	Places named Hillside are consistently at Winthrop Street or north of it.
6-7	*Modern Maps from the Medford Public Library Map Collection.*	One map showing Medford Hillside north of North Street; one showing Medford Hillside between College Avenue and Winthrop Street northeast of Boston Avenue.
8-11	*Historical Excerpts from the Medford Public Library General Reference Holdings.*	A definition of Medford Hillside as the northwesterly slope of College Hill. Mention of Winthrop Street and North Street as the two "rangeways" through the Hillside territory. Mention of Capen Street, Quincy Street, 286 Boston Avenue (all north of Winthrop) and Harold Street and Pinkham Road (both north of North Street) as Medford Hillside.
12-16	*Germane Content from Various Government Agencies.*	Excerpts and maps from the EOT's Beyond Lechmere Study; data and maps from US Geological Survey (USGS) Geographical Names Information System (GNIS); a map from EPA; all showing Medford Hillside situated north of Winthrop Street and closer to North Street than to Winthrop.
17-19	*Contemporary Photographs of locations with "Hillside" in their names.*	Seven photos of landmarks and businesses, all at, or north of Winthrop Street.
20-34	*Modern Maps from Internet Mapping Web Sites.*	Ten maps, all supporting placement of Medford Hillside north of Winthrop Street. A map showing the locations of 127 Hillside businesses, churches and organizations clustering north of Winthrop Street. A table of those businesses with distances from each to a possible station at Mystic Valley Parkway, Winthrop Street and College Avenue. Average distance to College Avenue is roughly twice either Winthrop Street or Mystic Valley Parkway.
35-44	*Newspaper References (Articles, Obituaries, Real Estate Transactions, Classified Ads) Locating Medford Hillside.*	37 excerpts from newspapers from 1889 to 2006 mentioning neighborhood streets and overwhelmingly placing Winthrop Street as the de facto southern boundary of Medford Hillside.

---

MEDFORD HILLSIDE.

There are many of them, but the term is distinctively applied to but one, the northwestern slope of Walnut, now for half a century called College hill. As a portion of the so-called Hillside district is included in the level plain beside the railway, and its development has been in a way different from the real Hillside, this sketch will deal with that mainly.

...

From early times there had been two "rangeways" through this territory, from Menotomy road to the Mystic, one became Winthrop street in Medford, the other North street. The first proved the most convenient stopping place for the Medford patrons of the railroad, which laid its track between two towns all the way from Boston to Lowell.

Medford Hillside
Vol. XX 1917, p.5
The Medford Historical Register
Published by Medford Historical Society
(defining Medford Hillside as the northwestern slope of College Hill and traversed by Winthrop and North Streets)

West Medford in 1870
Moses Whitcher Mann

...

Three buildings crowned the top of Walnut Tree Hill, as it was formerly called, the beginning of Tufts College; and the depot across the track, as was also the college site, became known as College Hill.

145

...

Just back from College Hill on the right, sheltered by the trees and hedges, was, and still is, the Stearns residence. With its brick windmill tower it was an attractive sight, to which was added the interest of its connection with another railway, the Underground Railroad of antebellum days.

Passing the old station of Medford Steps with its long stairway—this was on the right hand—and under a bridge now removed, and emerging from the railway cut, the most noticeable object was the First Parish Church, with its several-storied steeple, one of which contained the original town clock presented by Mr. Brooks, while higher up was the bell cast by Paul Revere.

(showing Medford Hillside adjacent to Mystic Valley Parkway,
well north of Winthrop and North Streets and southwest of Boston Avenue)

Medford Hillside is the area extending north from Powderhouse Square through Tufts University and over the Mystic River into West Medford. With its residential, educational and commercial land uses, it is an important center in the study area that could support improved transit service. Boston Avenue is a primary roadway through Medford Hillside that has urban centers and activity centers at the intersection of Winthrop Street and along the section from College Avenue to Arlington Street.

Notes:

The bulk of the newspaper clippings were from ProQuest searches conducted through the Boston Public Library. The searches variously included The Boston Globe and The Boston Herald plus other Massachusetts newspapers. Nearly 800 articles were culled down to thirty-seven that mentioned other streets in the neighborhood. They comprised news articles, real estate transaction records, obituaries, wedding announcements, public process announcements and classified advertisements. The following streets were mentioned:

Number of mentions	Street Name	Notes
7	Winthrop Street	
4	Quincy Street	North of Winthrop Street, closer to North Street
4	Capen Street	North of Winthrop Street
2	Emery Street	North of Winthrop Street
2	Marshall Street	North of Winthrop Street
2	Orchard Street	North of Winthrop Street
2	Boston Avenue	Both addresses north of Winthrop Street
2	Mason Street	North of Winthrop Street
2	Fairmount Street	Closer to Winthrop Street than College Avenue
2	Tesla Avenue	North of Winthrop Street
1	Hillsdale Road	North of Winthrop Street
1	North Street	North of Winthrop Street
1	Harris Road	North of North Street
1	Taylor Street	North of Winthrop Street
1	Sharon Street	North of North Street
1	Greenleaf Avenue	At the corner of Winthrop Street
1	Brookings Street	South of Winthrop Street
1	Hume Avenue	South of Winthrop Street
1	College Avenue	South of Winthrop Street

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA #03886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-105-001 As a resident of the Glass Factory Condominiums, I am deeply concerned about the design and placement of the Green Line Extension and the new Lechmere Station.

TRACKS ARE TOO CLOSE TO OUR BUILDING.
The present design shows the tracks running very close to the rear of our building. We urge your designers and engineers to place the tracks as far to the rear of our building as possible to preserve views & light to the many units that will be severely impacted by the elevated tracks. The design and placement of the tracks and supports should do all it can to minimize the visual impact to those units and also minimize noise & vibration impacts to the whole building as well as the surrounding neighborhood.

LECHMERE STATION.
At present, your designs show the new Lechmere Station so close to the Glass Factory that it appears to be part of our condominium building. Please move the station closer to East Street, where it could be part of the entrance way to the eventual North Point development. The station design needs to be substantially improved so it is not an eyesore but rather an enhancement to this rapidly developing neighborhood. It should reflect the importance of this location as the gateway between Cambridge & Boston.

BUS TRAFFIC.
The many bus lines that converge on Lechmere Station are presently designed to enter at one end of our building, pick up passengers, and emerge at the other end of our condo building. Please do not route bus traffic, directly under our windows. Bus traffic noise, vibrations and fumes are a great concern. Sidewalks where passengers wait, should also be moved farther from our building to preserve our privacy and minimize impacts from noise, light and smoking. If too close, it will feel like we are living in the bus station.

PRESERVE OUR TREES & GREEN SPACE.
Presently there is a row of mature evergreen trees behind our building. I urge you to preserve all these trees and the entire small green space behind our building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks should be on the far side of the large trees. These trees serve as a natural screen for the tracks and busway.

I-105-001

Please see Comment Letter I-013.

MAINTENANCE FACILITY.
I strongly oppose the Mirror H location. It is much too close to the Glass Factory and other residential buildings and will effectively destroy further development in North Point. Putting a maintenance facility on prime land in a desirable, developable location that would generate significant tax revenue to Cambridge simply does not make sense. Of the three options proposed, Option L seems to be the best choice however I would prefer there be no maintenance facility in this area but rather it be at the end of the line.

REDUCE SURFACE PARKING.
The present Lechmere Station is at the end of the Green Line. That will no longer be the case with the new Green Line Extension and the number of parking spaces should be substantially reduced. Please consider using the under-utilized parking garages that are already in this neighborhood. Surface parking is bad urban design and should be minimized in the new North Point neighborhood. One half of our building will overlook the new parking and we request it be carefully designed with this in mind. Ample green space should be included in the design and all lighting should be down lighting that minimizes light pollution to our building.

Thank you for hearing my concerns.

Sincerely,

Subject: Comments on Green Line Extension - Lechmere Relocation

Dear Secretary Bowls,

As a resident of the glass factory condominiums, I am very concerned about the design and location of the new Lechmere station.
I understand this is a part of a major project, the green line extension and I appreciate all the effort going on but I urge you to consider all these people negatively affected. I would like to stress on how much damage the current design will have on our community and our quality of life.

I-106-001 Having the train station tracks so close to our building is by virtue dangerous and not healthy to us and our children. Please consider not using the existing tracks but moving them as far away from the rear of the glass factory building and at least 200 feet away.
We are very proud of our green space and we took very good care of it for many years so we urge you to preserve it and grow it to provide a visual barrier between our building and the new station.

I-106-002 Also, I understand the land capacity constraints you are facing for the maintenance facility but this is not the last stop and there should not be any facilities on this land. I am sure you are aware of how valuable this land is and how much it would be beneficial for our society to use it appropriately and build something like a park. Whatever it is, please keep in mind the people vision of this potential development area.

I-106-003 Please review the bus lines and their route as these will add to the noise and traffic that is going to severely affect us.
I only ask you to remember that this building exists and there are 104 units with families living in them so don't build around us, take us into consideration and look for our interest. Other alternatives may be costly but this is a once in a lifetime project so let's build the next Lechmere Square and have it improve our community in Cambridge rather than pose stress and safety threats.

Thank you for hearing us and good luck.
Sincerely,
Elias El-Wadi
160 Monsignor Obrien Hwy, Unit 301, Cambridge MA 02141

I-106-001

Revised conceptual plans for Lechmere Station and connecting track structures are included in FEIR Chapter 5, Lechmere Station. These plans will be further refined in the preliminary engineering stage of the Project. Impacts to trees, landscaping, and the visual environment on or near the Glass Factory Condominium property will also be addressed during preliminary engineering. In accordance with the Secretary's Certificate on the DEIR, the FEIR includes only conceptual station designs and station design criteria. The Public Involvement Plan, Chapter 6 of the FEIR, proposes a structure for community involvement throughout the station and trackway design process.

I-106-002

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-106-003

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA to evaluate opportunities to improve connections between existing bus routes and proposed stations. Specifically at Lechmere Station bus operations have been accounted for and evaluated for their impacts on traffic and noise.The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

Boston, MA 02114

RE: Green Line Extension Draft EIR (EEA #13886)

Dear Secretary Bowles:

I strongly support the construction of the Green Line Extension to Route 16 and to Union Square and believe its positive environmental impacts dwarf potential negative impacts. I would like to offer my sincere thanks to MassDOT for committing to a Route 16 terminus, to full design of the Community Path, and to continued analysis of alternative locations for the maintenance and storage facility. The DEIR represents a critical milestone in the public evaluation process and I appreciate the opportunity to comment on MassDOT's work thus far.

However, I do believe that major design and planning improvements must be included in the final EIR to yield a first-class transit system, as well as to support robust economic development and improved quality of life for Cambridge, Somerville, and Medford residents. Therefore I think it is critical that the following issues be incorporated as requirements in the MEPA Certificate:

Station Design & Siting

I-107-001

- Green Line stations must connect as seamlessly as possible with all other clean modes of transportation, including current and re-routed buses. Station designs should accommodate bus drop off and pick-up (for example, using bus pull-out pockets or curb extensions), provide bus shelters for all travel directions, and include maximum integration of transit modes. Re-routed bus lines connecting to Green Line stations should be implemented simultaneously with the start of Green Line service, as was done for the Red Line northwest extension.

I-107-002

- Station designs should only allow for minimal car drop-offs ("kiss-and-ride") where necessary, but not parking, and should prioritize ease of pedestrian and bicycle access over car access. Any "kiss-and-rides" should not cut off the sidewalk to pedestrians as is shown at Brickbottom and Route 16; a drop-off zone on the street would be more appropriate.

I-107-003

- Pedestrian and neighborhood access should be maximized by locating station headhouses on major streets whenever possible, with station access from both sides of the street and in all directions of travel—especially at Broadway, College Avenue, and Lowell Street stations. A second headhouse should be considered on School Street for access to the west end of Gilman Square Station; also direct station access to the Somerville High School/Library/City Hall complex would be beneficial. To provide direct pedestrian access to Union Square from Union Square Station and higher station visibility, please consider building a 100-foot connecting street-level pedestrian promenade or plaza between Webster Street and Prospect Street (opposite the proposed headhouse) over the Fitchburg railroad right of way. At all stations, sidewalks leading to headhouses should be widened and additional crosswalks considered near stations; traffic calming measures such as curb extensions and raised crosswalks or tables should be considered where possible. This will maximize transit use.

I-107-004

I-107-001

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

I-107-002

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. The only Green Line Extension station that will provide parking is Lechmere Station. Drop-off and pick-up areas will be provided at at several stations. These will accommodate expected kiss-and-ride activity.Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-107-003

Stations have been designed to meet MBTA design standards and to be ADA-compliant in regard to access. The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-107-005

- MassDOT should reconsider station designs to maximize ease of access where riders will access stations at bridge crossings. For example, Brickbottom Station should be shifted to abut Washington Street for direct high-visibility access from Washington. Pedestrian and bus access to stations and high station visibility from major streets should be prioritized for maximum convenience.

I-107-006

- Stations should provide adequate bicycle storage. This should be calculated based on a percentage of 3 to 5% of boardings at the stations, as is done on the Red Line, e.g., at Alewife and Davis. Route 16, Lowell Street, and Union Square stations will have direct bicycle access from the Community Path and should therefore have bike parking based on 5% of ridership; all other stations should be allotted 3% ridership bike parking. Bicycle storage should be sheltered from the elements if at all possible to enable all-weather bike access, and it should be installed in easy-to-locate, well-lit and safe locations. Way-finding signage should be provided if bike parking is not immediately obvious to arriving bicyclists. Excellent bike access and parking is important for improving connectivity to the Green Line Stations and is cost-effective for increasing ridership.
    - Note that the Federal Transit Administration has issued a proposed change to bicycle/pedestrian access to public transportation: "all pedestrian improvements located within one-half mile and all bicycle improvements located within three miles of a public transportation stop or station shall have a de facto physical and functional relationship to public transportation." Federal Register: November 13, 2009 (Volume 74, Number 218), http://edocket.access.gpo.gov/2009/E9-27240.htm.

I-107-007

- More attention should be given to bicycle access to and from the stations. MassDOT should work directly with the Cities of Somerville, Medford, Cambridge and DCR to plan and install bike lanes, sharrows, and other facilities that connect directly to the stations.

I-107-008

- The new Green Line stations should not include escalators, which are expensive to install and maintain. Wide staircases and ADA elevator access are sufficient. Reallocate the escalator budget for other needed station elements recommended in this letter, such as bike shelters and additional headhouses.

I-107-009

- Takings of private land for stations should be minimized to save the state money and reduce construction delays. This particularly applies to the Route 16 Station.

I-107-010

- Designs for the relocated Lechmere Station should be based on or incorporate the East Cambridge Planning Team (ECPT) pedestrian-friendly station proposal and old Lechmere Station re-use suggestions. The terminus at Route 16 should be based on the Medford Green Line Neighbors Alliance (MGNA) well-reasoned design concept for minimizing takings.

Community Path Integration

I-107-011

- The Community Path and its important station connections must be designed and constructed simultaneously with the Green Line extension in order to facilitate direct pedestrian and bicycle access to the stations. The final EIR should clearly state that the extension of the Somerville Community Path will be designed by MassDOT's contractors as agreed to in a February 24, 2009 letter from the former EOT.

- For obvious cost efficiencies, the Green Line and Community Path extensions should be constructed as one project and clearly described as such by MassDOT in their project documents. The Community Path will provide cost-effective off-road bicycle and pedestrian access to the stations,

I-107-004

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-107-005

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. Stations have been designed to meet MBTA design standards and to be ADA-compliant in regard to access. The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-107-006

Bicycle storage at each station was evaluated based on ridership projections developed by CTPS. DEIR/EA Appendix D includes methods

I-107-011

offering superior neighborhood connectivity (like in Davis Square where 60% of the residents use public transportation and thousands walk and bike to the station each day). More riders means a greater chance of getting New Starts funding.

I-107-012

- MassDOT should commit to work with the City of Somerville and State and Federal agencies to obtain the necessary funding to build the Community Path extension as part of the Green Line extensions (as was done with the Linear Park as part of the Red Line and the Southwest Corridor path as part of the Orange Line, as well as other examples in Los Angeles and DC), including applying for Federal New Starts funding for allowed bicycle and pedestrian access costs (see note above on FTA proposed bike/ped eligibility).

I-107-013

- Community Path access at Lowell Street in particular should be redesigned for direct bicycle access to the station. The design as proposed requires large vertical and horizontal detours and a road crossing for Community Path users going to the station. Consider a bike/pedestrian grade crossing to access the platform from the Path.

I-107-014

- The Community Path route should connect the Washington St./Brickbottom station, the Brickbottom community and Inner Belt to Lechmere. The present plans do not make these connections. If the proposed Yard 8 location for maintenance and storage facility is "dropped", better routes for the Community Path (such as along the Green Line to Brickbottom and over the former Red Bridge location) that do make these connections are possible. The Green Line extension plans should state that this re-evaluation will be done.

Preservation of Corridor Transit Potential: Beyond Union Square and Route 16, Plus Infilling

I-107-015

- Track design and construction should enable adding future stations – between Lechmere and Washington Street / Union Square, between College Avenue and Route 16, and along a future Green Line extension to Porter Square that would serve dense, transit-deprived Cambridge and Somerville neighborhoods. Potential extension to West Medford, as once planned, should also be made possible by the design of the Route 16 terminus.

Route 16 Construction and Connections

I-107-016

- The Medford extension should be designed and constructed to Route 16 as one project, not in two phases (the first phase stopping at College Ave), for the following reasons: building in two phases is not a cost-effective way to construct this transit system; the shortened system will attract far fewer riders; and this strategy increases the chance that the Green Line is never extended to Route 16.

I-107-017

- The plans should show how riders will safely access the Route 16 terminus station from the Alewife Brook paths that are being improved as a $3.6 million ARRA stimulus project. (The current plans in the DEIR do not show this.) Safe routes for pedestrians and bicyclists should be shown from the west side of Route 16.

- A multi-use path should also be designed and constructed together with the Green Line Extension project that will run from the Route 16 Station to the West Medford Commuter Rail Station. This is a 1,900-foot distance that is easily walkable in 5-10 minutes if there is a direct connection between the two stations; it will allow for commuter rail- Green Line transfers, boosting the ridership of both transit lines, even if a Green Line extension to West Medford (still preferable) cannot be built.

Economic Development & Regional Corridor Planning

used to analyze demand for bicycle parking at each Project station. Detailed bicycle parking designs will be further developed during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

I-107-007

Where appropriate, MassDOT will work with the local municipalities to evaluate bicycle access opportunities at stations.

I-107-008

Stations have been designed to meet MBTA design standards and to be ADA-compliant in regard to access. The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-107-009

DEIR/EA Section 5.2 describes the Project's potential acquisitions. MassDOT is currently conducting detailed property surveys to obtain more specific data. MassDOT will continue to evaluate opportunities to minimize these property impacts.

I-107-010

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. These plans will be further refined in the preliminary engineering stage of the Project. In accordance with the Secretary's Certificate on the DEIR, the FEIR includes only conceptual station designs and station design criteria. Designs for each station and the Green Line Extension alignment will be refined during the Project's

I-107-018

- Track, station and Green Line corridor area designs must provide full roadway and community access to Brickbottom Inner Belt and Lechmere Station through reconstruction of Route 28 as a human-scale, pedestrian-friendly surface boulevard that invites pedestrian and bicyclist use. Improved connectivity between both sides of Route 28 is crucial for economic development, walkable station access, and improved quality of life.

I-107-019

- State and other leading Transit-Oriented Development guidelines should be utilized to promote strategic regional economic development within a mixed use context in the Brickbottom Inner Belt and Union Square Boynton Yard districts.

I-107-020

- The design and siting of the maintenance facility should not prevent development of a street grid in Inner Belt/Brick Bottom that enables access from North Point, McGrath-O'Brien Highway and Washington St.

System-wide Accessibility

I-107-021

- System-wide accessibility should be a goal of the MBTA Green Line. To accomplish this the MBTA should strongly consider building the Green Line Extension stations with high-level platforms that are 14" above the rail, allowing level entry onto low-floor Type 8 and Type 9 LRVs. At the same time, it would be necessary to (1) replace all the existing bi-fold Green Line car doors with bi-parting plug doors that are compatible with level entry; (2) raise all other station platforms in the Green Line system to 14" height over a phase-in period of several years; (3) and follow through with ordering bi-parting plug doors in the new Type 9 rolling stock, as I understand is already planned. This systemwide change would eliminate the need for time-consuming bridge plates and mobile lifts, while speeding up all passenger boarding.
    - Once sliding doors are retrofitted on all Type 7 and 8 cars and ordered with Type 9 cars, operators would continue to use low-floor cars' bridge plates at partly raised platforms (e.g., Park and Arlington) and the mobile lifts at low-level platforms (e.g., Hynes Center and surface branches) that have not yet been upgraded. As all stations are upgraded over some number of years, bridge plates and lifts would no longer be necessary for wheelchair access at those stations. The phase-in of level boarding could be handled the same way that bridge plates are currently being phased in over lifts for partly "raised" platforms. Subway maps and the MBTA website would indicate which stations have become level boarding, where wheelchair customers do not need to request assistance. The Green Line Extension is the largest change to the Green Line system since Riverside and combined with the future Type 9 orders presents the best chance to achieve universal accessibility and improved boarding efficiency across the system.
    - Note that the U.S. Access Board specifies the maximum step height for level-entry LRVs as 5/8" inch for new-construction platforms and 1.5" for existing platforms. http://www.access-board.gov/transit/manuals/transit%20manual%20-%20d.htm Therefore the existing bi-fold doors prevent level entry because of more than 5/8" car sway during boarding, and they should be retrofitted across the system with sliding plug doors.

Maintenance Facility & Regional Environmental Justice

I-107-022

- More detailed analysis of Option L and particularly "Mirror L BET" (described by Alan Moore in his public comment letter) is necessary. The siting of the maintenance facility and storage yards should

preliminary engineering stage. The Public Involvement Plan, Chapter 6 of the FEIR, proposes a structure for community involvement throughout the design process for each station.

The contractor that secures the Green Line Extension construction contract will be expected to prepare the existing Lechmere Station site for future redevelopment.

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. In the interim, MassDOT proposes a community planning process for the area of a future Mystic Valley Parkway/Route 16 station to cover issues relating to station design and layout, neighborhood impacts, attendant economic development, and other area planning issues.

I-107-011

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-107-012

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-107-022 not increase the transportation infrastructure and environmental burdens in Somerville or interfere with proposed economic development in the Brickbottom Inner Belt area.

I-107-023 • Current use of the Boston Engine Terminal for the maintenance of diesel engines serving the commuter rail network south of Boston should either be phased out and a new facility built south of Boston, or the urban core passenger rail should be electrified with dual-mode locomotives, to eliminate the pollution from shuttling of trains through Cambridge.

FEIR versus Supplemental EIR

To avoid the significant delay that a separate FEIR would entail, I believe the most critical issues with the DEIR should either be addressed in a Supplemental EIR, or in Addenda to the FEIR. These issues include:

I-107-024 ▪ Eliminate the Yard 8 Option for the Maintenance Facility and require a full analysis of Scheme L and "Mirror L BET" designs.

I-107-025 ▪ Commit to a collaborative public process for the next phase that would provide oversight and station area participation and develop a process for addressing mitigation concerns.

I-107-026 ▪ Fully integrate the Community Path into the design, planning, construction, and funding of the Green Line extension.

I-107-027 ▪ Coordinate the Green Line extension with calming of the McGrath/O'Brien Highway to a surface boulevard in Cambridge & Somerville.

I-107-028 ▪ Design and construct the Mystic Valley Parkway / Route 16 terminus at the same time as the rest of the project.

I-107-029 ▪ Prioritize pedestrian and bicyclist access over motor vehicle access in the new station designs.

Thank you for taking the time to consider these important improvements to the Green Line Extension project plans. Please don't hesitate to contact me for more information at (917) 239-8785 or alexepstein@gmail.com.

Sincerely,

Alexander Epstein

278 Beacon Street

Somerville, MA 02143

I-107-013

For safety reasons, the MBTA, the future owner and operator of the Green Line Extension, has required that this portion of the Green Line be entirely separated from vehicular, pedestrian, and bicycle traffic. This separation would not allow at-grade track crossings for pedestrians and/or bicyclists at any point. Plans for Lowell Station and the Community Path connection will be further refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the design process for stations, trackways, and the Community Path.

I-107-014

MassDOT is committed to completing all planning, design, and engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community Path between Lowell Street and Inner Belt Road. MassDOT is not able at this point to commit to funding the construction of the Community Path. The limits of the path were predicated on the connections to Lechmere being made through the Inner Belt area via Inner Belt Road and the proposed Urban Ring Bridge into the Lechmere area. However, the cessation of planning for the Urban Ring Project has changed the timing of this anticipated connection. MassDOT is unable to assume responsibility for designing the Urban Ring Bridge as part of the Green Line Extension Project. That being said, MassDOT is committed to working with the City of Somerville, residents and businesses in the Brickbottom and Inner Belt neighborhoods, and Community Path advocates to design the Path to create improved connectivity within the Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension.

I-107-015

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and

infrastructure design with conceptual future Green Line additions and extensions.

I-107-016

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-107-017

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout and access at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-107-018

DEIR/EA Section 3.9 describes the compatibility of the Green Line Extension with other regional projects, such as the conceptual reconstruction of McGrath Highway and the Urban Ring transit corridor initiative. MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses to

ensure, to the extent feasible, consistency with planning and other projects.

I-107-019

Direct and indirect impacts to land use are described in DEIR/EA Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for sustainable land use, which could further reduce automobile traffic congestion and improve air quality. However, reconstruction of Route 28 is not part of the Green Line Extension Project.

I-107-020

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. The evaluation considers land use and connectivity impacts and opportunities associated with each maintenance facility site alternative.

I-107-021

The Green Line Extension Project is being designed for fully accessible stations in compliance with ADA requirements. However, the issue of systemwide level boarding on the Green Line and modifications to existing vehicles is beyond the scope of this Project.

I-107-022

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real

estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-107-023

The Boston Engine Terminal (BET), its operations, and general commuter rail operations and maintenance are beyond the scope of the Green Line Extension project. The conceptual future electrification of MBTA commuter rail lines in the Study Area is also beyond the scope of the Green Line Extension Project. However, the conceptual plans in the DEIR/EA and FEIR do not preclude future electrification of commuter rail.

I-107-024

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility

alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-107-025

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-107-026

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-107-027

DEIR/EA Section 3.9 describes the compatibility of the Green Line Extension with other regional projects, such as the conceptual reconstruction of McGrath Highway and the Urban Ring transit corridor

initiative. MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses to ensure, to the extent feasible, consistency with planning and other projects.

I-107-028

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-107-029

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary’s Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary

engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA #03886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-108-001 I As a resident of the Glass Factory Condominiums, I am deeply concerned about the design and placement of the Green Line Extension and the new Lechmere Station.

TRACKS ARE TOO CLOSE TO OUR BUILDING.
The present design shows the tracks running very close to the rear of our building. We urge your designers and engineers to place the tracks as far to the rear of our building as possible to preserve views & light to the many units that will be severely impacted by the elevated tracks. The design and placement of the tracks and supports should do all it can to minimize the visual impact to those units and also minimize noise & vibration impacts to the whole building as well as the surrounding neighborhood.

LECHMERE STATION.
At present, your designs show the new Lechmere Station so close to the Glass Factory that it appears to be part of our condominium building. Please move the station closer to East Street, where it could be part of the entrance way to the eventual North Point development. The station design needs to be substantially improved so it is not an eyesore but rather an enhancement to this rapidly developing neighborhood. It should reflect the importance of this location as the gateway between Cambridge & Boston.

BUS TRAFFIC.
The many bus lines that converge on Lechmere Station are presently designed to enter at one end of our building, pick up passengers, and emerge at the other end of our condo building. Please do not route bus

I-108-001

Please see Comment Letter I-013.

traffic, directly under our windows. Bus traffic noise, vibrations and fumes are a great concern. Sidewalks where passengers wait, should also be moved farther from our building to preserve our privacy and minimize impacts from noise, light and smoking. If too close, it will feel like we are living in the bus station.

PRESERVE OUR TREES & GREEN SPACE.
Presently there is a row of mature evergreen trees behind our building. I urge you to preserve all these trees and the entire small green space behind our building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks should be on the far side of the large trees. These trees serve as a natural screen for the tracks and busway.

MAINTENANCE FACILITY.
I strongly oppose the Mirror H location. It is much too close to the Glass Factory and other residential buildings and will effectively destroy further development in North Point. Putting a maintenance facility on prime land in a desirable, developable location that would generate significant tax revenue to Cambridge simply does not make sense. Of the three options proposed, Option L seems to be the best choice however I would prefer there be no maintenance facility in this area but rather it be at the end of the line.

REDUCE SURFACE PARKING.
The present Lechmere Station is at the end of the Green Line. That will no longer be the case with the new Green Line Extension and the number of parking spaces should be substantially reduced. Surface parking is bad urban design and should be minimized in the new North Point neighborhood. One half of our building will overlook the new parking and we request it be carefully designed with this in mind. Ample green space should be included in the design and all lighting should be down lighting that minimizes light pollution to our building.

Thank you for hearing my concerns.

Sincerely,

The Executive Office of Energy and Environment Affairs
MEPA Office

RECEIVED
JAN 8 2010
MEPA

Dear Secretary Ian Bowles,

I'm writing this letter with regards to the Draft Environmental Impact Report (DEIR) and in particular the Maintenance Facility and Storage Yard alternatives.

I have lived at Brickbottom for over twelve years and have been a big supporter of the Green Line extension project. Also as an avid cyclist, the prospect of the Community bike path being located so close to Brickbottom is a clear win for us as well.

I-109-001 That said, I'm extremely unhappy with the continued insistence by the DOT that Yard 8 is the best site for the Maintenance and Storage Yard. I know first hand the effects of a maintenance facility, as the Boston Engine Terminal went online shortly after I moved to Brickbottom. Ever have a diesel train engine idle outside your window? I have. In fact, I've had work crews outside my window at 3AM, soot on my windows and in the air I breathe, air horns blown outside my window (even though it's a no-horn zone), with little to no recourse from any of the agencies involved.

I-109-002 I have little faith in the promises from the DOT that folks on the other side of my building (I live on the McGrath Highway side) will be able to live with the noise, vibration and light pollution the siting of Yard 8 will bring to their lives. Asking them to bear this burden is unjust.

I-109-003 I urge you to hear our plea for one of the alternative sites, in particular Mirror H, which is preferred by the City of Somerville. This site, or even Scheme L, will push the facility closer the existing Engine Terminal and away from the only residential buildings in the area, resulting in better quality of life for the 200+ residents of Brickbottom. I also would request that a Citizen Advisory Committee be established to oversee the remainder of the project and ensure that community has a voice in the process.

Regards,

Anthony Espy
1 Fitchburg St. C201

<tonyespy@gmail.com>

Emailed FAXED

I-109-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-109-002

Please see response to Comment I-109-001.

I-109-003

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

Dear Secretary Ian Bowles,

I am writing about the Draft Environmental Impact Report on project EEA #13886.

I-110-001 A maintenance and storage facility placed at Yard 8 will damage the environment of the residents of Somerville, who already absorb a disproportionate percentage of transportation infrastructure for metropolitan Boston.

Here at 1 Fitchburg Street our environment will be bombarded with yet more noise, more vibration, more artificial light, and more pollution from facility workers' cars and maintenance vehicles.

Option L and Mirror H at least would not be placed directly next to a vibrant community of 200 people, including a number of families with young children, my own family included.

The residents of Somerville must be listened to, in our unanimous opposition to the placement of this facility at Yard 8.

I-110-002 Regarding the environmental impact of the Green Line extension, a tunnel taking the trains underground, out of sight and decreasing the noise and vibration impacts on residents, should be seriously considered. Somerville is a dense urban area which, like most other areas of it same density, needs more, and more convenient, public transportation. However, Somerville deserves not more trains seen, heard, and felt by residents 20 hours a day, but landscaped open spaces like those created above the Big Dig in Boston; spaces that can improve our physical environment instead of decreasing our quality of life.

I appreciate your continued serious consideration of alternatives to Yard 8 and to building a transportation infrastructure that will not only help thousands of people each year, but hundreds of Somerville residents every day.

Sincerely,

April Evans

I-110-001

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-110-002

Tunneling alternatives were evaluated but dismissed, as described in DEIR/EA Appendix B, Section 7.

Boston MA 02114

Dear Secretary Ian Bowls:

I-111-001 I am an artist with a studio at the Brickbottom Artists Building in Somerville and am writing in regard to the Draft Environmental Impact Report on project No. EEA#13886. The detailed evaluation of alternative sites for the Green Line maintenance facility and train storage yard has shown three options. Of the three proposed sites, Mirror H. is the most preferable. This is the preferred site of the City of Somerville and the residents of the Brickbottom Artists Building. Option L will need further study and refinement, but might work.

I-111-002 I strongly oppose siting the Green Line Train Storage Yard and Maintenance Facility in Yard 8. Yard 8, is immediately adjacent to the Brickbottom Building and would have serious negative effects on our quality of life. I am particularly concerned about the noise and vibration levels as it impacts our building and surrounding businesses

In addition to noise and vibration concerns, the Yard 8 location would build a barrier between the Inner Belt and the Brickbottom areas and would impact the potential for future development in the region. The Storage Yard and Maintenance Facility would have a direct impact on future tax revenue as it impacts adjacent property value and future growth.

I support the Green Line Extension and hope to see continued community involvement as plans proceed. In this spirit, I am voicing my strong objections to the Yard 8 site for the Storage Yard and Maintenance Facility. Brickbottom is a diverse community of 220 residents and many who work in the building. The Yard 8 location would unjustly punish us and does not live up to the standards that Mass DOT has promised to deliver.

Thank you for your continued consideration of the alternative sites Mirror H and Option L.

Yours truly,

Phyllis Ewen, C103

I-111-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, Option L is identified as the preferred maintenance facility site.

Boston, MA 02114

Dear Secretary Bowles:

I-112-001

I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

First of all, I strongly support the Green Line extension, and urge that it be built in the most practical, beneficial and cost-effective manner – that is, to construct the entire project in one phase, with a terminus station at Mystic Valley Parkway (Route 16), by December 31, 2014.

The DEIR is encouraging in that it concludes that the Route 16 station would provide the most benefits according to all project criteria, including air quality and environmental justice. However, MassDOT states that it is incapable of building (and funding) the entire "Preferred Alternative," so it only intends to build the extension to College Avenue in the Tufts University area of Medford, by its deadline of December 31, 2014.

In my opinion, the DEIR as currently written does not serve the best interests of the project. More importantly for your review, it was not done in a way that "adequately and properly" complies with the state environmental regulations, nor with the December 1, 2006 MEPA certificate that defined the requirements of the DEIR.

For the following reasons, I strongly urge you to not accept the DEIR as the Final EIR and require further environmental analysis of the project by MassDOT:

1. A two-phased approach is unacceptable. The Route 16/Mystic Valley Parkway Station should be built as part of a single-phase project to minimize costs and negative impacts and achieve the maximum benefits with regard to ridership, vehicle mile travel reduction, air quality improvements, and service to environmental justice communities.

The recommendation as outlined in the DEIR is for the Route 16/Mystic Valley Parkway station to be a **separate** stand-alone Phase II project with no funding source identified. **This means, Route 16 may never be built.**

There are many, many problems with the Phase II approach, including:

- **Risk.** Without an identified funding source there is a very high probability that Route 16 will never be built and the implications of this are critical.
- **Terminus Impact.** Without a Route 16 Station, the College Avenue stop (designed and intended to be an **interim station**) would become the de facto terminus for the Green Line extension. It is not designed for a terminus and due to the traffic flow and neighborhood density, as well as the lack of opportunity for transit-oriented development at College Ave., it is not a good location for a terminus.

- **Cost.** The two-phased approach is fiscally irresponsible and by MassDOT's own estimates will inflate the cost by $55 million over a single-phase approach. Severing a single stop (less than one mile of track) from the project as a whole will cost the state,

I-112-001

Please see Comment Letter I-002.

and thus the taxpayers, significant additional money. There are obvious ways to easily reduce costs in the overall project and provide enough additional funds to include Route 16 as part of a single, complete project. This is the most prudent approach, and also would ensure that the project produces the air quality improvements the Commonwealth must achieve to come into compliance with the Clean Air Act.

- **Project Management.** There are significant efficiencies gained from completing the project in one phase, rather than the starts and stops required to execute on separate, multi-stage efforts for such a small add-on project as a single station stop.
- **Environmental Justice:** The environmental justice population cited, in part, to justify the project as a whole will largely not be served if the project terminates at College Avenue. The negative aspects of this project will affect them most, while they will receive the least benefit without service to a Route 16 terminus.
- **Legal Mandate:** The state is legally obligated to provide public transit services to Medford Hillside by December 31, 2014, and stopping the extension at College Ave. fails to meet this legal obligation. At a minimum, this incurs significant mitigation costs required if the obligation is not met.

2. College Avenue should not be a terminus. The College Avenue station is not designed for the additional requirements of a terminus. The neighborhood cannot sustain the impact of a terminus station operations and traffic volume and the potential environmental damage is of serious concern.

3. The Route 16 station design is inadequate. The DEIR offers only a "worst case scenario" (MassDOT's description) for the Route 16 station design, while offering optimized station designs for all other Green Line extension stations. The Route 16 station design must be revisited. The Medford Green Line Neighborhood Alliance, a volunteer citizen group, has offered an alternative station design that prevents two major commercial property acquisitions and the resulting job displacement, preserves $182,000/year in property taxes for the City of Medford, optimizes traffic flow and better serves the integrity of the station's surroundings. MassDOT apparently has been exploring similar improved designs, which should be presented to the public for comment. A $1 billion project deserves a higher caliber design than a "worst case scenario."

To summarize, there is much more work to be done on the Environmental Impact report, and I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis in order to make the Green Line extension the best project it can be, and MUST be.

Thank you.

Dear Secretary Bowles,

The needs of a vibrant, expanding city are numerous and complex. Ideally, decisions of growth and expenditure are debated and resolved on the basis of benefit for a majority, in tandem with efficient use of limited funds.

The Green Line expansion into Somerville is a welcome, long-awaited development, certain to enhance the quality of life here. That a new MBTA maintainence facility is a necessary component of the expansion is entirely understandable and realistic. But the siting of the facility must be thoroughly considered, weighing all options, and bearing in mind potential future tax revenue and the broader development of the area.

This will be a "one and only" decision. It's vital to get it right.

Respectfully,
Matthew Fallon

Re: Comments on the Green Line Extension DEIR

Dear Secretary Bowles:

I am writing to provide my comments on the DEIR for the proposed green line extension. I previously served on the MBTA's Beyond Lechmere Advisory Committee.

I-114-001

I support MassDOT's designation of the Mystic Valley Parkway (Route 16) terminus station, with no parking, as the Preferred Alternative. Nevertheless, the Draft Environmental Impact Report (DEIR) should NOT be accepted as the Final Environmental Impact Report (FEIR) because the DEIR fails to fulfill the requirements set forth by the Executive Office of Environmental Affairs in its Dec. 1, 2006 MEPA Certificate on the Expanded Environmental Notification Form.

I-114-002

The DEIR includes unnecessary eminent domain takings of buildings near Route 16 in Medford. In an appearance before the Medford City Council, EOT representative Stephen Woefel discussed the takings as a 'worst case scenario.' If that is the case, why wasn't a better scenario presented in the DEIR as well?

A better scenario exists, without any unnecessary takings near Route 16, and it has been submitted by the Medford Green Line Neighborhood Association (MGNA). It may also be viewed online at http://www.medfordgreenline.org/MGNA-EIRA/MGNA_Rt16_Design.pdf

I understand, from Mr. Woefel's discussion with the Medford City Council, that MassDOT has developed a 'better scenario' internally as well. If that is the case, it should be presented. As Mayor McGlynn noted in his comment letter, Medford should not be required to accept incomplete information.

I-114-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

I-114-002

All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

By providing only the worst case scenario for the Route 16 terminus, the DEIR increases the prospect that a Route 16 terminus will be rejected, compelling the terminus to be located at College Avenue instead. A terminus station at College Avenue, however, would not fulfill the state's legal commitment to serve Medford Hillside, per the extensive documentation that MGNA and its members have provided concerning the definition and location of Medford Hillside.

In a final EIR, after rejection of the DEIR, MassDOT should complete its analysis of a Route 16 terminus, taking into account MGNA's submissions concerning station design, track placement and related issues.

Thank you for this opportunity to provide comments.

Very truly yours,

Robert Feigin

Subject: green line + bike path= Biggest bang

Dear Secratary Bowles,

I am very excited that the Green Line is FINALLY coming to Somerville.

I-115-001

I just have one main point to urge: Please fold in the Communnity Path extension into the Green line extension as ONE project. We'll get much more bang for the buck, and each one will compliment the other.

Keep up the good work,

Alex and Ami Feldman
80 Rogers Ave
Somerville

1

I-115-001

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA #03886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-117-001 As a resident of the Glass Factory Condominiums, I am deeply concerned about the design and placement of the Green Line Extension and the new Lechmere Station.

TRACKS ARE TOO CLOSE TO OUR BUILDING.
The present design shows the tracks running very close to the rear of our building. We urge your designers and engineers to place the tracks as far to the rear of our building as possible to preserve views & light to the many units that will be severely impacted by the elevated tracks. The design and placement of the tracks and supports should do all it can to minimize the visual impact to those units and also minimize noise & vibration impacts to the whole building as well as the surrounding neighborhood.

LECHMERE STATION.
At present, your designs show the new Lechmere Station so close to the Glass Factory that it appears to be part of our condominium building. Please move the station closer to East Street, where it could be part of the entrance way to the eventual North Point development. The station design needs to be substantially improved so it is not an eyesore but rather an enhancement to this rapidly developing neighborhood. It should reflect the importance of this location as the gateway between Cambridge & Boston.

BUS TRAFFIC.
The many bus lines that converge on Lechmere Station are presently designed to enter at one end of our building, pick up passengers, and emerge at the other end of our condo building. Please do not route bus traffic, directly under our windows. Bus traffic noise, vibrations and fumes are a great concern. Sidewalks where passengers wait, should also be moved farther from our building to preserve our privacy and minimize impacts from noise, light and smoking. If too close, it will feel like we are living in the bus station.

PRESERVE OUR TREES & GREEN SPACE.
Presently there is a row of mature evergreen trees behind our building. I urge you to preserve all these trees and the entire small green space behind our building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks should be on the far side of the large trees. These trees serve as a natural screen for the tracks and busway.

I-117-001

Please see Comment Letter I-013.

MAINTENANCE FACILITY.
I strongly oppose the Mirror H location. It is much too close to the Glass Factory and other residential buildings and will effectively destroy further development in North Point. Putting a maintenance facility on prime land in a desirable, developable location that would generate significant tax revenue to Cambridge simply does not make sense. Of the three options proposed, Option L seems to be the best choice however I would prefer there be no maintenance facility in this area but rather it be at the end of the line.

REDUCE SURFACE PARKING.
The present Lechmere Station is at the end of the Green Line. That will no longer be the case with the new Green Line Extension and the number of parking spaces should be substantially reduced. Please consider using the under-utilized parking garages that are already in this neighborhood. Surface parking is bad urban design and should be minimized in the new North Point neighborhood. One half of our building will overlook the new parking and we request it be carefully designed with this in mind. Ample green space should be included in the design and all lighting should be down lighting that minimizes light pollution to our building.

Thank you for hearing my concerns.

Sincerely,

Dear Secretary Ian Bowles:

Thanks for inviting citizen comments regarding extension of the Green Line into Somerville.

First, like most people I know, I enthusiastically support the Green Line extension into Somerville,..both branches. Expeditious completion of this "Big Dig promise" is long overdue. Somerville and Medford have been denied for too long the benefits of convenient, environmentally wise transportation by "T" for which they have already paid much in taxes and environmental degradation in the area. Thankfully, the extension of the Green Line will deliver on that promise.

I have spent a number of hours reviewing the planning documents provided by the State and by your office regarding Project # EEA13866. I respectfully ask that my letter be entered into the official record of citizen comments:

I-118-001

I believe the negative impacts of selection of Yard 8 as the site for a Green Line maintenance and train storage facility have not been sufficiently analyzed. The documents do not seriously consider or provide in-depth studies for alternatives that have been recommended, namely Mirror H and Option L.

The materials do not adequately address the serious environmental and economic development objections raised (a) by local elected officials (city and state), (b) by the many resident-owners at Brickbottom Condominium who will directly suffer both in the long and short term, and (c) by other Medford and East Cambridge citizens who voiced their reservations at public forums.

I-118-002

From the point of view of those who wrote the latest documents Yard 8 seems to be the only serious site candidate. This is a mistake from these important perspectives: it would create a major barrier between the Inner Belt and Brickbottom areas, thereby permanently limiting future development in the region. As a result, it would have a direct negative impact on the future tax revenue of adjacent property value both from existing homeowners and from future growth potential which the City of Somerville needs in its eastern district. Plans described in the documents to mitigate operational noise and vibration that would affect residents at Brickbottom Condominium are partial and rather sketchy. For example, only 40 of the 155 residences are designated for soundproofing. All such gaps need to be filled with additional in-depth study before design plans move ahead. In a word, selection of Yard 8 would inflict an unjust burden on Somerville and fly in the face of serious calls for study of alternative sites Mirror H and Option L.

Finally, a personal observation: Before buying a retirement home in East Somerville ten years ago I owned a NYC coop home for twenty-one years in neighborhoods impacted by environmentally and economically damaging mega-projects created by Robert Moses. They are the subject of *Wrestling with Moses* by Anthony Lind (published 2009, Lincoln Land Institute, Cambridge). I recommend it.

Please accept this letter as an effort to help your agency avoid making some of the damaging mistakes Moses made. Again, I enthusiastically support extension of the Green Line.

Sincerely yours,

David J. Fillmon

I-118-001

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-118-002

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

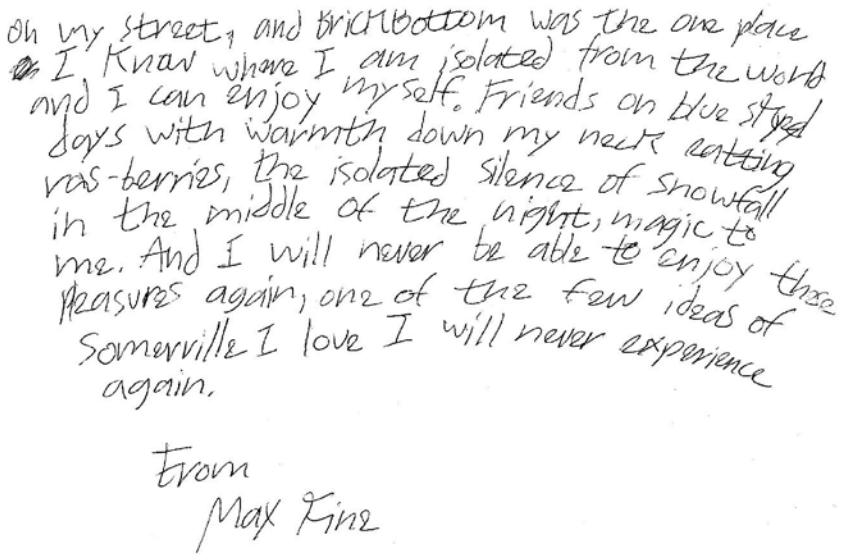
Dear Secretary Bowles,
I am writting to talk about the Green Way
extension. I personaly don't find the extension as
Upsetting as most, as a 13 yearold the disturbing
loud sound that would come from the extension
would eventualy ease into my mind almost Soothing,
and I would grow accustomed to the sound.
But there are two reasons that I agree personaly
that the green way extension should not be
put up. The first reason is there a fair amount
of shall we say the "elderly" in the building
and when the noise of the extensions comes
pounding through the windows, doors, the tiny
cracks of Brick Bottom there will be complaints
and when I hear the complaints I will be
annoyed and when I'm annoyed I will
write you a letter every Single day until the
extension is taken down. But more impatantly
I live in a neighbourhood of loud, repetitive sound.
Peeling paint and garbage littered at every corner

I-119-001

I-119-001

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-119-002



Oh my street, and Brickbottom was the one place
I knew where I am isolated from the world
and I can enjoy myself. Friends on blue sled
days with warmth down my neck eating
ras-berries, the isolated silence of snowfall
in the middle of the night, magic to
me. And I will never be able to enjoy those
pleasures again, one of the few ideas of
Somerville I love I will never experience
again.

From
Max Fine

I-119-002

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

Johnson, Holly (EEA)

Boston, MA 02114

Dear Secretary Ian Bowles,

Life at Brickbottom, although uniquely exciting (despite our unusual location), was to take a new turn. The Green Line Extension to Medford was to afford us greater accessibility to the world and the world to us. The addition of a Bike Path offered us an "Urban Parkway" and greater accessibly in normalizing our lives within our unusual Brickbottom setting.
The area would be revitalized . New developments would occur that would enhance the neighborhood and offer to the City of Somerville increase revenues for its well being.
How fortunate.. this was a greater boon than any of us expected.

I-120-001

Then the "Cloud" appeared and it got progressively darker by the moment..
We, the residents of Brickbottom, were to be the "casualties" in this new undertaking. That despite the mandated meetings to assuage many aching souls.. the maintenance Facility and Storage Yard would proceed to be built in Yard 8.. the designated "best " place for it.

You are hearing many voices. The predominate message echoing back and forth is that it would be a grave mistake to build the Maintenance Facility in this location. This is obvious to a city which will probably lose revenues and the possibility of vitalization for it's residents and business as well. As a business owner in Somerville, I have a great opportunity to benefit from the Green Line Extension. As a resident of Brickbottom, the Maintenance Facility in Yard 8 would imprison us within our homes and put a pall on our neighborhood. The arguments are clear and precise as to how we would be affected. Who would you wish this on?

There are, however, sensible alternatives to this location. Your obligation for mitigation would be realized by building the Maintenance Facility in another location than Yard 8.

Thank you for your attention,

Norman Fine
1 Fitchburg Street, C311, Somerville, MA 02143
normanfinecatering@verizon.net

I-120-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

Subject: Lechmere T station / McGrath Highway

Dear Secretary Bowles:

By now you should have received the fine letter sent you by Barbara Broussard, an East Cambridge neighbor and the chair of the East Cambridge Planning Group. Like Ms. Broussard, I am a concerned and affected East Cambridge homeowner (though of fewer years standing) who, as someone who is carless-by-choice, depends exclusively on public transportation (and his own two feet) to move about. By the force of circumstance, I am a monthly link pass purchaser from the T and move into and out of the current configuration of public transit offered by the Lechmere T station (both subway and bus), most often taking multiple trips on both forms of transit. I write to express my wholehearted support of the

positions taken by Ms. Broussard and hope your office will take the views of community members into its considerations that affect the shape, location, and functionality of the new Lechmere T station.

I-121-001

To the points raised by Ms. Broussard, I would add the following. In addition to normal neighborhood and commercial activity in the area, East Cambridge in recent years has become a neighborhood of hotels catering to both convention attendees in Boston and tourists to our area generally. Because out-of-towners need to orient themselves quickly and efficiently to our local transit system, often with just the aid of slightly out of date maps or guidebooks, it is all the more essential, for their sakes as well as the sakes of area residents who come into the Lechmere/East Cambridge area only occasionally (let us not forget the influx of visitors to the area who have been called to jury duty at the Middlesex County Courthouse, which is also a major landmark in the neighborhood), the new station must have more than one entrance, those entrances *must* provide shelter from the elements (i.e. an enclosed area for the purchase of Charlie Cards), and the signage must be clear, typographically unambiguous, and strategically positioned to counteract the prevailing mass transit lay-out and attitude, which is that everything is counterintuitive and harder to figure out than it ought to be in what – by the standards of most major US cities -- is a modest and comparatively small transit system.

Before retiring from higher education in 2008, I was a librarian my entire career and as such have 35+ years experience in dealing with the questions people ask to obtain information and the fact that the most urgent need a sign or an information specialist can fulfill is knowing or sensing the *real* question the questioner has in mind, particularly when English may not be that questioner's primary language. There are currently two 'stump-the-panel' questions that come up at Lechmere with such tedious regularity that the city, planners including your office, and the MBTA ought to be embarrassed that they cannot be quickly or easily answered. Question one, when one approaches the current Lechmere T station from the O'Brien Highway (i.e. where two hotels frequented by visitors to our area are located), is: How do I take a train into Boston and isn't this the way in? Question two, when one alights from a train at Lechmere: how do I get to the Cambridgeside Galleria?

The existing signage (i am being very generous, since the current signage is either nonexistent or done in an informal, crudely lettered manner and located in the most counterintuitive location, which is to say useless) at the station is not helpful. MBTA supervisory staff are never in evidence even during daylight hours, so many visitors flail about trying to make what ought to be a simple set of maneuvers to get to the Cambridge Street side of the station.

I-121-002

When the new station is relocated, the information it will need to provide, and the manner in which it will need to be provided (and even the languages in addition to English in which it should be provided), needs to be well thought out and expressed in a typographically clear and studied way. The local method of simply layering newer pieces of information on top of older

I-121-001

Revised conceptual plans for Lechmere Station, including modifications to the station headhouse and entrances, enclosed automatic fare collection, and other amenities are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-121-002

MBTA has a standardized signage and map update program for all its stations. MBTA Transit Operations will be responsible for keeping signs and maps current and attractive. Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. In accordance with the Secretary's Certificate on the DEIR/EA, the FEIR (Chapter 5, Lechmere Station) includes only conceptual station designs. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-121-002 ones, which might have been acceptable when East Cambridge was not the locus for tourism, trade, and neighborhood traffic that it now is, will no longer do. I strongly urge your office not to make the bad planning mistakes that were made in the past and that were – regrettably – allowed to stand and merely accrete with the passage of years.

I-121-003 I share Ms. Broussard's utmost concern for the safety of pedestrians (but particularly of pedestrians with a disability) who will now need to navigate passage of one of the busiest and dangerous thoroughfares in the area, namely the O'Brien Highway. I do not have a quick solution to this problem. Suffice it to say that, given the high volume of foot traffic the area currently experiences, the problem is already severe and is likely to become more so when the new station and the extension to the Green Line are built even further away from the Courthouse, the Galleria, and local hotels, homes, and shops than is the case today. Again, I express the urgent hope that your office will take the proper measure of this matter and arrive at a solution that gives the highest priority possible to pedestrian safety in the redesigned area.

I wish you and your colleagues luck in addressing and resolving these issues, which are of vital concern to this community.

Cordially yours,

Frances L. Freiman

Copy (for information): B. Broussard, 148 Third Street, Cambridge, MA 02141

I-121-003

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. The chapter presents a traffic analysis, a detailed description of pedestrian crossings of O'Brien Highway, and proposed roadway, crosswalk and sidewalk improvements that are consistent with the approved NorthPoint development plans. These station and street plans will be further refined in the preliminary engineering stage of the project.

January 3, 2010

The Executive Office of Energy and Environment Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston MA 02114

Dear Secretary Ian Bowles,

As a longtime resident of the Brickbottom Artist Building and Somerville's Union Square (for almost 30 years, 21 at Brickbottom), I write to join other Somerville residents to express my deepest concerns about the placement of the Maintenance Facility and Storage Yard in what is called Yard 8.

I-122-001

While I, of course, support the extension of the Green Line, I am confused and dismayed at the suggestion to locate the facility so close to Brickbottom and in an area that has, potentially, great value for the economic development of Somerville. My concern is not only for the Brickbottom community but also for the larger community.

As an owner/resident at Brickbottom, I am especially concerned, however, with the impact this maintenance facility will have on the life of residents here. We already deal with an abundance of noise and air quality issues surrounding Brickbottom: a waste reprocessing center, a U-Haul distribution point, a parking lot for school busses, the McGrath Highway, an Amtrak train line that runs along the Boston side of Brickbottom, and a number of car repair lots. The result is a mash-up of noise, vibrations, smells and disruption that we have put up with because of our extraordinary dedication to and love of our neighborhood and community.

We have 220 residents here – families with babies and teenagers, elderly people and young artists just starting out. Our community works because we are eager and determined to develop the good work Brickbottom does for the art scene and for Somerville. We are always working to deepen our ties and commitment to the larger community and to each other.

I-122-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

My concern is that the Yard 8 placement at the edge of Brickbottom will be one burden too many for residents to absorb. That years of working to create a community will be lost.

Please reconsider the location of the maintenance facility in Yard 8. Please listen to the grave concerns of the residents of Somerville – not just those of us at Brickbottom – who will be so deeply affected.

I-122-002

Also, I ask that you please keep the community involved as this project moves forward. It is so important for us to be heard.

With my thanks and best regards,

Lois Fiore

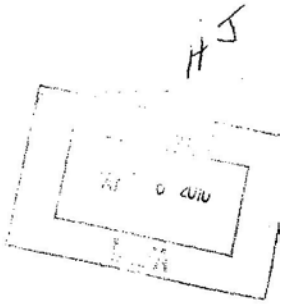
I-122-002

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.



January 04, 2010

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-123-001

I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

First of all, I strongly support the Green Line extension, and urge that it be built in the most practical, beneficial and cost-effective manner – that is, to construct the entire project in one phase, with a terminus station at Mystic Valley Parkway (Route 16), by December 31, 2014.

The DEIR is encouraging in that it concludes that the Route 16 station would provide the most benefits according to all project criteria, including air quality and environmental justice. However, MassDOT states that it is incapable of building (and funding) the entire "Preferred Alternative," so it only intends to build the extension to College Avenue in the Tufts University area of Medford, by its deadline of December 31, 2014.

In my opinion, the DEIR as currently written does not serve the best interests of the project. More importantly for your review, it was not done in a way that "adequately and properly" complies with the state environmental regulations, nor with the December 1, 2006 MEPA certificate that defined the requirements of the DEIR.

For the following reasons, I strongly urge you to not accept the DEIR as the Final EIR and require further environmental analysis of the project by MassDOT:

1. A two-phased approach is unacceptable. The Route 16/Mystic Valley Parkway Station should be built as part of a single-phase project to minimize costs and negative impacts and achieve the maximum benefits with regard to ridership, vehicle mile travel reduction, air quality improvements, and service to environmental justice communities.

The recommendation as outlined in the DEIR is for the Route 16/Mystic Valley Parkway station to be a **separate** stand-alone Phase II project with no funding source identified. **This means, Route 16 may never be built.**

There are many, many problems with the Phase II approach, including:

- **Risk.** Without an identified funding source there is a very high probability that Route 16 will never be built and the implications of this are critical.
- **Terminus Impact.** Without a Route 16 Station, the College Avenue stop (designed and intended to be an **interim station**) would become the de facto terminus for the Green Line extension. It is not designed for a terminus and due to the traffic flow and neighborhood density, as well as the lack of opportunity for transit-oriented development at College Ave., it is not a good location for a terminus.

- **Cost.** The two-phased approach is fiscally irresponsible and by MassDOT's own estimates will inflate the cost by $55 million over a single-phase approach. Severing a single stop (less than one mile of track) from the project as a whole will cost the state,

I-123-001

Please see Comment Letter I-002.

and thus the taxpayers, significant additional money. There are obvious ways to easily reduce costs in the overall project and provide enough additional funds to include Route 16 as part of a single, complete project. This is the most prudent approach, and also would ensure that the project produces the air quality improvements the Commonwealth must achieve to come into compliance with the Clean Air Act.

- **Project Management.** There are significant efficiencies gained from completing the project in one phase, rather than the starts and stops required to execute on separate, multi-stage efforts for such a small add-on project as a single station stop.
- **Environmental Justice:** The environmental justice population cited, in part, to justify the project as a whole will largely not be served if the project terminates at College Avenue. The negative aspects of this project will affect them most, while they will receive the least benefit without service to a Route 16 terminus.
- **Legal Mandate:** The state is legally obligated to provide public transit services to Medford Hillside by December 31, 2014, and stopping the extension at College Ave. fails to meet this legal obligation. At a minimum, this incurs significant mitigation costs required if the obligation is not met.

2. College Avenue should not be a terminus. The College Avenue station is not designed for the additional requirements of a terminus. The neighborhood cannot sustain the impact of a terminus station operations and traffic volume and the potential environmental damage is of serious concern.

3. The Route 16 station design is inadequate. The DEIR offers only a "worst case scenario" (MassDOT's description) for the Route 16 station design, while offering optimized station designs for all other Green Line extension stations. The Route 16 station design must be revisited. The Medford Green Line Neighborhood Alliance, a volunteer citizen group, has offered an alternative station design that prevents two major commercial property acquisitions and the resulting job displacement, preserves $182,000/year in property taxes for the City of Medford, optimizes traffic flow and better serves the integrity of the station's surroundings. MassDOT apparently has been exploring similar improved designs, which should be presented to the public for comment. A $1 billion project deserves a higher caliber design than a "worst case scenario."

To summarize, there is much more work to be done on the Environmental Impact report, and I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis in order to make the Green Line extension the best project it can be, and MUST be.

Thank you.

Brian Flynn

Reference to the Project Number EEA #13886

Dear Secretary Ian Bowles,

I wish to thank you for encouraging the residents of Somerville, Cambridge and Medford to state their opinions concerning the Draft Environmental Impact Report (DEIR) and in particular the report on the Maintenance Facility and Storage Yard alternatives.

I-124-001

As an early supporter of the Green Line Extension to Medford, I believe the extension is both physically helpful and a boost to the development of the entire area served. The issue I have with the DOT is their position on the placement of the Maintenance Facility and Storage Yard in what is called Yard 8 in the Brickbottom and Innerbelt area of Somerville. Although I note that the DOT is also interested in exploring other areas such as Mirror Scheme H and Scheme L for their facility project, the fact remains that it still proposes Yard 8 as the principle place for the Maintenance Facility in the face of near total objection and opposition from all quarters of the general community, as witnessed at the recent open meetings held by the DOT. I can only surmise that the DOT is not seriously interested in the opinions of the residents at large, though by law they must hold these meetings.

From the discussions at the open meetings two very important questions were raised. First was the negative impact the Maintenance Facility would have on the economic development on the area from Lechmere to Brickbottom/Innerbelt. The second was the affect the Maintenance Facility and Storage Yard would have on the quality of life of the residents who live in the vicinity of the facility.

As an artist resident and homeowner at the Brickbottom Artist Buildings (there are three) I must take issue with the DOT on the placement of the Maintenance Facility in Yard 8 which is directly adjacent to the northeast side of the three buildings. As the map in the DEIR report indicates, if the plans go forward, we as a community would be adversely affected. The track systems will run on three sides

I-124-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-124-002

of our buildings, i.e., the Greenline Extension to Medford, the Greenline extension to Union Square, the Fitchburg Commuter line to Boston, the BET train yards and their maintenance facility, the Pan Am freight track and finally the Greenline Maintenance Facility and track yards only 18 feet from our buildings. According the report on the Maintenance Facility, the activity of the trains in all directions will begin at 5AM in the early morning and continue continuously until 1AM in the morning. The noise and vibration made by all the trains moving back and forth all day long past our buildings would amount to a "daily nightmare" placed on the residents and workers (yes we do work here) at the Brickbottom Artist Buildings. Even if the DOT decides to put the facility and track yards elsewhere, we, the residents would still have to live with the enormous disadvantages posed by the trains running all day long. Without a major investment in mitigating our circumstances, our lives here would be made impossible. In the DEIR report DOT proposes mitigation for windows in only 40 apartments out of 155. This is insulting and maybe criminal as it may violate existing laws concerning human habitation.

In order to effectively alleviate the problems caused by the Greenline extension project, I propose that twenty foot high walls be place on the Northeast and South sides of our buildings and adjacent to the new track systems. New windows that meet the minimum requirements for noise abatement must be installed on all sides of the buildings that do not meet normal noise standards.

I am enclosing an article from the December 20, 2009 edition of *The Boston Sunday Globe*, that discusses the usefulness of highway barriers to not only block noise but also block pollution. Because the buildings will be surrounded by multiple tracks, as well as the McGrath Highway these barriers will be efficacious for the Brickbottom artist community.

Finally, let us, the DOT and the cities of Cambridge, Somerville and Medford go forward with this project with due respect and amity for all.

Sincerely,

George Gabin

I-124-002

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

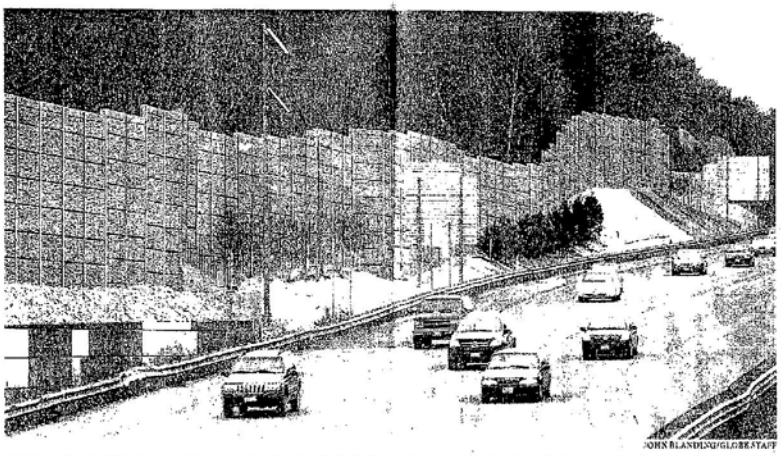
Starts & Stops

BY NOAH BIERMAN, GLOBE STAFF | TRAFFIC UPDATES ONLINE AT WWW.BOSTON.COM/STARTS

lighway arriers block ıuch more ıan sound



JOHN BLANDING/GLOBE STAFF

Traffic on Route 128 at a sound barrier in Lexington. A study found that concrete barriers deflect air pollution as well as sound.

It's tough to think about car ıast and eight-lane highways en you're in a sparse Idaho ert, staring at bales of straw. But such was the task for a up of federal research meteorgists last year who conducted udy on traffic sound barriers. ir findings, set for publica- ı next month in the journal ıosphere Environment, bol- the arguments of neighhood activists who often by for the expensive concrete ls.

The research found that the rriers do more than protect ghbors against unwanted nds. They also keep pollution y, reducing it by more than ercent on the other side of barrier.

To simulate car fumes and er pollutants, the scientists d harmless proxy gases that measurable at very low levels, l Dennis Finn, the lead author a research meteorologist at National Oceanic and Atmosric Administration Air Reırces Laboratory in Idaho s, Idaho.

Finn and his team set up a ual highway in the desert, he said, using the bales of straw to simulate concrete barriers.

Then they let out the gas upwind of a barrier, sampling the air on the other side. They set up a parallel experiment without a barrier so they could compare results.

Finn said the 50 percent drop in pollution mirrored findings of other barrier tests conducted in real-world conditions. The advantage in the desert test was that he could control for such outside factors as trees and inconsistent car traffic that can affect real-world tests.

Finn said the gas released in front of the barrier gets picked up by the wind. Some hits the barrier; some goes above the barrier but disperses rather than coming down on the other side.

But Finn said that some scientists had previously hypothesized that pollutants could become trapped on the other side of a barrier, where the neighbors live, because wind would be blocked and there would be nothing to disperse the fumes.

Finn lives in an Idaho town with only one highway and relatively few neighbors. He said research does not mean much to his daily life.

But what if he lived in a big city, say next to the Massachusetts Turnpike? Would he want a barrier?

"I would certainly be appreciative of it, I think, if I was living within 100 yards of a heavily traveled road," he said. "A sound barrier would reduce

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA #03886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-125-001 As a resident of East Cambridge, I am concerned about the design and placement of the Green Line Extension and the new Lechmere Station and the effect it will have on my friends & neighbors at the Glass Factory.

TRACKS ARE TOO CLOSE TO THE GLASS FACTORY.
The present design shows the tracks running very close to the rear of the building. We urge your designers and engineers to place the tracks as far to the rear of the building as possible to preserve views & light to the many units that will be severely impacted by the elevated tracks. The design and placement of the tracks and supports should do all it can to minimize the visual impact to those units and also minimize noise & vibration impacts to the whole building as well as the surrounding neighborhood.

LECHMERE STATION.
At present, your designs show the new Lechmere Station so close to the Glass Factory that it appears to be part of the building. Please move the station closer to East Street, where it could be part of the entrance way to the eventual North Point development. The station design needs to be substantially improved so it is not an eyesore but rather an enhancement to this rapidly developing neighborhood. It should reflect the importance of this location as the gateway between Cambridge & Boston.

BUS TRAFFIC.
The many bus lines that converge on Lechmere Station are presently designed to enter at one end of the Glass Factory, pick up passengers, and emerge at the other end of the building. Please do not route bus traffic, directly under people's windows. Bus traffic noise, vibrations and fumes are a great concern. Sidewalks where passengers wait, should also be moved farther from the building to preserve privacy and minimize impacts from noise, light and smoking.

PRESERVE OUR TREES & GREEN SPACE.
Presently there is a row of mature evergreen trees behind the Glass Factory. I urge you to preserve all these trees and the entire small green space behind the building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks should be on the far side of the large trees. These trees serve as a natural screen for the tracks and busway.

I-125-001

Please see Comment Letter I-013.

MAINTENANCE FACILITY.
I strongly oppose the Mirror H location. It is much too close to the Glass Factory and other residential buildings and will effectively destroy further development in North Point. Putting a maintenance facility on prime land in a desirable, developable location that would generate significant tax revenue to Cambridge simply does not make sense. Of the three options proposed, Option L seems to be the best choice however I would prefer there be no maintenance facility in this area but rather it be at the end of the line.

REDUCE SURFACE PARKING.
The present Lechmere Station is at the end of the Green Line. That will no longer be the case with the new Green Line Extension and the number of parking spaces should be substantially reduced. Surface parking is bad urban design and should be minimized in the new North Point neighborhood. One half of ~~the~~ building will overlook the new parking and we request it be carefully designed with this in mind. Ample green space should be included in the design and all lighting should be down lighting that minimizes light pollution to ~~the~~ building.

Thank you for hearing my concerns.

Sincerely,

Florence L. Gates

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA #03886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-126-001 As a resident of the Glass Factory Condominiums whose unit is facing the rear of our building, I am deeply concerned about the design and placement of the Green Line Extension and the new Lechmere Station.

TRACKS ARE TOO CLOSE TO OUR BUILDING.
The present design shows the tracks running very close to the rear of our building. We urge your designers and engineers to place the tracks as far to the rear of our building as possible to preserve views & light to the many units that will be severely impacted by the elevated tracks. The design and placement of the tracks and supports should do all it can to minimize the visual impact to those units and also minimize noise & vibration impacts to the whole building as well as the surrounding neighborhood.

LECHMERE STATION.
At present, your designs show the new Lechmere Station so close to the Glass Factory that it appears to be part of our condominium building. Please move the station closer to East Street, where it could be part of the entrance way to the eventual North Point development. The station design needs to be substantially improved so it is not an eyesore but rather an enhancement to this rapidly developing neighborhood. It should reflect the importance of this location as the gateway between Cambridge & Boston.

BUS TRAFFIC.
The many bus lines that converge on Lechmere Station are presently designed to enter at one end of our building, pick up passengers, and emerge at the other end of our condo building. Please do not route bus traffic, directly under our windows. Bus traffic noise, vibrations and fumes are a great concern. Sidewalks where passengers wait, should also be moved farther from our building to preserve our privacy and minimize impacts from noise, light and smoking. If too close, it will feel like we are living in the bus station.

PRESERVE OUR TREES & GREEN SPACE.
Presently there is a row of mature evergreen trees behind our building. I urge you to preserve all these trees and the entire small green space behind our building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks should be on the far side of the large trees. These trees serve as a natural screen for the tracks and busway.

I-126-001

Please see Comment Letter I-013.

MAINTENANCE FACILITY.
I strongly oppose the Mirror H location. It is much too close to the Glass Factory and other residential buildings and will effectively destroy further development in North Point. Putting a maintenance facility on prime land in a desirable, developable location that would generate significant tax revenue to Cambridge simply does not make sense. Of the three options proposed, Option L seems to be the best choice however I would prefer there be no maintenance facility in this area but rather it be at the end of the line.

REDUCE SURFACE PARKING.
The present Lechmere Station is at the end of the Green Line. That will no longer be the case with the new Green Line Extension and the number of parking spaces should be substantially reduced. Surface parking is bad urban design and should be minimized in the new North Point neighborhood. One half of our building will overlook the new parking and we request it be carefully designed with this in mind. Ample green space should be included in the design and all lighting should be down lighting that minimizes light pollution to our building.

Thank you for hearing my concerns.

Sincerely,

Peter Gee

November 12, 2009

Dear Secretary Bowles,

I have heard you speak on many occasions and have always been proud to have someone as articulate and informed as you to lead one of the Commonwealth's most important agencies. I am writing to apprise you of a situation that I believe, if it were more closely examined, might stimulate more investigation by your staff. I am concerned about the placement of the new Lechmere Station and the necessity of creating a truly safe intermodal transit station.

As you may know, the Green Line expansion will open up a new corridor for development as well as serve many residents currently not served or underserved by public transit options. The site that has been designed for the new Lechmere Station while laudable as part of this greater scheme, is deeply flawed when one considers pedestrian safety as well as transit oriented design in a fuller appreciation.

I-127-001

If you go to Lechmere Station now and observe the existing heavy flow of pedestrians crossing Cambridge Street you will see many infuriated motorists who frequently miss traffic signals that would otherwise allow them to proceed because of the density of foot traffic. This is an extremely dangerous condition, of particular concern now when these same pedestrians will be crossing over the major thoroughfare of Monsignor O'Brian Highway as part of the Lechmere Station redesign. According to previous studies as many as one million pedestrians cross Cambridge Street annually. As you might expect, many of these Green Line riders are teenagers and young mothers with strollers and toddlers who do not own cars and find the Galleria a convenient location for shopping.

I-127-002

Further, the proposed station design makes no concession to protect passengers from the elements. This is a mistake. While we are encouraging passengers to take the T, the last

I-127-001

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. The chapter presents a traffic analysis, a detailed description of pedestrian crossings of O'Brien Highway, and proposed roadway, crosswalk, and sidewalk improvements that are consistent with the NorthPoint development plans. These station and street plans will be further refined in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-127-002

Revised conceptual plans for Lechmere Station, including modifications to the station headhouse and entrances, enclosed automatic fare collection, and other amenities are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-127-002

thing we want is them to feel is like they are being punished by our winters standing in the cold waiting for a train or bus.

I-127-003

Finally, I would urge you to consider the Lechmere Station as a transit oriented design in the fuller promise it can provide through promoting retail activity. I have seen a creative proposal presented to the East Cambridge Planning Team that re-purposed the existing and potentially historic bus barn as a covered market. Photographs of a market in Paris of comparable size were also shown, and although one might think it unduly fanciful to consider such a re-use proposal, this is the exact sort of identity building authenticity that creates neighborhood character. I would be most delighted myself to see the local fish dealers, poultry market, bakery and dry cleaner all further down Cambridge Street have stalls or kiosks in such a market. The convenience value of retail activity coordinated with transit cannot be underestimated.

I hope my letter encourages you and your staff to reconsider the design and placement of the Lechmere Station. We rarely get these opportunities to place infrastructure in the fabric of our cities and towns. And so it must be done with great care and appreciation of public health, safety and welfare.

Very truly yours,

Diane Georgopulos FAIA

I-127-003

MassDOT has reviewed the suggestions submitted by the East Cambridge Planning Team. Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. These plans, including the pedestrian crossings of O'Brien Highway and associated street, crosswalk, and sidewalk designs will be further refined in the preliminary engineering stage of the Project. As part of the Green Line Extension, MassDOT intends to demolish the existing Lechmere Station and prepare the site for potential future redevelopment. Based on the current requirements of the O'Brien Highway roadway improvements (as shown in FEIR Chapter 5, Lechmere Station), the existing bus shed must be removed.

I-128-001

- I THINK IT WILL BE WONDERFUL TO HAVE THE GREENLINE EXTENDED IN TO OUR AREA, UNION SQ., OF SUMMERVILLE. I AM NOT IN FAVOR OF THE PLACEMENT OF THE GREENLINE MAINTANENCE FACILITY IN YARD 8. I LIVE IN THE BRICKBOTTOM CONDOMINIUM OF ARTISTS AT ONE FITCHBURGE ST. IN SOMERVILLE. WE ENJOY A STRONG RELATIONSHIP WITH THE LOCAL COMMUNITY AT LARGE WHICH IS BENEFITED BY OUR LOCATION AND THE INFISTUCTURE OF ROADS & SIDEWALKS THAT CONNECT(S) WITH THE CITY. ALSO, YARD 8 WILL RUIN THE POSSIBILTY FOR FUTURE COMMERCE IN THAT AREA THAT WOULD BENEFIT THIS AREA OF SOMERVILLE.

THE IMPACT THE CLOSE PROXIMITY OF YARD 8 TO BRICKBOTTOM & MY CONDO. WOULD CREAT DANGEROUS INVIRONMENTAL CONDITIONS TO GROW HERE: CHEMICAL DISCHARGE INTO THE AIR AND LAND BOARDERING OUR BUILDING. THE CONSTANT INDUSTRIAL NOISE CREATED BY YARD 8, 24 HRS. A DAY, 8 DAYS A WEEK WOULD GREATLE IMPACT MY ABILITY TO FOCUS ON MY WORK AND SLEEP.

I-128-002

I FEEL THAT OPTION L IS THE BETTER LOCATION FOR THE PROPOSED FACILITY. IT WILL BE SUFFICIENTLY DISTANT FROM OUR 220 RESIDENTIAL UNIT CONDOMINIUM TO AFFORD US A SAFE AND AUTONOMOUS LOCATION FROM THE PROJECT.

THANK YOU, Louis Gippetti

I-128-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-128-002

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, Option L is identified as the preferred maintenance facility site.

Boston, MA 02114

Dear Secretary Bowles

As a citizen of Medford who is committed to the environment and to life without a car (despite living two miles from the nearest T stop),

I applaud the effort that went into putting together the Draft Environmental Impact Report (DEIR) for the Green Line Extension project

to Medford, EE #13886.

I-129-001

I strongly support the Green Line extension and urge that it be built in an expeditious manner that provides the most benefit to citizens

and to the environment. That is, the extension must be built in a single phase to extend to the "Preferred Alternative" terminus at Route

16/Mystic Valley Parkway.

MassDOT states that it is not capable of building (and funding) an extension to Route 16, and therefore that it intends to build the extension

only toCollege Avenue in the Tufts University area of Medford by its 2014 deadline. However, the DEIR is also clear that the Route 16

station would provide the most benefits according to all project criteria, including air quality and environmental justice.

A two-phased approach is not acceptable. The Route 16/Mystic Valley Parkway Station must be built as part of a single-phase project in order to:

I-129-002

- Minimize costs: inefficiencies in the two phased approach by MassDOT's estimates will inflate the cost by $55 million over a single-phase approach

1

I-129-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-129-002

Project cost estimates are based on the current, conceptual level of design, and will be further refined as the Project progresses through preliminary engineering. It is anticipated that Green Line Extension construction would be financed with a combination of funds from federal and state sources. Efforts to engage a developer for the North Point development will continue as this Project moves into the next phases of design.

I-129-002 - Ensure completion: without an identified funding source there is a very high probability that the Route 16 terminus will not be built in this century

- Provide the greatest air quality improvements, mobility improvements, ridership gains, traffic reduction, and service to environmental justice communities

I-129-003 - Achieve the legal mandate: The state is legally obligated to provide public transit services to the residents of Medford Hillside by December 31, 2014, and stopping the extension at College Avenue fails to meet this legal obligation.

I-129-004 The document does not analyze the impacts of College Avenue station as the Phase I terminus. A terminus station would have a dramatically

different operation and impact on the neighborhood than would a midroute stations. It just does not make sense to subject the area to endure the costs and adaptation that would be necessary to function as an "interim terminus" given that the Route 16 site would function as a far more suitable terminus.

I-129-005 The Route 16 station design is inadequate. The DEIR offers only a "worst case scenario" (MassDOT's own description) for the Route 16 station design, while offering optimized station designs for all other Green Line extension stations. In particular, the design in the DEIR necessitates the destruction of two major commercial properties. An early EOT design accommodated the existing buildings, and Medford Green Line Alliance (MGNA) has provided another design with a slight curvature of the tracks to avoid conflict with the buildings. An optimized Route 16 station design must be incorporated into the final EIR after study of the MGNA (and MassDot's own) better designs.

I urge you to require MassDOT to continue its analysis and design modifications to address the deficiencies in the current DEIR.

There is much work to be done to ensure that the Green Line extension fulfills its mandated potential.

Sincerely,

Hans Geuns-Meyer
54 Whitney Rd
Medford, MA 02155

hans.geuns@nuance.com
hansgeunsmeyer@earthlink.net

I-129-003

Since the release of the DEIR/EA, a few stakeholders raised concerns that the proposed College Avenue Station, serving as a terminal station for the Proposed Project, would not adequately serve the Medford Hillside neighborhood. Serving this neighborhood was identified as part of the SIP description. To address and resolve these concerns, CTPS prepared a memorandum demonstrating that the College Avenue Station location does adequately serve the walk market area for the Medford Hillside neighborhood. This memorandum is provided in Appendix C of the FEIR.

I-129-004

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-129-005

All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and

layout, neighborhood impacts, economic development, and other area planning issues.

Dear Secretary Bowles

As a citizen of Medford who is committed to the environment and to life without a car (despite living two miles from the nearest T stop), I applaud the effort that went into putting together the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EE #13886.

I-130-001

I strongly support the Green Line extension and urge that it be built in an expeditious manner that provides the most benefit to citizens and to the environment. That is, the extension must be built in *a single phase to extend to the "Preferred Alternative" terminus at Route 16/Mystic Valley Parkway*.

MassDOT states that it is not capable of building (and funding) an extension to Route 16, and therefore that it intends to build the extension only to College Avenue in the Tufts University area of Medford by its 2014 deadline. However, the DEIR is also clear that the Route 16 station would provide the most benefits according to all project criteria, including air quality and environmental justice.

A two-phased approach is not acceptable. The Route 16/Mystic Valley Parkway Station must be built as part of a single-phase project in order to:

I-130-002

- Minimize costs: inefficiencies in the two phased approach by MassDOT's estimates will inflate the cost by $50 million over a single-phase approach.

- Ensure completion: without an identified funding source there is a very high probability that the Route 16 terminus will not be built in this century; such a failure would be a terrible detriment to the environment and to future generations.

- Provide the greatest air quality improvements, mobility improvements, ridership gains, traffic reduction, and service to environmental justice communities within walking distance of the Route 16 terminus.

I-130-003

- Achieve the legal mandate: The state is legally obligated to provide public transit services to the residents of Medford Hillside by December 31, 2014, and stopping the extension at College Avenue fails to meet this legal obligation. (It is not possible/ acceptable for MassDOT to redefine the boundaries of "Medford

I-130-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-130-002

Project cost estimates are based on the current, conceptual level of design, and will be further refined as the Project progresses through preliminary engineering. It is anticipated that Green Line Extension construction would be financed with a combination of funds from federal and state sources. Efforts to engage a developer for the North Point development will continue as this Project moves into the next phases of design.

I-130-003

As directed by the Secretary's Certificate on the DEIR/EA, the FEIR includes a limited scope of issues related to the Green Line Extension Project. The Proposed Project, with a Medford Branch terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Although an extension to Mystic Valley Parkway/Route 16 is MassDOT's Preferred

I-130-003

Hillside" in order to diminish the size of the mandated project. Medford Hillside always has been and shall be the area around Boston Avenue that extends from College Avenue to the Mystic River

I-130-004

The document does not analyze the impacts of College Avenue station as the Phase I terminus.
A terminus station would have a dramatically different operation and impact on the neighborhood than would midroute stations. It just does not make sense to subject the area to the environmental adaptation that would be necessary to function as an "interim terminus" given that the Route 16 site would function as a far more suitable terminus.

I-130-005

The Route 16 station design is inadequate. The DEIR offers only a "worst case scenario" (MassDOT's own description) for the Route 16 station design, while offering optimized station designs for all other Green Line extension stations. In particular, the design in the DEIR necessitates the destruction of two major commercial properties. An early EOT design accommodated the existing buildings, and Medford Green Line Alliance (MGNA) has provided another design with a slight curvature of the tracks to avoid conflict with the buildings. Further, there is so much potential for transit-oriented development at a Route 16 terminus that is not yet addressed. An optimized Route 16 station design (minimizing the taking of commercial property and maximizing pedestrian and cyclist access and connections) must be incorporated into the final EIR after study of the MGNA (and MassDot's own) better designs.

I urge you to require MassDOT to continue its analyses and design modifications to address the deficiencies in the current DEIR; and that you use your best judgment with regard to the mechanism by which to ensure a quality extension of the Medford Green Line extension to Route 16 by the 2014 deadline. There remains so much work to be done to ensure that the Green Line extension fulfills its mandated potential.

Yours,

Stephanie Geuns-Meyer
54 Whitney Rd
Medford, MA 02155
781-396-4648

p.s. This is somewhat of a tangent, but I want to make the point that over the years the City of Medford has failed to engage in planning for the Green Line extension in any meaningful way, and therefore that they have failed Medford citizens, the environment, and future generations. Please do not allow the lack of competence and vision of the City to destroy this once-in-a-century opportunity.

Alternative, financial constraints prohibit the Commonwealth from progressing the Project beyond College Avenue at this time.

I-130-004

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-130-005

All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

City officials are generally focused on short term awards and returned favors, and their engagement with the Green Line planning process has been largely a stance of strategic helplessness.

How can one work with a City of Medford who whines, "Ehhh, why won't you walk with us, Daddy!?" when in fact they want to be carried? Perhaps some gentle guidance would be in order. "I'll walk with you, dear, but first you must stand on *your own two feet*!"

That is:

"I *know* that parking enforcement is very important! Why don't *you* find out what the City of Somerville has done to address the issue? Maybe you can even turn parking enforcement into a source of revenue – how about that!?"

"Yes, when residential areas become better places to live (as happens when good mass transit is introduced), prices tend to go up. People call that gentrification. Do you think it follows that it is a bad idea to make the places people live more desirable? No? Then good! What can *you* do to ensure that there will remain affordable places to live for everyone?!"

MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA#13886
100 Cambridge Street,
Suite 900
Boston, MA 02114

Dear Secretary Ian Bowles and MEPA Analyst Holly Johnson

I am the owner of three properties at Brickbottom. Thank you for taking the time to read my letter. Let me begin by saying that I a fully behind the extension of the Green Line. It will be a most transformative element in many people's lives. At the same time I want to strongly urge you in helping put this plan into to being to consider the merits of Mirrow Scheme H.

First let me describe the role of Brickbottom in the area as I and many others see it. It is well known that artists are like yeast. We go into areas that no one wants and we by our presence raise the property values and the lives of those around us. We have created a very special environment at Brickbottom, a magnet for many communities with our art shows and our outreach. The building is alive at night and rescues the area from being an industrial wasteland. Where artist are the public benefits.

I-131-001

Now, this has been acknowledged by the Mayor and economic experts as a prime area for redevelopment. The proposed site of the EOT to put a maintenance and storage facility in "Yard 8" would destroy that possibility and also destroy our living situation as it stands. The land taken would remove 11.5 acres from the City and remove it from the city's commercial tax vase, a most foolish thing to do in these very troubled times.

Environmentally speaking what will this Yard 8 scheme do? It will destroy the living conditions for the residents of Brickbottom by bringing noise and light pollution as well as a potential toxic runoff into the ground water and the Charles River Watershed. Construction at yard8 would require complex and expensive construction mitigation because it is so close to exiting homes.

I believe that Yard 8 is being rushed through without our input and that the mandated use planning was not performed. We are mindful of the disaster which befell home owners when Pizer came into a community used right of eminent domain to throw people out of their homes and then several years later without warning pulled out of their development leaving a shocked and bereft group of citizens behind. Will the same high-handedness prevail here?

I-131-002

Let me say again. I am in favor of the extension but decisions have been made behind closed doors and all alternative proposals have been DISMISSED by EOT. It is not just ourselves at risk it is East Somerville, the city and the region. Meanwhile The Mirror Scheme places the bulk of the facility to an existing rail maintenance facility and further away from current residential uses.

I-131-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-131-002

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Mirror H location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-131-002

I-131-003

So why is that not the ideal solution? Why this rush to invade our space at the price of destruction on so many fronts.

Lastly, one can simply decouple the Green Line planning and design from the maintenance and storage facility because that facility is NOT part of the mandated 2014 Green Line Extension completion deadline. So in whose interest is this most injurious plan being rushed through? This is a plan for 100 years. Draft EIR should not be allowed to become the final EIR.

At a time when the public is aware of how many noxious plans have been secretly made and put into action, at a time when daily we learn how safeguards for public welfare have been brazenly ignored, for example, the BIG DIG why should we trust a program that has not shown us how even the maintenance will be secure and efficient. Very little is these days.

I hope you will to listen to Brickbottom's well thought out questions and proposals and take time and reconsider what better plans than the present Yard 8 could be put in place.

Sincerely,
Celia Gilbert

Celia Gilbert property owner
Brickbottom

C207 ; C319 ; C214

I-131-003

The Green Line Extension storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the overall Project. Chapter 2 of the FEIR fully describes the environmental impacts of the proposed storage and maintenance facility. The facility must be constructed adjacent to the Green Line Extension to maximize operating efficiencies and be constructed within the same time frame as the Project.

MEPA

Dear Secretary Ian Bowles,

I am writing this letter in regards to project number EEA 13886. First, I want to say that I support the Green Line extension

I-132-001 However, I am particularly concerned that the noise and vibration level from the storage yard will have a detrimental impact the residents of the Brickbottom Artists Building.

I-132-002 I am opposed to the Green Line storage yard and maintenance facility being situated in yard 8. Another consideration is that the storage yard and facility would build a barrier between the inner belt and Brickbottom areas and would impact future development in the region.

I-132-003 The storage yard and maintenance facility would have a direct impact on future tax revenue as it impacts adjacent property values and future growth potential.

Again, I support the Green Line Extension but feel like the Train Storage Yard and Maintenance Facility add an unjust additional burden to Brickbottom district and to Somerville.

I appreciate your continued thoughtful consideration of alternatives to yard 8.

Sincerely,

William J Gilligan

I-132-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. Vibration impacts and mitigation measures have been identified and are included in FEIR Chapter 2. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-132-002

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-132-003

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site. A discussion of the socioeconomic impacts of the maintenance facility sites is included in FEIR Chapter 2.

Subject: Regarding EEA #13886 Green Line extension DEIR

Secretary Ian Bowles/Holly Johnson
MEPA Analyist

Dear Secretary Ian Bowles,,

I-134-001 The community members engaged with CCP would like to see all decisions related to the planning of the Green Line and the land use in the ¼ mile areas around the 7 proposed stations to reflect this list of Corridor Core Principles. Please see third paragraph for list of Core Principles and corresponding suggested changes to Draft Environmental Impact Report (DEIR).

The Community Corridor Planning project, a grassroots effort to engage community members in the land use planning along the Green Line extension, has brought together hundreds of people to frame a list of core principles to guide their recommendations for land use along the extension in upcoming months. We ask that these principles be taken into consideration as the Mass. Department of Transportation finalizes its Environmental Impact Report.

Core Community Principles for
Neighborhood Development Along the Green Line Corridor

? More Local Jobs: We want a fixed percentage of respectable jobs of all types with good wages and benefits for Somerville residents, from construction to permanent.

? Increase Commercial and Economic Development: We want to see the creation of squares as destinations, with careful attention to mixed use of commercial/residential, reuse of buildings, and economic development to increase the tax base.
o Draft Environmental Impact Report (DEIR) does not address Department of Transportation (DOT) commitment to economic development
o New MA DOT is supposed to work with Secretary of Economic Affairs to promote station location and design that promotes economic development and the community needs to show MA DOT how to do this ? to change the paradigm pro-actively.

? Improve the Green Environment: We want a safe, environmentally friendly neighborhood with more green space, trees, and gardens; reduction of noise; avoidance of light pollution; and prevention of toxic chemicals in the air.
o Response to DEIR: Given this principle, it is important that more attention be given to:
o Noise of operations
o Mitigation during construction for noise, vibration, etc.
o How close the tracks will be to the Brickbottom Building and other buildings along the right of way
o The need to involve neighborhoods affected regarding noise and vibration
o Recommendation that testing be done immediately after project begins to determine if estimates for vibration and noise done for the DEIR are accurate.
o Possibly transfer at Ball Square but only if Commuter rail is electric not diesel because of the pollution it would create for neighbors
o Rep. Provost noted in comments made that diesel trains should not stop in Somerville. This should only be permitted if trains are electrified

1

I-134-001

Please see Comment Letter I-084 for responses to this form letter.

o Consider dual-mode conversion of existing commuter trains
? Encourage Walking and Biking: We want to encourage walking and cycling, through safe, bike/pedestrian friendly design of streets and paths around and between stations.
o Pedestrian accessibility is poor for the station designs in the DEIR
o The design required in the MEPA Scope (EENF) does not sufficiently address the detailed concerns and requirements for each station.
o In the DEIR design and engineering is insufficient for moving the project to a final EIR because of a range of unaddressed issues (i.e., station design, siting, bike parking, community path integration)
o Bike access and bike parking at all stations needs to be improved.
o New Light Rail Vehicles (LRVs) should be designed to accommodate bicycles (like Portland LRVs)
o The Community Path and its important station connections must be designed and constructed simultaneously with the Green Line extension in order to facilitate direct pedestrian and bicycle access to the stations and to ensure a safe, attractive, and highly-functional Community Path.

? Create Community Gathering Spaces: We want both indoor and outdoor safe, public gathering spaces for community members.

? Improve Access: We want above standard, safe access to and between stations for people with disabilities, strollers, and pedestrians in general

? Community Involvement: We want to make sure residents are included on an ongoing basis in the planning, design, and zoning changes to the stations and areas around them. Youth, artists, and others should help design stations, with attention to amenities. We need an easy and clear process for residents to address problems as they come up, with ways of immediately resolving unseen impacts.
o Ongoing Community participation in the next phase (presumed to be done as a design/build project) is necessary
o Public involvement will help to keep decision-making public (transparency)
o Need to have a field office that residents can go to with concerns on an ongoing basis
o Need neighborhood based community groups to be involved in planning around each station,
? Connecting Buses and Trains: We want to ensure inter-modal access between neighborhoods and stations, for new train service to be adequate and speedy, and for existing bus lines to continue to serve areas not connected by train.
o Need opportunity for future connection with other lines, such as Red Line at Porter Square.
o Several stations do not show bus stops, or nearest bus stop is located outside of station. Would be helpful to design station and alter bus route to allow for stops at the stations.

? Keep and Add Local Businesses: We want locally owned, culturally diverse, clean businesses in commercial areas with employees who live in Somerville.

? Keep Somerville Affordable: We want to make sure people of all economic means have the ability to afford housing and living costs, so that Somerville residents, such as child care workers, cab drivers, local business employees and others can stay here affordably.

? Maintain Our Diversity: Preserve and encourage economic and ethnic diversity of residents and businesses.

The state needs to plan all transportation projects on the basis of guiding principles for Transit Oriented Develoment (TOD), smart growth and quality of live impacts. For example, TOD and land use are the planning and organizing focus of the South Coast Rail project, but

have been ignored in the Green Line extension planning despite the requirement by the Secretary to address these concerns in the EENF.

MEPA

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA #03886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-135-001

As owners of a condominium unit at the Glass Factory Condominiums, we are deeply concerned about the design and placement of the Green Line Extension and the new Lechmere Station. We are extremely concerned about the property value of our unit, which is located in the rear of the building. We urge you to build an aesthetically pleasing station instead of the eyesore design that has been previously presented. We would like to see parks and with trees and grass so that looking out our condo unit is a pleasurable view. Should you carelessly construct the new station and tracks without minimizing the noise level and not taking into consideration the aesthetics of the project, our property value of our unit will undoubtedly decrease.

We first purchased our unit with the knowledge of the Green Line Lechmere Station being built in the North Point development. We would like to see the station built further away from the Glass Factory instead of n our back yard. Furthermore, developing the Lechmere parking lot is not necessary since this will no longer be the end of the Green Line. Instead of an empty parking lot, we would like to see parks or perhaps guest parking for the Glass Factory.

Please see our following concerns:

TRACKS ARE TOO CLOSE TO OUR BUILDING.
The present design shows the tracks running very close to the rear of our building. We urge your designers and engineers to place the tracks as far to the rear of our building as possible to preserve views & light to the many units that will be severely impacted by the elevated tracks. The design and placement of the tracks and supports should do all it can to minimize the visual impact to those units and also minimize noise & vibration impacts to the whole building as well as the surrounding neighborhood.

LECHMERE STATION.
At present, your designs show the new Lechmere Station so close to the Glass Factory that it appears to be part of our condominium building. Please move the station closer to East Street, where it could be part of the entrance way to the eventual North Point development. The station design needs to be substantially improved so it is not an eyesore but rather an enhancement to this rapidly developing neighborhood. It should reflect the importance of this location as the gateway between Cambridge & Boston.

BUS TRAFFIC.
The many bus lines that converge on Lechmere Station are presently designed to enter at one end of our building, pick up passengers, and emerge at the other end of our condo building. Please do not route bus traffic, directly under our windows. Bus traffic noise, vibrations and fumes are a great concern. Sidewalks where passengers wait, should also be moved farther from our building to preserve our privacy and minimize impacts from noise, light and smoking. If too close, it will feel like we are living in the bus station.

PRESERVE OUR TREES & GREEN SPACE.
Presently there is a row of mature evergreen trees behind our building. We urge you to preserve all these trees and the entire small green space behind our building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks should be on the far side of the large trees. These trees serve as a natural screen for the tracks and busway.

MAINTENANCE FACILITY.
We strongly oppose the Mirror H location. It is much too close to the Glass Factory and other residential buildings and will effectively destroy further development in North Point. Putting a maintenance facility on prime land in a desirable, developable location that would generate significant tax revenue to Cambridge simply does not make sense. Of the three options proposed, Option L seems to be the best choice however we would prefer there be no maintenance facility in this area but rather it be at the end of the line.

REDUCE SURFACE PARKING.
The present Lechmere Station is at the end of the Green Line. That will no longer be the case with the new Green Line Extension and the number of parking spaces should be substantially reduced. Surface parking is bad urban design and should be minimized in the new North Point neighborhood. One half of our building will overlook the new parking and we request it be carefully designed with this in mind. Ample green space should be included in the design and all lighting should be down lighting that minimizes light pollution to our building.

Thank you for hearing our concerns.

Sincerely,

Sharman E. Gingrich

Subject: comments on Green Line extension

Dear MassDOT - thank you so much for accepting my comments regarding the plan to extend the Green Line into the public record.

I am a strong supporter of the extension but would like to make the following comments to Mass DOT:

I-136-001
- The planned alignment should come out to Rt. 16 in the first phase to provide improved transit for residents living in West Medford and East Arlington where I live

I-136-002
- The Community Path extension within the Green Line corridor should be built concurrently with the light rail line. It would make no sense to build the tracks and come in later for the multi-use trail. The trail will not only decrease reliance on vehicle trips for Somerville residents but will increase ridership on the train and reduce the demand for parking near the station areas.

I-136-003
- Include plentiful, secure and covered bike parking at all proposed green line stations. On nice weather days 250-300 bikes are parked at Alewife Station and hundreds more at Davis and Porter squares. This shows a demand for bike parking that is likely to be similar at the green line stations.

I-136-004
- Improve sidewalk, bike lane and trail connections at the stations, especially at the rt. 16 terminus where many transit riders should have a seamless walk or ride from the future paths along the Mystic River or Alewife Brook to the platform.

Thank you so much. I look forward to biking to the Green Line in 2014!

-Phil Goff
94 Grafton Street
Arlington MA 02474

Hotmail: Free, trusted and rich email service. Get it now.

I-136-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-136-002

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-136-003

The amount of bicycle storage at each station is based on ridership projections developed by CTPS. DEIR/EA Appendix D includes the methods CTPS used to analyze demand for bicycle parking. Detailed bicycle parking designs will be further developed during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

I-136-004

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not

included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

Boston, MA 02114

January 3, 2010

Dear Secretary Ian Bowles,

I am writing in regard to the Draft Environmental Impact Report (DEIR) on project EEA#13886
I am very pleased with the more detailed evaluation of the alternate sites for the Green Line maintenance facility and train storage yard, Option L and Mirror H, with comparisons to Yard 8.

I-137-001

I would like to see a more detailed comparative cost analysis of noise and vibration mitigation costs for both the construction and permanent phases of the project considered in the selection of sites for the maintenance facility and train storage yard.

I-137-002

I am particularly concerned that the noise and vibration level from the storage yard, as it impacts the Brickbottom Artists Building and surrounding businesses, does not seem to be adequately studied. I am a homeowner at Brickbottom. Currently, I lease my unit to a tenant who both lives and works there. I hope to live and work there again myself in the future. The Brickbottom community is a strong one that has been in place since 1988, providing live/work space to over 200 residents, and contributing to the greater Somerville community yearlong with public cultural events.

The noise and vibration levels at the storage yard at the Riverside facility, especially during peak hours, are significantly higher than noise levels from the maintenance facility. The DEIR current mitigation provisions in the case of the Brickbottom Artists Building at 1 Fitchburg Street does not allow for noise barriers or containment in relation to the storage yard and only 40 out of 155 residences are designated for soundproofing. I would like to see the mitigation requirements be more adequately studied for construction and permanent impact with a complete cost analysis and deadlines for fulfillment.

I-137-003

I am opposed to siting the Green Line Train Storage Yard and Maintenance Facility in Yard 8. In addition to noise and vibration concerns cited above, the Yard 8 location would build a barrier between the Inner Belt and Brickbottom areas and would impact the potential for future development in the region. The Storage Yard and Maintenance facility would have a direct impact on future tax revenue as it impacts adjacent property value and future growth potential.

I support the Green Line Extension; however, the Train Storage Yard and Maintenance Facility add an unjust burden to the Brickbottom District and to Somerville.

I appreciate your continued thoughtful consideration of alternatives to Yard 8.

Sincerely,

I-137-001

FEIR Chapter 2 presents an analysis of noise and vibration impacts for each site alternative. The storage and maintenance facility and its rail approaches will be designed to minimize noise and vibration impacts to neighboring properties and stakeholders. Noise and vibration mitigation measures are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-137-002

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. An expanded analysis of potential noise and vibration impacts at the Brickbottom Artists Buildings is included in FEIR Chapter 8. These projections take into account the collective impacts of rail uses in the area. During preliminary engineering, MassDOT will conduct further analysis for several individual properties, including the Brickbottom Artists Lofts. As described in FEIR Chapter 8, MassDOT will then be able to identify the specific measures that will be appropriate for mitigating the Project's noise and vibration impacts. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

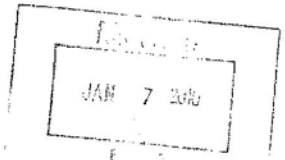
I-137-003

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter

2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

Rex Gonsalves
169 Monsignor O'brien hwy
Apt 204
Cambridge, MA

7th Jan 2010



Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA #03886
Dear Secretary Bowles:

I am an owner [apt 204] at the Glass Factory Condominiums. I have the following concerns about the Green Line Extension Project:

I-138-001 Tracks are way too close to the building, Just 30 – 50 feet away. Request the tracks be moved as far back as possible and at least past the current fence behind the building.

Tracks will block light and views, make the elevated track is as slim and visually appealing as possible. Position the supports where they block views the least.

I-138-002 Extreme noise & vibration from trains & busses. The DEIR lists us as SEVERELY IMPACTED. Adequate mitigation may not be possible. The T must do everything it can to reduce impacts. They may need to give us new windows, insulation, etc. since there is not enough space to build a sound barrier wall behind the building.

I-138-003 We strongly oppose putting the new maintenance facility behind our building. We already get noise from the existing BET facility. Putting the Mirror H Option behind our building will effectively destroy any further development in North Point. It is an Inappropriate use for this valuable land. Option L is a better choice.

I-138-004 Noise & light pollution from station lighting, station announcements etc. Lighting should be carefully designed to reduce these impacts.

I-138-005 The proposed station is not of adequate quality for our neighborhood and is totally unacceptable (and an insult). This is a gateway to Cambridge. The station should be an amenity and should be of similar quality to Charles Station. The station is too close to our building (right behind the outdoor parking) and should be moved toward East St.
Not enough green space. Too much parking. Why so much parking when we won't be the end of the line anymore. Reduce surface parking. Hide any parking with trees and other landscaping. The corner of East Street & O'Brien should not be surface parking.

I-138-006 We want the trees to remain behind our buildings, add additional trees as barrier. When we bought we were told the T boundary is the fence lined with trees. These plans put the tracks on the space we thought was our green space and dog walking area. Preserve all existing green space.

I-138-007 Concerns about darkness, crime, smoking, urinating under elevated tracks. We need additional security & new fencing since so many people will cross by our parking areas

I-138-008 Busses should be as far away from the building as possible. We do not want the noise and fumes. Busses must not be allowed to idle. Health concerns: fumes, electric fields, noise, vibrations, smokers outside station. People talking right under our windows.

Sincerely,

Rex Gonsalves
617-240-6655
rg@halstead.com

1

I-138-001

FEIR Chapter 5 describes the revised conceptual plans for Lechmere Station, including station design, track alignment, bus routings, and other elements. Changes to the track alignment depicted in the DEIR/EA were evaluated, but could result in additional impacts on area abutters. Proposed mitigation measures for area abutters are also described in FEIR Chapter 5. During preliminary engineering, specific station design elements will be further developed.

I-138-002

As described in DEIR/EA Chapter 6, FEIR Chapter 5 (Lechmere Station), and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. FEIR Chapter 8 describes proposed mitigation measures and next steps pertaining to mitigation. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-138-003

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Mirror H location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-138-004

Revised conceptual plans for Lechmere Station, including station lighting, are included in FEIR Chapter 5, Lechmere Station. Elements such as lighting and specific station amenities will be addressed during the preliminary engineering stage.

I-138-005

Revised conceptual plans for Lechmere Station, including modifications to the station headhouse and entrances, enclosed automatic fare collection, and other amenities are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-138-006

The revised conceptual plan for Lechmere Station, as shown in FEIR Chapter 5, is entirely on MBTA property. This conceptual design does not require any Glass Factory property or the removal of trees and landscaping from Glass Factory property. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, outlines how MassDOT will involve residents in developing landscape design.

I-138-007

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering phase of the Project, with additional consideration given to urban design and the pedestrian environment under the trackway areas. Along the back side of the Glass Factory, fencing is currently proposed to minimize trespassers crossing the existing Glass Factory parking area and will be further evaluated during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-138-008

Revised conceptual plans for Lechmere Station, including bus facilities and bus waiting areas, are included in FEIR Chapter 5, Lechmere

Station. Bus layover has been shifted further to the east and away from the Glass Factory Condominiums in the revised Lechmere Station design. Signs will be posted to limit idling of buses, in conformance with MBTA standards.

Boston, MA 02114

RE: Green Line Yard 8 – A Big Mistake

January 2, 2010

Dear Ms. Johnson

We urge you to consider the viable alternatives to the Green Line maintenance Facility proposed for Yard 8.

I-139-001 Out household at Brickbottom is situated such that we would severely suffer the effects of the proposed plan: Out unit is at grade, and we face north and north east. Our bed is, by my approximation, less than 100 feet from the proposed facility, and probably half that to the proposed track. We do not look forward to the constant noise and vibration shaking us from slumber each morning beginning with the proposed construction, and continuing into perpetuity. Serious remediation would be needed to allow our unit to be habitable BEFORE construction even begins.

I-139-002 While we welcome the Green Line Extention, the placement of the track and the facility at Yard 8 would be a mistake: The Yard 8 location is a shortsighted solution demonstrating a lack of integrated planning that the area desperately needs in order to build a successful future. Boston and its environs were defined by cow paths, now paved into an inextricable web understandable only to the most seasoned and patient insider. While this approach does have its unique charms, we live in a time where space is limited, and growth is inevitable. It does not behoove any of us to be penny wise and pound foolish when considering what a carefully planned Inner Belt / Brickbottom area could mean in terms of cultivating future economic development. The Yard 8 plan would quash that potential.

We support the alternatives to Yard 8, and hope you will do the same.

Thank you,

Lisa Gordon

I-139-001

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-139-002

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

Subject: Green Line extension comment

Hi Holly,

I-140-001

I noted the snippet in the Globe this weekend suggesting that any comments re: the Green Line extension project be directed to you – the article didn't really say what type of comments you were looking for...I've been following the project closely since buying a condo along the proposed extension in 2005 – I have to say that the only real comment I have is that I wonder if this really has any chance whatsoever of being completed on time. It just seems to be moving extremely slowly and I worry about funding with regular news pieces covering the MBTA budget (or lack thereof, ha).

When the Green Line extension comes up in conversation now, most people I know honestly roll their eyes and seem to expect that this thing is going to fall apart completely. Obviously I hope that's not the case – I wonder if a statement or two clarifying that things are on schedule, with an expected completion date, etc would be helpful?

Thanks!
Steve

Steve Gottlieb

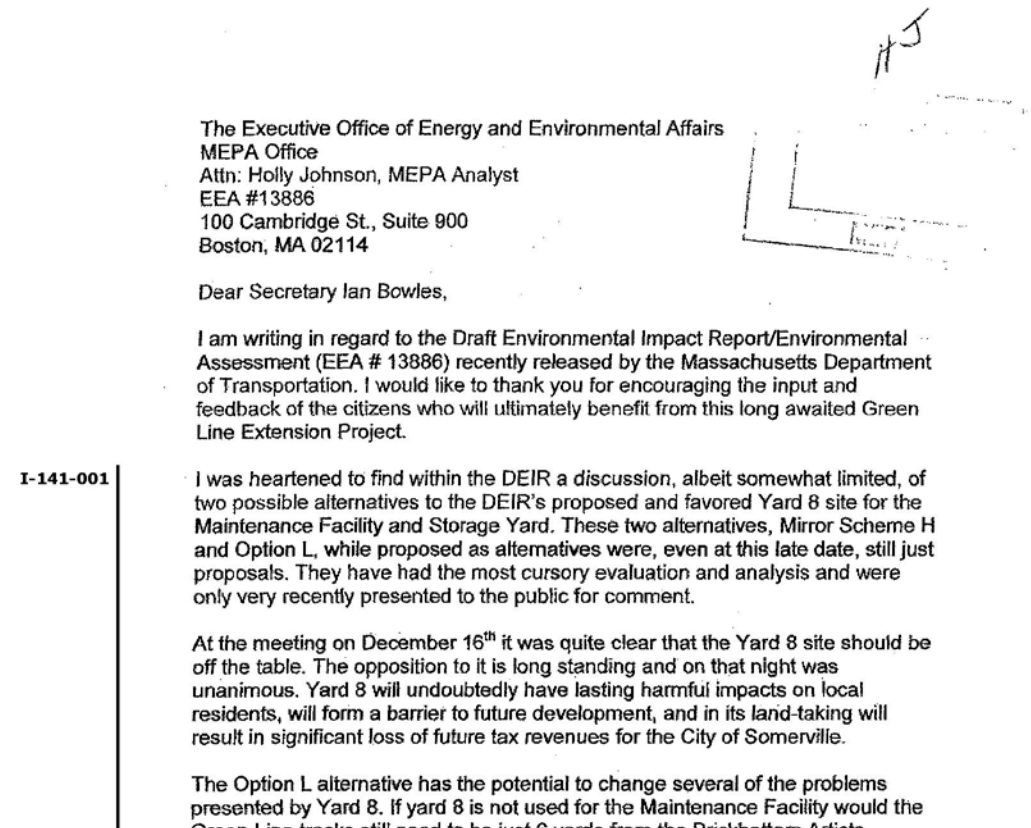
I-140-001

As described in Section 1.1 of the DEIR/EA, the Proposed Project is anticipated to be completed by December 31, 2014 in compliance with the SIP. MassDOT is continuing to strive to achieve this goal.



The Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Ian Bowles,

I am writing in regard to the Draft Environmental Impact Report/Environmental Assessment (EEA # 13886) recently released by the Massachusetts Department of Transportation. I would like to thank you for encouraging the input and feedback of the citizens who will ultimately benefit from this long awaited Green Line Extension Project.

I-141-001

I was heartened to find within the DEIR a discussion, albeit somewhat limited, of two possible alternatives to the DEIR's proposed and favored Yard 8 site for the Maintenance Facility and Storage Yard. These two alternatives, Mirror Scheme H and Option L, while proposed as alternatives were, even at this late date, still just proposals. They have had the most cursory evaluation and analysis and were only very recently presented to the public for comment.

At the meeting on December 16th it was quite clear that the Yard 8 site should be off the table. The opposition to it is long standing and on that night was unanimous. Yard 8 will undoubtedly have lasting harmful impacts on local residents, will form a barrier to future development, and in its land-taking will result in significant loss of future tax revenues for the City of Somerville.

The Option L alternative has the potential to change several of the problems presented by Yard 8. If yard 8 is not used for the Maintenance Facility would the Green Line tracks still need to be just 6 yards from the Brickbottom Artists Building? And if the tracks and the Green Line cars were farther away wouldn't it

I-141-002

be easier and less expensive to mitigate the resulting sound and vibration? If we are not going with Yard 8, would it be possible to build the Community Bike Path

I-141-003

closer to the only residence in the area? If we don't spend all that money (and all this time) on Yard 8, the DEIR's "perfect" place for the Maintenance Facility and Storage Yard, and instead build a "good and adequate" maintenance facility at one of the alternative sites would it be possible to extend the Green Line out to Medford (Rt. 16) on this project rather than having those folks wait another 6 years?

We have wasted so much time. This project has been held up for almost two years because of MassDOT's insistence on Yard 8 for its Maintenance Facility and Storage Yard. Please keep the MEPA process open, require the preparation of a Final Environmental Impact Report with more details and specifics, and

I-141-001

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-141-002

MassDOT is committed to completing all planning, design, and engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community Path between Lowell Street and Inner Belt Road. MassDOT is not able at this point to commit to funding the construction of the Community Path. The limits of the path were predicated on the connections to Lechmere being made through the Inner Belt area via Inner Belt Road and the proposed Urban Ring Bridge into the Lechmere area. However, the cessation of planning for the Urban Ring Project has changed the timing of this anticipated connection. MassDOT is unable to assume responsibility for designing the Urban Ring Bridge as part of the Green

demand that MassDOT prepare complete evaluations and analyses of the Mirror Scheme H and Option L alternatives.

The point of this project is to favorably impact our environment by cutting down on automobile traffic and encouraging use of public transit. Putting the maintenance Facility and Storage Yard at Yard 8 flies in the face of environmentally improving and positively developing this last piece of Somerville land.

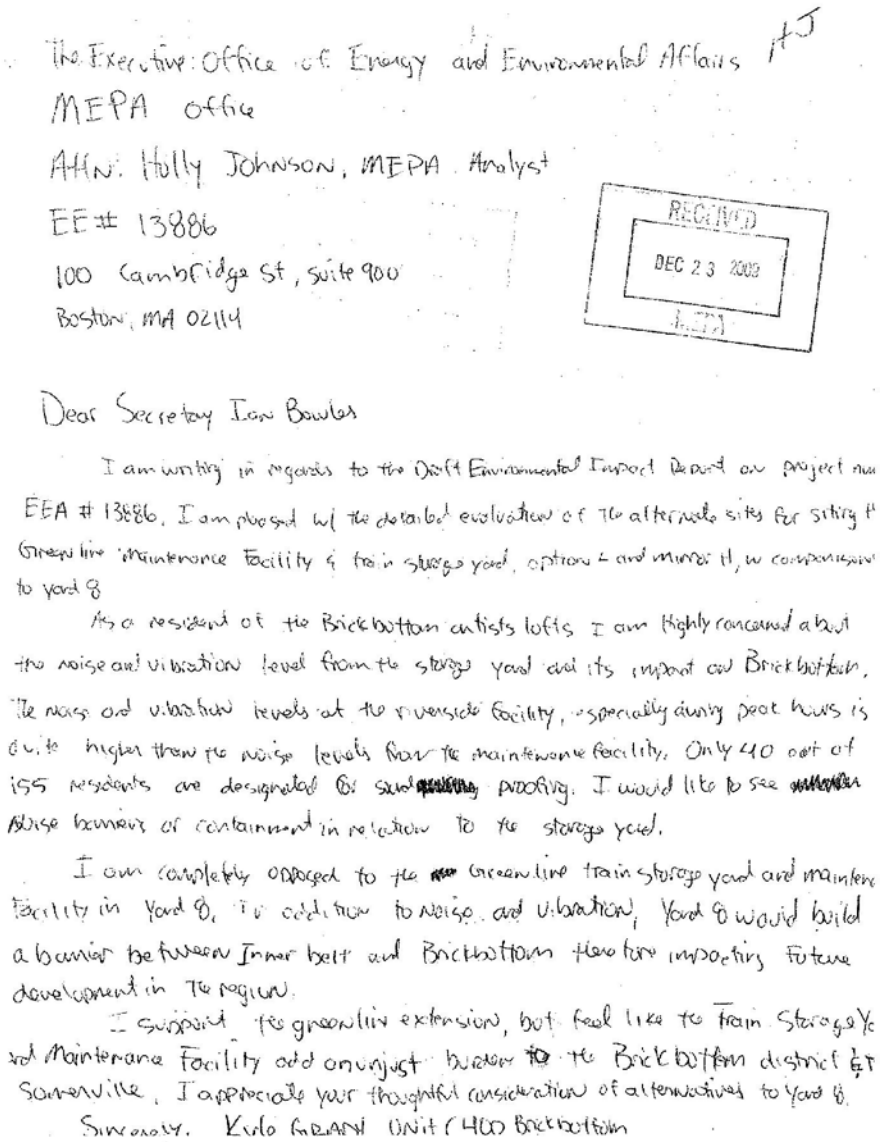
Sincerely,

Linda M. Goulet
1 Fitchburg St. C-301
Somer. MA 02143

Line Extension Project. That being said, MassDOT is committed to working with the City of Somerville, residents and businesses in the Brickbottom and Inner Belt neighborhoods, and Community Path advocates to design the Path to create improved connectivity within the Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension.

I-141-003

The Green Line Extension storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the overall Project. Chapter 2 of the FEIR fully describes the environmental impacts of the proposed storage and maintenance facility. The facility must be constructed adjacent to the Green Line Extension to maximize operating efficiencies and be constructed within the same time frame as the Project.



The Executive Office of Energy and Environmental Affairs HJ
MEPA office
Attn: Holly Johnson, MEPA Analyst

Boston, MA 02114

RECEIVED
DEC 23 2009
MEPA

Dear Secretary Ian Bowles

I am writing in regards to the Draft Environmental Impact Report on project num EEA # 13886. I am pleased w/ the detailed evaluation of the alternate sites for siting the Green line Maintenance Facility & train storage yard, option L and mirror H, w comparison to yard 8

I-142-001 As a resident of the Brickbottom artists lofts I am highly concerned about the noise and vibration level from the storage yard and its impact on Brickbottom. The noise and vibration levels at the riverside facility, especially during peak hours is

I-142-002 quite higher than the noise levels from the maintenance facility. Only 40 out of 155 residents are designated for sound proofing. I would like to see noise barriers or containment in relation to the storage yard.

I-142-003 I am completely opposed to the Green line train storage yard and maintenance facility in Yard 8. In addition to noise and vibration, Yard 8 would build a barrier between Inner belt and Brickbottom therefore impacting future development in the region.

I support the greenline extension, but feel like the Train Storage Yard and Maintenance Facility add an unjust burden to the Brickbottom district & Somerville. I appreciate your thoughtful consideration of alternatives to Yard 8.

Sincerely, Kyle Grant Unit C400 Brickbottom

I-142-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-142-002

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-142-003

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

MEPA

DEAR SECRETARY IAN BOWLES,

I AM writing in regards to the Draft Environmental Impact Report on project Number EEA#13886. I AM very pleased with THE MORE DETAILED EVALUATION OF THE Alter SITES FOR SITING THE GREEN LINE MAINTENCE FACILITY & TRAIN STORAGE YARD, OPTION "L" AND MIRROR "H", WITH COMPARISONS TO YARD 8.

I-143-001

As A Resident and homeowner AT THE BRICKBOTTOM ARTISTS BUILDING, I MUST take issue WITH THE DOT IN THE PLACEMENT OF THE MAINTENANCE facility in yard WHICH is Directly Adjacent to the northeast side of the three Buildings. AS THE MAP IN DEIR REPORT INDICATES, IF THE PLANS GO FORWARD, WE AS A community would be Adversely AFFECTED.

I AM completely opposed to the Green line train storage yard and maintenance facility in yard 8. In addition to Noise And Vibration, yard 8 would build barrier between Inner belt & Brickbottom therefore impacting Future Development in the Region.

I support the Green line extension, but I feel

I-143-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

Facility ADD an unjust burden to the Brick bottom District, and to Somerville

I appreciat your thoughtful consideration of alternatives to yard 8.

Thank you for your time,

Lauren Grady Unit C40

Boston, MA 02114

Dear Secretary Bowles:

I am writing in support of the overall scope and purpose of the Green Line Extension Project, as described in the EOT's Draft Environmental Impact Report, dated October 2009. Such a project will provide two major benefits to the region in question: first, it will link the densely-populated and under-served residential areas of Somerville and Medford to the rest of the Boston metropolitan area, via light-rail; and second, it will help to reduce the nuisance caused by automotive traffic along the McGrath-O'Brien Highway.

Yet as a resident of East Cambridge, I must call your attention to three subjects related to this project which could pose significant problems for my neighborhood and its environs. These are (1) the relocation of Lechmere Station and its proposed building design, (2) the location of the maintenance and start-up facility, and (3) the present and future state of the McGrath-O'Brien Highway.

I-144-001 Regarding the Lechmere Station relocation, it is necessary to recognize that the safety of both the East Cambridge residential community and the millions of shoppers who flock to the Cambridgeside Galleria Mall on an annual basis will be placed at a higher level of risk once Lechmere Station has been moved to the other side of the Monsignor O'Brien Highway, since these Green Line riders will be forced to cross five to seven lanes of highway traffic on a regular basis as a result. Little or no attention has been given to this danger in the DEIR as published, and this should be cause for concern. Regarding the

I-144-002 proposed design of the relocated Lechmere Station, it appears that this will be the only Green Line Extension station that does not have an enclosed area or lobby to protect its users from the elements. Add to this that only one entrance is given for this station and that it is to be oriented towards future development on the northern side, rather than the existing neighborhood and mall ridership which will be coming to it from

(1)

I-144-001

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. The chapter presents a traffic analysis, a detailed description of pedestrian crossings of O'Brien Highway, and proposed roadway, crosswalk, and sidewalk improvements that are consistent with the NorthPoint development plans. These station and street plans will be further refined in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-144-002

Revised conceptual plans for Lechmere Station, including modifications to the station headhouse and entrances, enclosed automatic fare collection, and other amenities are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-144-002

I-144-003

the south. And finally, there is the inclusion of two parking lots next to the station, which is unusual since this station is not intended to be a terminus and no other Green Line Extension station seems to require parking lots. Prior to this observation, my understanding has always been that the chief intention of the Green Line Extension was to discourage automobile usage.

I-144-004

Concerning the location of the maintenance and start-up facility, the report states that Yard 8, in East Somerville, is the preferred location. Yet given that the ideal location for a maintenance and start-up facility would be at the terminus, it seems odd to be locating it in the middle of the line like this. Furthermore, the Yard 8 location will have a negative impact upon neighboring Brickbottom residents, as well as future Inner Belt development desired by Somerville. Similarly, the Mirror H alternative appears almost as detrimental, since it promises to encroach upon the residents of the Glassworks Factory, as well as future North Point development desired by Cambridge. Out of the three potential sites accepted by the report, the least noxious for all parties involved would appear to be Option L--which has the added benefit of not requiring right-of-way track when a given train needs to change directions in starting up.

I-144-005

But to reiterate, it still seems far wiser to eliminate the wastefulness of dead-heading trains at the start and end of each day by locating this facility at the terminus, or, failing this, to at least make better use of the already existing Boston Engine Terminal by locating the facility there instead--this latter possibility having the added advantage of prompting the South Shore commuter rail trains to be more properly housed on the South Shore, as well as minimizing a recent tendency to transform unused areas of the BET into adult entertainment dens.

I-144-006

With reference to the present and future state of the McGrath-O'Brien Highway, perhaps the ultimate oversight of this report has been to ignore this highway's inevitable reformation. For in order to achieve what the residents of both East Cambridge and East Somerville truly desire in this regard--which is nothing less than the reduction of this largely elevated highway to a boulevard located at grade--it becomes necessary to sink the heavy- and light-rail associated with this area below ground. In this way, some of the problems mentioned above also begin to resolve themselves: crossing the Monsignor O'Brien Highway relative to the Lechmere Station relocation will no longer pose such a threat, and the future development and interconnectedness of the North Point and Inner Belt areas, desired by the Cities of Cambridge and Somerville, can be

(2)

I-144-003

Although Lechmere Station will no longer function as a terminal station, there is still a demonstrated demand for existing parking. Nonetheless, parking at the relocated Lechmere Station was reduced in the revised conceptual design. These revised plans are included in FEIR Chapter 5, Lechmere Station.

I-144-004

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-144-005

The Boston Engine Terminal (BET) and major modifications to its operations are beyond the scope of the Green Line Extension Project. MassDOT will continue to coordinate with the MBTA to explore possibilities for shared facilities between the Green Line Extension storage and maintenance facility and the BET.

I-144-006

DEIR/EA Section 3.9 describes the compatibility of the Green Line Extension with other regional projects, such as the conceptual reconstruction of McGrath Highway and the Urban Ring transit corridor initiative. MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses to ensure, to the extent feasible, consistency with planning and other projects.

I-144-006

brought to closer fruition. Instead, what this report almost guarantees is that the McGrath-O'Brien Highway will continue to lumber about like a brontosaurus in our midst; and as a result, a great opportunity would appear to have been lost by our not addressing this highway in tandem with the Green Line Extension as proposed. This seems especially unfortunate given that both the McGrath-O'Brien Highway and the Green Line Extension have recently come under the collective auspices of MassDOT.

In conclusion, I wish to state that the above problems have been deemed so serious that a number of us from a local neighborhood organization, the East Cambridge Planning Team, have met on several occasions over the past seven months to arrive at what we feel is a better plan for the Lechmere Square area than what

I-144-007

the EOT (now MassDOT) is proposing in this report. In essence, our plan calls for a relocated Lechmere Station with an interior lobby and an additional entrance oriented towards both the traditional East Cambridge residential quarter and the Cambridgeside Galleria Mall; the reduction of the Monsignor O'Brien Highway to a five-lane pedestrian crossing at the First

I-144-008

Street intersection; and the preservation and redevelopment of the old Lechmere Station structures (which have been recommended for eligibility to the National Register of historic places) into a year-round covered market and public square, which would then be bordered by two developable building parcels matching the PUD as previously agreed upon.

Yours most truly,

Alan Greene

Alan Greene
82 Fifth Street
Cambridge, MA 02141

I-144-007

MassDOT has reviewed the suggestions submitted by the East Cambridge Planning Team. Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. These plans, including the pedestrian crossings of O'Brien Highway and associated street, crosswalk, and sidewalk designs will be further refined in the preliminary engineering stage of the Project. As part of the Green Line Extension, MassDOT intends to demolish the existing Lechmere Station and prepare the site for potential future redevelopment. Based on the current requirements of the O'Brien Highway roadway improvements (as shown in FEIR Chapter 5, Lechmere Station), the existing bus shed must be removed.

I-144-008

As part of the Green Line Extension, MassDOT intends to demolish the existing Lechmere Station and prepare the site for potential future redevelopment. MEPA

January 3, 2010

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles and Ms. Johnson:

I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

I-145-001

First of all, I strongly support the Green Line extension, and urge that it be built in the most practical, beneficial and cost-effective manner – that is, to construct the entire project in one phase, with a terminus station at Mystic Valley Parkway (Route 16), by December 31, 2014.

It is encouraging that the DEIR concludes that the Route 16 station would provide the most benefits according to all project criteria, including air quality and environmental justice. However, MassDOT states that it is incapable of building (and funding) the entire "Preferred Alternative," so it only intends to build the extension to College Avenue in the Tufts University area of Medford, by its deadline of December 31, 2014.

However the DEIR as currently written does not serve the best interests of the project. More importantly for your review, it was not done in a way that "adequately and properly" complies with the state environmental regulations, nor with the December 1, 2006 MEPA certificate that defined the requirements of the DEIR.

I-145-002

For the following reasons, **I strongly urge you to not accept the DEIR as the Final EIR and require further environmental analysis of the project by MassDOT**:
1. A two-phased approach is unacceptable. The Route 16/Mystic Valley Parkway Station should be built as part of a single-phase project to minimize costs and negative impacts and achieve the maximum benefits with regard to ridership, vehicle mile travel reduction, air quality improvements, and service to environmental justice communities.
The recommendation as outlined in the DEIR is for the Route 16/Mystic Valley Parkway station to be a separate stand-alone Phase II project with no funding source identified. This means, Route 16 may never be built.

There are many, many problems with the Phase II approach, including:

- Risk. Without an identified funding source there is a very high probability that Route 16 will never be built and the implications of this are critical.
- Terminus Impact. Without a Route 16 Station, the College Avenue stop (designed

I-145-001

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

I-145-002

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

and intended to be an interim station) would become the de facto terminus for the Green Line extension. It is not designed for a terminus and due to the traffic flow and neighborhood density, as well as the lack of opportunity for transit-oriented development at College Ave., it is not a good location for a terminus.

I-145-003 • Cost. The two-phased approach is fiscally irresponsible and by MassDOT's own estimates will inflate the cost by $55 million over a single-phase approach. Severing a single stop (less than one mile of track) from the project as a whole will cost the state, and thus the taxpayers, significant additional money. There are obvious ways to easily reduce costs in the overall project and provide enough additional funds to include Route 16 as part of a single, complete project. This is the most prudent approach, and also would ensure that the project produces the air quality improvements the Commonwealth must achieve to come into compliance with the Clean Air Act.

• Project Management. There are significant efficiencies gained from completing the project in one phase, rather than the starts and stops required to execute on separate, multi-stage efforts for such a small add-on project as a single station stop.

I-145-004 • Environmental Justice: The environmental justice population cited, in part, to justify the project as a whole will largely not be served if the project terminates at College Avenue. The negative aspects of this project will affect them most, while they will receive the least benefit without service to a Route 16 terminus.

I-145-005 • Legal Mandate: The state is legally obligated to provide public transit services to Medford Hillside by December 31, 2014, and stopping the extension at College Ave. fails to meet this legal obligation. At a minimum, this incurs significant mitigation costs required if the obligation is not met.

I-145-006 2. College Avenue should not be a terminus. The College Avenue station is not designed for the additional requirements of a terminus. The neighborhood cannot sustain the impact of a terminus station operations and traffic volume and the potential environmental damage is of serious concern.

I-145-007 3. The Route 16 station design is inadequate. The DEIR offers only a "worst case scenario" (MassDOT's description) for the Route 16 station design, while offering optimized station designs for all other Green Line extension stations. The Route 16 station design must be revisited. The Medford Green Line Neighborhood Alliance, a volunteer citizen group, has offered an alternative station design that prevents two major commercial property acquisitions and the resulting job displacement, preserves $182,000/year in property taxes for the City of Medford, optimizes traffic flow and better serves the integrity of the station's surroundings.

MassDOT apparently has been exploring similar improved designs, which should be presented to the public for comment. A $1 billion project deserves a higher caliber design than a "worst case scenario."

To summarize, there is much more work to be done on the Environmental Impact report, and I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis in order to make the Green Line extension the best project it can be, and MUST be.

Thank you for your consideration.

Gabrielle Rossmer Gropman

I-145-003

Project cost estimates are based on the current, conceptual level of design, and will be further refined as the Project progresses through preliminary engineering. It is anticipated that Green Line Extension construction would be financed with a combination of funds from federal and state sources. Efforts to engage a developer for the North Point development will continue as this Project moves into the next phases of design.

I-145-004

The Proposed Project offers substantial benefits to environmental justice communities and serves the majority of Study Area environmental justice population zones. As described in DEIR/EA Section 5.4, Environmental Justice, impacts to environmental justice populations would be neither severe nor disproportionate with any of the Build Alternatives.

I-145-005

As directed by the Secretary's Certificate on the DEIR/EA, the FEIR includes a limited scope of issues related to the Green Line Extension Project. The Proposed Project, with a Medford Branch terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Although an extension to Mystic Valley Parkway/Route 16 is MassDOT's Preferred Alternative, financial constraints prohibit the Commonwealth from progressing the Project beyond College Avenue at this time.

I-145-006

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR

Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-145-007

All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

Subject: Somerville Community Path

Dear Secretary Ian Bowles,

I-146-001

I support the extension of the Green Line to Somerville and Medford and the design of the Community Path. I feel that the DEIR should clearly state that the Community Path will be designed by MASSDOT's contractors as agreed in a Feb. letter from the former EOT. The Green Line and the Community Path Extension should be considered as one project to save money and insure their construction. This must be clearly described by the MassDOT. MassDOT should commit to get funding for this most necessary work! So many people in the community have been waiting too longer for better opportunities for public transportation and alternative transport.

Thank you for considering these comments.
Alice Grossman

http://www.alicegrossman.com

1

I-146-001

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

Subject: Green Line Extension Draft EIR (EEA #13886)

This letter is to Secretary Ian Bowles, Executive Office of Energy and Environmental Affairs
MEPA office

As a new homeowner two blocks from the proposed Gilman Square station, I support the Green Line extension to Somerville and Medford.

I-147-001

I'd add that the DEIR should be explicit in ensuring that the Somerville Community Path is extended. The portion of this path which exists already is heavily used, working beautifully as both parkspace and green transitway. What's not to like? These paths are the best values in infrastructure that a city can buy.

Therefore the DEIR should state that the Community Path extension will be designed by MassDOT's contractors as agreed to in the February 24, 2009 letter from the former EOT.

It should also say that the Green Line and Community Path extensions will be constructed as one project, since it doesn't make any sense to do them separately, and MassDOT must describe them as such.

Lastly, it should say that MassDOT must commit to obtain funding to build the Community Path extension as part of the Green Line extension. (This was done with the Linear Park as part of the Red Line, and it was incredibly successful: it's a major selling point for nearby properties and the neighorhood in general.) MassDOT must work with City, State and Federal agencies to secure this funding, including applying for Federal New Starts funding that allows bicycle and pedestrian access costs.

Thanks for considering these comments!

Best regards,

-Bathsheba

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles

I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

I have been participating actively in the above issue because of the efforts of the Medford Green Line Extension Neighborhood Alliance to keep local residents informed and interested. I have just read through several documents relating to the DEIR and wish to submit comments on the project. Although there are many important issues here, the ones that concern me the most are these:

I-149-001

1) Submitting a DEIR for a project that does not include a no-parking Route 16 terminus is a self-defeating gesture on the part of the MDOT. All the information so far considered makes it clear that the no-parking Route 16 terminus does the most to mitigate environmental concerns, to serve the Environmental Justice community, and to reach the largest ridership. Submitting a DEIR that stipulates that such a terminus would be built "later" is almost a guarantee it will never be built. As I understand it, the DEIR as presently written does not even present the best possible scenario for the Route 16 station. In my opinion, such a document cannot and should not be accepted as final. The managers must go back to the drawing board and rethink the station and then submit a revised DEIR. There is a serious risk that accepting a defective DEIR will seal the doom of the proposed future completion. As you certainly comprehend, once the DEIR is accepted it will take on a weight and inertia that will be hard to move.

I-149-002

2) Making College Avenue a terminus, even temporarily, is not going to solve many of the problems that extension is designed to solve and it will create new ones. It cannot possibly attract the numbers of riders that would achieve the desired environmental mitigation. It is close to the Red Line and is served by two bus lines and a Tufts shuttle bus service already. College Avenue is already a traffic disaster. Making it a terminus can only exacerbate the situation.

3) No matter how the project is realized, it is going to be very disruptive for everyone in the area between now and 2014. Renewing that disruption to expand to Route 16 at a later date is an unnecessary torture. If it's all done at once the disruption will be minimized rather than maximized.

4) Seeking funding for a later phase by no means assures that it will be found. If it costs an additional $50 million now, it will surely cost twice that 6 years from now.

5) The Medford Green Line Extension Neighborhood Alliance has submitted alternative plans for the Route 16

I-149-001

All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-149-002

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

terminus which coincide in large measure with alternatives the DOT is considering but has NOT included in the DEIR. There are some cost-saving measures that will help close the gap in funding. I believe that it is incumbent on you to see that the DEIR that becomes final is the best possible version, which is not the case with the draft now before you.

As a citizen, I ask you to send the plan back to the DOT. Please do not accept it in its present form.

Sincerely

Lois Grossman

To: Johnson, Holly S (ENV)
Subject: Ball Square Greenline Extention concerns

My name is Anthony R. Guarciariello. My sister, Benice Costanzo, and I own a triple decker located on Boston Avenue. It is the last residential apartment house on the east side of Boston Avenue before Broadway and Ball Square or about 120 yards from Broadway. The railroad tracks are about 60 yds west of the front of the house.

I-150-001

We attended the November 18th informational meeting at Somerville High School and one item that we brought up with one of your consultants there was the issue of parking problems on that section of Boston Avenue after the new station is built.

The vast majority of the complaints we hear from our tenants is the lack of parking spaces on the street. There is only one-side parking now permitted on this section of Boston Ave. and the off-street parking is minimal at these turn-of-the-century buildings. I read in your proposal that increased enforcement by the local police would be necessary but the only restriction that exists now to 24-hr street parking is street-sweeping on Fridays and, of course, snow emergencies. There is no residential-only parking restriction.

The increased traffic that will ensue is another concern that has been voiced by our tenants. Backing out of the narrow driveway at our building is a dangerous proposition now.

Comments?

I-150-001

DEIR/EA Table 6-1, Project Mitigation Commitments, lists the traffic and parking measures to which MassDOT has committed to mitigate impacts. These mitigation measures address pedestrian and roadway traffic signal improvement needs, impacts during construction, and parking enforcement coordination.

The additional traffic expected to be generated by the project (related to pick-up and drop-off activity) is minimal. A review of the traffic volume networks in the DEIR/EA shows an increase of less than 50 trips during the peak hours along Boston Avenue. This equates to less than one additional vehicle per minute.

> RE: Green
> Line Extension Draft EIR (EEA #13886)
>
>
>
> Dear
> Secretary Bowles:
>
I-151-001 > I am writing on behalf of the Friends of the Community Path, a local
> community group with over 2,000 supporters of the existing and
> proposed Somerville Community Path. We strongly support the
> construction of the Green Line Extension to Route 16 on the
> Medford/Somerville line and to Union Square in Somerville and believe
> in its positive economic and environmental impacts.
>
> However, because of shortcomings and omissions in the design, we
> cannot support this Massachusetts Department of Transportation
> (MassDOT) Draft Environmental Impact Statement (DEIR) becoming the
> Final EIR, unless a Supplemental EIR or Addendum is performed to
> correct the deficiencies.
>
> We urge you to:
> 1) Request that MassDOT incorporate the revisions outlined below
> into the EIR and the subsequent final design
> 2) Request that MassDOT seek state and federal funding for the
> Community Path extension as an integral part of the Green Line
> Extension
> 3) ensure that a Citizens Advisory Committee public process be
> instituted to help guide these necessary design improvements.
>
> Although a 10% design stage cannot contain all the details everyone
> would like, now is the time to ensure that the Community Path
> extension is incorporated into the final EIR and the subsequent final
> design. Notably, the Community Path is good for the Green Line, and
> the Green Line is good for the Community Path. There are many local
> and national examples of successful rail- and-path projects (a few are
> cited near the end of this letter), and now is the right time to
> garner state and federal funding for such projects.

1

I-151-001

Please see Comment Letter I-081 for responses to this form letter.

> The Somerville Community Path (also known regionally as an extension
> of the Minuteman Trail) provides the logical connection to the City's
> neighbors to the east and west. Every improvement to the Community
> Path extension in its co-design with the Green Line extension
> maximizes the potential of our regional transportation resources.
>
> We appreciate your consideration of these revisions to both the EIR
> and the subsequent final design:
>
> REVISIONS TO Funding
> and Construction(followed by details):
> · The
> DEIR should clearly state that the extension of the Community Path
> will be designed by MassDOT's contractors as agreed to in a February
> 24,
> 2009 letter
> from the EOT.
> · That
> to take full advantage of cost efficiencies and technical necessities,
> the Green Line and Community Path extensions will be funded and
> constructed together as a single project and must clearly be described
> as such by MassDOT.
> · MassDOT
> should commit to work with the City of Somerville and other State and
> Federal agencies to obtain the necessary funding to build the
> Community Path extension as an integral part of the Green Line
> extensions - as was done with Boston's 4.7mile long Southwest Corridor
> path as part of the Orange Line, and with the mile-long Linear Park as
> part of the Red Line from Davis Square to
> Alewife. (By comparison, the
> Community Path extension is about 2.5 miles.) Applications for
> funding should include Federal New Starts funding for allowed bicycle
> and pedestrian access costs
> · As
> the location of the support facility is finalized, the route of the
> Community Path from Washington St. to Lechmere in Cambridge should be
> re- evaluated.
>
> Details
>
> Funding and the Importance of the Community Path extension - By
> acquiring federal funding for the Community Path in conjunction with
> the Green Line extension, both transit projects will benefit
> tremendously, with the added perk of creating additional design and
> construction jobs in the Commonwealth. By contrast, if funding for
> both transit projects is not sought concurrently, it will cost many
> times more to construct the Community Path as a separate project, in
> turn yielding the grim possibility that the Community Path extension
> may never get built.
> We understand that the City of Somerville has about $3 million of the
> reportedly $15 - $20 million Community Path extension estimated cost.
>
>
> The request for State and Federal transit funding is reasonable and
> appropriate, as follows:
>

> · The
> Federal Transportation Act (FTA) has recently proposed a policy that
> "pedestrian improvements located within 1/2 mile and all bicycle
> improvements located 3 miles of a public transportation stop … may be
> eligible for FTA funding"
> http://edocket.access.gpo.gov/2009/E9-27240.htm
> · The
> Community Path - a mere 2 miles from Boston at it's current Cedar
> Street terminus - will provide desirable off-road bicycle and
> pedestrian access to the T stations, offering superior connections to
> the surround neighborhoods, especially in East Somerville - as in
> Davis Square, where 60% of the residents use public transportation and
> thousands walk and bike to the station each
> day. The Community Path
> will attract more T-riders in a very cost-effective manner. More T-
> riders means enhanced opportunities for getting federal New Starts and
> other federal funding.
> · In
> the vicinity of Lowell St., Gilman Sq. and Washington St. stations,
> the Community Path is designed as an integral part of the station
> access. This will allow the public transportation success of the
> Davis Square station to be repeated in parts of Somerville that really
> need it.
>
> REVISIONS TO DESIGN
>
> Community Path from Lowell St. to Route 16: The MEPA
> certificate said that the environmental review would include
> evaluation of
> continuing the Community Path west of the Lowell St. station to
> Medford. The
> study results that were presented (Appendix E of the DEIR) concluded
> that the
> width of certain sections right-of-way was insufficient to provide
> such a
> continuous Path. However, since there are some sections where there
> isenough width, a route, path connections to local
> streets, can be studied further.
>
> Community Path from Route 16 to West Medford: Section
> 3.2.3 of the RFP said that Vanasse Hangen
> Brustlin, Inc. (MassDOT / EOT's consultant)should study "Using the
> bikeway/pathway
> guidelines, consider options for providing pedestrian connections to
> the West
> Medford commuter rail station and evaluate the viability and
> potential impacts
> of including a community path in this section of the project area."
> This
> seems not to have been done but should be. Such a Path would make a
> transfer
> connection from Route 16 to West Medford. Therefore MassDOT should
> plan for a
> community path to connect the Route 16 terminus to West Medford via
> an overpass
> of Route 16, a bridge over the Mystic River and a route along the
> Lowell

> commuter rail tracks.
>
> Access to Route 16 Station - The plans in the DEIR
> document do not show how Green Line riders will safely access the
> Route 16
> station from Arlington and Medford and from the Alewife Brook paths
> that are
> being improved as part of a $3.6 million ARRA stimulus project. A
> multi-use
> path for pedestrians and bicyclists to the station should be
> included in the
> design from the Alewife paths to the station. Please request that
> MassDOT
> perform this design.
>
> Community Path Route from Washington St. to Lechmere - the
> Somerville Community Path route should connect the Washington
> St./Brickbottom station, the Brickbottom community and Inner Belt to
> Lechmere.
> The present plans do not make these connections. If the proposed
> Yard 8
> location for maintenance and storage facility is "dropped", better
> routes for
> the Community Path (such as along the Green Line to Brickbottom and
> over the
> former Red Bridge location) that do make these connections are
> possible. The
> Green Line extension plans should state that this re-evaluation will
> be done.
>
> Bicycle Parking
> · The amount of bicycle parking presently described in
> the plans (270 spaces) is welcome but will be insufficient for the
> expected
> number of bicyclist coming to the stations. 270 spaces is only about
> 1% of the
> expected ridership. Based on the
> present parking at Red line stations, bike parking at 3-5% of
> ridership will
> soon be needed. Therefore, we request that the amount of bike
> parking be
> increased to approximately 5% at the Union Square, Route 16 and
> Lowell St.
> (major intersection with Community Path) stations and 3% at the
> remainder.
> · Also, the location of the bicycle parking (where
> specifically shown in the plans) are good at some locations but not
> at others.
> The bicycle parking locations should be as close to as possible to
> the entrance
> and in well lit and safe locations.
> · Lastly, bicycle parking should be covered parking if at
> possible.
>
> Improved pedestrian and bicycle
> access
> Pedestrian connections to some of

> the stations could be better designed. Access to some of the
> stations could be vastly improved by having more
> thanone entrance or access pointsuch as:
>
> · a
> direct connection from the Gilman Square station to the Somerville
> High
> School/Library/City Hall complex)
>
> · the
> Washington St. station design which seems particularly poor in this
> regard for
> riders coming from the west and north. This could be greatly
> improved by
> locating the station directly above Washington St. where direct
> access via
> elevator would be possible (earlier designs included such a layout).
>
> · In
> general, pedestrian and bicycle access should be given higher
> priority in these
> "community-based" station designs that motor vehicles connections.
>
> · station
> designs (specifically College Ave and also Washington St.), where
> drop-off
> stops ("kiss and ride"), directly blocks the front of the T-station
> entrance
> and will congest entrance to the station. Paradoxically, pedestrian
> access to the station entails a long,
> complicated route.
>
> · Lowell St. station, where a direct connection to the
> platform from the Path coming from Cedar St. would be possible via a
> safe
> pedestrian crossing of one track. MassDOT has said this would not be
> allowed because
> of safety concerns even though every light rail system in the US
> (including in
> Boston: Longwood stop on the Green Line and Milton and Butler stops
> on the
> Mattapan line) allows crossing of tracks for access. Even if
> MassDOT will not allow this access point at this
> time, the Lowell St. station platform should be designed for such
> future
> access.
>
> We look forward to seeing these revisions incorporated into
> the FIR and the subsequent final design.
>
>
> Here are just a few local and national precedents for
> successful rail-with path projects:

Johnson, Holly (EEA)

From: Melissa Glenn Haber [glenhaber@rcn.com]
Sent: Thursday, January 07, 2010 9:57 PM
To: Johnson, Holly S (ENV)
Subject: Support for Community Path/Green Line extension linkage

Dear Ms. Johnson,

I-152-001

I am writing to express my thanks to the DOT for the work you've done on the Green Line Extension to Somerville and Medford. As a carless resident of Somerville, and one who believes that public transportation and bike paths are essential to the Commonwealth's future, I want to urge the Commonwealth to proceed with the project in ways that maximize flexibility for the future (such as putting the Union Square stop in a place it might be able to extend to Porter in the future) and in ways that ensure the construction of the bike path. Bus-riders like me already have a way to get to Lechmere, but the extension of the bike path wi provide a healthy and low-emission option for Somerville commuters. I hope the DOT will make sure the Green Line and Community Path extensions will be considered as one project, and that the Community Path will be designed by MassDot's contractors (as I gather was the agreement last February).

Thank you so much,

Melissa Glenn Haber
Somerville

1

I-152-001

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able at this point to commit to funding the construction of the Community Path.

Subject: Comments on Green Line Extension DEIR for Ian Bowles

Dear Secretary Bowles,

I am writing to offer my comments on the Draft Environmental Impact Report. As a former resident of Somerville and user of the Community Path, and as strong supporter of pedestrian and bike friendly policies to make urban areas more livable, I think it is essential the DEIR state the following clearly:

I-153-001

- The extension of the Somerville Community Path will be designed by MassDOT's contractors as previously agreed to, and

- The Green Line extension and Community Path extension will be built and managed as one unified project

I think it's readily apparent that, if the Community Path extension is not done as part of the Green Line extension, it will never happen due to much higher costs associated with adding on the Community Path extension separately. Since the entire project is intended to reduce pollution and take cars off the road, it's only natural that the project would also encourage bicycle and pedestrian traffic, which I believe which augment the progress made by the T rather than take riders away. It's important the DEIR clearly state the Community Path extension will be an integral part of the Green Line extension.

Thank you for consider my comments as you review this report.

Sincerely,
Daniel Hamalainen
62 Waverley Oaks Road
Waltham, MA 02452

1

I-153-001

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

January 6, 2010

Dear Secretary Ian Bowles:

I write in support of a Green Line Extension but in opposition to the plan to locate the storage yard and maintenance facility adjacent to the residences of the Brickbottom Artists' community. (Yard 8)

I commute to my studio every day and would certainly prefer to use public transportation – hence my enthusiasm for the Green Line Extension. However, my studio is, and must be, a sanctuary. Were I to lose the quiet, the open sky, the sea gulls, the lovely light, I would no longer be able to work there. The Yard 8 location would have a devastating effect on all of us, not only residents.

I urge you to consider what losing the Brickbottom community would mean to Somerville. I have been working there for 20 years, and every year we participate in art projects to benefit Somerville – bringing students to our studios and going to them in their schools, opening our gallery space to local artists, bringing art into public spaces throughout the city – the list is long and the commitment to the community is deep. We are a real cultural asset.

I-154-002

I urge you to create a community Advisory Committee. I urge you to investigate seriously other locations, Option L and Mirror H. I also am disappointed to learn that the mitigation plans are as yet far from adequate.

This project will affect Somerville for generations to come. Please consider what the Yard 8 location will do to our community and the surrounding area.

Sincerely,

Margery Hamlen

Margery Hamlen

I-154-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-154-002

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114
Via email: Holly.S.Johnson@state.ma.us

Dear Secretary Bowles:

I am a Medford resident writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Cambridge, Somerville and Medford, EEA #13886.

I-155-001

I strongly support the Green Line extension, and urge that it be built in one phase, with a terminus station at Mystic Valley Parkway (Route 16), by December 31, 2014. I ask that you reject the DEIR as written because it does not comply with the December 1, 2006 MEPA certificate and does not satisfy the legal mandate to serve the Medford Hillside neighborhood.

The DEIR concludes that the Route 16 station would provide the most benefits according to all project criteria, including air quality and environmental justice. However, MassDOT states that it is incapable of building (and funding) the entire "Preferred Alternative," so it only intends to build the extension to College Avenue in the Tufts University area of Medford, by its deadline of December 31, 2014. For the following reasons, I strongly urge you to not accept the DEIR as the Final EIR and require further environmental analysis of the project by MassDOT:

- **A two-phased approach is unacceptable.** The Route 16/Mystic Valley Parkway Station should be built as part of a single-phase project to minimize costs and negative impacts and achieve the maximum benefits with regard to ridership, vehicle mile travel reduction, air quality improvements, and service to environmental justice communities. The recommendation as outlined in the DEIR is for the Route 16/Mystic Valley Parkway station to be a separate stand-alone Phase II project with no funding source identified is whatsoever a bad idea.

- **Environmental Justice:** The environmental justice population cited, in part, to justify the project as a whole will largely not be served if the project terminates at College Avenue. There are five separate Environmental Justice sites within walking distance of the Route 16 terminus that will simply not be served by a College Ave terminus.

- **Legal Mandate:** The state is legally obligated to provide public transit services to Medford Hillside by December 31, 2014, and stopping the extension at College Ave. fails to meet this legal obligation. The vast majority of the Medford Hillside neighborhood will not be served by a College Ave terminus.

- **The Route 16 station design in the DEIR is inadequate.** The DEIR design for the Route 16 station is deficient and unworkable. It unnecessarily calls for the taking of two existing buildings that should remain intact with a proper design. The Final EIR should show a realistic and workable design for the Route 16 site, which is by far the best location for a terminus for the Green Line Extension.

In conclusion, I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis to go to Route 16 to serve the largest possible population, achieve the maximum ridership, and provide the maximum air quality and environmental benefits to the residents of Cambridge, Somerville, and Medford.

Thank you.

RE: Green Line Extension Project

Dear Secretary Bowles:

I-156-001

As a resident of the Glass Factory Condominiums, I am extremely concerned about the design and placement of the Green Line Extension and the new Lechmere Station. The placement of the new Lechmere Station negatively impacts me and the residents of the Glass Factory tremendously. Unless the Glass Factory residents' concerns are addressed, the construction of the new Lechmere Station and Green Line Extension will be viewed as an extremely negative project. Please see my following concerns:

I-156-002

TRACKS ARE TOO CLOSE TO OUR BUILDING.

The present design depicts the tracks running very close to the rear of our building. This is ridiculous because it does not have to be like this. No representative of the MBTA has given a decent reason why the old tracks need to be used. Why can't the tracks be moved further away from our building? This especially impacts the residents in the rear of the building. I happen to live on the rear side of the building. I am extremely concerned about the noise this construction will bring as well as the day-to-day noise of the trains passing by. I am already frustrated by the noise of the commuter rail located behind our building. The MBTA has said that they will try to prevent noise, but this is not a guarantee. Where would this money come from?

Additionally, the views and light will be severely impacted by the elevated tracks. I understand that this project is being constructed no matter what. There is no arguing against the extension of the green line. However, why can't you make it as pleasant an experience as possible for the Glass Factory residents? We urge your designers and engineers to place the tracks as far to the rear of our building as possible to preserve views & light to the many units that will be severely impacted. The design and placement of the tracks and supports should do all it can to minimize the visual impact to those units and also minimize noise & vibration impacts to the whole building as well as the surrounding neighborhood.

I-156-003

LECHMERE STATION.

Presently your designs show the new Lechmere Station so close to the Glass Factory that it appears to be part of our condominium building. NO ONE WANTS TO LIVE ADJACENT TO A TRAIN STATION! Please move the station closer to East

I-156-001

Please see Comment Letter I-013, plus the additional responses below.

I-156-002

FEIR Chapter 5 describes the revised conceptual plans for Lechmere Station, including station design, track alignment, bus routings, and other elements. Changes to the track alignment depicted in the DEIR/EA were evaluated, but could result in additional impacts on area abutters. These will be new tracks on an aerial guideway, not existing tracks at ground level northeast of the Glass Factory Condominiums. Proposed mitigation measures for area abutters are also described in FEIR Chapter 5. During preliminary engineering, specific station design elements will be further developed.

I-156-003

Revised conceptual plans for Lechmere Station, including modifications to the station headhouse and entrances, enclosed automatic fare collection, and other amenities are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-156-003

Street, where it could be part of the entrance way to the eventual North Point development. The current plan of the station is hideous and cheap looking. Again, please make the station as aesthetically pleasing as possible. This is our home! We do not want to look at an eyesore of a train station everyday. Perhaps you could design the station to as well designed as the Charles MGH station on the Red Line. The station design needs to be substantially improved so it is not an eyesore but rather an enhancement to this rapidly developing neighborhood. It should reflect the importance of this location as the gateway between Cambridge & Boston.

BUS TRAFFIC.

The many bus lines that converge on Lechmere Station are presently designed to enter at one end of our building, pick up passengers, and emerge at the other end of our condo building. Please do not route bus traffic, directly under our windows. Bus traffic noise, vibrations and fumes are a great concern. Sidewalks where passengers wait, should also be moved farther from our building to preserve our privacy and minimize impacts from noise, light and smoking. If too close, it will feel like we are living in the bus station.

PRESERVE OUR TREES & GREEN SPACE.

Presently there is a row of mature evergreen trees behind our building. I urge you to preserve all these trees and the entire small green space behind our building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks should be on the far side of the large trees. These trees serve as a natural screen for the tracks and busway.

MAINTENANCE FACILITY.

I strongly oppose the Mirror H location. It is much too close to the Glass Factory and other residential buildings and will effectively destroy further development in North Point. Putting a maintenance facility on prime land in a desirable, developable location that would generate significant tax revenue to Cambridge simply does not make sense. Of the three options proposed, Option L seems to be the best choice however I would prefer there be no maintenance facility in this area but rather it be at the end of the line.

I-156-004

REDUCE SURFACE PARKING.

The present Lechmere Station is at the end of the Green Line. That will no longer be the case with the new Green Line Extension and the number of parking spaces should be substantially reduced. You make it seem like a positive aspect that you will be redoing a parking lot to hold a greater number of vehicles. Since this will no longer be the end of the Green Line, why do we need so much parking at the Lechmere Station? Perhaps some of this parking area could serve as guest parking for the Glass Factory since you will be destroying any room behind our building that currently exists. Surface parking is bad urban design and should be minimized in the new North Point neighborhood. One half of our building will overlook the new parking and we request it be carefully designed with this in mind. Ample green space should be included in the design and all lighting should be down lighting that minimizes light pollution to our building.

I-156-004

Although Lechmere Station will no longer function as a terminal station, there is still a demonstrated demand for existing parking. Nonetheless, parking at the relocated Lechmere Station was reduced in the revised conceptual design. These revised plans are included in FEIR Chapter 5, Lechmere Station.

As stated in DEIR/EA Section 3.7, station designs will minimize light impacts to neighboring properties. The MBTA generally does not include landscaping within station parking areas, though other station landscaping opportunities will be evaluated. As explained in FEIR Chapter 5, design criteria for all Project elements, including Lechmere Station lighting and landscaping, and detailed station designs will be developed during preliminary engineering.

Thank you for your attention to these matters.

Sincerely,

Jennifer Harris

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #03886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-157-001 As a property owners and residents of the Glass Factory Condominiums, we are very concerned about the design and placement of the Green Line Extension and new Lechmere Station.

SAFETY CONCERNS

I-157-002 We have a major concern about the darkness, crime, the homeless living, smoking, urinating under the elevated tracks. We will need additional security and new fencing since so many people will cross by our parking areas. Health concerns from bus fumes, electric fields, excessive noise, and smokers outside our windows.

TRACKS - TOO CLOSE TO OUR CONDOMINIUM BUILDING

The present design shows the tracks running extremely close the rear of our building; anywhere from 30 to 50 feet. We ask that you encourage your designers and engineers to position the tracks as far to the rear of the building as feasible to preserve the views and natural light to many of the residential properties that will be severely influenced by the elevated tracks. The design and placement of the tracks and supports should be as to minimize the visual impact to those properties and also minimize noise and vibration impacts to the whole building as well as the surrounding neighborhood.

LECHMERE STATION

At present, the designs show the new Lechmere Station so close to the Glass Factory that it looks like an out-crop of our condominium building. Please consider relocating the station closer to East Street, where it could be part of the entrance way to the North Point development. The station design needs to be substantially improved, it is not constant with current or proposed neighborhood ascetics the station should designed to enrichment this rapidly developing neighborhood. It should reflect the importance of this location as the gateway between Cambridge and Boston. The station should be an amenity and should be of similar quality to the Charles Street station.

I-157-001

Please see Comment Letter I-013 for responses to this form letter, as well as the additional response below.

I-157-002

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project, with additional consideration given to urban design and pedestrian environment considerations under the trackway areas. Fencing options along the Glass Factory property are currently proposed and will continue to be evaluated. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

It is anticipated that the Project will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality. As described in Chapter 5 of the FEIR, and in Chapter 8, Mitigation Measures, the bus layover facility would be posted "no idling" in conformance with MBTA policy.

BUS TRAFFIC

The many bus lines that converge on Lechmere Station are presently designed to enter at one end of our building, pick up passengers, and emerge at the other end of our condo building. Please do not route bus traffic, directly under our windows. Bus traffic noise, vibrations and fumes are a major concern. Consider moving the sidewalks where passengers wait farther from our building to preserve our privacy and minimize impacts from noise, light, and smoking. If too close, it feels like we are living a bus station.

PRESERVE OUR TREES AND GREEN SPACES

Presently there is a row of mature evergreen trees behind our building. We urge you to preserve all these trees and the entire small green space behind our building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks could be located on the far side of the large trees. These trees would serve as a natural screen for the tracks and bus way.

MAINTENANCE FACILITY

We unequivocally oppose the Mirror H location. It is much too close to the Glass Factory and other residential buildings and will effectively eradicate further development in the North Point. Putting a maintenance facility on prime land in a desirable, developable location that would generate significant tax revenue to the City of Cambridge simply does not make sense. Of the three options proposed, Option L seems to be the best choice however we would prefer there be no maintenance facility in this area but rather it is placed at the end of the line.

REDUCED SURFACE PARKING

The present Lechmere Station is at the end of the Green Line. That will no longer be the case with the new Green Line Extension and the number of parking spaces should be substantially reduced. Please consider using the under-utilized parking garages the North Point neighborhood. One half of our building will overlook the new parking and we request it be carefully designed with this in mind. Ample green space should be included in the design and all lighting should be down lighting that minimizes light pollution to our building.

Thank you for hearing our concerns.

Best regards,

Michael and Jacqueline Heath

Reference to Project # EEA # 13886

Dear Secretary Ian Bowles,

I'd like to applaud the efforts that are in the process of being made, in regard to the green line extension, an endeavour I'm very much in favor of. Clearly, there are many complications and considerations to be made in the planning and prioritizing of issues related to these matters.

I have been an owner, resident and artist in my live/work space for almost 10 years, and plan to be here for many more years. Therefore I have a vested interest in the impact various development projects will have in this area.

I-158-001 One issue I'd like to address is the opposition to Yard 8. It will take 11.5 acres of land from Somerville and remove it from the city's commercial tax base. It creates a permanent barrier to neighbourhood cohesion by dissecting the inner belt and Brickbottom area, creating a barrier to future economic that will last for generations to come. Yard 8 maintenance facility and storage yard would directly abut the Brickbottom Building and have ongoing and negative sound and vibration impacts.

I-158-002 Stations should all be located on major streets and have easy access from many points, including both sides of the street. There needs to be more pedestrian access, as well as inviting and accessible community paths + bicycle connections.

In summary, I am opposed to the facility at Yard 8. In addition, I think it is vital that there be empowered community involvement at every step in the process.

Sincerely,
Lana Herman
LANA HERMANN

B158

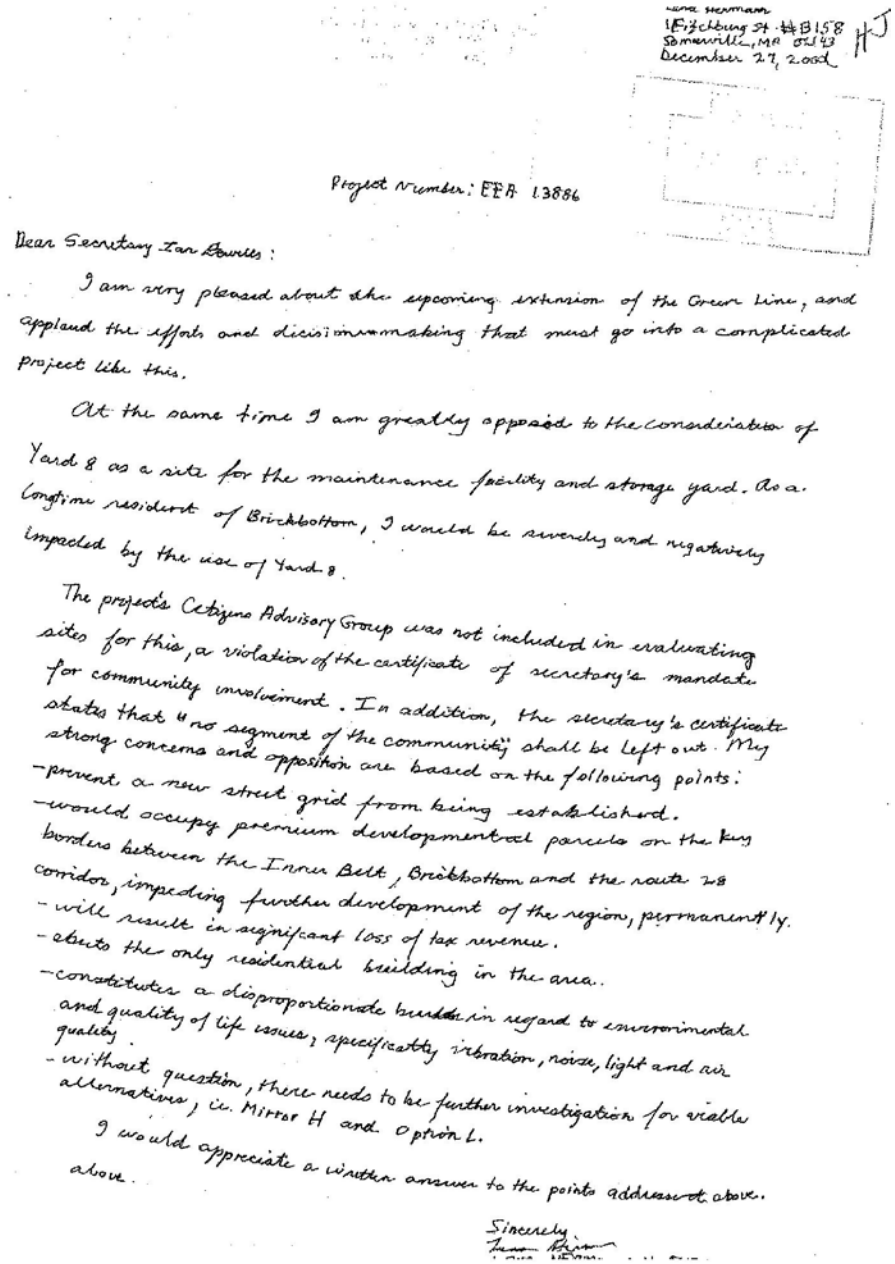
I-158-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-158-002

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.



Lena Sherman
1 Fitchburg St #B158
Somerville, MA 02143
December 27, 2008

Project Number: EEA 13886

Dear Secretary Ian Bowles:

I am very pleased about the upcoming extension of the Green Line, and applaud the efforts and decisionmaking that must go into a complicated project like this.

I-159-001 At the same time I am greatly opposed to the consideration of Yard 8 as a site for the maintenance facility and storage yard. As a longtime resident of Brickbottom, I would be severely and negatively impacted by the use of Yard 8.

I-159-002 The project's Citizens Advisory Group was not included in evaluating sites for this, a violation of the certificate of secretary's mandate for community involvement. In addition, the secretary's certificate states that "no segment of the community" shall be left out. My strong concerns and opposition are based on the following points:

I-159-003
- prevent a new street grid from being established.
- would occupy premium developmental parcels on the key borders between the Inner Belt, Brickbottom and the route 28 corridor, impeding further development of the region, permanently.
- will result in significant loss of tax revenue.
- abuts the only residential building in the area.
- constitutes a disproportionate burden in regard to environmental and quality of life issues, specifically vibration, noise, light and air quality.
- without question, there needs to be further investigation for viable alternatives, i.e. Mirror H and Option L.

I would appreciate a written answer to the points addressed above.

Sincerely

I-159-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-159-002

As described in the DEIR/EA Section 1.5.3, throughout the development of the DEIR/EA regular coordination with the Advisory Group and local municipalities on various aspects of the Project, including siting of the maintenance facility, occurred. During the Summer of 2008, tutorials on the proposed maintenance facility as well as site visits to existing maintenance facilities were conducted for Advisory Group members. Additionally, in December 2009 a public meeting was held on the various maintenance facility sites.

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-159-003

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option

L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

Johnson, Holly (EEA)

To: Johnson, Holly S (ENV)
Subject: Comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886

To whom it may concern:

I-160-001

The following is a sample letter regarding the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886, distributed by the Medford Green Line Neighborhood Alliance. I agree with its contents in full. If you have any questions, please do not hesitate to contact me by email or:

Jonathan Herzog
101 Woods Ave.,
Somerville MA 02144.

Dear Secretary Bowles:

I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

First of all, I strongly support the Green Line extension, and urge that it be built in the most practical, beneficial and cost-effective manner – that is, to construct the entire project in one phase, with a terminus station at Mystic Valley Parkway (Route 16), by December 31, 2014.

The DEIR is encouraging in that it concludes that the Route 16 station would provide the most benefits according to all project criteria, including air quality and environmental justice. However, MassDOT states that it is incapable of building (and funding) the entire "Preferred Alternative," so it only intends to build the extension to College Avenue in the Tufts University area of Medford, by its deadline of December 31, 2014.

In my opinion, the DEIR as currently written does not serve the best interests of the project. More importantly for your review, it was not done in a way that "adequately and properly" complies with the state environmental regulations, nor with the December 1, 2006 MEPA certificate that defined the requirements of the DEIR.

For the following reasons, I strongly urge you to not accept the DEIR as the Final EIR and require further environmental analysis of the project by MassDOT:

I-160-002

First, A two-phased approach is unacceptable. The Route 16/Mystic Valley Parkway Station should be built as part of a single-phase project to minimize costs and negative impacts and achieve the maximum benefits with regard to ridership, vehicle mile travel reduction, air quality improvements, and service to environmental justice communities. The recommendation as outlined in the DEIR is for the Route 16/Mystic Valley Parkway station to be a separate stand-alone Phase II project with no funding source identified. This means, Route 16 may never be built.

1

I-160-001

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

I-160-002

Please see Comment Letter I-002 for responses to this form letter.

I-160-002

There are many, many problems with the Phase II approach, including:

• Risk. Without an identified funding source there is a very high probability that Route 16 will never be built and the implications of this are critical.

• Terminus Impact. Without a Route 16 Station, the College Avenue stop (designed and intended to be an interim station) would become the de facto terminus for the Green Line extension. It is not designed for a terminus and due to the traffic flow and neighborhood density, as well as the lack of opportunity for transit-oriented development at College Ave., it is not a good location for a terminus.

• Cost. The two-phased approach is fiscally irresponsible and by MassDOT's own estimates will inflate the cost by $55 million over a single-phase approach. Severing a single stop (less than one mile of track) from the project as a whole will cost the state, and thus the taxpayers, significant additional money. There are obvious ways to easily reduce costs in the overall project and provide enough additional funds to include Route 16 as part of a single, complete project. This is the most prudent approach, and also would ensure that the project produces the air quality improvements the Commonwealth must achieve to come into compliance with the Clean Air Act.

• Project Management. There are significant efficiencies gained from completing the project in one phase, rather than the starts and stops required to execute on separate,
multi-stage efforts for such a small add-on project as a single station stop.

• Environmental Justice: The environmental justice population cited, in part, to justify the project as a whole will largely not be served if the project terminates at College Avenue. The negative aspects of this project will affect them most, while they will receive the least benefit without service to a Route 16 terminus.

• Legal Mandate: The state is legally obligated to provide public transit services to Medford Hillside by December 31, 2014, and stopping the extension at College Ave. fails
to meet this legal obligation. At a minimum, this incurs significant mitigation costs required if the obligation is not met.

Second, College Avenue should not be a terminus. The College Avenue station is not designed for the additional requirements of a terminus. The neighborhood cannot sustain the impact of a terminus station operations and traffic volume and the potential environmental damage is of serious concern.

Third, the Route 16 station design is inadequate. The DEIR offers only a "worst case scenario" (MassDOT's description) for the Route 16 station design, while offering optimized station designs for all other Green Line extension stations. The Route 16 station design must be revisited. The Medford Green Line Neighborhood Alliance, a volunteer citizen group, has offered an alternative station design that prevents two major commercial property acquisitions
and the resulting job displacement, preserves $182,000/year in property taxes for the City of Medford, optimizes traffic flow and better serves the integrity of the station's surroundings. MassDOT apparently has been exploring similar improved designs, which should be presented to the public for comment. A $1 billion project deserves a higher caliber design than a "worst case scenario."

To summarize, there is much more work to be done on the Environmental Impact report, and I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis in order to make the Green Line extension the best project it can be, and MUST be.

Thank you.

1

I-161-001

The current limit of the Proposed Project only extends the Green Line as far as College Avenue, with a potential future extension to Mystic Valley Parkway / Route 16. However, as the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

Sent: Friday, January 08, 2010 8:30 AM
To: holly.s.johnson@state.ma.us
Subject: Green Line Extension Draft EIR (EEA #13886)

Ian and Holly-
As a recent first time home buyer in Medford, the Green Line extension is of great interest to myself, wife and young son. Being connected to both Union Square and particularly downtown would be of great importance. We moved to the Boston area 10 years ago from the great expanses of the Rocky mountains, and public transit was a big factor in our decision to move. We have always lived close to one form or another and use it extensively.
I'd like to add that I support these points included below that have been drafted by others, but summarize well.

I-162-001
- *Eliminate the Yard 8 Option for the Maintenance facility (that will prevent economic development and integration of the Inner Belt) and do a full analysis of the other locations: Mirror H option, Option L and the alternate Option L-BET.*

I-162-002
- MassDOT should clearly state that the extension of the Community Path will be designed by MassDOT's contractors as agreed to in a February 24, 2009 letter from the former EOT.
- That for cost efficiencies and technical necessities, the Green Line and Community Path extensions will be constructed as one project and must clearly be described as such by MassDOT.
- MassDOT should commit to work with the City and other State and Federal agencies to obtain the necessary funding to build the Community Path extension as part of the Green Line extensions (as was done with the Linear Park as part of the Red Line and the Southwest Corridor path as part of the Orange Line), including applying for Federal funding.

I-162-003
- Design and construct the Mystic Valley Parkway / Route 16 terminus at the same time as the rest of the project (i.e., do not stop at College Ave.) It makes no sense in doing this in 2 phases. It only creates a risk that it will never be extended to Route 16.

I-162-004
- Design and construct the Union Square station so that it can extended to Porter Sq. in the future.

Thanks for your time and support-

I-162-001
An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

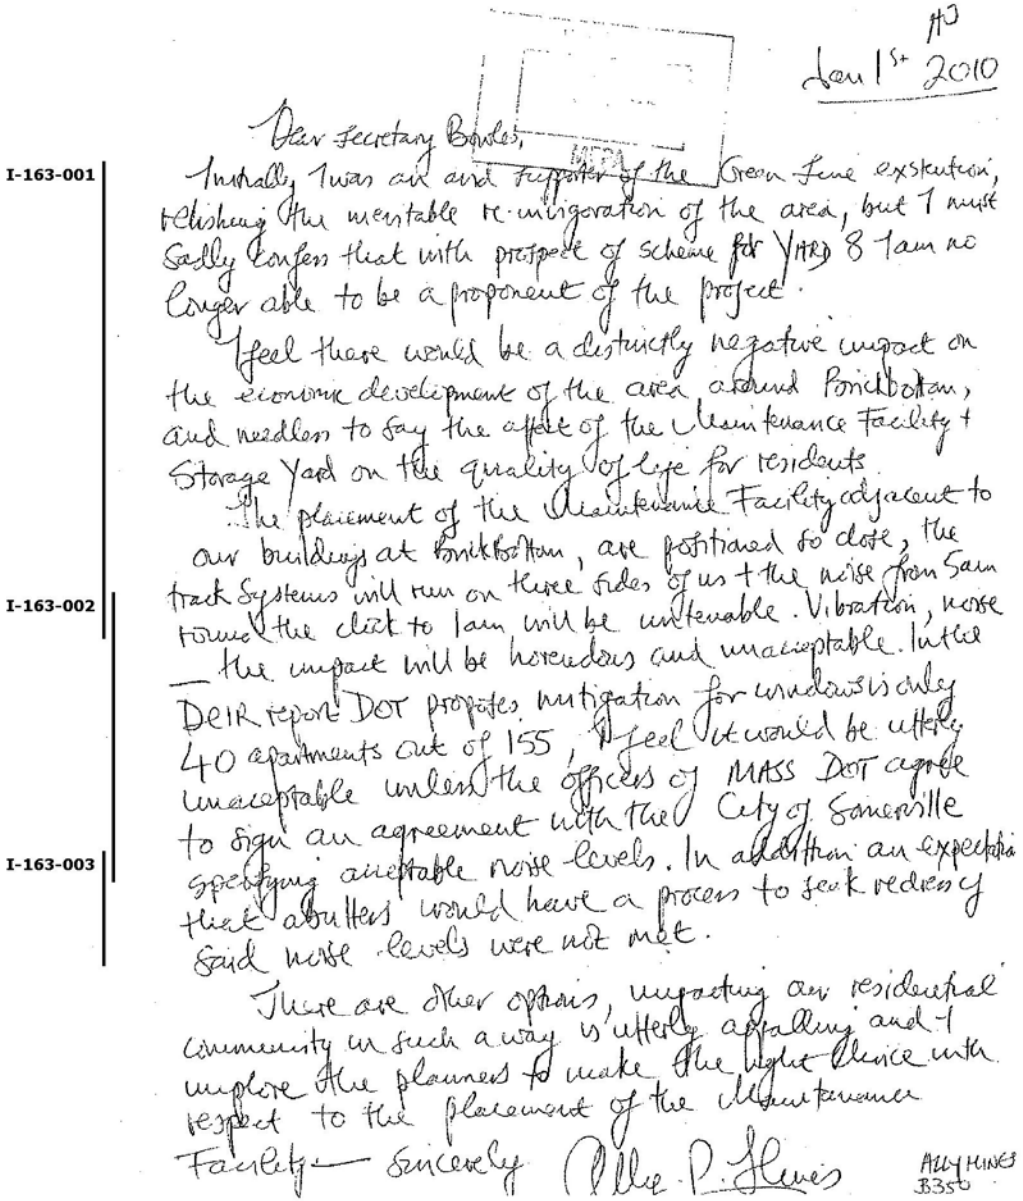
I-162-002
MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-162-003
Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the

Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-162-004

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.



Jan 1st 2010

Dear Secretary Bowles,

I-163-001 Initially I was an avid supporter of the Green Line extension, relishing the inevitable re-invigoration of the area, but I must sadly confess that with prospect of scheme for YARD 8 I am no longer able to be a proponent of the project.

I feel there would be a distinctly negative impact on the economic development of the area around Poindexter, and needless to say the affect of the Maintenance Facility + Storage Yard on the quality of life for residents.

I-163-002 The placement of the Maintenance Facility adjacent to our buildings at Brickbottom, are positioned so close, the track systems will run on three sides of us + the noise from Sam round the clock to 1am will be intolerable. Vibration, noise — the impact will be horrendous and unacceptable. In the DEIR report DOT proposes mitigation for windows is only 40 apartments out of 155, I feel it would be utterly unacceptable unless the officers of MASS DOT agree to sign an agreement with the City of Somerville

I-163-003 specifying acceptable noise levels. In addition an expedite that abutters would have a process to seek redress said noise levels were not met.

There are other options, impacting on residential community in such a way is utterly appalling and I implore the planners to make the right decision with respect to the placement of the Maintenance Facility — Sincerely Ally P. Hines

ALLY HINES
B35b

I-163-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-163-002

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

I-163-003

Chapter 8, Mitigation, of the FEIR describes the proposed mitigation measures and the process by which they will be implemented and monitored following construction.

RECEIVED

JAN 8 2010

MEPA

January 7, 2010

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

As a resident of Medford Hillside and regular MBTA commuter, I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886. I have lived for nine years in Medford Hillside. I work in Back Bay, so my daily commute involves several modes of public transportation — generally an express bus to Haymarket where I transfer to the Green Line

I-164-001

I strongly support the Green Line extension. For myself, extending the Green Line to a terminus station at Mystic Valley Parkway/Route 16 will provide a one-seat ride to work, while a terminus at College Avenue is too far away to serve my needs. For my neighborhood, I believe that constructing the entire project in one phase, with a terminus station at Route 16, is the most practical, beneficial, and cost-effective means to provide public transportation to the underserved communities in Medford and, in particular, the Medford Hillside area.

The DEIR concludes that the Route 16 station would provide the most benefits according to all project criteria. However, MassDOT states that it is incapable of building (and funding) the entire "Preferred Alternative," so it only intends to build the extension to College Avenue in the Tufts University area of Medford, by the SIP's deadline of December 31, 2014.

The DEIR as written does not present the best possible vision of the project, or even a reasonable and considered compromise among options. More importantly for your review, it was not done in a way that "adequately and properly" complies with the state environmental regulations, nor with the December 1, 2006 MEPA certificate that defined the requirements of the DEIR.

For the following reasons, I strongly urge you to reject the DEIR as the Final EIR and require further environmental analysis of the project by MassDOT:

1. College Avenue must not be a terminus station.

I-164-002

Without a Route 16 station, the College Avenue stop, which is designed to be an interim station, would become the terminus for the Green Line extension. The College Avenue stop is a bad location for a terminus due to already existing traffic flow problems, inconvenient access from densely populated neighborhoods in Medford Hillside, and a lack of opportunity for transit-oriented development at College Avenue.

Splitting the project into two phases increases the time during which the College Avenue abutters must deal with construction work, as well as increasing the amount of work required at College Avenue to allow the stop to be used as a terminus — whether temporary or permanent.

I-164-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-164-002

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

2. The Route 16 station design is inadequate.

I-164-003

The DEIR offers only a "worst case scenario" (MassDOT's description) for the Route 16 station design, while offering optimized station designs for all other Green Line extension stations.

The Medford Green Line Neighborhood Alliance has offered an alternative station design that prevents two major commercial property acquisitions and the resulting job displacement, preserves $182,000/year in property taxes for the City of Medford, optimizes traffic flow and better serves the integrity of the station's surroundings. MassDOT apparently has been exploring similar improved designs, which should be presented to the public for comment. A $1 billion project deserves a higher caliber design than a "worst case scenario."

3. A two-phase approach increases costs, increases time to completion, and increases the risk that the project will never be fully implemented. A single-phase project will minimize costs and negative impacts and achieve the maximum benefits with regard to ridership, vehicle mile travel reduction, air quality improvements, and service to environmental justice communities.

I-164-004

No funding source is identified in the DEIR for the separate stand-alone Phase II Mystic Valley Parkway/Route 16 station. Without an identified funding source there is a very high probability that Route 16 will never be built and the implications of this are critical.

The two-phase approach is fiscally irresponsible and by MassDOT's own estimates will inflate the cost by $55 million over a single-phase approach. The later creation of a single stop and less than one mile of track will cost the state, and thus the taxpayers, significant additional money. There are obvious ways to reduce costs in the overall project and provide enough additional funds to include Route 16 as part of a single, complete project. This is the most prudent approach, and also would ensure that the project produces the air quality improvements the Commonwealth must achieve to come into compliance with the Clean Air Act.

I-164-005

The environmental justice populations adjacent to the Route 16 station cited, in part, to justify the project as a whole will largely not be served if the project terminates at College Avenue. The negative aspects of this project will affect them most, while they will receive the least benefit without service to a Route 16 terminus..

To summarize, the Draft Environmental Impact Report does not fully account for the use of College Avenue as a terminus, even if only temporarily, nor does it present a reasonable plan for the Route 16 terminus. I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis in order to make the Green Line extension fully meet the legal obligation to provide public transit to Medford Hillside in a way that truly benefits the neighborhoods it will go through.

Thank you.

Lisa Hodsdon
11 Lyman Avenue
Medford, MA 02155

I-164-003

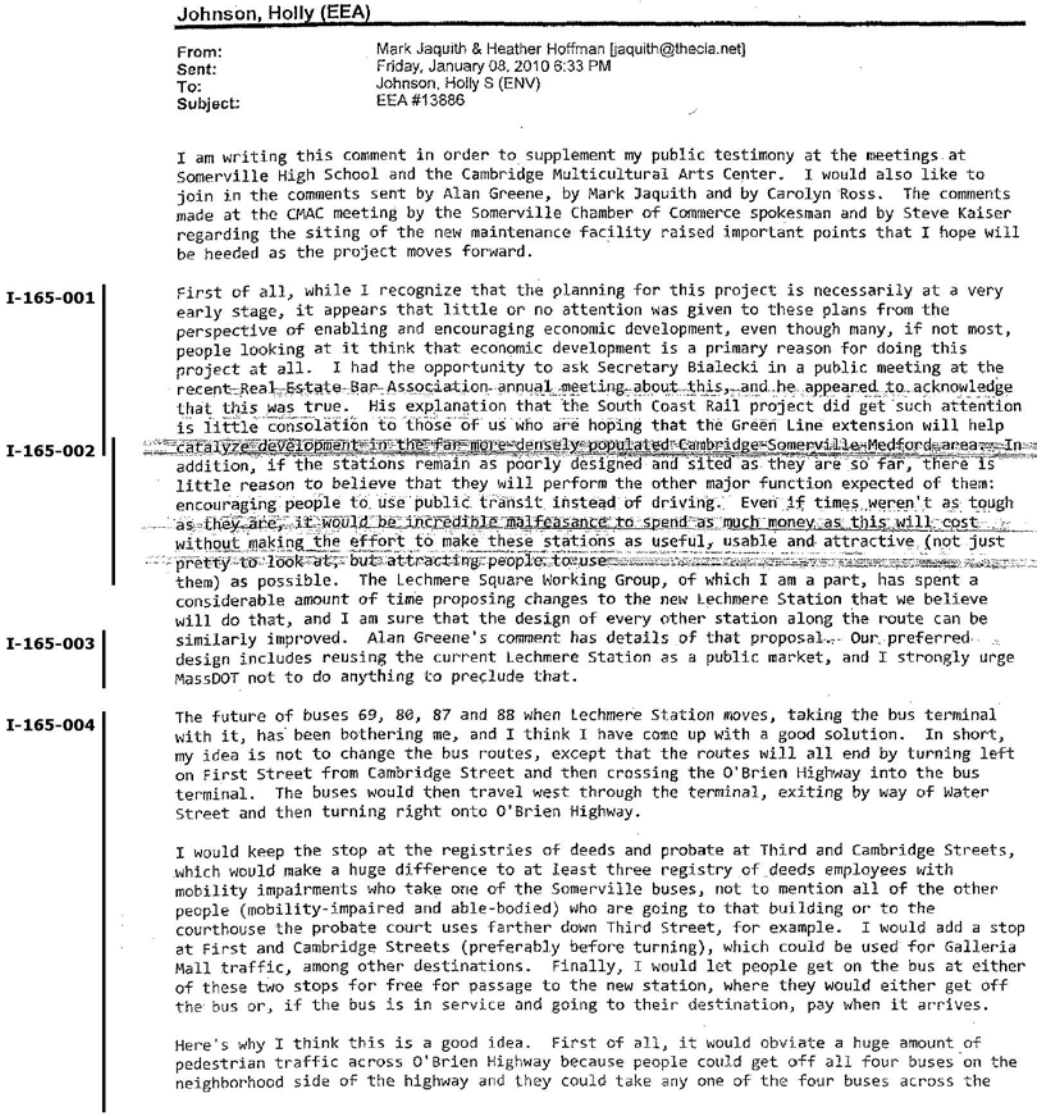
All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-164-004

Project cost estimates are based on the current, conceptual level of design, and will be further refined as the Project progresses through preliminary engineering. It is anticipated that Green Line Extension construction would be financed with a combination of funds from federal and state sources. Efforts to engage a developer for the North Point development will continue as this Project moves into the next phases of design.

I-164-005

The Proposed Project offers substantial benefits to environmental justice communities and serves the majority of Study Area environmental justice population zones. As described in DEIR/EA Section 5.4, Environmental Justice, impacts to environmental justice populations would be neither severe nor disproportionate with any of the Build Alternatives.



Johnson, Holly (EEA)

From: Mark Jaquith & Heather Hoffman [jaquith@thecia.net]

Subject: EEA #13886

I am writing this comment in order to supplement my public testimony at the meetings at Somerville High School and the Cambridge Multicultural Arts Center. I would also like to join in the comments sent by Alan Greene, by Mark Jaquith and by Carolyn Ross. The comments made at the CMAC meeting by the Somerville Chamber of Commerce spokesman and by Steve Kaiser regarding the siting of the new maintenance facility raised important points that I hope will be heeded as the project moves forward.

I-165-001 First of all, while I recognize that the planning for this project is necessarily at a very early stage, it appears that little or no attention was given to these plans from the perspective of enabling and encouraging economic development, even though many, if not most, people looking at it think that economic development is a primary reason for doing this project at all. I had the opportunity to ask Secretary Bialecki in a public meeting at the recent Real Estate Bar Association annual meeting about this, and he appeared to acknowledge that this was true. His explanation that the South Coast Rail project did get such attention is little consolation to those of us who are hoping that the Green Line extension will help

I-165-002 catalyze development in the far more densely populated Cambridge-Somerville-Medford area. In addition, if the stations remain as poorly designed and sited as they are so far, there is little reason to believe that they will perform the other major function expected of them: encouraging people to use public transit instead of driving. Even if times weren't as tough as they are, it would be incredible malfeasance to spend as much money as this will cost without making the effort to make these stations as useful, usable and attractive (not just pretty to look at, but attracting people to use them) as possible. The Lechmere Square Working Group, of which I am a part, has spent a considerable amount of time proposing changes to the new Lechmere Station that we believe

I-165-003 will do that, and I am sure that the design of every other station along the route can be similarly improved. Alan Greene's comment has details of that proposal. Our preferred design includes reusing the current Lechmere Station as a public market, and I strongly urge MassDOT not to do anything to preclude that.

I-165-004 The future of buses 69, 80, 87 and 88 when Lechmere Station moves, taking the bus terminal with it, has been bothering me, and I think I have come up with a good solution. In short, my idea is not to change the bus routes, except that the routes will all end by turning left on First Street from Cambridge Street and then crossing the O'Brien Highway into the bus terminal. The buses would then travel west through the terminal, exiting by way of Water Street and then turning right onto O'Brien Highway.

I would keep the stop at the registries of deeds and probate at Third and Cambridge Streets, which would make a huge difference to at least three registry of deeds employees with mobility impairments who take one of the Somerville buses, not to mention all of the other people (mobility-impaired and able-bodied) who are going to that building or to the courthouse the probate court uses farther down Third Street, for example. I would add a stop at First and Cambridge Streets (preferably before turning), which could be used for Galleria Mall traffic, among other destinations. Finally, I would let people get on the bus at either of these two stops for free for passage to the new station, where they would either get off the bus or, if the bus is in service and going to their destination, pay when it arrives.

Here's why I think this is a good idea. First of all, it would obviate a huge amount of pedestrian traffic across O'Brien Highway because people could get off all four buses on the neighborhood side of the highway and they could take any one of the four buses across the

I-165-001

Anticipated indirect and cumulative effects of the Project, including impacts on corridor transportation and traffic, growth, property values, land use, transit-oriented and economic development are described in DEIR/EA Section 5.15, Indirect and Cumulative Effects. As stated in FEIR Section 6.4, MassDOT and the MBTA will conduct a series of public workshops to gather input on land use and facility design issues from the communities. These workshops will offer an opportunity to discuss how facility design can influence indirect and cumulative effects.

I-165-002

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. The stations have been designed to meet MBTA standards, as well as to be ADA-compliant. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

Revised conceptual plans for Lechmere Station, including modifications to the station headhouse and entrances, are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-165-003

As part of the Green Line Extension, MassDOT intends to demolish the existing Lechmere Station and prepare the site for potential future redevelopment.

I-165-004

highway to get to the new station. It would also give the neighborhood the same level of bus service we get now, which would lessen the hardship we will be suffering with the move. Also, if you look at the map of the future roadways, you will see that all of these turns are right angles or obtuse angles, which would make it easier and safer for the buses to turn. By contrast, under what I assume to be the current plan, the 69 bus would have to make a very tight turn from Third Street onto O'Brien Highway and then turn left almost immediately onto Water Street across three lanes of highway traffic, which the other three buses would also have to do, minus the turn from Third Street. The turn from First Street onto the O'Brien Highway is also tighter than the turn from Water Street. Finally, my plan would have the buses making no left turns from O'Brien Highway; they would be going straight across at First Street.
All in all, I think that this plan would not have a huge impact on schedules (who knows? it might even be the same, given the omission of left turns off the highway), and it would create an enormous amount of goodwill when people realize that they will have an alternative way to cross O'Brien Highway.

I-165-005

As for the maintenance facility, it seems to me that Yard 8 will almost certainly invite lawsuits that will throw a huge monkeywrench into this project because of its unreasonable impact on the residents of the Brickbottom Condominium and its effect on Somerville's plans to develop Brickbottom and Inner Belt. Mirror H would likewise tend to invite a lawsuit from the City of Cambridge and the B and M Railroad, which owns most of NorthPoint and still expects to build a massive development there. Scheme L is, as some of the testimony at CMAC put it, the least objectionable of the three alternatives that were being presented, but, as I said above, the spokesman for the Somerville Chamber of Commerce made a very good argument for using land already owned by the Commonwealth on the north side of the Boston Engine Terminal.

I-165-006

Finally, given what I see as tremendous flaws in this preliminary design, I do not support MassDOT's request that the draft EIR be considered the final EIR. Proper attention paid to the many good suggestions for improvement that you are receiving will pay huge dividends later when it comes time to put shovels in the ground and turn plans into reality. As the carpentry maxim goes, measure twice, cut once. A little more time spent improving the desigr now will make this a far better project and make future generations thank us.

Heather Maguire Hoffman
213 Hurley Street
Cambridge, Massachusetts 02141

I-165-004

Revised conceptual plans for Lechmere Station, including bus facilities and bus waiting areas, are included in FEIR Chapter 5, Lechmere Station. Routes 80, 87 and 88 are expected to enter the station directly from O'Brien Highway via Water Street and not travel to Cambridge Street. The path for Route 69 can remain on Cambridge Street in East Cambridge, with inbound service along North First Street, O'Brian Highway, and Water Street.

I-165-005

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-165-006

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

RECEIVED
JAN 8 2010
MEPA

Dear Secretary Ian Bowles:

We are Karen Holtzman and Thomas Gardon, residents of the Brickbottom Artists Buildings. Ms. Holtzman has been a resident in Brickbottom's Cannery building for 21 years. Mr. Gardon has been a resident of Somerville for over 20 years and a resident of the Brickbottom Cannery for the past 11 years. We are pleased that the Union Square and Brickbottom areas of Somerville will have increased access to public transportation and expect that the location of an MBTA station in these areas will help spur development. However, the extreme burden being imposed on the Brickbottom/Inner Belt area is cause for great alarm.

The DEIR speaks to environmental justice, and we suspect that there are many ways (both legally and literally) to interpret the phrase. But if there is an injustice being perpetrated in this proposal it is on the Brickbottom/Inner Belt community and, by extension, the City of Somerville.

- Brickbottom is being asked to acquiesce to being surrounded by 2 Green Line tracks that will be operating from 5:30 am until 12:30 pm; it is being told to withstand the construction and 24/7 operation of a maintenance facility and storage yard to be located just yards away from the buildings, along with its concomitant light, noise, vibration and pollutants.

- The city of Somerville is being asked once again to bear the brunt of project construction and land takings while losing hope for future development.

- The citizens of Somerville are being told that there will be no property tax relief in the future because the MBTA is taking one of the few remaining parcels of developable land in the city.

- The Brickbottom/Inner Belt area will be subjected to a permanent barrier to neighborhood cohesion with a maintenance facility and storage yard that cuts off the Inner Belt from Brickbottom.

- Any future hope for a Brickbottom/Glass Factory corridor that could unite the Cambridge/Lechmere area to Brickbottom and thus further the transportation options of a traditionally underserved population would be lost by the use of Yard 8 for a maintenance facility/storage yard.

- And the residents of Brickbottom are being told that they are not relevant in the expansion plans of the MBTA, that there will be negligible moneys allotted for mitigation, and that any benefit that a Green Line station in the area might bring will be offset by 11.5 acres of noise, vibration and pollutants that will affect the lives of residents and the city's

I-166-001 The DEIR states that because Brickbottom is already situated next to a rail yard the residents will find little change in the area. Like many sections of the report, this fantasy speaks to the lofty hopes and aspirations of the MBTA and hearkens not at all to reality. The rail activity in the area adjacent to Yard 8 is sporadic and has minimal impact on the community. To suggest that the construction of a maintenance facility and storage yard will somehow be little more than a nuisance to Brickbottom residents is disingenuous.

We ask that the proposal for siting the maintenance facility and storage yard in Yard 8 be abandoned and encourage continued study of Mirror H, Option L and additional alternate sites. We also request that the project not go to a Final EIR in regards to the maintenance facility.

I-166-002 The footprint of the proposed site will have an adverse effect on whatever area it occupies. Any maintenance facility/storage yard should be configured to minimize adverse impact on economic development and neighborhood connectivity.

I-166-003 **MassDOT should explore the possible reconfiguration and reuse of the existing BET land (43 acre commuter rail maintenance facility) in an effort to consolidate other MBTA land uses in the Inner Belt area.**

I-166-004 The MBTA proposes to add a maintenance facility and storage yard for more vehicles than are needed for the Green Line Extension. System-wide storage needs should be evaluated system-wide and be required as part of this project. It is imperative that forward-thinking planning and design for the facility and storage yard is formulated to blend with future mixed-use development.

I-166-005 **We request that a citizen advisory committee (CAC) be created to oversee the ongoing direction of the project and to ensure that the community has a voice in the process.**

The formulation of such a body is part of an optional MEPA Special Review Process (Regulation 301 CMR 00 MEPA which is cited on the MEPA website). Adoption of MEPA Regulations calls for a special review process based on a CAC that is enabled to review the project, address community concerns, drive issue redress and implement remedies through the entire process.

The CAC should be empowered to review every contract in the bid process in order to confirm that proper and agreed-to mitigation language is included before contracts related to the project are awarded.

Regarding mitigation issues related to resident abutters:

I-166-006
- There needs to be a process in place to address mitigation problems both during construction and after the fact; there must be a way for residents to seek redress if specific goals are not met.
- Mitigation, especially mitigation for noise and vibration, must be in place before construction begins and measures to avoid or eliminate these impacts should be identified and implemented.
- Considering the MBTA's woeful history, there is concern not just about construction and immediate post-construction impacts, but the future upkeep of all MBTA facilities to maintain any new Green Line stops and facilities.

I-166-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-166-002

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. The evaluation considers land use and connectivity impacts and opportunities associated with each maintenance facility site alternative.

I-166-003

As explained in FEIR Chapter 2, MassDOT has explored opportunities for the Green Line Extension storage and maintenance facility to share resources with the Boston Engine Terminal. The independent needs and constraints of these facilities limit opportunities for shared resources. MassDOT will coordinate with the MBTA during preliminary engineering to maximize efficient land utilization between these storage and maintenance facilities, if possible.

I-166-004

The Green Line Extension storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the Project. Chapter 2 of the FEIR fully describes the environmental impacts of the proposed storage and maintenance facility. In order to maximize operating efficiencies, the facility must be constructed within the same timeframe as the Green Line Extension Project, in the vicinity of the Green Line Extension right-of-way, and north of downtown Boston.

I-166-006

With the introduction of the Green Line Extension, residents of the Brickbottom Artists Buildings will live in perpetuity with two Green Line spurs on either side of the building. Many Brickbottom residents will co-exist with the Green Line just 19 feet away. This proximity needs to be investigated to see if there are any alternatives, and be redressed and thoroughly remediated.

I-166-007

One of the greatest sources of noise in the system is the air conditioning of the light rail cars. **We request that fan-quieting mitigation* be implemented on cars stored and used on the Green Line Extension.** This can be accomplished by installation of quiet, efficient fans. Placement of fans on the vehicle can make a significant difference in the noise radiated toward residents closest to the tracks, especially, on the Union Square spur.

Additionally, **Green Line railcars should be fitted with acoustical absorption* under the cars.** This has been demonstrated to provide up to 5 decibels of mitigation for wheel/rail noise. Similarly, vehicle skirts* over the wheels can provide 5 decibels of mitigation. By carrying their own noise barriers, vehicles with these features can provide cost-effective noise reduction.

*These recommendations are included in the 2006 Transit Noise and Vibration Impact Assessment, done by the Federal government. This same document was cited in the DEIR.

I-166-008

Mitigation discussion in the DEIR is confusing and insufficient. DEIR Section 5.4.7-3 Noise Mitigation, p. 5-118, states: "At some locations projected to be exposed to noise impact, noise barriers may not be a feasible or effective means of mitigation." However, only 40 residences in Brickbottom are designated for soundproofing. Brickbottom has a total of 155 residences.

The DEIR further states (Section 6.5.4-1 Environmental Justice, p. 6-7): "The proposed maintenance facility site is located in an existing industrial area next to the MBTA Fitchburg and Lowell Lines. There would be no moderate or severe impacts from noise after mitigation was implemented. Therefore, there would be no disproportionate noise impacts to environmental justice populations from the proposed maintenance facility." This language is misleading, disingenuous, and contrary to the report's own findings.

I-166-009

Indoor air quality changes have not been studied as part of the DEIR. There is no mention of indoor air quality as well as air-conditioning mitigation to accommodate the installation of air-tight noise-reduction windows.

I-166-010

We live on the fifth floor of Brickbottom's Cannery building, directly overlooking Yard 8. The impending addition of the Green Line Extension and the possibility of a maintenance facility and storage yard will mean that we will be exposed to around-the-clock noise, vibration, light and pollution. If window mitigation means a permanent sealing of our unit, the need for year-round air conditioning will become necessary. There is no central air conditioning in the building – most residents use window air conditioners for those few days when opening the window provides little relief.

The need to keep closed all windows in our unit 365 days a year to help mitigate noise and pollution is an unbearable burden and devastating to our quality of life.

The need to air condition our unit 365 days a year is grossly prohibitive and, if the current plan for the maintenance facility and storage yard location in Yard 8 comes to pass, we will demand that the MBTA be responsible for any and all mitigation costs related to air conditioning and air quality control, both during and after construction.

The current DEIR has several flaws and is missing important measurements needed to identify the current environmental state of Brickbottom to accurately calculate the actual environmental

The storage and maintenance facility alternatives include storage for Green Line Extension vehicles and replacement of the existing Lechmere Station vehicle storage. Storage capacity is also provided for vehicles currently stored in trackways between Lechmere Station and Government Center; this storage will be lost due to the Green Line Extension.

I-166-005

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-166-006

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

I-166-007

While noise from fans in auxiliary equipment such as air-conditioners on transit cars is a significant noise source for stationary trains, the greatest source of noise on moving trains is generated at the wheel-rail interface. Installing quieter fans could be effective in reducing noise emissions from Green Line cars while stationary, such as when they are in the maintenance yard being prepared for revenue service. However, this mitigation measure would not be effective in reducing the noise generated by moving Green Line cars or the total noise generated by both Green Line and commuter trains. Noise barriers proposed for the

impact of the Green Line Extension and specifically, the Union Square spur. The missing items include:

I-166-011

- Noise and vibration measurements were only taken on the north side of the Brickbottom Artists Buildings only. The south side of the buildings – which are currently severely impacted by the existing Fitchburg commuter line, and Boston Engine terminal rail head used by Amtrak, commuter rail and PanAm freight cars – has not been given adequate study to establish a baseline for current noise, vibration and air quality.

- Exploration of mitigation and changes in practices in the use of the dead-ended railhead by AMTRAK, MDOT and PanAm.

- Exploration of vehicle mitigation and changes in operations with regard to the Fitchburg Line.

The Brickbottom Artists Buildings have been a point of focus in many of the community meetings held by MassDOT but we worry that the residents of the buildings are being overlooked. There are 220 people occupying the buildings; approximately 180 are full-time, live-in residents. There are 155 units in the buildings. These are people who consider the area home, raise families, pay taxes and are happy to be in the area.

Because the Brickbottom/Inner Belt area has that industrial look and the double onus of being home to those suspect "artists," the area has traditionally been considered a kind of outcast in the Somerville development discussion. This is the opportunity to reverse that stigma and allow the neighborhood to become more integrated into the fabric of Somerville and become an asset in the City's future development.

Sincerely,

Karen Holtzman

Thomas Gardon

4

Project would be more effective in reducing the noise from both Green Line and commuter trains.

Specific modifications to existing Green Line vehicles would be a systemwide effort and may be beyond the scope of the Project. As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes proposed mitigation measures and next steps pertaining to mitigation.

I-166-008

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-166-009

The Green Line Extension will have a positive impact on outdoor air quality within the study area. Indoor air quality is unique to each individual building, and is outside the scope of this project.

I-166-010

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the

evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-166-011

Potential noise and vibration impacts, including impacts associated with railroad operations, were assessed for the southwest facade of the Brickbottom Artists Building abuttings the existing MBTA Fitchburg Commuter Rail line. Because the northeast façade represents the location of the building with a potential for more severe noise impact, findings for the southwest façade were not originally reported in the DEIR/EA. These findings have been included in FEIR Chapter 8. All noise projections take into account proposed changes to the topography of the alignment, including things such as retaining walls and grading.

During preliminary engineering, MassDOT will conduct further analysis for several individual properties, including the Brickbottom Artists Lofts. As described in FEIR Chapter 8, MassDOT will then be able to identify the specific measures that will be appropriate for mitigating the Project's noise and vibration impacts. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

Major changes to operations of the Boston Engine Terminal (BET), MBTA Commuter Rail and other railroads, and railroad vehicles are beyond the scope of the Green Line Extension Project. The BET "Drill Track," or the track used to access the BET from the west, will be relocated approximately five feet further from the Brickbottom Artists Building as part of the Green Line Extension Project.

EEA# 13886

Green Line Extension 1/6/10

Dear secretary Ian Bowles,

Having the Green Line extend into Somerville is a wonderful idea. Currently, traveling around this city is limited by having very few train stations. As a teen, I find the "T" extremly useful for my everyday life. I use the train to go to school, hang out with friends, and go to my work. Convenity for me, I live really close to the Davis Square "T" stop, but for many of my friends this is not true. Lack of public transportation has limited them from getting jobs, attending events, and gaining independence.

I would love to see many benches

I-167-001 For the Green Line, I would love to see nice waiting areas. Many benches would be great, along with lights near the benches and stops so people feel safe. Also, having the police moderate the stops would increase

I-167-001

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs, which includes enclosed headhouses, alternate fare collection, and waiting areas. Detailed designs for each station, including locations of amenities such as canopies, benches, security features and lighting, will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-167-001

Safety, bringing in more ~~[illegible]~~ riders.

Thank you so much for reading! I can't wait for the Green Line Extension in Somerville!

~~[illegible]~~ Sincerely,

Olivia Hural, 17

Senior, ~~[illegible]~~

Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

The purpose of this letter is to provide comments on the Draft Environmental Impact Report (DEIR) for the Green Line Extension Project through Somerville to Medford, EEA #13866 and to offer my support for the full build of this project both to Union Square, Somerville and to Rt. 16 in the Medford Hillside as a single project to be completed by December 31, 2014. While there are many elements to the DEIR that warrant comment, most of mine will revolve around the portion of the project the impacts Medford, the incompleteness of the DEIR as currently submitted, and ultimately, my recommendation that the DEIR should NOT be accepted as the Final Environmental Impact Report.

College Avenue

I-168-001 | I-168-002

According to the EENF certificate, the State of Massachusetts is legally bound to extend the Green Line to serve the Medford Hillside by 2014. Unfortunately, a College Ave terminus does not do this and does not serve the Medford Hillside. The intersection of College Ave. and Boston Ave. is historically College Hill and just the edge of Medford Hillside, and many of the residents within the Hillside are nearly a mile from the proposed station. In addition, the traffic patterns of this intersection are already troublesome and adding car drop-off and feeder-busses to this congestion will adversely affect local air quality, noise and traffic conditions and make an already dangerous intersection even more dangerous.

In addition to a terminus at this location not fulfilling the intent of the EENF, the additional track layout and construction involved in terminating the Green Line here will drop it right in the middle of a densely populated residential neighborhood instead of a mostly commercial area nearly a mile down the track at Route 16.

Winthrop Street

I-168-003

For unexplained reasons, the proposed Winthrop Street Station disappeared from the planning early on in the process. The reason given was general community feedback that

I-168-001

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. The Proposed Project, with a terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Additionally, FEIR Chapter 4 includes a detailed description of College Avenue Station functioning as a terminal station.

Since the release of the DEIR/EA, a few stakeholders raised concerns that the proposed College Avenue Station, serving as a terminal station for the Proposed Project, would not adequately serve the Medford Hillside neighborhood. Serving this neighborhood was identified as part of the SIP description. To address and resolve these concerns, CTPS prepared a memorandum demonstrating that the College Avenue Station location does adequately serve the walk market area for the Medford Hillside neighborhood. This memorandum is provided in Appendix C of the FEIR.

I-168-002

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-168-003

this station was unwanted when the proposed station was presented at community meetings. This reason is very suspect as the consensus from people in the community who attended those meetings was there was no such sentiment. It is likelier that the station was dropped as it was too close to the College Ave station, which will be the gateway to Tufts University and a realization of a T stop that the University has been seeking for years. Had this station been included, it probably would have satisfied the EENF certificate which required that the Medford Hillside be served by this project.

Route 16, Mystic Valley Parkway

I-168-004

One of the overall weakest areas of the DEIR is the planning that has been done around Mystic Valley Parkway and Rt. 16. In the document, the terminus outline takes four commercial properties in both Somerville and Medford in what has been described as a 'worst case scenario'. The Medford Green Line Neighborhood Alliance conducted an independent analysis and discovered by slightly changing the trajectory of the tracks, a terminus could be fit into the existing right of way, thus avoiding the taking of any commercial property in that area. This did not take extensive hours of study or advanced engineering, it was done by reviewing the public materials and surveys that had been furnished by state agencies to that point. Because of this, it leaves one under the impression that not much thought or effort was put into designing this particular location, and was included largely as an afterthought.

Leaving the commercial properties in tact at Rt. 16 gives Medford its best chance at transit oriented development in that area as 196, 200 and 222 Boston Ave have tremendous potential as commercial properties at the end of the Green Line. In addition, they are an important tax base for the City of Medford and should be left in tact.

The potential for ridership at Route 16 also makes it a strong terminus that should be included in the first phase of the project, with almost 10,000 people living within a 10 minute walk of that location. Extending the line this far in the first phase gives the state of Massachusetts its best shot at conforming to the air quality targets that this project must meet to comply with the Clean Air Act, targets that if not met jeopardize federal funding for other transit projects in Massachusetts, including highways and bridges. In addition to better ridership, a Rt. 16 would serve several Environmental Justice communities. Both factors make this project a more completive application for Federal New Starts monies.

Mitigation and Details

I-168-005

In addition to poor choices like commercial property taking at the terminus, the DEIR is short on details and specifics about mitigation materials, methods, station designs and accessibility. The DEIR should be more specific about plans for these areas, as it will engender more support in the community and the City of Medford for this project. It would also be a good idea to implement mitigation prior to the building of the stations, the moving of the commuter rail tracks, and the installation of the Green Line tracks to better help control construction noise for abutters of the rail line.

I-168-003

As described in DEIR/EA Appendix B, Section 4.5, MassDOT's analysis and understanding of the ridership market potential concluded that the Winthrop Street area would be best served by a single station in the vicinity of College Avenue and Winthrop Street. As explained in DEIR/EA Section 3.7, the preferred station location is at College Avenue.

I-168-003

As described in DEIR/EA Appendix B, Section 4.5, MassDOT's analysis and understanding of the ridership market potential concluded that the Winthrop Street area would be best served by a single station in the vicinity of College Avenue and Winthrop Street. As explained in DEIR/EA Section 3.7, the preferred station location is at College Avenue.

I-168-004

All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-168-005

MassDOT has developed proposed mitigation measures / draft Section

Finding the money for Route 16.

I-168-006

One of the stated rationales for removing the Route 16 station project and putting it into a second phase is funding. In order to make the project more competitive for Federal New Starts funding, this final phase was removed and tied to State highway project money to make the overall cost of the project more attractive. It is my belief that the money for the route 16 terminus can be found in the project by reducing some of the design inflation and additional projects that have been included that do not relate to improving air quality and reducing automobile trips in the area.

The first inflated expense in the DEIR is the oversized maintenance facility. MasDOT has been given a maintenance facility that will house the Green Line trains for nearly the entire Green Line, not just the extension through Somerville to Medford. The maintenance facility should only house trains that service the ridership on the two lines that will travel to Union Square and Medford Hillside, and should not be sized to support the vehicles for the entire transportation trolley line. Even if this facility is 40% oversized, there is certainly savings to be found there.

After design of this project had begun, the commercial North Point development and Lechmere relocation funding fell through, and MasDOT was forced to assume the $100 million cost of building a new Lechmere station. This cost roughly covers the cost to extend the Green Line from College Ave and putting the terminus in the first Phase at Route 16. The state should find new private partners to develop transit oriented development at Lechmere to re-assume some of the costs of that station.

Conclusion

I-168-007

I-168-008

Because of the design deficiencies and limited detail critiqued above, it is my opinion that the Draft Environmental Impact Report (DEIR) should NOT be accepted as the Final Environmental Impact Report (FEIR) as the DEIR fails to fulfill the requirements as set forth in the MEPA certificate on the Extended Environmental Notification Form. While I support Massachusetts Department of Transportation's designation of Mystic Valley Parkway terminus station, with no parking, as the Preferred Alternative, the DEIR both fails to fully analyze and design the station to minimize impacts on the surrounding neighborhood, maximize the benefit to the community AND does not include the project as part of the Phase 1 build. This project should be built at one time to Mystic Valley Parkway to fulfill it's promise to the communities of Somerville and Medford.

Thank you for your time and consideration

Sincerely,

Jared Ingersoll

61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

I-168-006

The Green Line Extension storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the Project. Chapter 2 of the FEIR fully describes the environmental impacts of the proposed storage and maintenance facility. In order to maximize operating efficiencies, the facility must be constructed within the same timeframe as the Green Line Extension Project, in the vicinity of the Green Line Extension right-of-way, and north of downtown Boston.

The storage and maintenance facility alternatives include storage for Green Line Extension vehicles and replacement of the existing Lechmere Station vehicle storage. Storage capacity is also provided for vehicles currently stored in trackways between Lechmere Station and Government Center; this storage will be lost due to the Green Line Extension. Some additional capacity is provided for future system growth.

Efforts to engage a developer for the NorthPoint development will continue as the Green Line Extension Project advances.

I-168-007

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

I-168-008

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

Dear Holly Johnson,

I hope that you are doing well and having a nice week. I am a resident of the Glass Factory Building and have attached a letter (MS Word) voicing my concerns with the current MBTA Greer Line Extension plan.

Please do not hesitate to contact me if there are any questions or concerns.

Thanks again,

Shuba

Executive Office of Energy and Environmental Affairs
MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA #03886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I am an owner at the Glass Factory Condominiums. I am very concerned about the Green Line Extension Project.

I-169-001 We live on the 4th floor of the building facing the MBTA property. The current plan has the tracks running approximately 30 – 50 feet away from the building. This is very concerning as it will have major repercussions for the other residents and I who have windows facing these tracks. These tracks will obscure the light, which affects our quality of life on a daily basis. This will also effect the property value of the unit, and many of us are likely to have significant decline in property values.

I-169-002 The trains, along with the buses, will also cause extreme noise and vibration problems. The DEIR lists us as severely impacted. With the current plan there is not adequate space to build a barrier wall, making this a major concern. The T currently does not have a sound plan to address these concerns. It is important that the MBTA do everything possible to address these issues. This includes considering the possibility of running the T tracks at ground level at an adequate distance away from the building and having the bus depot remain on Obrien Highway. Unless these issues are addressed in detail, they will severely impact the daily lives of the current residents.

I-169-003 I strongly oppose having a new maintenance facility behind our building. The existing noise and light (through the windows at night) is already a current issue, especially on the existing MBTA property (in the morning, they often use the loudspeaker which can be loud). The flood lights already cast light through our windows. It is important that the noise be kept under a reasonable threshold, as it will prohibit us from sleeping well. My husband and I both work in the medical field, and not resting well can have an impact on our ability to care for our patients. In addition, putting the Mirror H Option behind our building will effectively destroy any further development in North Point. Given this, I support option L as a better choice.

I-169-004 There are several other major issues. First, the proposed station is not of adequate quality for our neighborhood. This will affect existing property values. Next, there is not adequate trees and greenery. The existing trees have served as a nice barrier behind our building. Adding more parking (i.e. the corner of East Street & O'Brien should not be surface parking) and eliminating the trees will exacerbate this problem.

I-169-001

FEIR Chapter 5 describes the revised conceptual plans for Lechmere Station, including station design, track alignment, bus routings, and other elements. Changes to the track alignment depicted in the DEIR/EA were evaluated, but could result in additional impacts on area abutters. Proposed mitigation measures for area abutters are also described in FEIR Chapter 5. During preliminary engineering, specific station design elements will be further developed.

I-169-002

As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds. FEIR Chapter 5, Lechmere Station, described the proposed station, roadway and busway. It also describes proposed mitigation measures, including a noise barrier on the elevated structure near Glass Factory.

I-169-003

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Mirror H location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-169-004

The revised conceptual plan for Lechmere Station, as shown in FEIR Chapter 5, is entirely on MBTA property. This conceptual design does not require any Glass Factory property or the removal of trees and landscaping from Glass Factory property. The Public Involvement Plan

I cannot emphasize enough my concerns over the existing MBTA design for the T station and line (tracks and buses). I implore you to deeply consider our concerns as this will have a major impact on our current quality of life.

Please feel free to contact me if there are any additional questions.

Sincerely,

Shuba Rajashri Iyengar

(PIP), Chapter 6 of the FEIR, outlines how MassDOT will involve residents in developing landscape design.

HJ

January 5, 2010

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-170-001 I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

First of all, I strongly support the Green Line extension, and urge that it be built in the most practical, beneficial and cost-effective manner – that is, to construct the entire project in one phase, with a terminus station at Mystic Valley Parkway (Route 16), by December 31, 2014.

The DEIR is encouraging in that it concludes that the Route 16 station would provide the most benefits according to all project criteria, including air quality and environmental justice. However, MassDOT states that it is incapable of building (and funding) the entire "Preferred Alternative," so it only intends to build the extension to College Avenue in the Tufts University area of Medford, by its deadline of December 31, 2014.

In my opinion, the DEIR as currently written does not serve the best interests of the project. More importantly for your review, it was not done in a way that "adequately and properly" complies with the state environmental regulations, nor with the December 1, 2006 MEPA certificate that defined the requirements of the DEIR.

For the following reasons, I strongly urge you to not accept the DEIR as the Final EIR and require further environmental analysis of the project by MassDOT:

1. A two-phased approach is unacceptable. The Route 16/Mystic Valley Parkway Station should be built as part of a single-phase project to minimize costs and negative impacts and achieve the maximum benefits with regard to ridership, vehicle mile travel reduction, air quality improvements, and service to environmental justice communities.

The recommendation as outlined in the DEIR is for the Route 16/Mystic Valley Parkway station to be a **separate** stand-alone Phase II project with no funding source identified. **This means, Route 16 may never be built.**

There are many, many problems with the Phase II approach, including:

- **Risk.** Without an identified funding source there is a very high probability that Route 16 will never be built and the implications of this are critical.
- **Terminus Impact.** Without a Route 16 Station, the College Avenue stop (designed and intended to be an **interim station**) would become the de facto terminus for the Green Line extension. It is not designed for a terminus and due to the traffic flow and neighborhood density, as well as the lack of opportunity for transit-oriented development at College Ave., it is not a good location for a terminus.
- **Cost.** The two-phased approach is fiscally irresponsible and by MassDOT's own

I-170-001

Please see Comment Letter I-002.

estimates will inflate the cost by $55 million over a single-phase approach. Severing a single stop (less than one mile of track) from the project as a whole will cost the state, and thus the taxpayers, significant additional money. There are obvious ways to easily reduce costs in the overall project and provide enough additional funds to include Route 16 as part of a single, complete project. This is the most prudent approach, and also would ensure that the project produces the air quality improvements the Commonwealth must achieve to come into compliance with the Clean Air Act.

- **Project Management.** There are significant efficiencies gained from completing the project in one phase, rather than the starts and stops required to execute on separate, multi-stage efforts for such a small add-on project as a single station stop.
- **Environmental Justice:** The environmental justice population cited, in part, to justify the project as a whole will largely not be served if the project terminates at College Avenue. The negative aspects of this project will affect them most, while they will receive the least benefit without service to a Route 16 terminus.
- **Legal Mandate:** The state is legally obligated to provide public transit services to Medford Hillside by December 31, 2014, and stopping the extension at College Ave. fails to meet this legal obligation. At a minimum, this incurs significant mitigation costs required if the obligation is not met.

2. College Avenue should not be a terminus. The College Avenue station is not designed for the additional requirements of a terminus. The neighborhood cannot sustain the impact of a terminus station operations and traffic volume and the potential environmental damage is of serious concern.

3. The Route 16 station design is inadequate. The DEIR offers only a "worst case scenario" (MassDOT's description) for the Route 16 station design, while offering optimized station designs for all other Green Line extension stations. The Route 16 station design must be revisited. The Medford Green Line Neighborhood Alliance, a volunteer citizen group, has offered an alternative station design that prevents two major commercial property acquisitions and the resulting job displacement, preserves $182,000/year in property taxes for the City of Medford, optimizes traffic flow and better serves the integrity of the station's surroundings. MassDOT apparently has been exploring similar improved designs, which should be presented to the public for comment. A $1 billion project deserves a higher caliber design than a "worst case scenario."

To summarize, there is much more work to be done on the Environmental Impact report, and I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis in order to make the Green Line extension the best project it can be, and MUST be.

Thank you.

Comment on DEIR concerning Green Line Extension Project,

I will preface my comment with a strong statement of support of well thought out expansion of rapid transit in general, and this project in particular.

As a resident of East Cambridge and frequent rider of trolleys and busses to and from Lechmere Station, my comments will concern changes in that area of the project.

Crossing O'Brien Highway

I-171-001

The relocation of Lechmere Station to the north-east side of the Monsignor O'Brien Highway represents a major hardship to be endured by the residents of the East Cambridge neighborhood located on the south-west side of said highway. This burden will, of course, be felt most by my senior and physically challenged neighbors. This move will also have the effect of leaving more developable land in the in the area due to the abandonment of the present station.

When this move was first pitched to us by the old DOT and the North Point development partners, we were being offered a raised, covered, heated walkway over Route 28 and a fabulous new station to be built by the developer. With the demise of the development partnership, these promised amenities have also evaporated. The significantly longer trip to reach the station will now necessitate the crossing of a major traffic artery at grade to get to a bare-bones station. Many residents are dreading having to cross six or seven lanes of traffic to get to the MBTA.

I-171-001

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. The chapter presents a traffic analysis, a detailed description of pedestrian crossings of O'Brien Highway, and proposed roadway, crosswalk, and sidewalk improvements that are consistent with the NorthPoint development plans. These station and street plans will be further refined in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

Mark H. Jaquith
213 Hurley Street
Cambridge, Massachusetts 02141

I-171-001

I have not yet seen a good scheme to safely manage the millions of expected pedestrian crossings of Route 28. It is clear that the First Street crossing will be the most heavily used, and there is considerable improvement over MASS DOT plans shown in the East Cambridge Planning

Team's Lechmere Square Working Group plan. There will, however, be considerable numbers of people approaching from residences and businesses on Cambridge Street. Most of these folks will approach via either Second or Third Street, and crossings to accommodate this foot traffic are no less important. To date, there has been no comprehensive plan to deal with traffic and pedestrians on Route 28 between First Street and the Twin Cities shopping center.

I-171-002

I have heard one very good idea that addresses both the added distance to the station and the crossings. The vehicle (pun intended) to accomplish this is the bus circulation pattern near the station. Presently, the 69, 80, 87, and 88 bus routes travel east on Cambridge Street between Third and First Streets, and then turn left to loop back on Rt. 28. This results in a counter clockwise bus traffic pattern on Third St., Cambridge St., and Rt. 28.

Now, if that pattern were maintained, by having the 80, 87 and 88 busses turn right onto Third then left on Cambridge we could partially mitigate the distance and crossing issues, possibly improving bus circulation through the new station-all without any extra building cost. Here is how it would work. With all three bus lines traveling east on Cambridge Street, passengers could be transported by these busses from Cambridge Street to the new station safely and at no extra cost. It would work with the Charlie card's built in transfer feature, but since many less well to do riders do not have these, perhaps there should simply be no charge for the trip across the highway to the station from Cambridge Street.

Redevelopment of Lechmere Square:

I fully support the recommendations of the East Cambridge Planning Team's Lechmere Square Working Group plan for the ultimate disposition of the land now occupied by Lechmere Station. See PDF attachment.

I-171-003

The "land swap" plan for the current Lechmere station site with the North Point development partnership that was part of the plan several years ago no longer makes sense, and should be formally withdrawn. This land is a valuable asset, and as North Point has withdrawn its promise to build a deluxe new station, or provide anything of value that can be counted on regarding this project, it is no longer in the interest of the MBTA, DOT, the Commonwealth, the City of Cambridge or their citizens for this to be a part of the plan. The acquisition by DOT of several

I-171-002

Revised conceptual plans for Lechmere Station, including bus facilities and bus waiting areas, are included in FEIR Chapter 5, Lechmere Station. Routes 80, 87 and 88 are expected to enter the station directly from O'Brien Highway via Water Street and not travel to Cambridge Street. The path for Route 69 can remain on Cambridge Street in East Cambridge, with inbound service along North First Street, O'Brian Highway, and Water Street.

I-171-003

MassDOT has reviewed the suggestions submitted by the East Cambridge Planning Team. Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. These plans, including the pedestrian crossings of O'Brien Highway and associated street, crosswalk, and sidewalk designs will be further refined in the preliminary engineering stage of the Project. As part of the Green Line Extension, MassDOT intends to demolish the existing Lechmere Station and prepare the site for potential future redevelopment. Based on the current requirements of the O'Brien Highway roadway improvements (as shown in FEIR Chapter 5, Lechmere Station), the existing bus shed must be removed.

Mark H. Jaquith
213 Hurley Street
Cambridge, Massachusetts 02141

I-171-003

small scattered parcels as has been suggested is not in keeping with the goals, environmental or otherwise, of this project.

The alternative that has been put forth by the East Cambridge Planning Team's Lechmere Square Working Group, will, on the other hand further these goals.

The proposal would keep all of the commercial development rights on the Lechmere station parcel, as previously permitted by the City of Cambridge, thereby retaining the value in the parcel and therefore its marketability. In addition to generating substantial revenue for DOT to help defray project cost, this plan will offer **substantial mitigation** to the community in which the parcel lies, the City of Cambridge, and the region as a whole.

Some of the advantages of this plan are as follows:

Enhancement to the layout of the commercial development.

Substantial improvement of station design.

Major improvements to pedestrian access and safety.

Traffic flow improvements.

Provision of substantial public open space in a location and configuration far more preferable and usable than in the T plan.

Provision for year-round public market and seasonal farmers market which will supplement and enhance the existing Cambridge Street and First Street business corridors.

Preservation and repurposing of existing historic structures.

Taken together, this is a well thought out, commercially viable, transit oriented development plan in the spirit that both the Commonwealth of Massachusetts and City of Cambridge have been advocating for several years. It also offers the not insubstantial advantage of coming equipped with substantial support and positive input from a community with a well deserved ,and hard earned, reputation of close scrutiny, vigorous public involvement, and when necessary litigiousness regarding development and quality of life issues.

The adoption of this plan would generate enormous amounts of good will and public support from the people and businesses of East Cambridge, the City of Cambridge, and our legislative

I-171-004

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

Mark H. Jaquith
213 Hurley Street
Cambridge, Massachusetts 02141

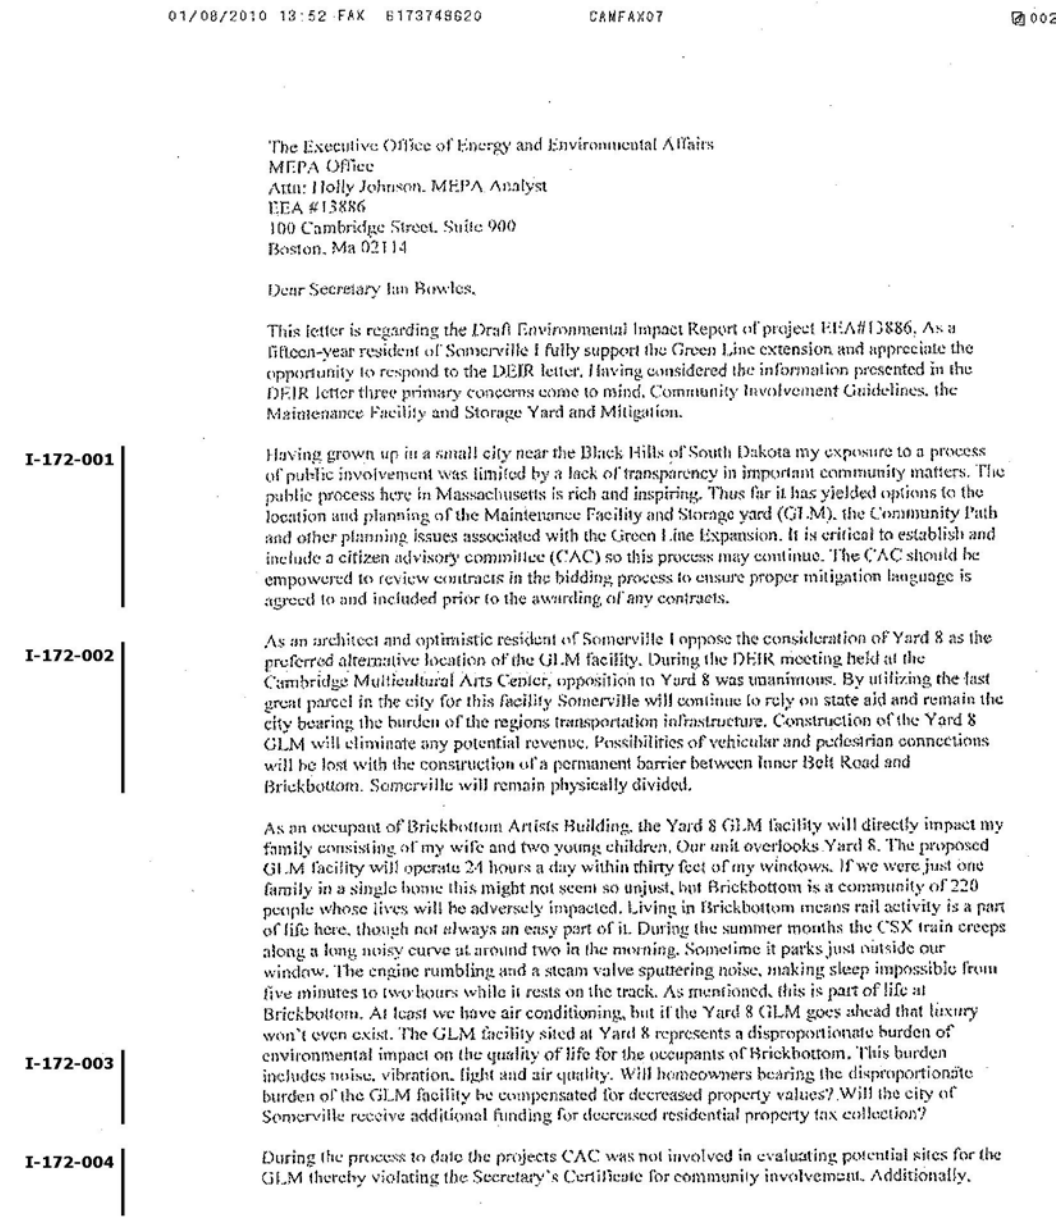
I-171-003

delegation. Indeed, much of the original impetus of the Working Group was to achieve cooperation and collaboration instead of the all to usual opposition and legal battles. I believe that all interests can achieve benefits that vastly out weigh those contained in the current DOT plan

I-171-004

Finally, as this comment is on a DRAFT EIR, I find it unacceptable that the effort to produce a final EIR has not been made to date.

Thank you for your consideration.



01/08/2010 13:52 FAX 6173748620 CAMFAX07 002

The Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, Ma 02114

Dear Secretary Ian Bowles,

This letter is regarding the Draft Environmental Impact Report of project EEA#13886. As a fifteen-year resident of Somerville I fully support the Green Line extension and appreciate the opportunity to respond to the DEIR letter. Having considered the information presented in the DEIR letter three primary concerns come to mind, Community Involvement Guidelines, the Maintenance Facility and Storage Yard and Mitigation.

I-172-001

Having grown up in a small city near the Black Hills of South Dakota my exposure to a process of public involvement was limited by a lack of transparency in important community matters. The public process here in Massachusetts is rich and inspiring. Thus far it has yielded options to the location and planning of the Maintenance Facility and Storage yard (GLM), the Community Path and other planning issues associated with the Green Line Expansion. It is critical to establish and include a citizen advisory committee (CAC) so this process may continue. The CAC should be empowered to review contracts in the bidding process to ensure proper mitigation language is agreed to and included prior to the awarding of any contracts.

I-172-002

As an architect and optimistic resident of Somerville I oppose the consideration of Yard 8 as the preferred alternative location of the GLM facility. During the DEIR meeting held at the Cambridge Multicultural Arts Center, opposition to Yard 8 was unanimous. By utilizing the last great parcel in the city for this facility Somerville will continue to rely on state aid and remain the city bearing the burden of the regions transportation infrastructure. Construction of the Yard 8 GLM will eliminate any potential revenue. Possibilities of vehicular and pedestrian connections will be lost with the construction of a permanent barrier between Inner Belt Road and Brickbottom. Somerville will remain physically divided.

As an occupant of Brickbottom Artists Building, the Yard 8 GLM facility will directly impact my family consisting of my wife and two young children. Our unit overlooks Yard 8. The proposed GLM facility will operate 24 hours a day within thirty feet of my windows. If we were just one family in a single home this might not seem so unjust, but Brickbottom is a community of 220 people whose lives will be adversely impacted. Living in Brickbottom means rail activity is a part of life here, though not always an easy part of it. During the summer months the CSX train creeps along a long noisy curve at around two in the morning. Sometime it parks just outside our window. The engine rumbling and a steam valve sputtering noise, making sleep impossible from five minutes to two hours while it rests on the track. As mentioned, this is part of life at Brickbottom. At least we have air conditioning, but if the Yard 8 GLM goes ahead that luxury won't even exist. The GLM facility sited at Yard 8 represents a disproportionate burden of environmental impact on the quality of life for the occupants of Brickbottom. This burden includes noise, vibration, light and air quality. Will homeowners bearing the disproportionate burden of the GLM facility be compensated for decreased property values? Will the city of Somerville receive additional funding for decreased residential property tax collection?

I-172-003

I-172-004

During the process to date the projects CAC was not involved in evaluating potential sites for the GLM thereby violating the Secretary's Certificate for community involvement. Additionally,

I-172-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-172-002

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-172-003

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in DEIR/EA Chapter 6, Draft Section 61 Findings and Mitigation Measures. Mitigation measures for the College Avenue and Lechmere Stations are further described in FEIR Chapters 4 and 5, respectively. The mitigation measures and steps required for implementation and post-construction monitoring required by the Secretary's Certificate on the DEIR are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

Socioeconomic impacts, including projected effects on businesses, jobs, tax revenues, and community disruptions, are described in DEIR/EA Section 5.3, Socioeconomic Impacts. Effects on land use and transit access are discussed in DEIR/EA Section 5.2, Land Use, and Section 5.15, Indirect and Cumulative Effects. As required by the Secretary's Certificate on the DEIR/EA, additional analysis of the socioeconomic effects of the maintenance facility alternatives are described in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. A series of Project

01/08/2010 13:52 FAX 6173748620 CAMFAX07 003/00

I-172-004

mandated land use planning was not performed. Mirror H and Option L are viable alternatives to the preferred site. These alternatives deserve further serious analysis and consideration. Why does a decision need to made now regarding the location and design of the GLM if the planning and design of the facility is not contingent on the 2014 Green Line Extension completion deadline?

I-172-005

Mitigation should include a process to address problems during construction and after the fact and there must be a way for residents to seek redress if specific goals are not met. Mitigation of noise and vibration must be addressed and in place prior to construction. How will future upkeep of MBTA facilities impact mitigation? How will the proximity of two spurs flanking Brickbottom be addressed? In light of the existing noise MassDOT should assign five new EPA level 3 diesel rail engines to the existing Fitchburg Line to mitigate the overall environmental impact to the immediate area. The new Green Line railcars should be fitted with quiet fans and acoustical absorption to mitigate noise and vibration. If the Yard 8 GLM facility is constructed as planned I would like to see a year round earthen living wall twenty feet in height to mitigate the environmental impact of the facility.

I fully support the Green Line expansion and required facilities essential to its success. For myself as an architect, the beauty of Boston is that a perfect site with ideal conditions rarely exists. The most elegant solutions come from the careful consideration of old and new. Yard 8 seems all too perfect, as perfect as Government Center without the destruction of Scollay Square, or as ideal as cutting a swath through the city of Boston for I-93. Using Yard 8 for the GLM facility will devastate a city struggling to make life better for residents and businesses.

This is an opportunity for Massachusetts to set an example of exemplary railway and facility planning for a country grappling with local and regional transportation concerns. It is also a chance for individuals like you to have a positive impact of the history of the Boston area. Please consider the alternatives to Yard 8 and the impact to Somerville and the residents of Brickbottom.

Thank you for your commitment to this project and your consideration.

Sincerely,

Roger S. Johnsen

Roger S. Johnsen

workshops will provide opportunities to discuss broader impacts of the Project on job creation, economic development, housing affordability, and other community impacts.

I-172-004

As described in the DEIR/EA Section 1.5.3, throughout the development of the DEIR/EA regular coordination with the Advisory Group and local municipalities on various aspects of the Project, including siting of the maintenance facility, occurred. During the Summer of 2008, tutorials on the proposed maintenance facility as well as site visits to existing maintenance facilities were conducted for Advisory Group members. In December 2009, a public meeting was held on the various maintenance facility sites.

The Green Line Extension storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the overall Project. Chapter 2 of the FEIR fully describes the environmental impacts of the proposed storage and maintenance facility. The facility must be constructed adjacent to the Green Line Extension to maximize operating efficiencies and be constructed within the same time frame as the Project.

I-172-005

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

Subject: EEA #13886 - Green Line Extension Project

Dear Holly,

I-173-001

I am writing in support of extending the Green Line to Route 16 in Medford. Extending the Green Line through this dense urban corridor would improve air quality, energy efficiency, traffic, and general quality of life. Together with a planned bike trail along Route 16 to Alewife, the green line would greatly improve access to public transportation in this underserved area. As a resident of East Arlington, I would benefit from a Green Line that terminated at Route 16. If the Green Line ends in Somerville, tens of thousands of people in West Medford and Arlington (including me and my family) would not have access to this line.

The MBTA is facing severe budget issues and is considering scaling back this project. That would be a mistake. The state of Massachusetts and MBTA need to figure out how to fund vital extensions such as this while improving maintenance of the existing infrastructure. The Green Line project needs to include an extension to Route 16 now, not as a possible later phase. Boston's future as a world-class city depends on it.

I-173-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

Secretary Ian Bowles Executive
Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

I-174-001

I strongly support the Green Line extension but feel that the greatest economic and environmental benefits can only be gained by constructing the entire project in one phase, with a terminus station at Mystic Valley Parkway (Route 16). Because of this, I urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis in order to make the Green Line extension the most cost effective, time efficient, and environmentally sustainable project possible.

According to the DEIR, MassDOT intends to build the green line extension to College Avenue in the Tufts University area of Medford, by its deadline of December 31, 2014. Yet, the College Avenue station is not designed for the additional requirements of a terminus, and the neighborhood cannot sustain the impact of a terminus station operations and traffic volume. In addition, I feel very strongly that this decision does not meet the state's legal obligation to provide public transit services to Medford Hillside. In order to properly serve Medford Hillside, the project must extend all the way to Route 16.

I-174-002

Unfortunately, the Route 16 station design outlined in the DEIR is inadequate. The DEIR offers only a "worst case scenario" (MassDOT's description) for the Route 16 station design, while offering optimized station designs for all other Green Line extension stations. The Route 16 station design must be revisited. The Medford Green Line Neighborhood Alliance (MGNA), a volunteer citizen group, has offered an alternative station design that prevents two major commercial property acquisitions and the resulting job displacement, preserves $182,000/year in property taxes for the City of Medford, optimizes traffic flow and better serves the integrity of the station's surroundings. MassDOT apparently has been exploring similar improved designs, which should be presented to the public for comment.

Finally, the current two-phased approach is fiscally irresponsible, as there are significant efficiencies gained from completing the project in one phase. This is why it is of utmost importance to reject the current DEIR and require Mass DOT to correct the Environmental Impact analysis including an evaluation of MGNA's alternative design for the Route 16 station.

Thank you for your consideration

Sincerely,

I-174-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-174-002

All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area

planning issues.

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

Draft Environmental Impact Report for Green Line Extension in Cambridge, Somerville and Medford , EEA # 13886 Comment #1

Maintenance Facility Alternatives, Trackage Design, New Lechmere Station with Pedestrian Access and North Point Considerations

Of all the transit projects proposed by the MBTA in the past decade, the extension of the Green Line through Somerville makes the most sense. Thus the issues become how is the extension achieved, by which alternative, and on what schedule. The issues for MEPA are the selection of alternatives and identification of environmental impacts, and suitable mitigation.

1 PROCEDURES

I-175-001

The original DEIR submission included a request to accept the Draft EIR as a **Final EIR**, in effect rolling over the document. EOT in its submission last year may have hoped that MEPA would waive the need for a Final EIR. I think the three key remaining issues are sufficiently controversial and intense that they require resolution and response in a Final EIR. However, much of the DEIR material can be included directly within the FEIR. Any new materials in the FEIR can be in effect an addendum to the DEIR, with certain new replacement chapters, such as Maintenance Facility alternatives.

2 Green Line History

The DEIR discussion of project history is regrettably too brief. Admittedly, ideas and proposals go back to the period of BTPR in 1970, and have historical value only. But there

I-175-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

are several key historical events that have relevance to the future of the Green Line extension.

First is the **agreement** between state transportation officials and the Conservation Law Foundation for a major mitigation program stressing mass transit projects as a counterpart to the proposed Central Artery Depression. A key press conference at 3 Joy Street in December 1990 brought together Fred Salvucci, CLF's Doug Foy, the state Highway Commissioner, the regional Director of the EPA, and other Dukakis administration allies to support a multi-billion dollar transit master plan of commitments. The MBTA was noticeably absent.

A consequence of this effort was CLF's continued efforts in following years to seek inclusion of key transit projects in the State Implementation Plan for air pollution control, overseen by EPA. Fred Salvucci remained a supporter of the overall plan. The MBTA remained in opposition. The Green Line extension was an element of that plan, and the SIP commitments remain a driving force for the completion of the Green Line, including the deadline of 2014. Environmental laws are often criticized as a mechanism to slow down or prevent construction, but in the instance of the Green Line they were used to encourage, support and accelerate a construction project.

The second historical event was the 1999 **agreement** between MBTA and the North Point developers to have a public-private partnership whereby the developers would pay for and build the Lechmere station relocation with associated elevated structures, and in exchange the MBTA would give them six acres of land the MBTA owned in North Point. This agreement was amended in 2000 to become less binding on the developer. All aspects of this arrangement were secret and did not involve an open process. The agreement is still legally in effect, but the MassDOT is free to make other arrangements, which it has.

The third historical event is the submission by the developers of **North Point EIR #** 12650 in 2001 and receipt of a **special permit** for development from the Cambridge Planning Board. Both the special permit and MBTA agreement remain legally in effect, although the project design and the status of development and land ownership has changed considerably.

The DEIR does recognize the "rebirth" of the Green Line beginning with the 2004-2005 state studies and actions by the City of Somerville to make the Green Line a priority. The MBTA also became more enthusiastic, as other projects such as the Silver Line tunnel and Urban Ring began to lose public credibility and support.

The DEIR gives brief recognition to the breakup of the **developer team** at North Point in 2007, and the collapse of agreements to relocate the Lechmere station. I advocated for a state takeover of the Lechmere work, as did the City of Somerville. My proposals for further resolution of the Lechmere and North Point issues are contained in Comment section 10 below.

I-175-002

A different type of historical interest is the recognition given to **historical sites**. The DEIR on page 4-87 recognized two railroad corridors : the MBTA Lowell Line and the MBTA Fitchburg Line as active rights-of-way. In fact the Lowell Line is the first rail line to enter the Boston area from the North. The Boston & Lowell railroad was chartered in 1830, the land takings were made in 1833 and 1834, and the first rail operations were in 1835. An abandoned section of this right of way is found east of the Fitchburg tracks heading towards Lechmere, and it is now overgrown with trees. This section might yield artifacts of original railroading in the 1830s. I concur with the recommendation of the EIR that the corridor not be considered for formal historical designation.

3 Three major issues

The Green Line extension is ideally suited for new transit service because the ridership population is already in place, with generally good walk-in access. Most of the right-of-way already exists. Historically rail operations served East Cambridge and Somerville.

I see three primary controversies in the Green Line extension. One is the location of a terminus, with possible extension to Medford. The second is the location and design of the Maintenance and Storage yard. The third is the design of the relocated Lechmere Station and related road & development issues in the North Point area.

The Green Line proposal comes with general support from the City of Somerville and its residents, strangely limited support from Cambridge, and mixed reactions from Medford.

4 Medford Terminus

The approach of MassDOT to the Medford extension issue is reasonable given the controversy. Staged construction would allow Green Line service to function in Somerville while separating out the Medford issues for later resolution.

I-175-002

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

5 Maintenance facility general alternatives

State transportation officials have approached the EIR process with excessive rigidity concerning the proposal for a Yard 8 design, with no other alternatives to be discussed. Few people had anticipated the size and scale of the facility proposed for Somerville.

The DEIR does not clarify the scope of the maintenance operations on the Green Line. The size of the facility in Somerville needs more explanation and justification. Everything may indeed be needed, but I cannot tell from the information in the EIR.

I-175-003

The relation to the Riverside facilities needs explanation. In February 2009 the MBTA Board of Directors approved an 85-year lease to allow a developer to construct over 400,000 s.f. of office space, 200 housing units and 60,000 s.f. of retail on part of the Riverside site. State officials have presented an awkward scenario where it appears that Newton may gain development and tax base benefits, while Somerville's Inner Belt Industrial Park may suffer a loss of taxable land area. The Final EIR should explain the arrangement and the comparison of existing and future conditions for both Somerville and Newton in terms of maintenance and storage capabilities, as well as development leases.

The Yard 8 situation has changed considerably since the preparation of the Draft EIR :

> "Of the numerous sites considered in the screening process, only Yard 8 with the Adjacent Parcel is of a sufficient size and configuration to effectively store the required cars and house a support facility while providing the operational flexibility that is needed for such a facility without additional environmental impacts." (ES-25)

The location of the maintenance building within the industrial park and proximate to the Brickbottom apartments became a major point of contention which doomed the acceptability of Yard 8. An additional technical flaw was a track design which was inadequate in terms of Green Line operations and safety.

The Mirror-H alternate proposal sponsored by Somerville would be primarily in Somerville and partly in Cambridge, although no one is exactly sure where the city boundary line is in this area of North Point. Cambridge took objection to the changes affecting its North Point Plans. There were also problems with the trackage design as shown.

I-175-003

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

This logjam in site selection was broken by an important initiative from former Secretary Aloisi, after discussions with delegations from Somerville. As a result, the project consultants produced a new evaluation of alternate sites in their December 9 report -- issued a month after the DEIR. The December 16 meeting in Cambridge seemed to show general preference for Option L, located away from Brickbottom and Yard 8.

Option L has the advantage of allowing better track movements in the Yard 8 area and moving large structures away from residential areas, such as Brickbottom. However, there are disadvantages as well : two large, modern and serviceable industrial buildings would need to be taken and demolished for Option L, at a cost of $50 million. Somerville would lose jobs, tax income and development capability of these sites. In addition, two functional buildings would need to be demolished and turned to rubble, creating a large amount of waste materials for the state's limited landfills. In addition, there are questions of the appropriate use of eminent domain by public authorities, whereby private property can be taken without the owner's consent.

These problems with Option L were of sufficient importance to stimulate the search for an alternative which would share the advantages of Option L but share none of the disadvantages. Citizens, business leaders and city leaders became engaged in this effort in the hope that transit needs could be met without undue impacts to the Industrial park area.

From this ad hoc effort came the generation of a new concept plan called Mirror-L, which indeed was a variation in Option L with lesser impacts to the Inner Belt Industrial Park. The basic concept was to utilize vacant space in the vicinity of existing freight rail tracks. Part of the plan was to consider structured parking for the BET lot, to provide equivalent parking on half the footprint.

Today, there is a five track corridor of curved freight tracks curving between the industrial park and the Boston engine terminal. The CSX track is commonly known as the Grand Junction route, while in combination with B&M tracks the area is called the Valley tracks. The Mirror-L plan would use 3 to 4 of these underutilized tracks as well as half of the BET parking lot to locate the Maintenance Building. There would be a curved spine of storage tracks for Green Line vehicles.

This conceptual design would be able to avoid the $50 million landtaking within the industrial park, would require acquisition of three to four siding tracks from private railroads, and half of the BET parking lot, to be replaced by a deck structure offering

equivalent parking. Within the industrial park, the only taking would be from underutilized parking lots. No structures would be taken. The acquisition of railroad track land that is not highly utilized can be viewed as income to the railroads. The parking garage and landtakings costs would appear to be approximately $5 million, so that the net capital cost saving relative to Option L would be $45 million. The maintenance yard would add 100 jobs to the area, with no loss of jobs and no loss of tax base.

I-175-004

The essence of my comment to MEPA for the DEIR is that there appears to be a credible alternative to the location of the Maintenance Building and storage yard. Additional design and review work will need to be done to verify any claimed advantages and unresolved disadvantages. I am hopeful that MEPA will encourage MassDOT to investigate the Mirror-L alternative closely and to report their findings in the Final EIR.

The Green Line extension into Somerville will also result in a conflict with an existing and functional rail connection between B&M freight service in the Lowell corridor and the Valley tracks as they connect to CSX tracks connecting to Charlestown and Chelsea. Although I cannot find specific discussion in the DEIR, it is my understanding that this track is definitely removed by a Yard 8 and Option-L scenario, and may be lost with Option Mirror-L. However, it appears that Mirror-H may not interfere with this track connection.

It is my understanding that the proposed mitigation for the loss of this track is to open up an existing but unused track that passes through the industrial park at-grade, with an at-grade crossing of Inner Belt Road. This corridor is also know as track 10. Active use of track 10 would introduce the noise and smells of locomotives to an area which has a quieter environment today. The reintroduction of train travel through the industrial park is seen by Somerville as a further intrusion into this land area and its current setting.

I-175-005

Already additional thinking has begun on alternatives to reopening Track 10. One option is a track connection to the existing Lowell line embankment. A grade change and use of retaining walls would be required. Another option is to design the new Green Line service tracks to fit around the Lowell-to-Valley track connection, and to allow this existing connection to continue functioning without the need to use track 10. As with Mirror-L, these options require further design and review. I hope that MassDOT can consider them in their responses to comments in the Final EIR.

I-175-004

A detailed response to the "Mirror-L" storage and maintenance facility concept is included in the Appendices to the FEIR. An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, Option L is identified as the preferred maintenance facility site.

I-175-005

The expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives, provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis, includes a discussion on railroad connections in the area of the proposed storage and maintenance facility. A detailed response to the "Mirror-L" storage and maintenance facility concept is included in the Appendices to the FEIR. The yard 10 lead track will continue to be used by the MBTA as is the case today. The Wiley track to the Valley tracks will be removed from service before construction begins on the Green Line Extension Project.

6 Trackage Design and Green Line operations

One of the key design flaws in the Yard 8 proposal was its failure to provide for safe and efficient reversal of direction of Green Line trains. For example, to get to Union Square, a train leaving Yard 8 would be required to reverse direction twice. These movements would require each train to stop while blocking the mainline tracks in one direction, and then traveling backwards on that track before switching over directly into the opposite tracks which would also be blocked at this time. The only other way to make this move is even worse : to switch directly over onto the opposite tracks and travel briefly in the wrong direction, before stopping and reversing.

This design feature is most undesirable for two reasons -- it presents obvious safety problems, and it causes undue interference with mainline Green Line service. The safety problems would present environmental problems to the extent that reliable and safe transit service is essential to the public policy of providing quality transportation alternatives to the use of automobiles in greater Boston. The operational problems are crucial because of the history of difficulties in achieving smooth flow and consistency of good performance on the Green line. Bunching of trains, delays and crowding of trains are all features which must be kept to a minimum in a well-run system. The stoppages and delays introduced by the switching operations associated with the Yard 8 plan would appear to move backwards away from better operations on the Green Line as a whole.

I-175-006

The Yard 8 plans fails to include a center service and switching track to allow safe and effective reversal of train direction. Such a track is a standard feature on many transit systems -- for example the center track on the Boston College branch at the Kenmore Square portal. The central service track should be an element of every maintenance yard proposal. Unfortunately, none of the current designs include such a feature.

The issue of safe train reversal should be discussed in the Final EIR.

I-175-007

The controversy over the Somerville maintenance yard opens up the possibility for a more comprehensive evaluation of system operations on the Green Line. Years ago, an MBTA official told me that the MBTA had given up on the Green Line because no one could understand it. With the Green Line extension to both Union Square and Medford, the Green Line system is larger, having six branches rather than four. It will probably be more complicated to operate. We need an excellent understanding of how the Green Line could and should work.

I-175-006

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-175-007

The proposed Green Line Extension operation will extend the Green Line D Branch to College Avenue and the Green Line E Branch to Union Square. During the preliminary engineering phase of the Project, a computer simulation will be performed to model the proposed extension with the central subway. The simulation will be used to design the signal system for the extension that will optimize Green Line operations.

If that understanding has not been achieved in the past, let us obtain that understanding now, and what better place than in the Final EIR. It is time to seek the equivalent of a D'Alessandro report on train operations. A poorly operated new rail extension could damage the rest of Green Line operations.

I-175-008

A good form of operational mitigation would respond to some of the neighborhood complaints about existing rail operations, that the commuter trains are noisy and smelly. The MBTA locomotives are F-40s, which are old and reliable, but also noisy and polluting. It would be a poor investment for the MBTA to retrofit these locomotives for reduced noise and emissions. However, the MBTA does have an order for new commuter rail locomotives to replace its aging fleet. The mitigation could take the form of assigning 4-6 of the new locomotives to the Lowell line as soon as they are delivered to the MBTA.

I-175-009

Construction noise may also be a problem, so these operational changes to commuter rail would be reasonable for residents who would life next to both a commuter rail and LRV system. Another form of simple mitigation would be to find a way for the Amtrak Northeaster trains to idle somewhere else than on the Fitchburg tracks immediately adjacent to the Brickbottom apartments. It should be possible to find another layover area for the Amtrak F40s that right next to a residential building.

7 North Point History and the Hazards of Elevated Structures

Many of the issues in Somerville appear to be open for discussion and debate, and this situation is very encouraging because it suggests a possibility for resolution. The atmosphere around Lechmere is much less promising because of the long history of planning problems in the area and the fact that leadership from the City of Cambridge is not equal to what we have seen from Somerville.

The primarily flaw in the Lechmere plan is its dependence on the extension of an elevated transit line. This "city planning" initiative is being made in contravention to all that we have learned about the dangers of elevated transportation structures and the terrible costs of later regrets when we try to undo the damage.

Historically the construction of elevated highways and transit has been recognized as a fundamental planning error in virtually every city where it has occurred. The lessons of the past 50-100 years have been to avoid elevated structures and to take down the ones you have.

I-175-008

As presented in DEIR/EA Chapter 6, it is anticipated that the Green Line Extension will have a positive impact on outdoor air quality within the study area. Modifications to MBTA Commuter Rail equipment are outside the scope of this project. Noise and vibration mitigation measures are proposed on a location by location basis. Procurement of low emissions commuter rail locomotives is planned by the MBTA for a future date. The procurement will not be included in the Green Line Extension Project. The noise and vibration analysis considered existing rail activities as well as proposed rail activities. Noise and vibration mitigation has been proposed based on the analysis.

I-175-009

Operations of the Boston Engine Terminal (BET), including Amtrak access methods, are beyond the scope of the Green Line Extension Project. The BET "Drill Track," or the track used to access the BET from the west, will be relocated approximately five feet further from the Brickbottom Artists Building as part of the Green Line Extension Project.

The massive Central Artery project in Boston cost $15 billion and a dozen years of construction. It was motivated by a desire to get rid of the elevated Green Monster -- the 1950s elevated highway that sliced through the center of Boston. Originally proposed in the 1930 Whitten report, the elevated artery actually arose from early studies that had recommended removal of elevated transit lines and their replacement by tunnels.

A century ago, there were proposals to build an elevated rail track down Tremont Street in Boston, adjacent to the Boston Common. Opponents drew up drawings showing what the result would look like, and there was massive opposition to the elevated proposal. The result was that a tunnel was dug down Tremont Street and Boston had its first-in-the-nation subway.

Elsewhere the advocates of elevated transit were more successful. The Cities of Boston and Cambridge allowed a private corporation, the Boston Elevated Company, to construct elevated blighting structures along Washington Street, Atlantic Avenue, Causeway and O'Brien Highway. Only the concrete arch structure crossing the Charles river is aesthetically acceptable.

The steel elevated structures of elevated transit have been so ugly and so unacceptable to the public that they have been torn down almost everywhere in Boston (short sections at Leverett and Charles Circles remain). The ugly Lechmere elevated remains in Cambridge -- and Cambridge proposes to extend it! This extension of the elevated is basically Cambridge's plan, and MassDOT has been compelled to accept it.

In Boston the MBTA put the elevated into a tunnel and opened up Causeway. Other cities around the country have tried to remove their elevated structures -- seeking to be more successful that the Big Dig but with similar land use and aesthetic benefits.

Only in Cambridge is an extension of elevated transit being proposed. The EIR notes that "With the exception of the Lechmere Station area, which will be on an elevated structure, there will be minimal visual impact on the area. Because the changes would occur in urbanized areas within and adjacent to the existing right-of-way, they would have little overall visual impact on the public." (p. ES-41) This statement is the closest I could find to a commentary on the visual aspects of elevated structures. The excuses for the acceptability of such structures are very unfortunate, especially in an environmental document.

The setbacks in trying to create a new community of North Point seem to have unhinged whoever wrote these sections of the EIR : "The new Lechmere Station will be relocated and elevated, on a new and realigned viaduct on the east side of Monsignor O'Brien Highway/Route 28. The area around the relocated station is primarily industrial with some residential uses." Where is the realization that the area need not have a grim industrial future? The mental adjustment for new land uses has not been made. The old tolerance for environmental and aesthetic degradation has taken over.

I-175-010

The EIR plan is to remove the elevated steel viaduct crossing over O'Brien Highway, and replace it with elevated steel viaduct passing though North Point, behind the Glass Factory condominiums (elevated at second floor level), over Water Street, and elevated behind the new hotel, before gradually dropping to grade near the Somerville line. This dismal concept makes every past version of the maintenance yard look like a stroke of genius.

I-175-011

The land use problems are compounded by the plan to continue the 234 at-grade parking spaces for MBTA commuters. Why maintain commuter parking spaces within the city and near residential areas?

One party in the discussions understands the important issues in the urban fabric. In regard to elevated McGrath Highway through Somerville, the EIR notes on page 4-22 that "The City of Somerville would like the State to consider removing the elevated segment and replacing it with an at-grade roadway as a way of reuniting the community absent this barrier." So Somerville understands, but where is everyone else?

Cambridge has never explained in any document why the line must be elevated and how long it would take -- how soon after construction the elevated was complete -- for city planners and advocates to raise their voices and demand a tunnel solution. Of all elements of the Green Line proposal, the Lechmere plans are the most primitive.

We should realize that the Lechmere failure was inherited by the state, and not created by them. The longer MassDOT holds on to the original design and does not make improvements, the more the blame becomes their own.

8 Designs At and Around the New Lechmere Station

Of all the unresolved problems of the Green Line design, Lechmere is the worst. The Medford issue is peripheral and does not sink the entire project. The maintenance yard

I-175-010

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. The chapter presents a detailed description of pedestrian crossings of O'Brien Highway, as well as proposed roadway, crosswalk, and sidewalk improvements that are consistent with the NorthPoint development plans. These station and street plans will be further refined in the preliminary engineering stage of the Project. In accordance with the Secretary's Certificate on the DEIR/EA, the FEIR includes conceptual station designs. The proposed Lechmere viaduct is required to provide adequate vertical clearances over East Street and Water Street. Just north of Water Street the track transitions to an embanked fill section that descends slightly north of the Hampton Inn and then rises modestly to cross over the Fitchburg line at a level higher than the original Red Bridge to provide adequate clearance to the proposed Union Square loop track below.

I-175-011

The existing Lechmere parking area is an important source of annual revenue for the MBTA. Parking at the new Lechmere Station was reduced in the revised conceptual design. These revised plans are included in FEIR Chapter 5, Lechmere Station. As stated in DEIR/EA Section 3.7, station designs will minimize light impacts to neighboring properties. As explained in FEIR Chapter 5, design criteria for all Project elements, including lighting and landscaping, and detailed station designs will be developed during the preliminary engineering phase of the Project.

issue looks solvable. The Lechmere project if unresolved prevents any workable extension to Somerville or Medford.

I-175-012

The new street pattern is a product of tired prior planning and reflects a misplaced goal to try to use First Street as a traffic bypass to congestion on Land Boulevard. The result of this unfortunate policy is to point traffic at the dense pedestrian crossing areas of O'Brien Highway and Cambridge Street. This goal makes no pedestrian sense. Any new street system around Lechmere Square warrants a full rethinking for its traffic and pedestrian implications.

9 Improved Pedestrian Access

The EIR in Fig 5.6-Xc provides the raw numbers for pedestrian crossings at all intersections. The year 2030 projections indicate 1700 pedestrians seeking to cross O'Brien Highway in the peak hour and 1400 crossing Cambridge Street. The traffic growth in combination with additional pedestrian demand and the altered traffic circulation plan may actually create conditions worse than they are now, with notable conflicts between cars and pedestrians, especially during the morning peak hour.

As with Yard 8, the DEIR presents only a single design for the Lechmere area, with no alternatives. Such inflexibility and narrowness of perspective is unsuitable for a Draft EIR. No EIR should be considered adequate if it does not look into alternatives and the impacts on major pedestrian flows.

Under current conditions, arriving passengers at Lechmere in the morning pour off the trains and as many as 2/3 of them will cross four lanes of traffic on Cambridge Street. Often the pulsed volume of pedestrians is so great that traffic is stopped by swarms of jaywalking pedestrians.

The morning problem is most severe because of the pulsed nature of pedestrians coming from arriving trains. The pulse may last for 2-3 minutes, followed by 10-15 minutes until the next train arrives. Then the process repeats itself.

Normally, removal of elevated structures is desirable for urban areas, but one consequence of removing the existing Lechmere elevated structure over O'Brien Highway is that the highway sight lines will be opened up, resulting in higher vehicle speeds. Cars driving faster through a dense pedestrian area is precisely a consequence we should avoid.

I-175-012

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. The chapter presents a traffic analysis, a detailed description of pedestrian crossings of O'Brien Highway, and proposed roadway, crosswalk, and sidewalk improvements that are consistent with the NorthPoint development plans. These station and street plans will be further refined in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-175-013

The EIR contains no photos or discussion of pedestrian conditions at either Cambridge Street or O'Brien Highway. The current plan is little more than taking what is happening today at the Cambridge Street crossing and applying it to O'Brien Highway as well. The Cambridge Street crossing is hampered further by having one crosswalk deliberately left out. There are only three crosswalks, instead of the standard four (Figure 3.7-4).

While MassDOT has honorably accepted the Lechmere responsibilities, their task to upgrade Lechmere planning is a significant challenge. The one positive in the process is that the consultant working on traffic has some familiarity with the site and also has on-staff a skilled expert at dealing with traffic/pedestrian problems -- and who has not been involved in Lechmere planning. His input would be invaluable in resolving the Lechmere pedestrian circulation and safety problems.

I-175-014

An historical note : in both the 1999 and 2000 agreements between the MBTA and the North Point developer, the fundamental concept was for the developer to build a pedestrian overpass crossing over O'Brien Highway. In 2000 the requirements were relaxed, and in the 2001 North Point EIR there was no mention of a pedestrian overpass.

10 North Point proposals

The planning around Lechmere and North Point suffers from several seemingly intractable problems :

1. A complete breakdown in the development team at North Point, including their inability to sell the property as required by Court decree.

2. Continuation of the Cambridge commitment to extend transit on elevated structures, rather than seeking a tunnel solution.

3. An unsafe and uncomfortable at-grade pedestrian crossing of both O'Brien Highway and Cambridge Street.

Other problems such as the obsolete and unworkable special permit issued by the Cambridge Planning Board to North Point and the obsolete 1999/2000 agreements between the MBTA and the developer can be handled more easily. Declare them null and void. Have the MBTA and the City of Cambridge tear them up.

I-175-013

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. The chapter presents a detailed description of pedestrian crossings of O'Brien Highway, as well as proposed roadway, crosswalk, and sidewalk improvements that are consistent with the NorthPoint development plans. These station and street plans will be further refined in the preliminary engineering stage of the Project. The traffic analysis performed as part of the environmental analysis for Lechmere Station included traffic (vehicle and pedestrian) counts at each of the existing intersections. These volumes were increased based on future area developments to build year 2030. The 2030 volumes were modeled and analyzed for the proposed roadway improvements with a priority given to pedestrians. The roadway improvements proposed provide ample pedestrian crossing locations and times based on the projected pedestrian and vehicle volume.

I-175-014

The roadway and pedestrian improvements proposed for O'Brien Highway in the vicinity of Lechmere Station are the same improvements recommended by the NorthPoint development project. A pedestrian overpass was not included in this project. Based on discussions with the City of Cambridge, which was closely involved in the development of the traffic improvements, a pedestrian overpass was considered but eliminated from further consideration due to site constraints and practicality concerns.

Another complex issue at North Point is functionally separate from the Green Line. The issue of tidelands at North Point is now before the state Supreme Judicial Court, with a decision expected this spring. At issue is the status of public trust rights in tidelands, especially lands declared to be landlocked, as well as ownership of 13 acres of Commonwealth tidelands within the North Point development parcel. This land is represented by the original channel of the Miller's River, as it has since been completely filled in by the Boston & Maine Railroad. The land ownership situation is complicated by the two failed efforts to sell the property when the due diligence stage of negotiations arrived. Many properties at North Point appear to have an undeniable cloud over title, due at least in part to tidelands issues.

I-175-015

It is entirely a legitimate question whether the land is its current state of title disarray can ever be sold. Therefore I suggest that the North Point development land in Cambridge, Somerville and Boston should be acquired by the MBTA. Such property acquisition would automatically clear the title and increase the land value. The land would become developable, subject only to possible requirements for Chapter 91 licenses and legislative action to extinguish public trust rights in tidelands. MBTA could them sell the entire site to a new developer (less space for public roads, parks etc.) as well as its unused six acres in Cambridge. All lands would have cleared titles.

A new North Point plan should be developed in a public process and a new special permit issued by the Planning Board. Rezoning would also be a desirable action.

Two residential buildings S and T at North Point have substantially completed initial construction, although reported sales and occupancies indicate little financial success. Both structures are models for embarrassingly bad architecture and design. I would recommend some effort at finding an architect willing to retrofit and revamp the structures to make them more appealing and habitable.

Another radical and long term option is that the state should consider the possibility of purchasing the Boston & Maine Railroad and then contracting out its operations to CSX. I have been impressed with the activities of CSX both to operate a modern freight railroad carrying containers and piggy-back trailers, as well as working closely with the state on rail issues. I can only contemplate how dramatic an improvement would result from CSX operation of deteriorated B&M properties.

I-175-015

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

I hope to submit to MEPA and MassDOT more definitive engineering plans for the maintenance yard alternative Option Mirror-L.

Sincerely,

Stephen H. Kaiser, PhD

ADDENDUM ON TRAFFIC CAPACITY MODELS :

The goal of the Green Line project is most worthy in its efforts to serve established urban areas with modern transit and to expand transportation options without reliance on automobiles. Therefore, I have not given a detailed critique of the traffic analysis and modeling for accuracy and impact. However, I would flag concerns with some of the traffic modeling work that has been a problem in the past and continues in this EIR.

I-175-016

Modeling flaws I have found do not appear inherent in the Synchro results. Rather the cause appears related to defective mathematical formulations within the Highway Capacity Manual. These defects I understand are largely known to the programmers of Synchro. The continuing problems with the HCM accuracy for both signalized and unsignalized intersections have been a matter of controversy which the Transportation Research Board bureaucracy refuses to recognize. The Institute of Transportation Engineers has sought to deal with some of them, but not very effectively.

The result is that consultants have chosen to cover up the worse errors by techniques similar to traffic summaries in the text of this DEIR. Examples are references to V/C ratios being more than 1.20 (>1.2) and average delays being greater than 120 seconds (>120) [example page 5-59]. When this technique is used, the reader is not told that the model has given results with V/C ratios as high as 1.65 and delays of 750 seconds or 12 minutes in a left turn slot. This situation is scandalous, and EIRs should not be used as a medium to cover up the extent of the failings in methodologies.

I hope that MassDOT can take action to improve the generic accuracy and honesty of all traffic capacity analyses.

==========

I-175-016

The traffic analysis for the project was performed in conformance with local, state and national guidelines. All results are presented in the technical appendix as they are calculated by the model.

The traffic analysis preformed is a tool used to determine the impacts of the proposed development. The methodology is consistent for all conditions studied and the impact is mitigated through proposed traffic improvements.

Thank you for your comment.

MEPA

Draft Environmental Impact Report for Green Line Extension in Cambridge, Somerville and Medford , EEA # 13886 Comment #2

Design Concept for Option Mirror-L : Maintenance Facility Alternative in Somerville

I appreciate this opportunity to provide supplementary descriptive material to enhance elements of my January 7 comment to MEPA, relating to the identification and evaluation of alternatives for the MEPA review of the Green Line Extension project. In my initial comment, I identified three major controversies : the extension to Medford, the Maintenance Facility near the rail yards, and the design around and including the new Lechmere station.

The entirety of this second comment will focus on the maintenance facility issue and in particular a new variation on one of the three options presented in the December 9, 2009 report by Vanasse Hangen Brustlin, consultants for MassDOT. Moreover the focus of my comment will be to present an engineering sketch plan of the new alternative illustrating the physical feasibility as to location and operation of the new yard.

I recognize that the EEA office normally does not entertain detailed design review of projects submitted from either proponents or citizens. However, the issue of alternatives is primarily one of preliminary feasibility, of taking an alternative to the point where its elements can be understood and where there is no readily evident fatal flaw. My intent at this point is to present an alternative in sufficient engineering detail that MassDOT and its consultants will be able to report to you with a judgment of feasibility, with stated reasons. The hope is that this evaluation can be presented in the Final EIR, or earlier if that is convenient to MassDOT.

The new alternative is a variation on the concept of Option L -- an earlier plan to locate the maintenance building within the rail yard area, at some distance from residential sites such as the Brickbottom apartments. In the past several weeks, Option L has been identified with certain drawbacks that the new alternative is designed to avoid.

The greatest concern has been expressed over the taking of two large, modern and serviceable industrial buildings at 20 and 48 Third Avenue in Somerville. These buildings would be taken and demolished, as a direct cost of $50 million. Somerville would lose jobs, tax income and development capability. In addition, two functional buildings would be demolished and turned to rubble, creating a large amount of waste materials for the state's limited landfills. These elements of Option L represent undue cost and waste, and detract from many inherently good design aspects of that proposal.

I-176-001

The effort to develop a new alternative has been initiated by an ad hoc group of Citizens, business leaders and Somerville officials who sought a plan to achieve transit goals without undue impacts to the Inner Belt Industrial Park area. In that spirit, I am submitting the attached plan of the new plan, identified as Mirror L. I have further designated the plan as "Version A-1.1" to reflect my view that there may two variations A and B which allow for the location of the transit elements with similar reduced impacts, and to recognize that this plan A is the first iteration of the initial concept sketch plan or "Version 1.0."

The basic concept of the Mirror L plan is to identify underutilized railroad land and parking lots for possible Green Line reuse, while taking no structures from within the Inner Belt Industrial Park.

The Mirror-L plan is composed of the following features, with very preliminary cost estimates :

1. Reduce by about half the footprint of the parking lot of the Boston Engine Terminal and add a second level of structured parking to serve both the BET and Green Line maintenance operations (150 spaces x $20,000/space = $3 million).

2. Acquire four track widths of the Grand Junction/Valley tracks -- $1 million

3. Relocate the Grand Junction Track to the east, passing through the BET parking lot; remove associated blacktop from old BET parking lot. ($1 million)

I-176-001

A detailed response to the "Mirror-L" storage and maintenance facility concept is included in the Appendices to the FEIR. An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, Option L is identified as the preferred maintenance facility site.

Use of about half of the BET parking lot would require mitigation in the form of a second-level deck for parking, with space for about 150 cars on each level. The total of 300 cars should be sufficient for the needs of the BET and of the Green Line facility.

The storage or layover tracks would be located east of Inner Belt Road and would contain 6,000 feet of Green Line trackage capable of storing 80 train units. The arrangement shown in my plan is representative of the area involved, with the understanding that the yard could be reshaped, with a different arrangement of switches. As shown, the yard contains a two track connection to the Green Line mainline tracks, with the tracks splitting to enclose the storage yard in between. As an option, the two tracks could be kept to the easterly side of the yard.

Access to the yard from the Green Line mainline would be via a turnout from the outback mainline track. Inbound trains would utilize turnouts into a center service track, so that safe reversals of train direction could be made. The intent of this service track is to avoid any reverse directional movements of trains on mainline revenue tracks.

My plan shows this center service track extending much of the way to the Lechmere Station, but on reflection I think the length of this track could be reduced to only the segment west of the Fitchburg tracks. As the DEIR notes, trains coming from Union Square under any of the options, would travel to the Lechmere Station and reverse direction there.

I have shown the floor elevation of the maintenance building and layover yard as elevation 9, but this elevation could be raised if there is a specific need to do so. The design can also include a slip ramp track from the yard directly towards Union Square to avoid any reversing movements. As in all alternatives, the highest number of individual train reversals is two : coming from inbound trains to the yard from Union Square and Brickbottom. Two of the three movements from the yard could be made with no reversals at all. The Mirror L option makes these directional reversal movements safely and without operational interferences with mainline tracks.

The highest elevations are the bridge crossings over the Fitchburg tracks, at track elevation 34. On either side of the main bridge, the grades would be 2 percent, with the Brickbottom area to the west having a flat elevation of about 22 feet. I have shown these track areas with spot elevation figures adjacent to individual tracks, to provide a three-dimensional sense to the plan. Two stub tracks can store severely disabled trains, simply to get them off the mainline and out of the maintenance yard area during peak periods.

I-176-002

A detailed response to the "Mirror-L" storage and maintenance facility concept is included in the Appendices to the FEIR. An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, Option L is identified as the preferred maintenance facility site.

In summary, Option Mirror L avoids the $50 million landtaking within the industrial park, while requiring minor takings from underutilized private parking lots. The design shows remaining unused land that could contribute to partial mitigation for these takings. As in Option L, this plan would require acquisition of four siding tracks from private railroads, and half of the BET parking lot, with compensation being the creation of a deck structure offering equivalent parking.

Within the industrial park, the only taking would be from underutilized parking lots. No structures would be taken. The acquisition of railroad track land that is not highly utilized can be viewed as income to the railroads. The parking garage and landtakings costs would appear to be approximately $5 million, so that the net capital cost saving relative to Option L would be $45 million. The maintenance yard would add 100 jobs to the area, with no loss of jobs and no loss of tax base.

I-176-002

The essence of my comment to MEPA for the DEIR is that there appears to be a credible new alternative for the location of the Maintenance Building and storage yard. Additional design and review work will need to be done to verify any claimed advantages and unresolved disadvantages. I am hopeful that MEPA will encourage MassDOT to investigate the Mirror-L alternative closely and to report their findings in the Final EIR.

With regard to the lost track connection between the Lowell line corridor and the CSX Grand Junction track to the north, I have noted that the proposed mitigation in the DEIR for the loss of this service is to re-activate the dormant track 10 passing at grade through the industrial park. There is hope in Somerville that other alternatives might be considered to the track 10 option, but since this issue seems to apply to all alternatives, the matter should be a parallel investigation by MassDOT, with investigations of different ways to perform the track 10 function, as applied to Yard 8 and Options Mirror H, L and Mirror L. By my own observations, it could be that Mirror H does not require reactivating track 10.

To some extent, I apologize for the engineering details and any aspects of the attached plan that may not be very clear. I would anticipate an effort to redraw Mirror L on a larger plan with fewer background conflicts, so that track details can be shown more clearly. I would note that we have still not fully transported ourselves into the electronic era, since the plans included in the DEIR CD-ROM provide a "window" to look at specific locations, but the scale of the printout is simply too small for anything less than constant use of a magnifying glass.

Thank you again for this opportunity to provide extended comment. I will be submitting copies of both my comments and the plan drawing to MassDOT and various interested parties in Somerville -- the plans all hand-colored of course.

Sincerely,

Stephen H. Kaiser, PhD

ADDENDUM TO MEPA COMMENT

DESIGN SPECIFICATIONS UTILIZED IN PLAN A-1.1

Maximum mainline grades on Green Line	6 %
Maximum grades on entrance tracks into yard	2 %
Maximum grades on layover tracks	0 %
Track-to-track elevation difference, grade separation	26 feet
Green Line minimum track spacing	10 feet
Commuter rail/freight minimum track spacing...	13 feet
Minimum Green Line horizontal curve radius.....	50 feet
Minimum freight rail horizontal curve radius.....	400 feet
Layover track length, total active space	6,000 feet
Layover track area provided	60,000 sq. ft.
Support building active space	52,000 sq. ft
footprint	60,000 sq. ft.
Central service track for directional reversal	mandatory
New parking spaces needed	105 spaces
Takings of private property	Minimal
Track 10 Alternatives	Not shown

Dear Secretary Bowles:

We are owners of a condominium in the Glass Factory building at 169 Monsignor O'Brien Hwy. We live and work in the area, and therefore we are very concerned about the Green Line Extension Project and the DEIR currently under review by your office. We are regular users of the MBTA, and the idea of extending service is an exciting one. But the current proposal presented in the DEIR, although it reflects considerable effort, is not ready for approval. There are significant problems with what is proposed, particularly with regard to the new Lechmere station site and tracks. We outline our concerns in more detail below.

I-177-001

We recognize the efficiency of using the historic right of way located immediately behind our building, and building a station nearby. But it is important to note that the Glass Factory itself is a listed building on the historic register and is here to stay. If the changes to the site make the condominiums in the Glass Factory undesirable or untenable for domestic living, the problem of an unstable or even derelict historic building separating East Cambridge from the Lechmere station and NorthPoint is terrible news not only for current owners like ourselves but for the whole Cambridge community. The current plans threaten to make it very undesirable to live in the Glass Factory. Although the DEIR acknowledges a "severe" impact on our building in multiple instances, it does not propose adequate mitigating solutions. Please insist on changes to the design and placement of the new Lechmere station and to area traffic patterns before approval in order to minimize impact on residents of our building.

I-177-002

I-177-003

There are several concerning factors involved in the traffic pattern plan, or lack thereof, reflected in the DEIR. The DEIR places the anticipated ridership at the new Lechmere station at more than 10,000, nearly double the existing Lechmere station ridership, and according to the plan it outlines, almost every rider who accesses the station or an MBTA parking lot by car will drive through a loop around our building, including Water Street, which runs directly adjacent to our building. The use of Water Street as a major thoroughfare and the addition of North First Street will add complexity to the already dangerous traffic patterns in this region of O'Brien Hwy, most notably in the region adjacent to the current Lechmere station. In addition, the plan calls for these same streets to service four busy bus routes, taxis, and corporate shuttles. These same streets bear the traffic of

I-177-004

1

I-177-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

I-177-002

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

I-177-003

Revised conceptual plans for Lechmere Station, including modifications to the station headhouse and entrances, enclosed automatic fare collection, and other amenities are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-177-004

The Lechmere Station circulation plan has been revised for the FEIR. Water Street would be the primary access for vehicles entering from the north and for bus circulation. Water Street and O'Brien Highway are being redesigned to accommodate the appropriate traffic as permitted under the North Point project.

I-177-004

all who dwell in or visit our building, those who use the sizeable hotel on Water Street, and an increasing number of NorthPoint residents, and, moreover, it will be expected to serve residents, visitors, and commercial traffic to the new 22 Water Street development. Anyone who looks at Water Street, more of an alley than a street, would be bewildered by this idea. Indeed, as council records reflect, at one of the meetings concerning the 22 Water Street development, the architects of that project admitted that the road cannot be made to not meet city code to carry the traffic for that planned development alone, necessitating a separate service road away from the area for that project to be approved. Therefore, it is absurd to suggest that Water Street would be an acceptable primary access route for the new Lechmere station.

Currently, the DEIR only calls for slapping a traffic signal onto Water Street and adding a narrow access road connecting the new North First Street and Water Street, just behind our building. This proposal is clearly insufficient, even if the plan in the DEIR did not include the move to open the area to the major thru traffic from busy First Street. Please do not approve the DEIR until it includes a true service road that reroutes the bus lines and other heavy traffic invited by the new Lechmere site away from Water Street! Already, as the DEIR attests, the majority of current pedestrian crossings near our building (crossing McGrath or Cambridge St) provide a poor level of service (D, E, or F), and Cambridge has the highest level of bike traffic found at any point in the proposed area. Please insist on changes that will make the new site a true improvement rather than a dangerous recipe for traffic gridlock and accidents causing harm to vehicles, bicyclists, and pedestrians. Routing bus traffic away from directly under the windows of the Glass Factory will also diminish the traffic noise, vibrations, and fumes that would make life in the building untenable.

I-177-005

I-177-006

I-177-007

I-177-008

Current plans for the design and placement of the new Lechmere T-station are also insufficient. The DEIR claims the location was finalized through the earlier process when the station was to be built by a private developer – yet the plan for the station and the elevated tracks now presented is radically different from that proposed in the earlier process. Re-evaluation is absolutely necessary in this situation. The DEIR shows the tracks running very close to the rear of our building and acknowledges as indisputable that the impact of noise and vibration will be severe, 9 to 18 decibels higher, and also acknowledges that the mitigation methods listed in the appendix (particularly noise barrier walls) will not serve our location. The only basis that can be found in the report for claims that it will remain possible to live in our building are vague future condition statements like "analysis is needed" and the situation "will be assessed" (Noise and Vibration technical report p. 44, 45). Since this very necessary work has not yet been done, there is no basis for the report to claim that the project will not destroy our living conditions, making concentration and sleep impossible and prohibiting residents facing the trains from ever opening a window for fresh air. Imagine how you would feel if you lived here. Please do not approve the proposal until analysis has effectively shown the measures and true costs necessary for our building to remain habitable and has incorporated those into a more thoughtful design.

I-177-009

Ideally, we want to see the tracks moved further from the building than is indicated on current plans (less than 20 feet in certain instances!), preserving and extending existing green space. We also hope to see the station move closer to East Street, where it could be part of the entrance way to the eventual NorthPoint development, and for the station design to improve significantly. In particular, sidewalks where passengers for buses wait should move farther from our building to preserve our privacy and minimize impact from noise, light, and smoking. The substantial amount of surface parking shown in the plan is another serious concern. One half of our building will overlook the new parking, and we request that it be carefully designed with this in mind. Ample green space should be included in the design, and all lighting should be down lighting that minimizes light pollution to our building.

I-177-010

We also want to voice opposition to the proposed Mirror H location of the maintenance facility. It is much too close to the Glass Factory and other residential buildings and will effectively destroy further development in NorthPoint. Putting a maintenance facility on prime land in a desirable, developable location that would generate significant tax revenue to Cambridge simply does not make sense. Of the three options proposed,

I-177-005

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. The chapter presents a traffic analysis, a detailed description of pedestrian crossings of O'Brien Highway, and proposed roadway, crosswalk, and sidewalk improvements that are consistent with the NorthPoint development plans. These station and street plans will be further refined in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-177-006

Revised conceptual plans for Lechmere Station, including bus facilities and bus waiting areas, are included in FEIR Chapter 5, Lechmere Station. Bus layover has been shifted further to the east and away from the Glass Factory Condominiums in the revised Lechmere Station design. Signs will be posted to limit idling of buses, in conformance with MBTA standards.

I-177-007

Revised conceptual plans for Lechmere Station, including modifications to the station headhouse and entrances, enclosed automatic fare collection, and other amenities are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-177-008

As reported in FEIR Section 5.4, the existing outdoor-to-indoor noise reduction of the Glass Factory Condominiums has been measured and the resulting interior noise level projections have been assessed against appropriate interior noise criteria. As discussed in DEIR/EA Chapter 6

I-177-010

Option L seems to be the best choice, but it seems more logical to place the maintenance facility at the end of the newly extended line.

Sincerely,

Ravi Kamath
Stephanie Kamath

3

and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds. FEIR Chapter 5, Leachmere Station, described the proposed station, roadway and busway. It also describes proposed mitigation measures, including a noise barrier on the elevated structure near Glass Factory.

I-177-009

Although Lechmere Station will no longer function as a terminal station, there is still a demonstrated demand for existing parking. Nonetheless, parking at the relocated Lechmere Station was reduced in the revised conceptual design. These revised plans are included in FEIR Chapter 5, Lechmere Station.

I-177-010

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Mirror H location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

IAN BOWLES
THE EXECUTIVE OFFICE OF ENERGY & ENVIRONMENTAL AFFAIRS
MEPA OFFICE
ATTN: HOLLY JOHNSON, MEPA ANALYST.
EEA # 13886
100 CAMBRIDGE ST. SUITE 900
BOSTON, MA 02114

DEAR SECRETARY BOWLES,

I HAVE BEEN A WORKING ARTIST/DESIGNER IN THE BOSTON AREA SINCE 1985. I MOVED TO THE BRICKBOTTOM COMMUNITY IN 1997 FROM FORT POINT IN S. BOSTON WHEN MY STUDIO WAS BULLDOZED FOR A PARKING LOT. I FEEL LUCKY TO HAVE A PLACE IN SOMERVILLE WHERE MY PARTNER & I CONTINUE TO PRODUCE WORK & LIVE.

I-178-001 I AM STRONGLY IN FAVOR OF THE GREEN LINE EXTENSION AND AM LOOKING FORWARD TO TAKING ADVANTAGE OF THIS AS MY MAIN FORM OF TRANSPORTATION, SECOND ONLY TO BIKE AS MY WAY TO GET AROUND.

I-178-002 I'D LIKE TO BRING TO YOUR ATTENTION THAT AS A SMALL DESIGN BUSINESS (ONE WOMAN!) I LIVE & WORK AT MY STUDIO. THE EFFECTS FROM NOISE, FUMES AND IMPACT OF YARD 8 WILL BE ON MY BACK 24/7.

FURTHERMORE THIS WILL CREATE A BARRIER TO FUTURE ECONOMIC DEVELOPMENT IN MY AREA. I'D LIKE TO LOOK FORWARD TO EXTENDING MY SERVICES TO THE LOCAL AREA, I'M A VERY STRONG BELIEVER IN DOING BUSINESS IN MY LOCAL COMMUNITY!! YARD 8 WILL LIMIT OPPORTUNITIES HERE.

PLEASE CONSIDER THIS LETTER FROM A CONCERNED BRICKBOTTOM RESIDENT WHO TRULY LOVES HER COMMUNITY & THE CITY OF SOMERVILLE

BEST. GINA KAMENTSKY B353.

I-178-001

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

I-178-002

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

Subject: Comment on EEA #13886

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles,

I-179-001 I am writing to comment on the DEIR for the Green Line Extension, EEA #13886. I used to live in South Medford on Hancock St., and I am delighted to see that the Green Line will be extended to serve my old neighborhood. However, the DEIR is wrong when it states that the College Avenue station will serve Medford Hillside. The College Avenue station will serve South Medford, but it will not serve Medford Hillside.

I-179-002 The College Avenue station is also a terrible location for a terminus. Route 16 makes sense as a terminus, because there is room at Route 16 for a terminus, there is easier road access, and there are possibilities for transit-oriented development. Continuing the Green Line to Route 16 would allow South Medford residents (and Somerville residents) to use the Green Line to go grocery shopping by taking the Green Line to Route 16. I am a strong believer in the value of public transit, and in fact I do not own a car.

I-179-003 The full-build alternative in the DEIR, extending the Green Line to Route 16, will have a far greater environmental benefit to Medford residents. The Secretary's Certificate required that the benefits be maximized, so I hope MEPA will reject this DEIR's choice to leave construction of the Route 16 portion to an uncertain later time. MEPA should insist that the final environmental impact report extend the Green Line to Route 16 as a single project.

Thank you,

Tami Kaplan
600 Memorial Dr.
Cambridge, MA 02139

1

I-179-001

Since the release of the DEIR/EA, a few stakeholders raised concerns that the proposed College Avenue Station, serving as a terminal station for the Proposed Project, would not adequately serve the Medford Hillside neighborhood. Serving this neighborhood was identified as part of the SIP description. To address and resolve these concerns, CTPS prepared a memorandum demonstrating that the College Avenue Station location does adequately serve the walk market area for the Medford Hillside neighborhood. This memorandum is provided in Appendix C of the FEIR.

I-179-002

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-179-003

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA #03886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-180-001 | As a resident of the Glass Factory Condominiums, I am deeply concerned about the design and placement of the Green Line Extension and the new Lechmere Station.

TRACKS ARE TOO CLOSE TO OUR BUILDING.
The present design shows the tracks running very close to the rear of our building. We urge your designers and engineers to place the tracks as far to the rear of our building as possible to preserve views & light to the many units that will be severely impacted by the elevated tracks. The design and placement of the tracks and supports should do all it can to minimize the visual impact to those units and also minimize noise & vibration impacts to the whole building as well as the surrounding neighborhood.

LECHMERE STATION.
At present, your designs show the new Lechmere Station so close to the Glass Factory that it appears to be part of our condominium building. Please move the station closer to East Street, where it could be part of the entrance way to the eventual North Point development. The station design needs to be substantially improved so it is not an eyesore but rather an enhancement to this rapidly developing neighborhood. It should reflect the importance of this location as the gateway between Cambridge & Boston.

BUS TRAFFIC.
The many bus lines that converge on Lechmere Station are presently designed to enter at one end of our building, pick up passengers, and emerge at the other end of our condo building. Please do not route bus traffic, directly under our windows. Bus traffic noise, vibrations and fumes are a great concern. Sidewalks where passengers wait, should also be moved farther from our building to preserve our privacy and minimize impacts from noise, light and smoking. If too close, it will feel like we are living in the bus station.

PRESERVE OUR TREES & GREEN SPACE.
Presently there is a row of mature evergreen trees behind our building. I urge you to preserve all these trees and the entire small green space behind our building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks should be on the far side of the large trees. These trees serve as a natural screen for the tracks and busway.

I-180-001

Please see Comment Letter I-013.

MAINTENANCE FACILITY.
I strongly oppose the Mirror H location. It is much too close to the Glass Factory and other residential buildings and will effectively destroy further development in North Point. Putting a maintenance facility on prime land in a desirable, developable location that would generate significant tax revenue to Cambridge simply does not make sense. Of the three options proposed, Option L seems to be the best choice however I would prefer there be no maintenance facility in this area but rather it be at the end of the line.

REDUCE SURFACE PARKING.
The present Lechmere Station is at the end of the Green Line. That will no longer be the case with the new Green Line Extension and the number of parking spaces should be substantially reduced. Surface parking is bad urban design and should be minimized in the new North Point neighborhood. One half of our building will overlook the new parking and we request it be carefully designed with this in mind. Ample green space should be included in the design and all lighting should be down lighting that minimizes light pollution to our building.

Thank you for hearing my concerns.

Sincerely,

Signature

Boston, MA 02114

Secretary Bowles:

I am writing to comment on the Green Line Extension project, EEA 13886, DEIR/EA.

The Green Line Extension project is an important element in meeting the Commonwealth's long-standing obligations for environmental mitigation of the Central Artery Tunnel project. In addition, it is likely to bring significant economic benefits to Cambridge, Somerville, Medford, and surrounding communities for decades to come. Even as I voice some concerns below, I remain enthusiastic about the Green Line Extension project over-all, including the suggested Route 16 terminus.

Portions of the DEIR/EA are significantly flawed and require further refinement.

I-181-001
- Adequate analysis was not provided for noise and vibration affects of the Union Square spur on the Brickbottom Artists Building. This should factor-in any embankments that must be constructed to support the new grade in the immediate vicinity.

I-181-002
- Better access should be provided for transfers between the proposed Brickbottom station and buses along Washington Street. For example, this might include new or relocated bus stops plus a crosswalk with traffic signal at the intersection with Joy Street. Note that the latter also would improve pedestrian access to the Brickbottom station for the area north of Washington Street.

I-181-003
- Automobile parking at the Lechmere station should be reduced or eliminated since the station no longer will be the line's terminus. Reducing automobile traffic through measures such as this is a fundamental justification for building the Green Line Extension.

I-181-004
- Light pollution generated by proposed stations, storage and maintenance facilities, and employee parking has not been adequately analyzed or addressed.

I-181-005
- Routing the Green Line Extension tracks under, rather than over, the Fitchburg Line was not investigated. There are several viable options for such a route that are attractive in many ways. For example, maintaining the elevation of the proposed Brickbottom station but making the new Lechmere station subterranean or at grade, tracks could be placed in an open cut or tunnel

I-181-001

Potential noise and vibration impacts were assessed for the southwest facade of the Brickbottom Artists Building, which abuts the existing MBTA Fitchburg Commuter Rail line. Because the northeast façade represents the location of the building with a potential for more severe noise impact, findings for the southwest façade were not originally reported in the DEIR/EA. These findings have been included in FEIR Chapter 8. All noise projections take into account proposed changes to the topography of the alignment, including things such as retaining walls and grading.

During preliminary engineering, MassDOT will conduct further analysis for several individual properties, including the Brickbottom Artists Lofts. As described in FEIR Chapter 8, MassDOT will then be able to identify the specific measures that will be appropriate for mitigating the Project's noise and vibration impacts. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-181-002

The conceptual plan for the Brickbottom Station will be refined during the preliminary engineering stage, taking into consideration municipal, neighbor, and other stakeholder concerns to the extent practical. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

I-181-003

Although Lechmere Station will no longer function as a terminal station, there is still a demonstrated demand for existing parking. Nonetheless, parking at the relocated Lechmere Station was reduced in the revised conceptual design. These revised plans are included in FEIR Chapter 5, Lechmere Station.

I-181-005

I-181-006

through much of the route. Construction costs need not be excessive, there could be savings through reduced mitigation outlays, there would be greater flexibility in track alignment, and there would be reduced barriers to improving connectivity between the Innerbelt and Brickbottom areas. Furthermore, building the Green Line Extension tracks under the Fitchburg Line opens the possibility of adding a new station between Lechmere and Brickbottom, a station that would fill a notable gap and link the Innerbelt, Brickbottom, and NorthPoint communities. Such a routing is worthy of proper analysis.

I-181-007

- The proposed Community Path extension has not been given adequate treatment, particularly in the area between the Brickbottom and Lechmere stations. Easy connections between the Community Path extension and nearby Green Line stations should be provided, further discouraging automobile use to reach the Green Line Extension. A satisfactory right-of-way has not been allowed for, with the current proposal calling for a convoluted route with significant grade changes that would be difficult for bicyclists and pedestrians to negotiate effectively. A direct route adjacent and to the west of the Green Line Extension tracks, as had been envisioned in various earlier planning documents, must be allowed for.

The proposed maintenance facility, and analysis of alternatives, is particularly disconcerting for a variety of reasons.

I-181-008

- While storage and light maintenance facilities are needed along the Green Line extension route to provide for efficient operations, it is not clear that the proposed heavy maintenance facility is similarly required for efficient operations or more cost-effective than expanding the existing facilities at Riverside. In fact, the need for any new or expanded heavy maintenance facility has not been adequately demonstrated.

I-181-009

- Analysis fails to consider a potential commercial building adjacent to Yard 8, planned and through zoning variance approvals, on the recommended maintenance facility site as a "Proposed and Reasonably Foreseeable Project."

I-181-010

- As noted above, the "Yard 8" location of the maintenance facility results in an adjacent right-of-way bottleneck that does not allow for a direct and accommodating route for the proposed Community Path extension, another Proposed and Reasonably Foreseeable Project. Note that the "Mirror Scheme H" and "Option L" alternatives may allow for a Community Path extension route more similar to the envisioned route but this has not been explored.

I-181-011

- Insufficient analysis has been made of an overbuild option for "Mirror Scheme H." An appropriate design, perhaps integrating a parking structure with office and retail space, is likely to be commercially feasible, compatible with NorthPoint and Urban Ring visioning, and economically attractive even if "Mirror Scheme H" without an overbuild lacks these qualities. In addition, such an overbuild could provide substantial mitigation of sound from both the proposed Green Line and existing Commuter Rail maintenance facilities for the NorthPoint area.

I-181-004

The DEIR/EA and FEIR include conceptual Project designs. Designs for each station, the storage and maintenance facility, and the entire project alignment will be refined during the Project's preliminary engineering stage. The process for coordinating with local communities during Project design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-181-005

Tunneling alternatives were evaluated but dismissed, as described in DEIR/EA Appendix B, Section 7.

I-181-006

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

I-181-007

MassDOT is committed to completing all planning, design, and engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community Path between Lowell Street and Inner Belt Road. MassDOT is not able at this point to commit to funding the construction of the Community Path. The limits of the path were predicated on the connections to Lechmere being made through the Inner Belt area via Inner Belt Road and the proposed Urban Ring Bridge into the Lechmere area. However, the cessation of planning for the Urban Ring Project has changed the timing of this anticipated connection. MassDOT is unable to assume responsibility for designing the Urban Ring Bridge as part of the Green Line Extension Project. That being said, MassDOT is committed to working with the City of Somerville, residents and businesses in the

I-181-012

- Similarly, insufficient analysis has been made of an overbuild for "Option L," particularly with respect to reducing the cost of site acquisition. Further, employee parking in this option should be combined with Boston Engine Terminal parking, using a parking structure if necessary, to reduce the footprint required.

I-181-013

- The late inclusion of "Option L" suggests that there may be other viable locations for a storage yard and/or maintenance facility that have not received adequate treatment. Among these are the site on Somerville Avenue in Somerville now occupied by Target and AJ Wright (with overbuild potential to maintain commercial use of the property); the Somerville DPW site, which was rejected as too small, but including the adjacent Trum Field (with overbuild potential to provide a green roof and maintain recreational use of the field); and Tufts Alumni Field in Medford (again with overbuild potential to maintain sporting facilities). All of these options meet the required planning criteria yet have not received attention.

I-181-014

- Possible configuration changes to the Boston Engine Terminal and associated storage tracks were not factored into proposals for Green Line maintenance and storage facilities, even though this offers significant potential for improved plans with reduced mitigation requirements.

The Green Line Extension project will be transformative for the region. It deserves our very best effort if the communities it serves, and the Commonwealth as a whole, are to reap maximum benefit from the significant investment at hand.

Thank you for your consideration.

Sincerely,

Rob Kassel

1 Fitchburg St. Apt. C-420
Somerville, MA 02143

rob@alum.mit.edu
+1-617-388-3937

Brickbottom and Inner Belt neighborhoods, and Community Path advocates to design the Path to create improved connectivity within the Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension.

I-181-008

The Green Line Extension storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the Project. Chapter 2 of the FEIR fully describes the environmental impacts of the proposed storage and maintenance facility. In order to maximize operating efficiencies, the facility must be constructed within the same timeframe as the Green Line Extension Project, in the vicinity of the Green Line Extension right-of-way, and north of downtown Boston.

The storage and maintenance facility alternatives include storage for Green Line Extension vehicles and replacement of the existing Lechmere Station vehicle storage. Storage capacity is also provided for vehicles currently stored in trackways between Lechmere Station and Government Center; this storage will be lost due to the Green Line Extension.

I-181-009

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-181-010

Please see response to Comment I-181-009.

I-181-011

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Mirror H location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-181-012

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-181-013

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real

estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-181-014

The Boston Engine Terminal (BET) and major modifications to its operations are beyond the scope of the Green Line Extension Project. MassDOT will continue to coordinate with the MBTA to explore possibilities for shared facilities between the Green Line Extension storage and maintenance facility and the BET.

MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA# 13886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Ian Bowles,

I am writing in regards to the Project Number EEA #13886.

I have been a resident of the Brickbottom Artists Building since April of 1988. I have seen many changes and improvements in the direct area where we reside since that day. I have also seen some changes which have impacted negatively on my quality of life., such as the selling of an abutting building and destroying of many trees outside our windows. However, the train issue and specifically the maintenance facility and storage yard will provide the worst impact to the community. This community does not only serve itself, but it has overtime reached out to the larger Somerville area and has involved the larger community in projects and in providing such benefits as programs, 10 shows a year, and multiple special events., and the building has helped with scholarships, ETC. It has been a resource and asset for the larger community in many ways.

I-182-001

There have been issues such as diesel fuel and breakage of seals in windows facing trains, but we have tried to deal with these on our own. However, the placing of a maintenance Facility and Storage yard in what is called Yard 8 would really harm the community. The additional noise, negative sound and vibration impact and the light and air quality issues that would arise from this placement would be a big hindrance for the community , and would impact the lives of the 220 residents.

In addition to these concerns, the location at Yard 8 would be a hindrance to future development in the area and impact future tax revenue as property values in the area decrease.

I-182-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

As a resident of this area for over 20 years, I appreciate any consideration of alternatives to Yard 8.

Thank You,

Elissa Katler

To: Johnson, Holly S (ENV)
Subject: Greenline Extension to Rt16 Comments.

January 8, 2010

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-183-001 I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

First of all, I strongly support the Green Line extension, and urge that it be built in the most practical, beneficial and cost-effective manner – that is, to construct the entire project in one phase, with a terminus station at Mystic Valley Parkway (Route 16), by December 31, 2014.

The DEIR is encouraging in that it concludes that the Route 16 station would provide the most benefits according to all project criteria, including air quality and environmental justice. However, MassDOT states that it is incapable of building (and funding) the entire "Preferred Alternative," so it only intends to build the extension to College Avenue in the Tufts University area of Medford, by its deadline of December 31, 2014.

In my opinion, the DEIR as currently written does not serve the best interests of the project. More importantly for your review, it was not done in a way that "adequately and properly" complies with the state environmental regulations, nor with the December 1, 2006 MEPA certificate that defined the requirements of the DEIR.

For the following reasons, I strongly urge you to not accept the DEIR as the Final EIR and require further environmental analysis of the project by MassDOT:

1. A two-phased approach is unacceptable. The Route 16/Mystic Valley Parkway Station should be built as part of a single-phase project to minimize costs and negative impacts and achieve the maximum benefits with regard to ridership, vehicle mile travel reduction, air quality improvements, and service to environmental justice communities.
The recommendation as outlined in the DEIR is for the Route 16/Mystic Valley Parkway station to be a separate stand-alone Phase II project with no funding source identified. This means, Route 16 may never be built.
There are many, many problems with the Phase II approach, including:
    - Risk. Without an identified funding source there is a very high probability that Route 16 will never be built and the implications of this are critical.

1

I-183-001

Please see Comment Letter I-002.

- Terminus Impact. Without a Route 16 Station, the College Avenue stop (designed and intended to be an interim station) would become the de facto terminus for the Green Line extension. It is not designed for a terminus and due to the traffic flow and neighborhood density, as well as the lack of opportunity for transit-oriented development at College Ave., it is not a good location for a terminus.
- Cost. The two-phased approach is fiscally irresponsible and by MassDOT's own estimates will inflate the cost by $55 million over a single-phase approach. Severing a single stop (less than one mile of track) from the project as a whole will cost the state, and thus the taxpayers, significant additional money. There are obvious ways to easily reduce costs in the overall project and provide enough additional funds to include Route 16 as part of a single, complete project. This is the most prudent approach, and also would ensure that the project produces the air quality improvements the Commonwealth must achieve to come into compliance with the Clean Air Act.
- Project Management. There are significant efficiencies gained from completing the project in one phase, rather than the starts and stops required to execute on separate, multi-stage efforts for such a small add-on project as a single station stop.
- Environmental Justice: The environmental justice population cited, in part, to justify the project as a whole will largely not be served if the project terminates at College Avenue. The negative aspects of this project will affect them most, while they will receive the least benefit without service to a Route 16 terminus.
- Legal Mandate: The state is legally obligated to provide public transit services to Medford Hillside by December 31, 2014, and stopping the extension at College Ave. fails to meet this legal obligation. At a minimum, this incurs significant mitigation costs required if the obligation is not met.

2. College Avenue should not be a terminus. The College Avenue station is not designed for the additional requirements of a terminus. The neighborhood cannot sustain the impact of a terminus station operations and traffic volume and the potential environmental damage is of serious concern.

3. The Route 16 station design is inadequate. The DEIR offers only a "worst case scenario" (MassDOT's description) for the Route 16 station design, while offering optimized station designs for all other Green Line extension stations. The Route 16 station design must be revisited. The Medford Green Line Neighborhood Alliance, a volunteer citizen group, has offered an alternative station design that prevents two major commercial property acquisitions and the resulting job displacement, preserves $182,000/year in property taxes for the City of Medford, optimizes traffic flow and better serves the integrity of the station's surroundings. MassDOT apparently has been exploring similar improved designs, which should be presented to the public for comment. A $1 billion project deserves a higher caliber design than a "worst case scenario."

To summarize, there is much more work to be done on the Environmental Impact report, and I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis in order to make the Green Line extension the best project it can be, and MUST be.

Thank you.

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office, EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Attn: Holly Johnson, MEPA Analyst

Dear Secretary Bowles,

I am a resident of East Cambridge. We are very concerned about the relocation, as well as the new design of the Lechmere MBTA Station. I am sure your office has conducted a thorough investigation and is well informed on the number of people who travel on the Green Line to go to the CambridgeSide Galleria, as well as the numerous residents of East Cambridge and the surrounding Cambridge community that use the T. We are all very concerned about the relocation across McGrath Highway.

I-184-001

A major concern is safety. Considering the people who will be crossing McGrath Highway to catch the train or bus, which will include mothers with baby strollers, the elderly, teenagers who often disregard crossing lights, and just simply the masses that we witness everyday heading to the mall ignoring traffic lights, one could only imagine the dangerous situation this may cause for both cars and pedestrians. I hope that with a move to the other side of McGrath, all crossings at Cambridge Street and McGrath Highway will be well designed with protection and ease for crossing. The current pedestrian crossing down that street at the Museum of Science to NorthPoint Park is extremely dangerous having a long wait for the walk light and short timing to cross. The crossing to the proposed Lechmere Station is almost twice that distance. Neither drivers nor pedestrians are very patient.

I-184-002

Another issue is the design of the new MBTA Lechmere Station that was presented to the community. It is hard to conceive that a brand new station would be built without an interior space and sheltered area to purchase tickets and to wait for the train. It appears that all the other new and/or renovated stations have been designed for the elements of New England weather. A better design with an inside entrance will enhance the experience of using mass transportation encouraging more ridership.

1

I-184-001

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. The chapter presents a traffic analysis, a detailed description of pedestrian crossings of O'Brien Highway, and proposed roadway, crosswalk, and sidewalk improvements that are consistent with the NorthPoint development plans. These station and street plans will be further refined in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-184-002

Revised conceptual plans for Lechmere Station, including modifications to the station headhouse and entrances, enclosed automatic fare collection, and other amenities are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

The design and planning itself is very poor and flawed. I question why the location to the entrance is at the back of the station. There really needs to be more than one entrance and easy access for the handicap passengers. The bus station needs to be developed keeping the future of NorthPoint in mind. Good planning will be able to serve the residents, office workers, and others who will work or live there.

I-184-003

Most importantly, the historic Lechmere Station needs to be preserved. The East Cambridge community has created a plan for reuse of the structures as a year round public market. This is a brilliant idea. A market square that will function as a connector of East Cambridge to the new Lechmere Station will provide a much needed retail and open market. It will also bring new businesses to the area to serve the new residents and employees creating a lively marketplace that will enrich the neighborhood. Destination Lechmere will become just that - a place to go using the convenience of the T.

I sincerely hope you will consider the needs of the community and your riders in the design and relocation of Lechmere Station. It is very important to also look at reuse and maintaining some of the history and fabric of the community while making improvements.

Thank you,
Donna M. Keefe

In the realm of ideas, everything depends on enthusiasm; in the real world, all rests on perseverance.
- Johann Wolfgang Van Goethe

I-184-003

MassDOT has reviewed the suggestions submitted by the East Cambridge Planning Team. Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. These plans, including the pedestrian crossings of O'Brien Highway and associated street, crosswalk, and sidewalk designs will be further refined in the preliminary engineering stage of the Project. As part of the Green Line Extension, MassDOT intends to demolish the existing Lechmere Station and prepare the site for potential future redevelopment. Based on the current requirements of the O'Brien Highway roadway improvements (as shown in FEIR Chapter 5, Lechmere Station), the existing bus shed must be removed.

January 3, 2010

The Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA# 13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Ian Bowles:

I am writing in regards to the DEIR on The Green Line Extension Project going thru Somerville, Massachusetts. The project Number is EEA#13886.

First of all, I want you to know how delighted I am that the Green Line is finally coming to Somerville. I can assure you, I will be one of the first to ride it.

I-185-001

However, **I am opposed to Yard 8 which has the Maintenance Facility, Storage Yard, and tracks located very close to my front door.** This would mean excessive noise, vibration, noxious fumes, decreased light and other unknown problems that I and 220 other residents of the Brickbottom Artist's Community would have to deal with 24-7, forever.
I request that the project not go to a final EIR with yard 8 included.

I-185-002

I would like you to conduct a thorough review of other locations for the Maintenance Facility and Storage Yard such as Option L and Mirror H, a combination of the two or other locations. The plan could consider using more MBTA land from the Boston Engine Terminal site.

Option L should be studied and elaborated upon. As Option L is now drawn, the curved tracks coming toward the Brickbottom Community would create a shrill noise each time a car traveled over it which would be many times a day. Could Option L be shifted onto the Boston Engine Terminal Property to allow the tracks to have less of a curve?

I-185-003

According to your overview "The Commonwealth is committed to initiating passenger service on the Green Line Extension by December 31, 2014." **You do not need to have the Maintenance Facility and Storage Yard done by December 31, 2014.** I urge you to take more time to consider the needs of Somerville and the Brickbottom Community and draw up a plan for this extensive Maintenance Facility and Storage Yard, that shows consideration for our needs but also serves the whole MBTA system. This Facility is designed to serve the whole MBTA system not just Somerville and the Green Line Extension therefore it should be designed with that in mind.

I-185-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-185-002

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-185-003

The Green Line Extension storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the Project. Chapter 2 of the FEIR fully describes the environmental

I-185-004 The Green Line tracks planned adjacent to Brickbottom should be moved further away from the Community. The plan to have extensive train reversals during each day should be reevaluated and eliminated to prevent excessive noise near our community.

I-185-005 I am requesting that a Citizen Advisory Committee be established to oversee the rest of the project to ensure the community has a voice in the Green Line Extension Process. I want to impress upon you that this is our home. We do not want our homes excessively and negatively impacted by this Project. We enjoy socializing and dining in our small Courtyard which is within our complex of buildings. With Yard 8 a short distance from our Courtyard we would no longer be able to be outside. Yard 8 would completely destroy our way of life at our home.

Thank you and I look forward to seeing more agreeable alternatives to Yard 8.

Sincerely,

Priscilla L Kennedy

Priscilla Lamb Kennedy

impacts of the proposed storage and maintenance facility. In order to maximize operating efficiencies, the facility must be constructed within the same timeframe as the Green Line Extension Project, in the vicinity of the Green Line Extension right-of-way, and north of downtown Boston.

The storage and maintenance facility alternatives include storage for Green Line Extension vehicles and replacement of the existing Lechmere Station vehicle storage. Storage capacity is also provided for vehicles currently stored in trackways between Lechmere Station and Government Center; this storage will be lost due to the Green Line Extension.

I-185-004

The precise alignment for the tracks near the Brickbottom Artists Building will be determined during preliminary engineering and final design. The tracks will be located as far from the building as possible. The minimum clearance will probably be about 15 feet. Operations of the Boston Engine Terminal (BET), MBTA Commuter Rail and other railroads, and railroad vehicles are beyond the scope of the Green Line Extension Project. The BET "Drill Track," or the track used to access the BET from the west, will be relocated approximately five feet further from the Brickbottom Artists Building as part of the Green Line Extension Project.

I-185-005

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

Johnson, Holly (EEA)

Subject: Regarding EEA #13886 Green Line extension DEIR

Secretary Ian Bowles/Holly Johnson
MEPA Analyist

Dear Secretary Ian Bowles,,

I-186-001

The community members engaged with CCP would like to see all decisions related to the planning of the Green Line and the land use in the ¼ mile areas around the 7 proposed stations to reflect this list of Corridor Core Principles. Please see third paragraph for list of Core Principles and corresponding suggested changes to Draft Environmental Impact Report (DEIR).

The Community Corridor Planning project, a grassroots effort to engage community members in the land use planning along the Green Line extension, has brought together hundreds of people to frame a list of core principles to guide their recommendations for land use along the extension in upcoming months. We ask that these principles be taken into consideration as the Mass. Department of Transportation finalizes its Environmental Impact Report.

Core Community Principles for
Neighborhood Development Along the Green Line Corridor

? More Local Jobs: We want a fixed percentage of respectable jobs of all types with good wages and benefits for Somerville residents, from construction to permanent.

? Increase Commercial and Economic Development: We want to see the creation of squares as destinations, with careful attention to mixed use of commercial/residential, reuse of buildings, and economic development to increase the tax base.
o Draft Environmental Impact Report (DEIR) does not address Department of Transportation (DOT) commitment to economic development
o New MA DOT is supposed to work with Secretary of Economic Affairs to promote station location and design that promotes economic development and the community needs to show MA DOT how to do this ? to change the paradigm pro-actively.

? Improve the Green Environment: We want a safe, environmentally friendly neighborhood with more green space, trees, and gardens; reduction of noise; avoidance of light pollution; and prevention of toxic chemicals in the air.
o Response to DEIR: Given this principle, it is important that more attention be given to:
o Noise of operations
o Mitigation during construction for noise, vibration, etc.
o How close the tracks will be to the Brickbottom Building and other buildings along the right of way
o The need to involve neighborhoods affected regarding noise and vibration
o Recommendation that testing be done immediately after project begins to determine if estimates for vibration and noise done for the DEIR are accurate.
o Possibly transfer at Ball Square but only if Commuter rail is electric not diesel because of the pollution it would create for neighbors
o Rep. Provost noted in comments made that diesel trains should not stop in Somerville. This should only be permitted if trains are electrified

I-186-001

MassDOT has reviewed and considered the “Core Community Principles” for station area land use, presented by Community Corridor Planning. As described in the FEIR, Section 6.2 of the Public Involvement Plan, MassDOT will hold land use workshops to discuss related issues with the community.

o Consider dual-mode conversion of existing commuter trains
? Encourage Walking and Biking: We want to encourage walking and cycling, through safe, bike/pedestrian friendly design of streets and paths around and between stations.
o Pedestrian accessibility is poor for the station designs in the DEIR
o The design required in the MEPA Scope (EENF) does not sufficiently address the detailed concerns and requirements for each station.
o In the DEIR design and engineering is insufficient for moving the project to a final EIR because of a range of unaddressed issues (i.e., station design, siting, bike parking, community path integration)
o Bike access and bike parking at all stations needs to be improved.
o New Light Rail Vehicles (LRVs) should be designed to accommodate bicycles (like Portland LRVs)
o The Community Path and its important station connections must be designed and constructed simultaneously with the Green Line extension in order to facilitate direct pedestrian and bicycle access to the stations and to ensure a safe, attractive, and highly-functional Community Path.

? Create Community Gathering Spaces: We want both indoor and outdoor safe, public gathering spaces for community members.

? Improve Access: We want above standard, safe access to and between stations for people with disabilities, strollers, and pedestrians in general

? Community Involvement: We want to make sure residents are included on an ongoing basis in the planning, design, and zoning changes to the stations and areas around them. Youth, artists, and others should help design stations, with attention to amenities. We need an easy and clear process for residents to address problems as they come up, with ways of immediately resolving unseen impacts.
o Ongoing Community participation in the next phase (presumed to be done as a design/build project) is necessary
o Public involvement will help to keep decision-making public (transparency)
o Need to have a field office that residents can go to with concerns on an ongoing basis
o Need neighborhood based community groups to be involved in planning around each station,
? Connecting Buses and Trains: We want to ensure inter-modal access between neighborhoods and stations, for new train service to be adequate and speedy, and for existing bus lines to continue to serve areas not connected by train.
o Need opportunity for future connection with other lines, such as Red Line at Porter Square.
o Several stations do not show bus stops, or nearest bus stop is located outside of station. Would be helpful to design station and alter bus route to allow for stops at the stations.

? Keep and Add Local Businesses: We want locally owned, culturally diverse, clean businesses in commercial areas with employees who live in Somerville.

? Keep Somerville Affordable: We want to make sure people of all economic means have the ability to afford housing and living costs, so that Somerville residents, such as child care workers, cab drivers, local business employees and others can stay here affordably.

? Maintain Our Diversity: Preserve and encourage economic and ethnic diversity of residents and businesses.

I-186-002

The state needs to plan all transportation projects on the basis of guiding principles for Transit Oriented Develoment (TOD), smart growth and quality of live impacts. For example, TOD and land use are the planning and organizing focus of the South Coast Rail project, but

I-186-002

Direct and indirect impacts to land use are described in DEIR/EA Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for sustainable land use, which could further reduce automobile traffic congestion and improve air quality.

I-186-002

have been ignored in the Green Line extension planning despite the requirement by the Secretary to address these concerns in the EENF.

MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA #03886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-187-001 I am a resident of the Glass Factory Condominiums and have the following comments about the Green Line Extension DEIR.

TRACKS ARE TOO CLOSE TO OUR BUILDING.
The present design shows the tracks running very close to the rear of our building. We urge your designers and engineers to place the tracks as far to the rear of our building as possible to preserve views & light to the many units that will be severely impacted by the elevated tracks. The design and placement of the tracks and supports should do all it can to minimize the visual impact to those units and also minimize noise & vibration impacts to the whole building as well as the surrounding neighborhood.

LECHMERE STATION.
At present, your designs show the new Lechmere Station so close to the Glass Factory that it appears to be part of our condominium building. Please move the station closer to East Street, where it could be part of the entrance way to the eventual North Point development. The station design needs to be substantially improved so it is not an eyesore but rather an enhancement to this rapidly developing neighborhood. It should reflect the importance of this location as the gateway between Cambridge & Boston.

BUS TRAFFIC.
The many bus lines that converge on Lechmere Station are presently designed to enter at one end of our building, pick up passengers, and emerge at the other end of our condo building. Please do not route bus traffic, directly under our windows. Bus traffic noise, vibrations and fumes are a great concern. Sidewalks where passengers wait, should also be moved farther from our building to preserve our privacy and minimize impacts from noise, light and smoking. If too close, it will feel like we are living in the bus station.

I-187-001

Please see Comment Letter I-013.

PRESERVE OUR TREES & GREEN SPACE.
Presently there is a row of mature evergreen trees behind our building. I urge you to preserve all these trees and the entire small green space behind our building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks should be on the far side of the large trees. These trees serve as a natural screen for the tracks and busway.

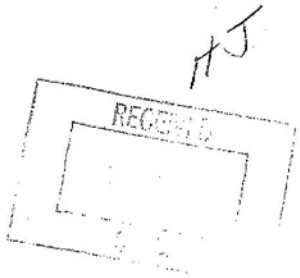
MAINTENANCE FACILITY.
I strongly oppose the Mirror H location. It is much too close to the Glass Factory and other residential buildings and will effectively destroy further development in North Point. Putting a maintenance facility on prime land in a desirable, developable location that would generate significant tax revenue to Cambridge simply does not make sense. Of the three options proposed, Option L seems to be the best choice however I would prefer there be no maintenance facility in this area but rather it be at the end of the line.

REDUCE SURFACE PARKING.
The present Lechmere Station is at the end of the Green Line. That will no longer be the case with the new Green Line Extension and the number of parking spaces should be substantially reduced. Surface parking is bad urban design and should be minimized in the new North Point neighborhood. One half of our building will overlook the new parking and we request it be carefully designed with this in mind. Ample green space should be included in the design and all lighting should be down lighting that minimizes light pollution to our building.

I hope you will take the concerns of Glass Factory residents seriously.

Sincerely,

Umair Khan



The Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EE#13886
100 Cambridge St, Suite 900
Boston, MA 02114

Dear Secretary Ian Bowles,

I am writing in regards to the Green Line Maintenance Facility and Storage Yards sites. We seem to have come down – or up -- to 3 choices for siting the maintenance yard buildings and tracks. I am thrilled to see that EOT (and others) have shown some flexibility in this process. At first I was not very happy with the way this was proceeding, seemingly without regard for the cities and with minimal opportunity for comment. I sent my emails, but I got the feeling they weren't having any effect. Maybe I was wrong. Glad to see.

Though I ride the green line about twice per year, I am strongly in favor of extending the line. I went to the nearby hearings and meetings even before the maintenance facility controversy started. I'm also thrilled about the "community path," which I expect to use quite a lot. I look forward to seeing some more detailed plans. Given the scale of the GLMF as an obstacle to the Community Path, are there plans being made to create access from the west side of the Green Line, such as from the Brickbottom neighborhood (which is currently isolated by tracks and a highway)??

I-188-001

So back when Yard 8 was initially presented, I thought nothing of it. It would be foolish to expect that undeveloped land/space in an urban area would never have a building on it. I was indifferent or even in support. I silently wondered if my neighbors were making a big fuss over nothing. However, since then a lot of people with more knowledge of transportation infrastructure and urban planning have convinced me that it's a bad idea to put the GLMF at Yard 8. I do understand that it is the easiest and cheapest option, but those considerations should not be overriding. Mayor Curtatone has also been very convincing in his arguments against Yard 8.

Would Yard 8 ever have worked? (rhetorical question) Perhaps if the building were situated further north away from Brickbottom and not so tall, and if some solution were found to the access issue of Innerbelt, but I only saw one set of drawings. I don't know the history of Innerbelt. It's sad that the area is named after the unfinished project that was supposed to destroy it. Anyway, Somerville (nevermind us noisy artists) should have much say in where in the city the GLMF gets built. I am sure the city would trade Yard 8

I-188-002

for some other parcel not owned by the MBTA(?) or whoever. Putting new windows on Brickbottom is not acceptable to me or anyone else. We do not want to live in a climate controlled building. We want to open the windows and breathe fresh – or somewhat fresh – air. Our building is not equipped with ductwork and all that anyway. You'd have to tear

I-188-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-188-002

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-188-002

it down and start over. If you're prepared to do that, then we can talk about it, but it won't be a popular notion. It seems to me that Yard 8 was poorly designed and very sloppily and aggressively presented. I doubt that it would have been acceptable to Somerville in any form. I am please to see alternatives.

I like Option L a lot and Mirror H okay. I have heard some noise from Cambridge about Mirror H, and I understand that North Point is valuable, but so far I see a huge expanse of wild grass and weeds over there. This reduces my sympathies. North Point is no more valuable than Innerbelt! It has the advantage of plans on paper, but nothing more. That being said, I have nothing against North Point. I actually share many of the concerns of the Glass Factory residents. [By the way, they need to move their main entrance off the McGrath Highway. Vehicles stopping on the highway are a terrible nuisance and hazard. Please see if you can design them some access on the other side of their building, which should have been done when it was developed.] Option L will mean the end of a few big box businesses, and I hope that they can be compensated adequately.

My suggestions in a nutshell:

I-188-003
- Stick the GLMF over by the existing MBTA blue thing and isolate it as much as possible from residential areas.

I-188-004
- Consider making the GLMF and train yard not so ugly as usual. Then you can save money on visual barriers. Some people like trains.

I-188-005
- Keep the Community path on track – or accelerate it.

I-188-006
- Organize – or let someone organize – a tour of the Newton/Watertown GLMF so people can get some idea what it would be like – or not like.

I-188-007
- Minimize parking at the GLMF. I realize that employees have to be there early, but there are other ways to get around.

I-188-008
- Put some solar panels on the roof and maybe over the yard. It would make the whole thing way more popular around here.

Thank you for your consideration,

Ulandt Kim
Brickbottom resident since 1997.

I-188-003

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, Option L is identified as the preferred maintenance facility site.

I-188-004

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

I-188-005

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-188-006

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-188-007

The Green Line Extension storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the overall Project. Chapter 2 of the FEIR fully describes the environmental impacts of the proposed storage and maintenance facility. Opportunities to reduce or consolidate parking requirements for

employees will be taken into consideration during preliminary engineering of the maintenance facility.

I-188-008

Detailed design of the maintenance facility, including the potential for solar panels, will be conducted during the preliminary engineering phase.

Subject: somerville bike path and green line extention support

Dear Ms Johnson,

I-189-001

I am a rider and commuter who uses the Somerville community bike path and I am writing to urge you to please support the extension of the bike path in Somerville.
I am not completely up to speed on the technicalities but I believe our best hope of including this far sighted and Green friendly transportation and rec. option is to bundle the request for the path together with]the proposal for the green line extension, which has more powerful backing behind it

I believe it is the right thing to do for the state and the community

The similar linear path above the red line which was similarly funded has been a great success and indeed is a huge asset to the region connecting as it does to the most used bike path in the country, the minuteman bike path/

Thank you again for taking the time to consider our comments and best of luck in obtaining approval for this important project !

Boston, MA 02114

Dear Secretary Bowles,

I-190-001 This letter is in response to **EEA #13886.** I want to register my objection to the MBTA's Yard 8 project and suggest that **Option L** be a less objectionable alternative. I look forward to the extended Green Line into Somerville, but I have some concerns.

First, the Brickbottom Artists' Condominium is a very active community with 220 residents in a live/work three building complex. Twenty two years ago as a young family along with eighty-five other members we converted an A&P warehouse complex into this creative community. Many more families followed and now there is a great mix of young and old. Adding Yard 8 would mean more noise, trains and pollution all detrimental to our community's health and livelihoods.

I-190-002 Second, on a photo assignment this summer on the top floor of One Federal Street in Boston, I had the time to look out over the buildings into Somerville. I was really stunned, shocked to see that the only large green space to the N.West was adjacent to the Brickbottom Complex and Inner Belt Road. It would be a shame, some would say a sin, if this green area were to be covered in train sheds and tracks.

I-190-003 Thirdly, I am concerned for the future of my photo business at One Fitchburg Street. If there is going to be constant ground vibration from the Yard 8 site it will make me rethink the type of work that I will be able perform there. I can presently live with a few trains a day rumbling by at the far end of the building, but constant vibration, even at low sonic levels, would be detrimental to the most lucrative part of my present business model.

Thank you for your time and consideration of my concerns.

Bill Kipp

I-190-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

Boston, MA 02114

Dear Secretary Bowles:

I am an abutter to the proposed Green Line Extension terminus location at College Ave. in Medford. We bought our house three years ago in Medford knowing the Green Line was coming, and I look forward to the project's eventual completion.

However, while I support this project in concept, the progress thus far has left me questioning whether the Green Line Extension (GLE) will ever actually serve the Medford Hillside. I disagree with MassDOT's claim that a terminus station at College Avenue fulfills the state's legal commitment to serve Medford Hillside, as the vast majority of what is commonly accepted as the Hillside area is far beyond where the service would terminate by December 2014. Further, the Medford Hillside neighborhood would bear the additional burden of increased traffic destined for a terminus station at College Avenue, resulting in a net negative effect for one of the specific environmental justice neighborhoods to be served by the SIP requirement.

I-191-001

I-191-002

MassDOT must construct the Preferred, Full-Build Alternative for the Green Line extension to Medford with a terminus station at Route 16 in one phase by Dec. 31, 2014, in order to achieve the maximum environmental benefits of the project and to fulfill the requirement to serve the Hillside. For these reasons, The Draft Environmental Impact Report should not be accepted as the Final Environmental Impact Report, because the DEIR fails to fulfill the requirements of the Dec. 1, 2006 MEPA Certificate that determined the scope of the project.

I-191-003

MassDOT defines the Medford Hillside only one time in the entire DEIR, and they define it as such:

I-191-004

"The Cecil Group, Inc., planning consultants, prepared the Medford Community Development Plan (2004) for the City of Medford, Office of Community Development as part of the Commonwealth of Massachusetts' Executive Order 418. Although the Development Plan focuses primarily on Medford Square, the document identifies Medford Hillside (broadly defined as Boston Avenue from the Mystic Valley Parkway to Warner Street) as an economic development area. If the station site is approved, the City of Medford has expressed an interest in exploring the implementation of TOD adjacent to the station."

I-191-001

As directed by the Secretary's Certificate on the DEIR/EA, the FEIR includes a limited scope of issues related to the Green Line Extension Project. The Proposed Project, with a Medford Branch terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Although an extension to Mystic Valley Parkway/Route 16 is MassDOT's Preferred Alternative, financial constraints prohibit the Commonwealth from progressing the Project beyond College Avenue at this time.

Since the release of the DEIR/EA, a few stakeholders raised concerns that the proposed College Avenue Station, serving as a terminal station for the Proposed Project, would not adequately serve the Medford Hillside neighborhood. Serving this neighborhood was identified as part of the SIP description. To address and resolve these concerns, CTPS prepared a memorandum demonstrating that the College Avenue Station location does adequately serve the walk market area for the Medford Hillside neighborhood. This memorandum is provided in Appendix C of the FEIR.

I-191-002

The Project is intended, in part, to relieve traffic congestion, as described in DEIR/EA Chapter 2, Purpose and Need. Some station access points for passenger drop-off/pick-up are likely to impact local traffic flow, as outlined in DEIR/EA Section 5.5, Traffic. As described in DEIR/EA Chapter 6, these impacts will be minimized to the extent practical. However, with the exception of relocated Lechmere Station, no parking is provided at any of the new Green Line Extension stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes how MassDOT

I-191-004

This definition is so broad, it is laughable, and more importantly it never actually appears in the Medford Community Development Plan (2004). The plan is available for download here: https://app2.ocd.state.ma.us/e418portal/Plans.asp?c=M

The plan linked above, as part of Executive Order 418, is largely a plan targeted for Medford Square. It contains no definition of the Medford Hillside that would agree with what MassDOT has claimed. In fact, in relation to "economic development areas" there is a map on page 22 that identifies economic development areas with red boxes. In the key at the right, Box E-1 is identified as Medford Hillside. On the map, Box E-1 is centered on Winthrop Street and Boston Ave., a block or two in each direction. There are a number of supporting maps in separate PDFs filed with the 2004 MCDP that define Hillside as between Winthrop and North St. with an apparent skew towards the North St. side.

We simply cannot and should not allow MassDOT to use a misleading definition of Medford Hillside just because it makes the project easier or cheaper for them to implement.

Consider:
-- If MassDOT is allowed to redefine Medford Hillside in this way, the Burget Brookings, and Charnwood Ave. neighborhoods will all be impacted with the additional burden of a College Ave. terminus and temporary train storage in the morning beginning at 4:00 AM. With a Route 16 terminus, residential neighborhoods would be spared from train staging in the morning, and the terminus would be situated much further from residential buildings.

-- Some parts of this neighborhood will receive no mitigation because MassDOT is not required to mitigate for the Commuter Rail track shift in the area in which full Green Line tracks are not laid, which will inevitably lead to a quality of life decrease for some residents.

-- Unfortunately, most residents do not know they will not receive mitigation since a College Ave. terminus was never shown at the heavily attended public workshops, but instead was slipped in during the last few months before the DEIR was released.

-- A terminus station at College Ave. would have a dramatically different operation and impact on the neighborhood than a mid-route station, and these impacts were not evaluated in the DEIR. MassDOT has not supplied a plan to the public showing College Ave. as a permanent terminus. This is a completely undesirable option, but it must be considered as a possible scenario.

-- The traffic impacts of a College Avenue terminus station also are understated and under-evaluated and require much further study.

will coordinate with municipalities and stakeholders to address traffic and parking concerns. Additionally, FEIR Chapter 4 summarizes the impacts of College Avenue as a terminal station.

I-191-003

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

I-191-004

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

Since the release of the DEIR/EA, a few stakeholders raised concerns that the proposed College Avenue Station, serving as a terminal station for the Proposed Project, would not adequately serve the Medford Hillside neighborhood. Serving this neighborhood was identified as part of the SIP description. To address and resolve these concerns, CTPS prepared a memorandum demonstrating that the College Avenue Station location does adequately serve the walk market area for the Medford Hillside neighborhood. This memorandum is provided in Appendix C of the FEIR.

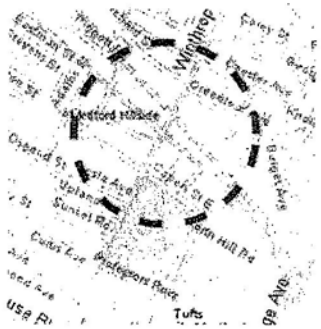
I-191-004

-- Constructing the Medford branch of the extension in two phases would result in unnecessary and undue disruption and other impacts to the College Avenue neighborhood.

-- If MassDOT is allowed to terminate the line at College Ave., easy access to the station from the neighborhoods closest would be dependent on path access through Tufts property to College Ave. (reached at the end of Burget Ave. and Sunset Ave.), without that access, which may be tenuous given the unlikelihood Tufts would want its Facilities parking lot to become a thoroughfare, there may not be a single non-Tufts Medford residents within a 5-10 minute walk of the only station in "Medford Hillside". This simply cannot be the intention of the project.

Many of these effects would at least be a burden worth bearing if the area would be fully served by the new service, but instead Medford just ends up bearing the load of the project so that MassDOT can claim success on some contrived definition of the Medford Hillside. When I look at maps from the Beyond Lechmere project, it's not clear to me that MassDOT, just a few years ago, would buy their own claim, that College Ave. serves the Medford Hillside, as these two areas were defined distinctly and separately in those maps with separate areas they intended to serve as specified by the locus' in the maps from Beyond Lechmere shown below:

Beyond Lechmere B-6



Beyond Lechmere B-7

While I think the failure to meet the SIP requirement to serve the Medford Hillside is the most critical element missing from this project thus far, it is not my only concern.

Operationally, I understand that the Maintenance facility for the proposed Green Line is of great importance to the project, but can't help but feel that the facility has become, to many, the focus the project, MEPA needs to bring this project back in line with its true purpose by shifting the focus to maximizing the environmental benefits

I-191-005

All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

of this project. The DEIR clearly demonstrates that the benefits from the project in regard to ridership when going to Rt. 16 (70% switching from auto travel), including reduction of vehicle miles traveled in the service region; air quality improvements; and service to environmental justice communities, are all best served by extending the Green Line to Rt. 16, and MEPA must not allow this to be put off into a nebulous second phase, which may or may not ever occur. By doing so, it fails to meet both the letter and spirit of the SIP requirement to serve the Medford Hillside. As former Secretary Aloisi said in his report on his tenure, "The Green Line extension is a lost opportunity without the clear and unequivocal commitment of extending the line to Route 16. "

I-191-005

In contrast to all of the concerns I have with this project, I am encouraged by MassDOTs commitment to design these stations in a manner that fits well with the surrounding neighborhoods, and does not include parking. Most importantly they have taken great care to minimize residential property takings. However, the current design of the Rt. 16 station (and the only one publically released) flies in the face of all other designs in this project. MassDOT officials have publicly acknowledged (at a Medford City Council Meeting on 11/17/2009) putting forth the "worst case scenario" for the Rt. 16 station. This is not acceptable in a document that is required to reduce all negative impacts. MEPA should require further analysis of Rt. 16 so that the public is not reviewing a best case or a worst case but a viable design of what MassDOT can actually achieve at this location. The Medford Greenline Neighborhood Alliance (MGNA) has put forth an alternative design for the Route 16 station, which demonstrates that adjusting the track curvature and platform orientation would eliminate the need to acquire the commercial properties at 200 and 222 Boston Avenue. This would reduce the project cost by at least $15.4 million (the buildings' current assessed values) and preserving nearly $200,000 in annual property tax revenue for the city of Medford. Analysis of MGNA's plan should be included as part of the further analysis of this site in a final EIR.

When you look at the $130 million dollars needed to absorb the Lechmere Relocation into the State's plan, one can't help but think that Lechmere and the Maintenance facility have taken an enormous amount of both time and budget to plan so far, some of it unexpectedly, and that we wouldn't be arguing over the inclusion of Rt. 16 had this not occurred. We cannot allow these pieces of underlying infrastructure distract and drive the project--these are requirements to support the project, but not the project itself. MEPA is well situated to assert this by requiring full service to the Medford Hillside and inclusion of Rt. 16 in a final EIR. As former Secretary Aloisi said, "The Green Line project must also be approached with the clear acknowledgement that prior assumptions regarding the source of funding the Lechmere Station relocation no longer are valid, and may not be for a long time."

We need to make the most of this incredibly unique opportunity, which will certainly not happen again in our lifetime. MassDOT has repeatedly referred to this project in public workshops as a 100-year opportunity, and we should all be proactive in ensuring that it is completed in a manner that best serves the affected

communities, and in one phase. The environmental and economical benefits of this project over years and decades will be enormous, and MEPA with its long view of the future benefits of this project to the environment and the Commonwealth is one of the few we'd hope to recognize and fight for this.

Sincerely,

Michael Korcynski

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA #03886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-192-001 As a resident of the Glass Factory Condominiums, I am deeply concerned about the design and placement of the Green Line Extension and the new Lechmere Station.

TRACKS ARE TOO CLOSE TO OUR BUILDING.
The present design shows the tracks running very close to the rear of our building. We urge your designers and engineers to place the tracks as far to the rear of our building as possible to preserve views & light to the many units that will be severely impacted by the elevated tracks. The design and placement of the tracks and supports should do all it can to minimize the visual impact to those units and also minimize noise & vibration impacts to the whole building as well as the surrounding neighborhood.

LECHMERE STATION.
At present, your designs show the new Lechmere Station so close to the Glass Factory that it appears to be part of our condominium building. Please move the station closer to East Street, where it could be part of the entrance way to the eventual North Point development. The station design needs to be substantially improved so it is not an eyesore but rather an enhancement to this rapidly developing neighborhood. It should reflect the importance of this location as the gateway between Cambridge & Boston.

BUS TRAFFIC.
The many bus lines that converge on Lechmere Station are presently designed to enter at one end of our building, pick up passengers, and emerge at the other end of our condo building. Please do not route bus traffic, directly under our windows. Bus traffic noise, vibrations and fumes are a great concern. Sidewalks where passengers wait, should also be moved farther from our building to preserve our privacy and minimize impacts from noise, light and smoking. If too close, it will feel like we are living in the bus station.

PRESERVE OUR TREES & GREEN SPACE.
Presently there is a row of mature evergreen trees behind our building. I urge you to preserve all these trees and the entire small green space behind our building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks should be on the far side of the large trees. These trees serve as a natural screen for the tracks and busway.

I-192-001

Please see Comment Letter I-013.

MAINTENANCE FACILITY.
I strongly oppose the Mirror H location. It is much too close to the Glass Factory and other residential buildings and will effectively destroy further development in North Point. Putting a maintenance facility on prime land in a desirable, developable location that would generate significant tax revenue to Cambridge simply does not make sense. Of the three options proposed, Option L seems to be the best choice however I would prefer there be no maintenance facility in this area but rather it be at the end of the line.

REDUCE SURFACE PARKING.
The present Lechmere Station is at the end of the Green Line. That will no longer be the case with the new Green Line Extension and the number of parking spaces should be substantially reduced. Please consider using the under-utilized parking garages that are already in this neighborhood. Surface parking is bad urban design and should be minimized in the new North Point neighborhood. One half of our building will overlook the new parking and we request it be carefully designed with this in mind. Ample green space should be included in the design and all lighting should be down lighting that minimizes light pollution to our building.

Thank you for hearing my concerns.

Sincerely,

Chantal Kesmidis & G P Kesmidis

Subject: Greenline Extension to Route 16

Dear Ms. Johnson:

I-193-001 | I-193-002 | I-193-003 | I-193-004

Up to this point I have kept quiet on the subject of the Green line extension but after reading today that this is the last chance to comment I must do it now. I am a home owner who lives on Piggott Road, and as a resident of the City of Medford who will be directly impacted by the proposed extension I am adamantly opposed to the Greenline extension to Route 16. I currently endure the noise from the Commuter Rail and cannot imagine living there with the additional and more constant noise of Greenline trolleys. I have serious concerns about increase of noise (during and after construction), increased activity in the area and increased number of people and cars in the area. More importantly, I am vehemently opposed to any plan that includes the demolition of any homes. I am dismayed and angry that such a project is even being considered if homes are to be sacrificed. The need for a T-stop is not at a level to warrant the taking of homes. In fact, I question the wisdom of adding one more stop to the extension when currently there exist a multitude of buses from the area to various subway stations in addition to direct access to the commuter rail in West Medford. Having the Greenline extension end at College Ave would allow still further access without negatively impacting home owners along the rail line to Route 16. Furthermore, if indeed it is true that a parking facility is planned as part of the Extension to Route 16 plan this means a major increase in traffic to an area that has recently seen an overwhelming increase in traffic along Boston Avenue due to more and more students bringing cars to school. If no parking structure is planned then only those within walking distance can access the trains but of course what will happen is people will be driven and dropped off there causing traffic increases that negatively impact the environment.

I see no real advantage to the extension to Route 16. A stop at College Ave would be within walking distance of Route 16 or a very short bus ride for people from the West Medford and certainly the Hillside area. The stop there as far as I know will not impact homes.

Having reviewed the names on the original petitions that were signed in favor of the project, I am bothered that so many of those people do not live in the Hillside/West Medford area.

I-193-005

I fear that there is a rush to advance this project before those of us who will be most impacted are able to respond adequately and to be heard sufficiently. Unfortunately, I have been disappointed to hear very little support or consideration from some of those who have been elected to represent the interest of all their constituents. What happened to the commitment to formulate a plan that did not include the taking and demolition of homes in Medford?

As a resident who lives alongside the tracks between College Ave and Route 16, I hope that my opinion would rank as high if not higher than those who live well beyond this area. It is easy to be in favor of something when it is not going to have any negative impact upon you.

I-193-006

How will the City of Medford compensate me for the impact the proposed extension to Route 16 will have upon my life and my property?

Sandra Kosta

1

I-193-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-193-002

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-193-003

DEIR/EA Section 5.2 describes the Project's potential acquisitions. MassDOT is currently conducting detailed property surveys to obtain more specific data. MassDOT will continue to evaluate opportunities to minimize these property impacts. It is intended that no residential buildings will be demolished or acquired for this Project.

I-193-004

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and

Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

I-193-005

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-193-006

Please see response to Comment I-193-001.

RECEIVED
JAN 7 2010
MEPA

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles,

Thank you for this opportunity to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project. As a Medford representative on the Green Line Extension Project Advisory Group, I have been actively involved in the project during the DEIR phase, and I was similarly engaged as a member of the Beyond Lechmere Northwest Corridor Study advisory group.

I am pleased to see the project advance to this important milestone, and find much to be complimentary of in the DEIR analysis and recommendations, including:

- Designation of the Mystic Valley Parkway (Route 16) terminus station, with no parking, as the Preferred Alternative, as this option is shown to have the greatest benefits under all evaluation criteria
- Minimization of neighborhood impacts by avoiding residential property takings or displacement of residents (neither anticipated in Medford)
- Recommendation of significant mitigation measures that will improve existing noise and vibration conditions, even with the addition of Green Line service.

However, the purpose of your review is to determine whether the DEIR fulfills the requirements set forth by your predecessor, former Environmental Affairs Secretary Robert Golledge, in the Dec. 1, 2006 MEPA Certificate on the Green Line Extension Expanded Environmental Notification Form, which determined the scope of the DEIR.

I-194-001

After through examination, it is my opinion that the DEIR *does not* fulfill these requirements, and therefore *should not* be accepted as the Final Environmental Impact Report (FEIR), as the project proponent MassDOT has requested.

I-194-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

According to the 2006 Certificate, in order to be accepted as an FEIR, the DEIR must provide a "reasonably complete and stand-alone description and analysis of the project, project alternatives and environmental impacts, and adequately address mitigation." Further, the Certificate states that the DEIR should "investigate all feasible methods of avoiding, reducing or minimizing impacts to land."

The DEIR fails to meet these requirements in numerous ways, most significantly by:

I-194-002
- Failing to analyze and design the Mystic Valley Parkway (Route 16) station to minimize impacts and maximize the benefits. In fact, the DEIR presents what MassDOT describes as a "worst-case scenario" for the station – the only element of the project treated in such a fashion.

I-194-003
- Failing to fully analyze the impacts of a College Avenue station as the terminus on the main branch to Medford, which is the proposal for Phase I of the project and for an undetermined period thereafter.

I-194-004
- Failing to fully assess environmental impacts and address mitigation measures, particularly in the Medford Hillside area, which will *not* be served by the Green Line extension if it terminates at College Avenue, and actually will bear additional burdens that would not be inflicted if the terminus station were at Route 16.

I-194-005
- Failing to fully assess the environmental impacts and address mitigation measures, nor even begin a design, of "Option L" for the Green Line storage and maintenance facility, a late addition to the DEIR but one with broad support from abutters and the affected communities, and much more preferable than the previously recommended Yard 8 site.

Despite being filed 10.5 months after the Dec. 1, 2008 deadline, I find the DEIR to be materially deficient in almost every category.

Therefore, the Secretary of Environmental Affairs should require MassDOT to continue the Environmental Impact analysis to address the many outstanding issues cited here and presented at the Nov. 18, 2009 public hearing, most importantly the complete analysis of the Mystic Valley Parkway (Route 16) station.

I-194-006
Further, MassDOT should be required to conceive a new funding strategy that will allow it to construct its Preferred, Full-Build Alternative – that is, a terminus station at Route 16 with no parking – in one phase by Dec. 31, 2014, in order to achieve the maximum environmental benefits of the project *without delay* and fulfill the commonwealth's legal deadline for providing Green Line service to Medford Hillside.

Following are specific issues related to the DEIR.

I-194-002

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-194-003

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-194-004

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

I-194-005

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further

Incomplete Analysis of Mystic Valley Parkway Station
The DEIR fails to fully analyze and reduce/mitigate the environmental impacts of the Mystic Valley Parkway terminus station, and scant work was performed on the station design over the last 20 months of the project. The DEIR states:

> "In February of 2008, a series of public workshops were conducted in the neighborhoods to discuss the proposed station areas and to obtain feedback from stakeholders on the various concepts developed. Based on previous work and the feedback obtained at these workshops, the station concepts for Gilman Square and Mystic Valley Parkway/Route 16 were generally accepted by the public and local officials and did not require additional evaluation." (Appendix B, page 7).

While the concept of the Mystic Valley Parkway station might have been "generally accepted," numerous serious issues were raised at the Feb. 6, 2008, station workshop, including objections to proposed commercial property takings from a major property owner in attendance, as well as concerns about pedestrian/bicycle accommodations, traffic volume/safety, parking, and impacts on the Mystic River Reservation.

Later, in Appendix B, the DEIR acknowledges the need for additional study of the station:

> **4.6 Route 16 / Mystic Valley Parkway Station**
> This station would extend the Green Line's service further into Medford. The proposed station location is just south of the railroad bridge over Mystic Valley Parkway. This station has potentially high capital costs for right-of-way and station site acquisition and bridge reconstruction. Due to design constraints, community and City of Medford concerns, further evaluation would be needed to determine the feasibility of this station. (Appendix B, page 15)

However, while Appendix B contains a detailed analysis of all the other stations (except Gilman Square) with regard to Station Access, Transit Operations, Land Use Compatibility and Project Cost, no such analysis is provided for the Mystic Valley Parkway Station, even though the DEIR states that the Future Full-Build Alternative has been "fully evaluated" (page ES-7).

Instead, the DEIR presents a design for the Route 16 station that would require the acquisition of two large office buildings in Medford, which would add at least $20 million to the cost of the project and result in a decrease of almost $185,000 in annual property tax revenue to the city of Medford.

When called to appear before the Medford City Council on Nov. 17, 2009, to explain this design recommendation and associated negative property impacts, Project Manager Steve Woelfel of MassDOT stated numerous times that the design for the Route 16 station represents the "worst case scenario" with regard to property acquisition needs.

consideration and Option L is identified as the preferred maintenance facility site.

I-194-006

Project cost estimates are based on the current, conceptual level of design, and will be further refined as the Project progresses through preliminary engineering. It is anticipated that Green Line Extension construction would be financed with a combination of funds from federal and state sources. Efforts to engage a developer for the North Point development will continue as this Project moves into the next phases of design.

This is not acceptable in a document that is required to minimize all negative impacts. Further, Mr. Woelfel's comment contradicts the DEIR's assertion that "station locations and track curvatures have been optimized in order to avoid unnecessary property acquisitions" (page 5-9).

Clearly no attempt at such optimization has not been undertaken at the Mystic Valley Parkway Station, although at the same Medford City Council meeting, Mr. Woelfel announced that MassDOT had in fact created another Route 16 station design that *did not* require the acquisition of the two office buildings, but had yet to publicize it.

I-194-007

Also at the Nov. 17 Medford City Council meeting, the Medford Green Line Neighborhood Alliance (MGNA) presented an alternative design for the Route 16 station that adjusts the track curvature and platform orientation such that the need to acquire the commercial properties at 200 and 222 Boston Avenue is eliminated. Further benefits of such a design include:

- Reducing the project cost by at least $15.4 million (the buildings' current assessed values).
- Preserving about $185,000 in annual property tax revenue for the city of Medford
- Eliminating the need to relocate numerous small businesses and more than 200 employees, and the related expense

MEPA should require MassDOT to complete its analysis and present a station design at Mystic Valley Parkway that preserves the commercial properties at 200 and 222 Boston Avenue, and also analyzes the potential adaptive re-use of the U-Haul building at 600 Mystic Valley Parkway, Somerville, as part of the station design.

In addition, further analysis is required at the station regarding:

I-194-008

- Providing a pedestrian connection to the West Medford commuter rail station, which was required in the DEIR but not addressed.

I-194-009

- Re-evaluating potential ridership to include additional bus route access, which is not considered in the DEIR.

I-194-010

- Including Alternative 2 (Mystic Valley Parkway terminus) in Air Quality Analysis Comparison for Project Packages Benefits; Table 5.6-10 only includes Alternative 1 (College Avenue terminus). The Mystic Valley Parkway terminus will result in greater CO_2 reductions (page 5-94) and should be included in the analysis.

All of this analysis should be required as part of an additional EIR submission to MEPA.

Full-Build Alternative Should be Built in One Phase

Citing an anticipated inability to obtain funds to construct the Full-Build Alternative as part of a single project, the DEIR recommends that the Medford branch of the extension be completed only to College Avenue by Dec. 31, 2014 (the commonwealth's legal requirement for providing Green Line service to Medford Hillside), with the section between College Avenue and Route 16 to be built by an unspecified date.

I-194-007

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-194-008

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-194-009

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout, access, and ridership potential at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

Relegating the Full-Build Alternative to an undetermined second phase contradicts the DEIR's conclusion that this alternative provides the maximum benefits from the project in regard to ridership, reduction of vehicle miles traveled, air quality improvements, and service to environmental justice communities.

At the Dec. 1, 2008 meeting of the Project Advisory Group, Tom Wholley of VHB said his company's analysis showed the greatest air quality benefits would be derived from the alternative that places the terminus station at Route 16. Further, Mr. Wholley stated that the Green Line extension would improve air quality on a local and regional basis by reducing levels of carbon monoxide, particulate matter, ozone, and greenhouse gases. He said it was "extremely rare" for a transportation project to show positive impact in all four of these areas.

Delaying the construction of the Full-Build Alternative also fails to respond to the acute need for better transit service in the immediate area that was quantified in the DEIR. According to the DEIR traffic analysis, the intersection of Route 16 and Boston Avenue had the second highest daily traffic volume (28,915 vehicles) in the entire project area (page 4-43). In addition to the accompanying mobility impairments and air quality degradation, this overwhelming traffic volume also negatively impacts the adjacent Mystic River, as storm run-off from Mystic Valley Parkway drains directly into the river, carrying harmful elements from auto emissions.

I-194-011

The Mystic Valley Parkway Station should be built as part of a single phase, otherwise the environmental benefits will be delayed or possibly never realized, as the construction of Phase 2 is not a certainty.

A one-phase project build to Route 16 also is preferable because:

- By providing the greatest benefits with regard to air quality, mobility, ridership and environmental justice, the Preferred Alternative is the strongest regional project and would be most competitive in vying for federal funding.
- By MassDOT's own estimate, the cost of constructing the final leg of the extension, from College Avenue to Mystic Valley Parkway, would increase by $50 million by undertaking it in a second phase between 2016-2020.
- Delaying the completion of the project into a second phase would push it outside the scope of the current MEPA and NEPA review process, requiring another complete review, additional costs and further delays. All can be avoided with a single-phase construction.

Other comments on the Route 16 terminus

- There are almost 10,000 people living with a half-mile (10-minute) walk of the Route 16 station. In addition, two multi-use paths (walk/bike) are being planned to lead directly to the station. The first, from the Alewife/Arlington side, just was approved for stimulus funds. The other, which will follow the Mystic River toward Wellington, will be the next to be built. These safe walking/biking options will encourage people

I-194-010

Please see response to Comment I-194-008.

I-194-011

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

to not drive to Davis Square, Alewife or Wellington Station to take the T, but rather walk to the Green Line.

- A terminus station at Route 16 would be accompanied by numerous roadway improvements that would improve traffic flow and safety, including the addition of a turning lanes, signalization changes, and a complete reconstruction of the dangerous (especially for pedestrians) rotary at Mystic Valley Parkway and Alewife Brook Parkway. None of these improvements will be undertaken if the extension terminates at College Avenue.

- In the DEIR analysis, the Route 16 station was one of four stations with "High" potential for Transit Oriented Development. Economic Development is a key component of the Green Line extension project, as well as regional mobility and air quality improvements.

- The Route 16 station also would serve three significant Environmental Justice communities in West Medford and West Somerville that otherwise would not be served by a College Avenue terminus.

I-194-012

- All of the proposed station designs, and in particular the Route 16 station, do not call for adequate bicycle parking. The Route 16 station should have at least four times as many parking spaces as called for in the DEIR (50), particularly since this station will be fed by two new bicycle/pedestrian pathways from east and west.

I-194-013

- All of the proposed stations do not provide for adequate and inviting access for pedestrians and for people with disabilities. Much more design work needs to be done in this area.

College Avenue Terminus Station Environmental Impacts Not Evaluated

The DEIR did not fully evaluate the environmental impacts of a terminus station at College Avenue. A terminus station would have a dramatically different operation and impact on the neighborhood than would a mid-route station.

Rather than passing through the station, trains will travel several hundred feet beyond the station in order to reverse direction on tail tracks. This operation will occur every 5 or 10 minutes throughout the service period. In addition, Green Line cars will be staged at the terminus station in the early morning hours prior to the start of service. These impacts are not evaluated in the DEIR.

I-194-014

The traffic impacts of a College Avenue terminus station also are understated and underevaluated. The Alternative 1 Peak Hour Trip Summary by station shows an increase of only 5 pick-up/drop-off passengers (40) at a College Avenue terminus station versus the number of pick-up/drop-off passengers at College Avenue (35) in Alternative 2B (Mystic Valley Parkway terminus). The total daily drop-off/pickup riders at a College Avenue terminus are shown to be only 15 high (115 vs. 100) than with a Route 16 terminus.

I-194-012

The amount of bicycle storage at each station is based on ridership projections developed by CTPS. DEIR/EA Appendix D includes the methods CTPS used to analyze demand for bicycle parking. Detailed bicycle parking designs will be further developed during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

I-194-013

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-194-014

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and

I-194-014

The actual number of pick-up/drop-off riders is likely to be much higher, the addition of which will have a greater negative impact on the traffic at College Avenue/Boston Avenue (9,000 daily vehicles) than it would have at Mystic Valley Parkway (29,000 daily vehicles).

I-194-015

Furthermore, several intersections in the College Avenue destination area – Boston Avenue/Winthrop Street, Boston Avenue/Harvard (Warren) Street, Main Street at George Street, Mystic Valley Parkway/Winthop Street – already are operating at an "F" level of service and will only be made worse by additional vehicle traffic destined for a College Avenue terminus station. These additional traffic delays equate to more emissions and diminished air quality.

Also, according to the DEIR, the intersection of Boston Avenue and College Avenue's level of service is projected to decrease from "E" to "F" with a terminus station at College Avenue, but would remain at level "E" with a Route 16 terminus station.

Indeed, the negative impacts of a terminus station at College Avenue cannot be overstated. This five-pointed intersection is already hazardous for drivers, pedestrians and bicyclists. Accommodations for pick-up/drop-off activity are only shown on the northbound side of Boston Avenue, when in fact a heavy amount of pick-up/drop-off traffic is likely to arrive traveling southbound (from West Medford, West Somerville, East Arlington, etc.) and will likely attempt U-turns on Boston Avenue, or try to snake through residential streets to access other arterials. The confluence of Mystic Valley Parkway and Boston Avenue is much more suited for accommodating pick-up/drop-off traffic.

Finally, constructing the Medford Branch of the extension in two phases would result in unnecessary and undue disruption and other impacts to the College Avenue neighborhood that are neither analyzed nor proposed to be mitigated in the DEIR.

Additional Environmental Analysis/Mitigation Deficiencies

I-194-016

- The DEIR recommends numerous mitigation measures, but they are often described with caveats such as "to the extent practicable" and "where feasible." Before construction begins, the MassDOT should be required to enter into written agreements with each affected city, defining the mitigation obligations and deadlines for fulfillment.

I-194-017

- Additional mitigation measures should be specified including cash payments to affected abutters, such as were agreed upon for the Greenbush commuter rail extension project, and retrofitting the existing commuter rail diesel locomotives with emission-reduction devices, especially since the commuter rail tracks will be moved closer to certain abutting properties.

I-194-018

- The construction of noise barriers is not included in the proposed Construction Sequencing (page 3-55). Addition of the noise barriers should be added to the Construction Sequencing and as early in the process as possible, so their benefits are realized during the construction period as well as during the Green Line service operation. The same holds true for financial payments to abutters for improvements

access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-194-015

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-194-016

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

I-194-017

Please see response to Comment I-194-016.

I-194-018

Please see response to Comment I-194-016.

I-194-018

such as new windows and insulation, which should be distributed before construction begins so the property owners will receive the benefits of these mitigation measures during the project construction.

I-194-019

- MBTA policy is to commit at least 2% of project cost to noise mitigation. With an overall cost estimate of $1 billion, the Green Line noise mitigation commitment should be at least $20 million; the DEIR estimates only $15.8 million.

- Underscoring the incomplete nature of the analysis of the Route 16 station, the DEIR does not appear to include any vibration monitoring in the portion of the project north of College Avenue. This should be rectified in a additional EIR.

I-194-020

- The proponent should be required to perform soil analysis when the commuter rail tracks are relocated, testing for contamination from the railroad ties (creosote, etc.) and performing any necessary cleanup or mitigation.

College Avenue Station Does Not Fulfill the State's Legal Obligation To Provide Service to Medford Hillside by Dec. 31, 2014

I-194-021

The Secretary's Certificate requires that the DEIR describe its consistency with the State Implementation Plan. While MassDOT maintains that extending Green Line service to College Avenue fulfills its SIP legal requirement to serve the Medford Hillside area by Dec. 31, 2014, I strongly disagree, an opinion that I and many others have expressed to MassDOT during the course of the DEIR and prior.

There has always been a degree of ambiguity regarding what constitutes "Medford Hillside," as it is a neighborhood without officially prescribed boundaries. Perhaps further complicating matters, MassDOT chose the DEIR as an opportunity to redefine what it considers to be Medford Hillside while seeking no input on the matter from the Project Advisory Group.

In the 2005 Beyond Lechmere study, Medford Hillside was defined as extending "over the river to West Medford," and that "Boston Avenue is a primary roadway through Medford Hillside that has urban centers and activity centers at the intersection of Winthrop Street and along the section from College Avenue to Arlington Street" (Beyond Lechmere Northwest Corridor Study, page 3-44.).

The DEIR offers a new description of Medford Hillside, which it says is "broadly defined as Boston Avenue from the Mystic Valley Parkway to Warner Street" (page 4-18). The DEIR intimates that this definition came from the 2004 Medford Community Development Plan, although that plan offers no such description of Medford Hillside (see https://app2.ocd.state.ma.us/e418portal/Plans.asp?c=M and document EO418_CD_Plan under Medford).

More accurate are dozens of maps submitted to EOT in August 2008 by the Medford Green Line Neighborhood Alliance (MGNA) that all label "Medford Hillside" as the area northwest of Winthrop Street to Mystic Valley Parkway. These include EOT's own maps from the Beyond Lechmere study and other state publications such as MBTA bus maps.

I-194-019

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-194-020

An analysis of hazardous materials potentially present within the Green Line Extension Study Area is provided in DEIR/EA Section 5.14, Hazardous Materials. Additional investigation may be conducted during the next phases of the Project to determine the nature and extent of any contamination and remediate any sites as appropriate. This work would be conducted in accordance with the Commonwealth's Massachusetts Contingency Plan requirements.

I-194-021

As directed by the Secretary's Certificate on the DEIR/EA, the FEIR includes a limited scope of issues related to the Green Line Extension Project. The Proposed Project, with a Medford Branch terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Although an extension to Mystic Valley Parkway/Route 16 is MassDOT's Preferred Alternative, financial constraints prohibit the Commonwealth from progressing the Project beyond College Avenue at this time.

The area south of College Avenue is generally known as South Medford, with Warren Street (a k a Harvard Street east of Boston Avenue) being in the center of South Medford. (Ironically, Warren Street is actually closer to the proposed station at Ball Square than it is to College Avenue, further indication of the absurdity of its inclusion as part of Medford Hillside.)

A terminus station at College Avenue does not constitute service to Medford Hillside, much of which is more than one-half mile from the station. Project Manager Kate Fichter admitted as much at an Aug. 24, 2009 meeting with College Avenue neighbors when she described the College Avenue station as "ill-defined as Medford Hillside."

Yet, the DEIR states that "the extension will pass through the Medford Hillside neighborhood to South Medford" (page 4-25). This is erroneous as applied to Alternative 1 (College Avenue terminus). The only things that will "pass through" the Medford Hillside neighborhood under this scenario will be additional automobiles destined for the station, adding to already congested traffic and poor air quality.

I-194-022

Medford Hillside would only be truly served by the Green Line extension if there were a station at Winthrop Street (which EOT evaluated but did not recommend) or at Mystic Valley Parkway. Thus, the latter should not only be the Preferred Alternative but also the Proposed Project, to be built in one phase by Dec. 31, 2014, as required by the SIP.

Maintenance/Storage Facility Unresolved

Another major unresolved issue of contention during the DEIR process has been the location of the maintenance/storage facility required by the Green Line extension. Despite studying approximately 20 potential sites, MassDOT continued to favor the original recommended location of Yard 8, even though this location was universally opposed by the city of Somerville, residents of the neighboring Brickbottom complex, the Somerville Chamber of Commerce and citizen advocates. MassDOT attributed to the lengthy delay in its filing of the DEIR to its ongoing efforts to resolve this issue.

Finally, just before the DEIR was filed, MassDOT added a new potential site, called Option L, to the DEIR, along with Yard 8 and a site submitted by the city of Somerville known as Mirror Scheme H.

Option L has received considerable support from all factions of the Somerville community, and its proximity to the existing Boston Engine Terminal makes it a more practical location than Yard 8. While this site seems to offer great potential, it has not been studied to any degree of depth, nor has a design been offered. Also, as proposed, Option L would cost approximately $52 million more than the Yard 8 location, mostly due to property acquisition needs.

I-194-023

Nevertheless, the site has the potential to break the logjam of community opposition and ultimately be satisfactory to all concerned parties. So, MEPA should require full analysis of this location and adjacent options in an additional environmental filing. (One additional option, adjacent to and east of the Option L site, is being proposed by

I-194-022

As described in DEIR/EA Appendix B, Section 4.5, MassDOT's analysis and understanding of the ridership market potential concluded that the Winthrop Street area would be best served by a single station in the vicinity of College Avenue and Winthrop Street. As explained in DEIR/EA Section 3.7, the preferred station location is at College Avenue.

I-194-023

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-194-023

Somerville resident Alan Moore and would eliminate the need for the expensive property acquisitions. Evaluation of this option should also be required.)

Lechmere Station Relocation Impacts

Midway through the DEIR process, MassDOT was forced to assume the redesign and cost of the relocation of Lechmere Station as part of the Green Line extension project, because a developer was unable to fulfill its commitment to pay for the station relocation into the stalled North Point project.

This has added approximately $111 million to the cost of the project, or roughly the estimated cost of the College Avenue-to-Route 16 section of the extension. More than anything, this circumstance has forced MassDOT to relegate this final portion of the Green Line extension to Medford into a second phase, to be built sometime between 2016 and 2020, even though the DEIR demonstrates that the Full Build Alternative to Route 16 provides the greatest air quality benefits, as described above.

I-194-024

MEPA should require MassDOT to seek alternative funding the for Lechmere Station relocation, as well as redesign major project elements such as the Route 16 station, to reduce costs in order for the entire project to be economically feasible to be built in one phase by Dec. 31, 2014.

Cost Estimates, Funding Details Missing

I-194-025

The DEIR was to include a Conceptual Construction and Operating and Maintenance cost estimate for the Preferred Alternative commensurate with 10% design including contingencies/allowances appropriate in this stage of project advancement. Construction costs were to include, at a minimum, the commuter rail and Green Line track, bridges, retaining walls, and other supporting infrastructure, the maintenance and storage facility, all stations and supporting facilities, and any portion of the Community Path included in the project. Operating costs were to include changes in Green Line, commuter rail, and bus operating costs.

While the DEIR provides an overall cost estimate, and occasional references to particular cost estimates such as for noise barriers and vibration mitigation, detailed cost estimates are not provided. Noticeably absent was any analysis of the Cost Per Hour of User Benefit for each alternative, a crucial measure of the project's competitiveness for federal funding.

Similarly, the DEIR was to include detailed information on funding sources, but it does not, only to say it is unable to identify sufficient funding to support the construction of the College Avenue-to-Route 16 section of the project.

An additional EIR should be required to provide a full, detailed cost project and a summary of funding sources and how these funds will be secured.

Other issues

I-194-026

- The project design in a further Environmental Impact Report should preserve the potential for future stations – between Lechmere and Washington Street/Union

I-194-024

Project cost estimates are based on the current, conceptual level of design, and will be further refined as the Project progresses through preliminary engineering. It is anticipated that Green Line Extension construction would be financed with a combination of funds from federal and state sources. Efforts to engage a developer for the North Point development will continue as this Project moves into the next phases of design.

I-194-025

Please see response to Comment I-194-024.

I-194-026

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

I-194-026

Square in Somerville, between College Avenue and Route 16 in Medford, along with an extension to Porter Square that could serve both Cambridge and Somerville.

I-194-027

- The DEIR lacks any meaningful analysis of how the Green Line extension will integrate with bus service and broad pedestrian and bicycle access. The fact that only 5 percent of riders are expected to travel to/from stations by car (pick-up/drop-off), and that 70 percent of new riders will be switching from the auto mode, speaks to the paramount importance of improving access to the station areas for people walking, bicycling, and arriving via bus.

I-194-028

- The MEPA certificate should require a public process framework for the remainder of the project that will ensure collaboration with the community and local governments to set project mitigation standards and remedies, to accomplish better station and area designs and minimize environmental impacts.

Conclusion

The new Massachusetts Department of Transportation is committed to make "investments and decisions that strengthen communities, support economic growth and improve public health." The Green Line extension is the perfect example of a project that will fulfill that mission, but only if it is built in the most environmentally beneficial and cost-effective manner. The Environmental Impact Report is perhaps the most crucial document for ensuring that this occurs, and by the SIP mandated deadline of Dec. 31, 2014.

I urge the Secretary to consider all the above comments as sound evidence of the need for MassDOT to conduct additional environmental analysis, and require such work.

However, it is also important that the overall project be able to continue without any unnecessary delays. Therefore, I urge the Secretary to use his discretion to frame the requirements in the forthcoming Certificate in such a way that the project can proceed on pace toward meeting its interim and final deadlines while the missing or incomplete environmental analysis is finished to MEPA's satisfaction.

MassDOT refers to the Green Line extension as a "100-year project:" we only get such an opportunity once a century. This also speaks to the importance of getting the project done right, for if we do not, the negative implications will be felt into the next millennium. I urge your careful consideration of these comments and trust you will require this project be "done right" for our communities, our environment, and future generations.

Thank you for your consideration.

To: Johnson, Holly S (ENV)
Subject: Greenline Extension/Lechmere Station

Dear Ms. Johnson -

We own a condo at the Glass Factory.

I-195-001 We are concerned that the tracks are too close to the building. Would it be possible to move the tracks further from the building? The DEIR reports lists the Glass Factory as severely impacted. How can we expect to quietly enjoy our property with the anticipated noise and vibration issues?

I-195-002 Our unit is on the 3rd floor. We will be facing train cars/tracks all day? Can a barrier be set up so that the view is not severely impacted?

I-195-003 It has become apparent that units that face the proposed construction are impossible to sell. In addition to the noise and vibration, most owners will be severely impacted by the decrease in property values. Can we expect some type of financial compensation?

Thank you for your attention and I look forward to your response.

I-195-001

FEIR Chapter 5 describes the revised conceptual plans for Lechmere Station, including station design, track alignment, bus routings, and other elements. Changes to the track alignment depicted in the DEIR/EA and the station layout were evaluated. It was determined that these changes could result in additional impacts on Lechmere area abutters. Proposed mitigation measures for area abutters are also described in FEIR Chapter 5. During preliminary engineering, specific station design elements will be further developed.

I-195-002

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

Re: Project Number EEA #13886

Dear Secretary Bowles:

Regarding to the above-referenced project, the Green Line Extension beyond Lechmere to Medford, I thank you for your ongoing engagement in and encouragement of public dialogue and comment throughout the course of this complex undertaking. I wish to comment on the Draft Environmental Impact Report (DEIR) filed for this project, particularly the siting of the Heavy Maintenance and Storage Facility as proposed in the DEIR for the Yard 8 site in the Brickbottom/Inner Belt district and the potential impacts this would have on the Brickbottom Artists Buildings as assessed by VHB/Vanasse Hangen Brustlin.

Let me state that I am a seven-year resident of the Brickbottom Artists Building, and have commuted, every day for seven years, to my job in Boston's Financial District via the Green Line from Lechmere. I have walked the half-mile to Lechmere through blizzards, rain, sweltering heat, and bitter cold. I have encountered groundhogs, coyotes, rats, the homeless, drug dealers, and speed-demons on my daily treks. I have stepped in or, luckily, skipped over broken glass, feces, roadkill, and fresh garbage. Few would welcome a nearby Green Line stop in our neighborhood more than me.

I-196-001
I-196-002

However, the fragile existence and tremendous potential of my neighborhood are greatly compromised by the proposed siting of the Heavy Maintenance and Storage Facility in our midst. The VHB/Vanasse Hangen Brustlin technical memorandum on "Potential Impacts to Brickbottom Artists Buildings," dated May 2009 and supplemental and informative to the DEIR, provides inadequate and misleading conclusions regarding the devastating consequences the siting of the Heavy Maintenance and Storage Facility would have on the vibrant mixed-used Brickbottom Artists community. Additionally, insufficient planning for mitigation of noise and vibration generated by the Green Line extension on the Brickbottom Artists Buildings threaten the continued existence of this community, and no economic study has been conducted to assess the impact this proposed siting would have on the Brickbottom/Inner Belt district, one of the

I-196-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-196-002

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. An expanded analysis of potential noise and vibration impacts at the Brickbottom Artists Buildings is included in FEIR Chapter 8. These projections take into account the collective impacts of rail uses in the area. During preliminary engineering, MassDOT will conduct further analysis for several individual properties, including the Brickbottom Artists Lofts. As described in FEIR Chapter 8, MassDOT will then be able to identify the specific measures that will be appropriate for mitigating the Project's noise and vibration impacts. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-196-002

"last frontiers" for development in the central Boston metropolitan area and a prime candidate for thoughtful, world-class transit-oriented development.

I-196-003

The VHB/Vanasse Hangen Brustlin technical memorandum does not state the parameters or methodology of the research behind its assessment of potential impacts to the Brickbottom Artists Buildings. It proceeds to make assumptions and statements regarding existing conditions and potential impacts based on, presumably, in-office research. This begs the questions:

- What was the research methodology used in the assessment of the potential impact of the Green Line Maintenance Facility on the Brickbottom Artists Buildings as stated by the VHB/Vanasse Hangen Brustlin Technical Memorandum?
- Were any thorough site visits conducted by VHB in the research process for this document?
- Were aspects such as building height, building materials, and building complex adjacencies considered throughout the process?

The VHB-authored Technical Memorandum states:

"The Artist Buildings are approximately 95 feet from the support facility site and are separated from the site by an existing wall topped with a chain-link fence, vegetation next to the fence, and the existing MBTA right-of-way."

I-196-004

This is incorrect. There is no separation between the Brickbottom complex and the proposed support facility site, excepting a chain-link fence. The grade of the proposed site is at the finish floor grade of the second level of the Brickbottom Cannery building, at the eave level of the Brickbottom Foundry building, and 15 to 20 feet above the rear ground elevation of the Brickbottom Bakery building, the three components of the work/live complex. An earth-backed retaining wall/viaduct runs the length of the complex along this grade separation. The vegetation mentioned are weeds and invasive species such as ailanthus. This mis-statement falsely gives the impression that the Brickbottom complex is separated from the proposed Maintenance Facility site by a substantial barrier; I assure you, it is not. Again, this begs the questions,

- Were any thorough site visits conducted by VHB in the research process for this document?
- Was any first-hand, on-the-ground research and documentation, such as site photography, field notes, etc., utilized in the research process?
- To what capacity was anecdotal evidence or online image research used in the production of this document?

The document then discusses noise.

"The existing noise levels at the Artist Buildings are 57.6 dBA due to the existing rail operations in the MBTA right-of-way. Combined with the noise from the commuter rail, new Green Line mainline operations alone would increase noise

I-196-003

As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds. FEIR Chapter 8 describes specific proposed mitigation measures, plans for monitoring after construction, and next steps pertaining to mitigation. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-196-004

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

levels at the Artist Buildings to 75.3 dBA."

The noise I experience from the MBTA commuter rail and freight trains is episodic; it occurs at intervals throughout the day, lasts for a few minutes, and occurs less frequently at night. I chose to live here with full knowledge of the nature of the railroad activity surrounding my home. Likewise, noise levels on the Green Line Extension will also be episodic, and, as a supporter of the extension project, I am more than willing to accommodate this additional noise in my life.

I-196-005

According to VHB's research, noise generated by

"...the support facility alone would increase noise levels at the Artist Buildings to 69.9 dBA. These would also constitute a "severe" impact...."

Thus, the Maintenance Facility alone would constitute a constant, "severe" noise level, "severe" being defined by the document as noise levels over 63.5 dBA. Yes, the combined noise levels of the Green Line, the commuter rail, and the maintenance facility will be 75.3 dBA as VHB's research indicates, but this will be episodic noise, the type of noise I have come to expect in my home. But the maintenance facility will subject me to severe noise levels of 69.9 dBA 24-hours a day, seven days a week. The logic that the maintenance facility "would increase noise levels by only 1.1 dBA when combined with the operation of the Green Line Extension" is entirely faulty and a gross mis-statement of fact. The maintenance facility will increase noise levels at Brickbottom to a *constant, severe* level of 69.9 dBA. See the table below:

Source of noise	dBA	Categorization	Frequency
Existing conditions (Commuter rail and freight activity)	57.6	**Less than Moderate**	**Episodic**; Commuter rail and freight trains run periodically throughout the day, less frequently at night
Existing conditions plus Green Line Extension activity	75.3	**Severe**	**Episodic**; existing rail activity plus Green Line main line activity will run periodically throughout the day, less frequently at night
Existing conditions plus proposed Green Line Maintenance Facility	69.9	**Severe**	**Constant**; the proposed maintenance facility would operate 24 hours a day, 7 days a week, 365 days a year

Source: *Technical Memorandum, "Potential Impacts on Brickbottom Artist Buildings, Green Line Extension Project."*

- How can a constant, severe noise level of 69.9 dBA not be considered a major impact?
- Why does the research not state the fact that rail-activity noise is episodic, while the noise generated by the Maintenance Facility, in operation 24 hours a day, 7 days a week, 365 days a year, will be a constant source of severe noise?

Lacour / 3

I-196-005

As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds. FEIR Chapter 8 describes specific proposed mitigation measures, plans for monitoring after construction, and next steps pertaining to mitigation. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

The noise assessment section of the document then states:

> *"Noise mitigation such as sound insulation would be provided to reduce indoor noise levels below the 60 dBA threshold for "moderate" noise impacts."*

I-196-006

Brickbottom is a residential structure, not a commercial office building. As such, residents rely on and delight in opening their windows for ventilation whenever possible; it is a basic quality of human shelter.

- How can sound insulation applied to a solid masonry building with operable windows possibly mitigate a "severe" noise condition?
- How can residents expect to live in a condition where the use of operable windows is lost?

I-196-007

With regards to vibration, the document notes that the Green Line main line will pass within 18 feet of the Brickbottom building. *"Vibration mitigation such as ballast mats would be provided to reduce these impacts,"* the document states, using a very declarative and final tone for this complex mitigation issue.

- Does vibration mitigation not require a more complex analysis and solution than the simple placement of a few ballast mats?
- Are vibration impacts not assessed from inside the building, taking into account the harmonic, amplifying qualities of a building complex constructed of concrete, steel, and glass?

I-196-008

The VHB document then discusses impacts on air quality caused by the maintenance facility, stating that *"the facility itself will not generate any additional emissions."* This massive maintenance facility will require significant heating, cooling, and ventilation systems to accommodate the functions outlined in the facility's program as published by EOT. There will be significant runoff from the cleaning and maintenance of vehicles that will contain toxic lubricants, fluids, and detergents.

- What will be the impact from emissions from the tremendous heating, cooling, and ventilation equipment required for an industrial facility of this size?
- What will be the toxic and olfactory impact from the inevitable runoff generated by the maintenance facility?
- What will be the impact of an additional 105 automobiles (based on the number of parking spaces required by the program) entering and leaving the site daily and the associated runoff from these vehicles?

The document then discusses visual impacts.

> *"Based on topography and building heights, the roof of the Artist Buildings would be approximately 16.5 feet higher than the tallest part of the support facility building."*

I-196-006

During preliminary engineering, MassDOT will conduct further analysis for several individual properties. As described in FEIR Chapter 8, MassDOT will then be able to identify the specific measures that will be appropriate for mitigating the Project's noise and vibration impacts.

I-196-007

As indicated in the DEIR/EA Section 5.8, and FEIR Section 5.2, vibration analysis, in accordance with FTA guidance has been conducted for the Project. This analysis involves an assessment of vibration impact and the effectiveness of mitigation measures, such as ballast mats. Vibration levels are assessed inside buildings, taking into account the coupling of vibration from the ground to the building, the potential amplification of vibration on span floors and the reduction of vibration on upper floors. The building coupling effect is based on the type of building construction.

I-196-008

As described in FEIR Chapter 2, the maintenance facility will be an open-air building requiring minimal heating and air conditioning equipment. Runoff systems have been designed to ensure the safe use and disposal of lubricants, fluids, and detergents. The local traffic to the maintenance facilities was included in the air quality analysis.

I-196-009

Again, the logic and appropriateness of this comment are questionable. Residents whose homes are on the second, third, and possibly fourth floors of the Cannery building will face the facility directly; it will be 95 feet from their windows, the only source of light and ventilation for their homes. That the facility falls below the roofline of the Brickbottom complex is irrelevant and misleading in terms of visual impact; the proposed Maintenance Facility will restrict light, air, and view from these homes, severely impacting the quality of life of residents.

- Why was consideration only given to building height, rather than the quality of life of the human inhabitants who abut the proposed facility?
- Were site visits not conducted to determine what uses (i.e., residential) would be directly impacted by the proposed facility?

The document further discusses visual impacts:

> *"Due to the surrounding industrial lots and existing buildings, the Artist Buildings would be the only residential properties facing the support facility. Given the existing industrial and commercial buildings visible from this area, which are similar in type to the support facility, the support facility would result in only a minor change to the local landscape."*

Yes, the surrounding landscape is a mixture of industrial lots and buildings, a landscape which, as residents, we find appealing for their simple, honest, utilitarian forms and harmonious scale. However, the proposed maintenance and storage facility will will not be a part of the local landscape; it *will be* the landscape: it will be all that is visible from three floors of residences in the Cannery building, it will tower three stories over the Foundry building and courtyard, and will obstruct all light and views from the west and north of the Bakery building.

I-196-010

The facility's scale as noted in the report is also misleading. The tallest buildings in the immediate Brickbottom area along Joy and Chestnut Streets are 2 to 3 stories tall, and the tallest building in the Inner Belt area is four stories tall. The much-despised Waste Transfer Station at Poplar and Joy streets is perhaps five stories tall, and is hardly a benchmark for appropriate scale. For illustration, I include VHB's rendering of the proposed "Overbuild Model" for the Maintenance Facility:

I-196-009

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-196-010

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. The evaluation considers land use and connectivity impacts and opportunities associated with each maintenance facility site alternative.

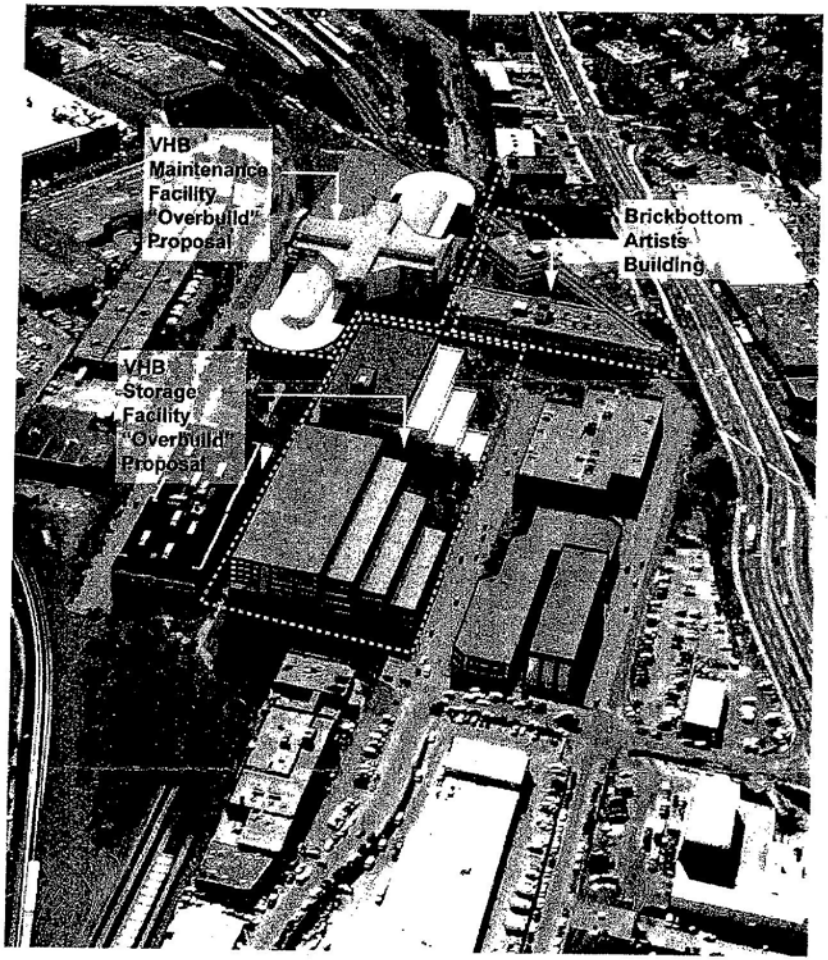

Image source: Maintenance Facility Overbuild, prepared by VHB/Vanasse Hangen Brustlin; www. greenlineextension.org, March 16, 2009.

I-196-011

This proposal not only towers over the Brickbottom complex, introducing an unprecedented scale into Brickbottom/Inner Belt area, but it also obliterates the Foundry building from Brickbottom, fills in the first floor of the remaining two buildings, and eliminates Brickbottom's

Lacour / 6

I-196-011

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. The evaluation considers land use and connectivity impacts and opportunities associated with each maintenance facility site alternative.

I-196-011

parking area along Fitchburg Street, a historic way privately-owned and maintained by the the Brickbottom Condominium Trust! Such careless attitude and blatant disregard for not only existing conditions but reality itself once again begs the questions:

- Has VHB conducted any thorough site visits in its research concerning the proposed Green Line Maintenance Facility and its impacts?
- What was the research methodology used in the assessment of the potential impact of the Green Line Maintenance Facility on the Brickbottom Artists Buildings?

I-196-012

The document then concludes:

> *"In the absence of the proposed support facility, the site selected may be redeveloped for other uses that would have similar or greater impacts on the local neighborhood. The proposed support facility building site is zoned for industrial use and other related uses. Somerville zoning would allow a 50-foot-high commercial or industrial building without invoking any special permits, and an existing building permit already issues (sic) for this site would allow a pair of 64-foot-high buildings. ...Based on the City of Somerville's stated plans for redevelopment and the local zoning regulations, future development on this site appears likely and could have a greater overall aesthetic impact on the Brickbottom Artist Buildings than the proposed support facility."*

As reiterated in the DEIR, some other commercial or industrial building may be erected on this site. However, any building other than one proposed and advanced by the Commonwealth of Massachusetts and DOT would undergo a comprehensive, separate environmental impact report; would involve a thorough, transparent public process; and, I assure you, my elected officials at the city and state level would never allow a use on this site that approaches the disastrous impacts and lasting effects that a maintenance and storage facility would impose on Brickbottom and Inner Belt.

I-196-013

The lack of a defined methodology and evidence of thorough research in this document should immediately disqualify the VHB technical memorandum's findings as valid contributors to the DEIR. In light of alternatives such as Mirror Scheme H and Option L that have been proposed subsequent to the VHB technical memorandum, I ask that VHB's findings be re-evaluated, and, more importantly, that the siting of the Heavy Maintenance and Storage Facility be de-coupled or eliminated from the DEIR and subjected to further study and public comment, independent of the final environmental impact study of the Green Line Extension project, and with greater diligence and skill than that demonstrated by VHB.

In considering the potential siting of the Heavy Maintenance and Storage Facility, I ask you to keep in mind that the Brickbottom Artists community represents an internationally-reknown beachhead of creativity, life, and potential in an otherwise barren part of the urban landscape. It could easily provide a lever and model for further development of the greater Brickbottom/ Inner Belt district as a model transit-oriented district based on values of creativity, expression, and sustainability. Placing the Heavy Maintenance and Storage Facility smack-dab in the middle of this area would destroy that potential forever.

I-196-012

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. The evaluation considers land use and connectivity impacts and opportunities associated with each maintenance facility site alternative.

I-196-013

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

Again, thank you for your support of discussion and comment on this matter. I and my community urge you to reconsider the siting of the Heavy Maintenance and Storage Facility in an area that is mutually agreeable to project requirements, economic development, and human habitation.

Sincerely,

Jayme Lacour

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114
Via email: Holly.S.Johnson@state.ma.us

Dear Secretary Bowles:

I am a Medford resident writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Cambridge, Somerville and Medford, EEA #13886.

I-197-001

I strongly support the Green Line extension and believe that it should be built in one phase, with a terminus station at Mystic Valley Parkway (Route 16. The DEIR as written should be rejected because it does not comply with the December 1, 2006 MEPA certificate and does not satisfy the mandate to serve the Medford Hillside neighborhood.

The DEIR concludes that the Route 16 station would provide the most benefits according to all project criteria, including air quality and environmental justice. However, MassDOT states that it is incapable of building (and funding) the entire "Preferred Alternative," so it only intends to build the extension to College Avenue in the Tufts University area of Medford. For the following reasons, I strongly urge you to not accept the DEIR as the Final EIR and require further environmental analysis of the project by MassDOT:

I-197-002

• **A two-phased approach is unacceptable.** Doing the project in 2 phases will significantly increase the costs. Creating two terminus stations, one for a first phase and a second one later, is a wasteful and foolish approach which will ultimately cost the taxpayers much more. Therefore, the recommendation as outlined in the DEIR is for the Route 16/Mystic Valley Parkway station to be a separate stand-alone Phase II project with no funding source identified is a bad idea.

I-197-003

• **Environmental Justice:** The environmental justice population cited, in part, to justify the project as a whole will not be fully, or even largely, served if the project terminates at College Avenue. There are five separate Environmental Justice sites within walking distance of the Route 16 terminus that do not have sufficient access to College Avenue to be truly served by a station there. The state has a responsibility to see the project serves those who need it most.

• **Environmental Impact.** Not only would an extension serve several Environmental Justice Communities, it would also allow for the largest ridership, significantly larger than if it terminated at College Ave. The environmental impact of the extension would therefore be much greater. At a time when we need to aggressively reduce our carbon footprint, it is inappropriate to allow short-sightedness to prevent a project with the potential impact of this one, especially as more federal funds are being devoted to public transportation, even in the recently approved FY2010 appropriations.

I-197-004

• **The Route 16 station design in the DEIR is inadequate.** The DEIR design for the Route 16 station is deficient and unworkable. It unnecessarily calls for the taking of two existing buildings that should remain intact with a proper design. The Final EIR should show a realistic and workable design for the Route 16 site.

In conclusion, I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis to go to Route 16 to serve the largest possible population, achieve the maximum ridership, and provide the maximum air quality and environmental benefits to the residents of Cambridge, Somerville, and Medford.

Thank you.

Donna Laquidara-Carr
124 Boston Ave
Medford, MA 02155

I-197-001

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. The Proposed Project, with a terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Additionally, FEIR Chapter 4 includes a detailed description of College Avenue Station functioning as a terminal station.

Since the release of the DEIR/EA, a few stakeholders raised concerns that the proposed College Avenue Station, serving as a terminal station for the Proposed Project, would not adequately serve the Medford Hillside neighborhood. Serving this neighborhood was identified as part of the SIP description. To address and resolve these concerns, CTPS prepared a memorandum demonstrating that the College Avenue Station location does adequately serve the walk market area for the Medford Hillside neighborhood. This memorandum is provided in Appendix C of the FEIR.

I-197-002

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is

considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-197-003

The Proposed Project offers substantial benefits to environmental justice communities and serves the majority of Study Area environmental justice population zones. As described in DEIR/EA Section 5.4, Environmental Justice, impacts to environmental justice populations would be neither severe nor disproportionate with any of the Build Alternatives.

I-197-004

All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

RE: Green Line Extension Draft EIR (EEA #13886)

Dear Secretary Ian Bowles:

First, thank you for the work and energy that you have put into the Green Line Extension project up to this point. I have gone to many of the public meetings and have heard from public officials on this subject and am grateful for that. As a resident of Bartlett Street, approximately 4 blocks from a future T stop, the EIR is incredibly important to me personally. Thank you again for your efforts. I am writing today to recommend that the Draft EIR be approved, with a few modifications.

I believe that it is imperative that this project be completed on time by December 31, 2014. In order for this to happen, design and construction must proceed, but in a thoughtful manner to ensure that full benefits occur from the extension. It is my belief that in order to ensure that this happens, a few critical factors must be noted.

I-198-001 First, I strongly urge a meaningful community advisory process. I believe that community involvement is the only way to ensure a successful Green Line extension project. A project-wide Citizens Advisory Group should be maintained throughout the entire project, including detailed design, engineering, construction and start-up phases. Smaller local advisory groups

I-198-002 should be established to work with the MBTA and consultants to address specific station design, land use, connectivity, and construction and mitigation issues. Additionally, MEPA should require collaborative planning, with meaningful community involvement and public coordination that should intensify immediately, before this project progresses and require that senior project staff work out of a centrally located field office to maximize access.

I-198-003 Second, I have participated with the Community Corridor Planning group over the past year and strong encourage MassDOT and MEPA to examine and utilize the 11 Core Principles to land use planning regarding the Green Line Extension that were created and ratified by over 300 residents.

I-198-004 I am in strong opposition to the Maintenance Facility site at Yard 8. I strongly urge you to eliminate this Option and to require Mass DOT to carry out a full analysis of the Option L alternatives and Option H for siting the Maintenance Facility. While not perfect, these other two options have much more support in the Somerville and Cambridge communities. Yard

I-198-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-198-002

MassDOT and the MBTA conducted a series of public workshops to gather input on land use and facility design issues from the communities. The workshops were organized around facility locations or groups of locations. All were well-advertised, open to the public and in accessible venues.

I-198-003

MassDOT has reviewed and considered the "Core Community Principles" for station area land use, presented by Community Corridor Planning. As described in the FEIR, Section 6.2 of the Public Involvement Plan, MassDOT will hold land use workshops to discuss related issues with the community.

I-198-004

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance

I-198-004

8 is opposed by the cities of Somerville and Cambridge and has been vocally rebuked by community residents and business owners at numerous public meetings. It would impose an onerous transportation infrastructure burden on the city that would negatively impact quality of life and preclude economic development of Brick Bottom/Inner Belt. Placing such a structure in Yard 8 would not only negatively impact current residents and businesses, but it would put Somerville at a significant disadvantage for future economic development in this optimal area.

I-198-005

The Community Path must be fully integrated into the design, planning, and construction of the Green Line extension. The Path exemplifies the Federal Transit Administration's new policy on bicycle/pedestrian access to public transportation recognizing the importance of maximizing multi-modal access. The DEIR should state specifically that the extension of the path will be designed by MassDOT as agreed to in February of 2009. It is also essential that the Community Path and the Green Line extensions be built as one project. I personally utilize this path daily, both on bike and on foot and believe that an extension would benefit the Somerville community immensely.

I-198-006

The Mystic Valley Parkway / Route 16 terminus should be designed and constructed at the same time as the rest of the project.

I-198-007

Track design and construction should enable adding future stations – between Lechmere and Washington Street/Union Square, between College Avenue and Route 16, and along a future Green Line extension from Union Square to Porter Square that could serve both Cambridge and Somerville neighborhoods.

I-198-008
I-198-009

Green Line station designs should effectively accommodate bus drop off and pick-up with much attention given to the ease of intermodal connections. Bus routes in Somerville must be aligned to optimize connections to Green Line stations simultaneous to the start of Green Line service. Community input must be gathered regarding the re-routing of bus lines and bus stops before this can happen.

I-198-010

The number of bike racks currently proposed does not meet the needs of the community. The number of riders in and around Somerville, and the increase in riders due to closer proximity to the new T stops, will increase necessitate even more bike racks than we are utilizing in Davis (which, even with their large numbers, are not sufficient). Additionally, all stations should be designed so as to encourage walking and should not impede pedestrian access. An important pedestrian access way will be the Community Path, and thus this infrastructure should be planned for well.

I-198-011

Lastly, it is imperative that the DEIR state clearly how the Maintenance Facility, Storage areas and stations will be sustainable structures. It is my belief that the environmental impact of extending the Green Line should also encompass the use of "green" technology that can be included in the construction of these new structures. This should include creating green roofs on all storage facilities, and utilizing renewable energy technology to power the buildings. Such technology, especially green roofs, will add insulation, sound proofing,

facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-198-005

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-198-006

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-198-007

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and

I-198-011

mitigate stormwater issues and decrease the urban heat island effect, not to mention add to the asthetics of the area.

Thank you for taking the time to listen to my concerns.

Sincerely,

Jennifer Lawrence
Somerville Resident
22 Bartlett Street
Somerville, MA 02145

infrastructure design with conceptual future Green Line additions and extensions.

I-198-008

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

I-198-009

Please see response to Comment I-198-008.

I-198-010

DEIR/EA Appendix D includes methods used to analyze demand for bicycle parking at each Project station. Detailed bicycle parking designs will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

DEIR/EA Section 3.7 describes pedestrian access at each of the proposed stations. In accordance with the Secretary's Certificate on the DEIR/EA, pedestrian access at stations and designed connections to the Community Path will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-198-011

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual designs. Detailed designs for each station, the maintenance facility, and the entire Project will be refined during the preliminary engineering phase. As stated in DEIR/EA Section 3.7, the Project will emphasize low-energy, low-impact, "green" design. The process for coordinating with the local communities during Project design is described in the Public Involvement Plan, Chapter 6 of the FEIR.

Subject: Protesting Green line extension DEIR
Attachments: Letter to Sec. Bowles January 6 2010.pdf

Greetings Ms. Johnson,
Please receive this letter addressed to Sec. Bowles in which I strongly urge the secretary to reject the DEIR related to the extension of the Green Line and to proceed with further study.
Thank you for ensuring Sec. Bowles receives my letter.

Regards,
Chris Leary

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-199-001 I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

First of all, I strongly support the Green Line extension, and urge that it be built in the most practical, beneficial and cost-effective manner – that is, to construct the entire project in one phase, with a terminus station at Mystic Valley Parkway (Route 16), by December 31, 2014.

The DEIR is encouraging in that it concludes that the Route 16 station would provide the most benefits according to all project criteria, including air quality and environmental justice. However, MassDOT states that it is incapable of building (and funding) the entire "Preferred Alternative," so it only intends to build the extension to College Avenue in the Tufts University area of Medford, by its deadline of December 31, 2014.

In my opinion, the DEIR as currently written does not serve the best interests of the project. More importantly for your review, it was not done in a way that "adequately and properly" complies with the state environmental regulations, nor with the December 1, 2006 MEPA certificate that defined the requirements of the DEIR.

For the following reasons, I strongly urge you to not accept the DEIR as the Final EIR and require further environmental analysis of the project by MassDOT:

1. A two-phased approach is unacceptable. The Route 16/Mystic Valley Parkway Station should be built as part of a single-phase project to minimize costs and negative impacts and achieve the maximum benefits with regard to ridership, vehicle mile travel reduction, air quality improvements, and service to environmental justice communities.

The recommendation as outlined in the DEIR is for the Route 16/Mystic Valley Parkway station to be a **separate** stand-alone Phase II project with no funding source identified. **This means, Route 16 may never be built.**

I-199-001

Please see Comment Letter I-002.

There are many, many problems with the Phase II approach, including:

- **Risk.** Without an identified funding source there is a very high probability that Route 16 will never be built and the implications of this are critical.
- **Terminus Impact.** Without a Route 16 Station, the College Avenue stop (designed and intended to be an **interim station**) would become the de facto terminus for the Green Line extension. It is not designed for a terminus and due to the traffic flow and neighborhood density, as well as the lack of opportunity for transit-oriented development at College Ave., it is not a good location for a terminus.
- **Cost.** The two-phased approach is fiscally irresponsible and by MassDOT's own estimates will inflate the cost by $55 million over a single-phase approach. Severing a single stop (less than one mile of track) from the project as a whole will cost the state, and thus the taxpayers, significant additional money. There are obvious ways to easily reduce costs in the overall project and provide enough additional funds to include Route 16 as part of a single, complete project. This is the most prudent approach, and also would ensure that the project produces the air quality improvements the Commonwealth must achieve to come into compliance with the Clean Air Act.
- **Project Management.** There are significant efficiencies gained from completing the project in one phase, rather than the starts and stops required to execute on separate, multi-stage efforts for such a small add-on project as a single station stop.
- **Environmental Justice:** The environmental justice population cited, in part, to justify the project as a whole will largely not be served if the project terminates at College Avenue. The negative aspects of this project will affect them most, while they will receive the least benefit without service to a Route 16 terminus.
- **Legal Mandate:** The state is legally obligated to provide public transit services to Medford Hillside by December 31, 2014, and stopping the extension at College Ave. fails to meet this legal obligation. At a minimum, this incurs significant mitigation costs required if the obligation is not met.

2. College Avenue should not be a terminus. The College Avenue station is not designed for the additional requirements of a terminus. The neighborhood cannot sustain the impact of a terminus station operations and traffic volume and the potential environmental damage is of serious concern.

3. The Route 16 station design is inadequate. The DEIR offers only a "worst case scenario" (MassDOT's description) for the Route 16 station design, while offering optimized station designs for all other Green Line extension stations. The Route 16 station design must be revisited. The Medford Green Line Neighborhood Alliance, a volunteer citizen group, has offered an alternative station design that prevents two major commercial property acquisitions and the resulting job displacement, preserves $182,000/year in property taxes for the City of Medford, optimizes traffic flow and better serves the integrity of the station's surroundings.

MassDOT apparently has been exploring similar improved designs, which should be presented to the public for comment. A $1 billion project deserves a higher caliber design than a "worst case scenario."

To summarize, there is much more work to be done on the Environmental Impact report, and I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis in order to make the Green Line extension the best project it can be, and MUST be.

Thank you.

Re: Green Line Extension DEIR EEA #13886

Dear Secretary Bowles:

I am very pleased to see the state move forward on its commitment to extend the Green Line through Somerville. However, I am very concerned to see that the current plans only involve extension to College Avenue. I also agree with many members of the community that the maintenance facility should be moved away from Yard 8.

I-200-001

Most interpretations of the term "Medford Hillside" in the SIP would mean someplace farther west than College Avenue. If the planning process has determined that Winthrop Street – right in the heart of Medford Hillside – is not an appropriate place for a station, than the terminus at Route 16 is the next most logical place. College Avenue is not the best place for a terminal station, even on an interim basis. I remain concerned that any extension to Route 16 is unlikely to be completed once the initial extension is built.

I-200-002

In addition, I would like to offer my support to the work done by the City of Somerville and the Somerville Transportation Equity Partnership with respect to station area planning and the location of a maintenance facility. There is no reason to locate the facility in Yard 8 when there is plenty of space in the area behind the "Big Blue" commuter rail maintenance facility that does not negatively impact present residents of Brickbottom and future commercial development in Inner Belt.

As an aside, there are outstanding commitments made by the MBTA remaining from the MEPA filings related to construction of Big Blue back in the early 1990's – including a commitment to improve drainage in that low-lying area as a benefit. If these commitments are not to be fulfilled, that is even more of a reason to require that a maintenance facility be located on site as a counterbalancing benefit.

Sincerely,

Jeff Levine

I-200-001

As described in DEIR/EA Appendix B, Section 4.5, MassDOT's analysis and understanding of the ridership market potential concluded that the Winthrop Street area would be best served by a single station in the vicinity of College Avenue and Winthrop Street. Analyses indicated that the preferred location would be at College Avenue.

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. The Proposed Project, with a terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements required under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions," which are also part of the State Implementation Plan (MassDEP DEIR comment letter, January 8, 2010).

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-200-002

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further

consideration and Option L is identified as the preferred maintenance facility site.

Re: Yard 8 proposed maintenance facility

Dear Ms. Johnson and members of the committee:

I-201-001 I am writing to voice my horror over the proposed Yard 8 Green Line maintenance facility being built just feet from my neighbors' bedroom windows in the Brickbottom Artists Building. While I support the extension of the Green Line to the long-underserved communities of Somerville and Medford, I urge you to reconsider placement of this facility to a place where it won't RUIN so many lives. We artists are a sensitive bunch; please have mercy: consider Mirror Scheme H or Option L instead. 220 people live at Brickbottom, and there are vast tracts of unused, unpopulated land that would be much better for a noisy, vibrating, 24-hour-a-day facility. Why pick a spot that abuts the ONLY residential building in the area? The DEIR is missing important measurements about impact on Brickbottom, including the noise and vibration in our award-winning courtyard (our only green space) and the south side of the building, which already gets a lot of noise from idling Amtrak and Commuter Rail cars, often at 2 or 3 a.m. Not consulting the Citizen's Advisory Group in evaluating sites for the facility and storage yard is in direct violation of the Secretary's Certificate for community involvement in the project (EENF, *Smart Growth/Land Use*, p.5).

I-201-002

I-201-003

Yard 8 also ruins Somerville's plans to develop the Inner Belt area, cutting off potential commercial tax revenue. Now is the time to stop abusing Somerville, which is burdened by all of the train tracks and none of the stations!

I-201-004 Please give us Brickbottomites direct access to the community path; right now the only access is at Washington St. We have many residents who walk/bike-commute, including myself. I urge you to spare the residents of this vibrant, lively, creative community. Please don't kill our development.

Sincerely,

I-201-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-201-002

As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds. FEIR Chapter 8 describes specific proposed mitigation measures, plans for monitoring after construction, and next steps pertaining to mitigation. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-201-003

As described in the DEIR/EA Section 1.5.3, throughout the development of the DEIR/EA regular coordination with the Advisory Group and local municipalities on various aspects of the Project, including siting of the maintenance facility, occurred. During the Summer of 2008, tutorials on the proposed maintenance facility as well as site visits to existing maintenance facilities were conducted for Advisory Group members. Additionally, in December 2009 a public meeting was held on the various maintenance facility sites.

I-201-004

MassDOT is committed to completing all planning, design, and engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community

Path between Lowell Street and Inner Belt Road. MassDOT is not able at this point to commit to funding the construction of the Community Path. The limits of the path were predicated on the connections to Lechmere being made through the Inner Belt area via Inner Belt Road and the proposed Urban Ring Bridge into the Lechmere area. However, the cessation of planning for the Urban Ring Project has changed the timing of this anticipated connection. MassDOT is unable to assume responsibility for designing the Urban Ring Bridge as part of the Green Line Extension Project. That being said, MassDOT is committed to working with the City of Somerville, residents and businesses in the Brickbottom and Inner Belt neighborhoods, and Community Path advocates to design the Path to create improved connectivity within the Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension.

RECEIVED
JAN 5 2010
MEPA

Dear Secretary Ian Bowles:

I-202-001 Please do not allow Yard 8 to go through. It will ruin the lives of many of my neighbors at Brickbottom Artists Building because it is mere feet from their bedroom windows. We already suffer from being cut off by train tracks on two sides and the elevated McGrath Highway, which makes my bike commute difficult. (Anything you

I-202-002 could do to help increase our access to the proposed Community Path would be most appreciated, too). Our wonderful community is the only residential oasis in an otherwise industrial wasteland; why not locate the Green Line Maintenance Facility in Mirror Scheme H or Option L? It would benefit the City of Somerville, which has historically gotten the short end of the stick, to develop its commercial

I-202-003 tax base by not amputating the Inner Belt road area. There needs to be more community involvement in the planning of this facility.

I-202-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-202-002

MassDOT is committed to completing all planning, design, and engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community Path between Lowell Street and Inner Belt Road. MassDOT is not able at this point to commit to funding the construction of the Community Path. The limits of the path were predicated on the connections to Lechmere being made through the Inner Belt area via Inner Belt Road and the proposed Urban Ring Bridge into the Lechmere area. However, the cessation of planning for the Urban Ring Project has changed the timing of this anticipated connection. MassDOT is unable to assume responsibility for designing the Urban Ring Bridge as part of the Green Line Extension Project. That being said, MassDOT is committed to working with the City of Somerville, residents and businesses in the Brickbottom and Inner Belt neighborhoods, and Community Path advocates to design the Path to create improved connectivity within the Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension.

I-202-003

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-202-004

(2) Brickbottom is the home of 220 residents and is home to the longest-running Open Studios events in the area, and is a pioneer in the country of live-work artist spaces. Please help us to keep it a vibrant (not vibrating) place to live. Protect our only green space, an award-winning garden courtyard, from being blighted by the noise of an abutting facility.

Thank you for your attention to this plea, and thank you for bringing the Greenline to the long-neglected residents of Somerville and Medford. Please be careful where you site this facility, as it will impact our city for many generations to come.

Sincerely,

Pauline Lim

I-202-004

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

RE: EEA #13886 Comments on Draft EIR (Green Line Project)

Dear Secretary Bowles:

As a longtime Medford resident, public transit rider, and environmental advocate, I appreciate the work of your office and MassDOT on this critical project. Nonetheless, we have only one opportunity to execute the Green Line Extension in a manner that: fully meets the state's obligation; maximizes environmental benefits; and serves the ridership and neighborhoods. This DEIR, while impressive in many ways, is not adequate to those required ends. Viz:

I-203-001 1 – **Fulfilling state obligations (Big Dig settlement) -** The DEIR fails to fulfill the state's legal requirement to provide Green Line service to the Medford Hillside neighborhood by December 31, 2014. In fact, it does not accurately describe the location of the Hillside neighborhood.

2 - **ENF Certificate Requirements** (from 12/1/06) – The DEIR does not adequately fulfills the requirements laid out in the original ENF letter of December 1, 2006. Basically, the DEIR does not serve as a substitute for a FEIR on the project, and must not be allowed to do so.

I-203-002 3 – **Other failures of the DEIR:**

A – Generally does not examine the College Avenue-to-Route 16 portion of the project in the degree to which the rest of the project has been analyzed. In particular, the analysis of the Route 16 station is only presented as a "worst case scenario," unlike every other aspect of the project. Impacts are not minimized and benefits are not maximized; this is a set-up for failure.

I-203-003 B – The DEIR does not lay out or commit to mitigation measures in the Hillside area.

I-203-004 C – Proposes College Avenue as some sort of interim terminus, built as an intermediate station. This makes no sense; moreover, it is a red herring.

I-203-005 4 – **Extension of the Green Line to Route 16 -** I strongly support the extension of the Green Line all the way to Route 16 in Medford, identified as the so-called "Full Build Alternative" in this DEIR. By relegating construction of the Route 16 station to an uncertain second phase, however, the DEIR contradicts its own findings that the maximum project benefits are derived by extending service to Route 16.

5 – **Miscellaneous comments:** I like the emphasis on sustainability in building materials, maintenance, and the like. Construction staging looks excellent. The "neighborhood station" approach is sensible and recognizes both the public will and physical realities in a refreshing fashion.

I-203-006 6 – **Middlesex Canal connection -** The entire route of the Middlesex Canal (1803-1853), which ran through Somerville and Medford, is now on the National Register of Historic Places. It would be wonderful to have its story told at some of the stations on the new Green Line, which parallels much of the original Canal's route.

7 – **Next steps –** I believe you should require a FEIR to make up for the skimpiness of the DEIR on the above (and other) issues. This will also clarify the need to complete this project to Route 16, and how best to do so.

Thank you for your time and attention.

Sincerely yours,

Thomas W. Lincoln

I-203-001

As directed by the Secretary's Certificate on the DEIR/EA, the FEIR includes a limited scope of issues related to the Green Line Extension Project. The Proposed Project, with a Medford Branch terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Although an extension to Mystic Valley Parkway/Route 16 is MassDOT's Preferred Alternative, financial constraints prohibit the Commonwealth from progressing the Project beyond College Avenue at this time.

Since the release of the DEIR/EA, a few stakeholders raised concerns that the proposed College Avenue Station, serving as a terminal station for the Proposed Project, would not adequately serve the Medford Hillside neighborhood. Serving this neighborhood was identified as part of the SIP description. To address and resolve these concerns, CTPS prepared a memorandum demonstrating that the College Avenue Station location does adequately serve the walk market area for the Medford Hillside neighborhood. This memorandum is provided in Appendix C of the FEIR.

I-203-002

All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can

be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-203-003

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

I-203-004

In accordance with the Secretary’s Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-203-005

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input

on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-203-006

The Middlesex Canal is adjacent to the proposed Mystic Valley Parkway/Route 16 station. When that station is constructed, a narrative panel describing the history of the canal could be incorporated into the station.

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

I-204-001

I strongly support the extension of the Green Line to Medford. The extension will help me reduce the number of automobile trip I take and will greatly reduce the motor vehicle traffic through my neighborhood and the rest of Medford. However, to achieve this in an effective manner the Green Line terminus must at a minimum be at Route 16 and optimally in West Medford with connections to the existing commuter rail.

The DEIR does not adequately and properly comply with the environmental review process. I moved to Medford in part to be able to access mass transit into Cambridge. Little did I realize how underserved western Medford is by transit. My neighbors and colleagues almost exclusively drive to work in Boston and Cambridge because the train and bus connection are slow and inconvenient. The commuter rail is only convenient for those traveling during rush hour and for those traveling to downtown Boston. The connection to Cambridge is so inconvenient that when ever I have to work late (and the conditions do not allow for biking) I must drive to Kendall Square.

The DEIR does not adequately address how we get Medford citizens out of their cars. If we assume that most commuters will not give up their cars if their walk is more than half mile, and that their commuting time is more than 50% longer, the College Avenue terminus will not get many people living in Medford out of their cars. The majority of users of that station will be students at Tufts; students who already walk and ride bikes. Additionally a College Avenue terminus is not easily accessible from the rest of Medford by bicycle. The streets leading to the station are narrow, have many cross streets, and have a high volume of

I-204-001

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. The Proposed Project, with a terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Additionally, FEIR Chapter 4 includes a detailed description of College Avenue Station functioning as a terminal station.

commuter traffic. A light rail station at Route 16, would allow many more of my neighbors to consider taking mass transit. This would have and immediate positive impact on Medford Hillside because fewer of my neighbors would be commuting down Boston Avenue and through the other streets of Somerville. (Locals do not avail themselves of Route 93 because of the heavy traffic during rush hour.)

The DEIR show a lack of imagination and a lack of commitment to provide transportation that is both environmentally friendly and pleasant. Only minimal effort was given in the preliminary designs to improving people's commuting experience. If you want people to get out of their cars you need to make the alternative pleasant, convenient and allow for side trips for errands on the way home.

If we are to actually improve the environment of Medford and Somerville we need to be much more ambitious. Historically the mass transit options for West Medford and Medford Hillside included trolley service and train service. Stations since then have been closed, tracks ripped up, schedules degraded, and with the ever increasing number of cars on the road, bicycling seems like a dangerous alternative. The following improvements should also be addressed to bring Medford into compliance with the spirit of the original consent decree, partially restore the level of transit service to historical levels, and all at much smaller cost than a single exit ramp for the Big Dig:

I-204-002 1. Connect the Green Line and commuter rail. Without this, folks from Woburn and Winchester who commute through Medford and Somerville, would still be driving because of the difficulty in commuting between North Station and Cambridge. People working at Tufts would also continue to drive. If the Orange Line can support stations with both rail and subway platforms, why not the Green Line?

I-204-003 2. Make the stations pedestrian and bike centric and not car centric. Include bike paths that allow commuters who live more than a half mile from the station easy access to the station.

I-204-004 Have the Route 16 terminus straddle Route 16 so that pedestrians and cyclist can access from both sides of the roadway. Provide a pedestrian bridge and path to Fortunato Drive to reduce the walk from 0.5 to 0.1 mile

I-204-005 Provide pedestrian access from College Ave Station to Burget Avenue. Without this access a commuter will add 0.8 mile to their walk to the train station and the walk will be on busy street instead of a pleasant side street. Do not provide car drop off at the College Avenue. The intersection is already one of the most difficult in Somerville/Medford.

I-204-006 3. Instead of making a Route 16 terminus in a second phase, require a second phase that extends the Green Line to West Medford. This phase would greatly improve safety by

I-204-002

Opportunities for a shared station between the Green Line Extension (on the Medford Branch) and MBTA Commuter Rail were evaluated for the Project. This connection was ultimately dismissed, as described in DEIR/EA Section 3.3, and Appendix B. While the potential for a joint station at Union Square would need to be studied further, it is not currently part of the Proposed Project. A connection currently exists between the Green Line and Commuter Rail at North Station; this connection would remain. However, as the Project advances into preliminary engineering, opportunities for future additions and extensions of service will be considered.

I-204-003

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-204-006

removing the two at-grade railroad crossing, raising and covering the platforms, and provide a pedestrian underpass so that commuters no longer have to cross the tracks.

I-204-007

4. Bring the commuter rail up to contemporary standards, improving the safety, convenience, and speed. Electrify the commuter rail, raise platforms, and add a stop at the Cambridge side of the Charles River.

It is my hope that with these improvements will reduce Medford's reliance on cars, just as the Red Line extension to Davis Square transformed that neighborhood.

Thank you for your time and patience.

Sincerely,

Dr. Stephen Paul Linder

I-204-004

All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-204-005

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. Detailed designs for each station, including access from Burget Avenue via Tufts property, will be further evaluated during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-204-006

As part of the 2005 Beyond Lechmere MIS/AA, an extension to West Medford was considered but dismissed from further consideration. As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

I-204-007

MBTA Commuter Rail operations and station design are outside the scope of the Green Line Extension Project. The conceptual future electrification of MBTA commuter rail lines in the Study Area is beyond the scope of the Green Line Extension Project. However, the conceptual plans in the DEIR/EA and FEIR do not preclude future electrification of commuter rail. Opportunities for a shared station between the Green Line Extension and MBTA Commuter Rail were evaluated for the Project. This connection was ultimately dismissed, as described in DEIR/EA Section 3.3, and Appendix B, Section 5. A connection currently exists between the Green Line and Commuter Rail at North Station; this connection would remain.

Subject: Comments on Green Line Extension DEIR

January 8, 2010

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

First of all, I would like to thank all the MEPA agency employees involved in producing the DEIR for all of their hard work leading up to this document, including your patience and good humor during the neighborhood public meetings that you have held throughout these last years.

As a resident of Somerville, I support the Green Line extension's stopping at College Avenue as outlined in the current DEIR. I believe that this fulfills the state's legal obligation to provide public transit services to Somerville.

I-205-001

However, I am opposed to the proposed Rte. 16/Mystic Valley Parkway terminus in two years. I have serious misgivings about the Green line extension going beyond College Avenue through what is mostly a densely built residential area composed of two-family homes constructed almost one hundred years ago. I am opposed to a terminus being situated in a mostly residential neighborhood that abuts the Mystic River when there already is a commuter train station in West Medford, which is a ten-minute walk away from this proposed site. I believe that the traffic, noise, air quality, and environmental issues that would result from this terminus on Rte. 16 would result in the environmenta devastation of a thriving neighborhood that the residents of West Somerville and West Medford share.

The impact of the proposed Rte. 16 extension will affect this largely residential West Somerville/ Wes Medford neighborhood on many levels: noise, vibration, traffic, air quality, parking, the taking of private property, and the environmental impact on historical areas that abut the extension, including this section of the Mystic River and its historical bridge and parks, and the historical churches situatec along Boston Avenue in West Medford.

I-205-002

Increased traffic along Mystic Valley Parkway and Boston Avenue is a particular problem. There are numerous accidents at the intersection of Rte. 16 and Boston Avenue and in recent years, an increasing number of pedestrian fatalities at Somerville and Medford intersections on streets that cross Boston Avenue near Rte. 16. These are important statistics to review because there are three

1

I-205-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-205-002

Traffic and pedestrian operations in the vicinity of Route 16 were throughly evaluated as part of the DEIR/EA. Pedestrian timings throughout the study area as proposed are being modified to better accommodate disabled and elderly pedestrians in accordance with the Americans with Disabilities Act and associated state regulations. Overall, because the Green Line is projected to remove traffic from local roadways, traffic congestion and the associated Air Quality emissions are projected to be reduced. Where traffic impacts are noted (due to pick-up and drop-off activity associated with the stations) mitigation has been recommended to offset these impacts.

I-205-002

elderly housing complexes that will be situated near the Rte. 16 terminus: Walking Court in Medford, and Somerville's 99 one-bedroom units in their newly constructed VNA building, and Somerville Elderly Housing Authority Capen Court's new building of 95 units. Pedestrian safety in this area needs to be reviewed more closely because of these new buildings and the increased number of pedestrians, many of them elderly.

Car traffic in this area is another issue that needs further study. The impact of the increased amount of traffic that will travel on Boston Avenue through both sides of the Mystic River in West Medford needs further study regarding air quality and other environmental issues. An analysis of increased traffic on the Mystic Valley Parkway bridge that is opposite from Whole Foods as cars approach Boston Avenue from the north is also needed. The air quality of this increased traffic along Rte.16 from Rte. 93 to Boston Avenue would also need to be analyzed.

I-205-003

Another problem is storm water and its impact on the Mystic River near this site, particularly the impact of the current work that is being done on Alewife Brook to mitigate flooding on its shores. Studies indicate that Alewife's water will be pushed down to where it intersects with the Mystic, and the current U-Haul site is in the area just below the point where Alewife joins the Mystic River. This would add to the impact of the water issues studied in the current DEIR.

To summarize, I support the Green Line extension's stopping at College Avenue. I believe that this fulfills the state's legal obligation to provide public transit services to Somerville. I am strongly opposed to the proposed Rte. 16/Mystic Valley Parkway terminus. Further environmental analysis needs to be done in this area than has been done in the DEIR in its current form.

Thank you.

Suzanne Lipsky

2

I-205-003

As described in DEIR/EA Section 5.9, the Project would be required to comply with federal and state stormwater discharge permit requirements during both the construction and operational phases. Compliance with these standards would include using Best Management Practices to prevent contamination of stormwater and control erosion and accretion (sedimentation) from stormwater runoff from the railroad alignment, stations, and maintenance facility.

EEA# 13886

Green Line Extension

Dear Secretary Ian Bowles,

I-206-001

I am very happy to hear that the Green Line will be easy to Somerville, With 7 new stations, transportation will be much easier than it is now since the Red Line in Davis Square is the closest station to my house and it is FAR very far. Not only will it provide me with more convenient means of transportation, but I can travel more safely, knowing that I will not have to walk long distances during late hours or in bad weather. It could also bring a lot more people to our already diverse community, which could improve our community even more. A bikeing or walking path would definitely make the Green Line easier to use, and I would be more encouraged to use the Green Line if it is easy and safe to access. Having community meetings concerning the Green Line is also very helpful because it gives people like me a chance to have a voice in things that impact their community.

Sincerely,

Anthony Lorenzo

Somerville, MA, 02143, Grade 10

I-206-001

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

Boston, MA 02114

Reference to Project Number EEA #13886

Dear Secretary Bowles:

We are writing in regards to the Draft Environmental Impact Report on project Number EEA#13886 (regarding the Green Line Extension Maintenance Facility and Storage Yard alternatives in Somerville).

I-207-001

We are opposed to siting the Green Line Train Storage Yard and Maintenance Facility in Yard #8. An alternative site, such as "Mirror H" which is farther away from the Brickbottom neighborhood should be considered.

While the Green Line Extension has community value, it seems unjust to ask the residents of East Somerville and the Brickbottom district, which includes many families and senior citizens, to bear the disproportionate environmental impact of noise, vibration, light and contaminant pollutants. In addition, they would be impacted by any hazardous materials accident. Also, by taking 11.5 acres of privately held land that is already permitted and zoned for development, potentially significant future tax revenue will be lost to the City of Somerville.

I-207-002

In addition, the DEIR report's current mitigation provisions in the case of the Brickbottom Artists Building at 1 Fitchburg Street does not allow for noise barriers or containment in relation to the storage yard (only 40 out of 155 residences are designated for soundproofing). The mitigation requirements should be more adequately studied for construction and permanent impact with a complete cost analysis and deadlines for fulfillment. Also, there needs to be a process in place to address mitigation problems during construction and after the fact. A citizen advisory committee (CAC) should be established which would allow for community members to review the project, address community concerns and seek redress if specific goals are not met.

In 1988, after the Brickbottom Artists Building was proposed and accepted by the City of Somerville, the artists helped rejuvenate an abandoned area. It is morally inexcusable, after 22 years, to allow an environmental disaster to happen to a community that has contributed to the cultural, economic and political fabric of Somerville and beyond.

Sincerely,

Patricia Lyga
Kay Canavino

Owners, One Fitchburg Street, B251, Somerville, MA 02143

1

I-207-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-207-002

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8. In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA #03886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-209-001 As a resident & owner at the Glass Factory Condominiums I would like to use this opportunity to express some concerns that I have regarding the Green Line Extension Project and the potential consequences that it may have on our building and the value of our apartments.

1) Proximity of the Tracks to Our Building:
The present design shows the tracks running very close to the rear of our building. We urge your designers and engineers to place the tracks as far to the rear of our building as possible to preserve views & light to the many units that will be severely impacted by the elevated tracks. The design and placement of the tracks and supports should do all it can to minimize the visual impact to those units and also minimize noise & vibration impacts to the whole building as well as the surrounding neighborhood.

2) Design and Location of the New Lechmere Station:
As of now, it is unclear how the new station will look like and where it will be located. Given that Lechmere is the gateway between Boston and Cambridge the design of the station should be of a high standard such as that of the new Charles MGH station. It should be easy to the eyes, functional and environmental friendly. Regarding the location of the new station, it should be placed as far as possible from the Glass Factory in order to minimize the negative effects of excess traffic of people and vehicles around the building.

3) Location of the Maintenance Facility:
I do not agree with locating the new maintenance facility in the Mirror H location. This location is very close to our building and will only increase the negative impact that the tracks, which are supposed to be built just a few feet away from the back of the Glass Factory, will generate.

I-209-001

Please see Comment Letter I-013, plus additional response below.

4) Noise and Vibration Impact:
The Glass Factory will be affected by additional noise and vibration due to the new tracks that will run behind the building. It is extremely important that additional resources are budgeted in order to minimize these impacts during and after the execution of the project.

5) Increased Buss Traffic and fumes:
The many bus lines that converge on Lechmere Station are presently designed to enter at one end of our building, pick up passengers, and emerge at the other end of our condo building. Please do not route bus traffic, directly under our windows. Bus traffic noise, vibrations and fumes are a great concern. Sidewalks where passengers wait should also be moved farther from our building to preserve our privacy and minimize impacts from noise, light and smoking. If too close, it will feel like we are living in the bus station.

I-209-002

6) Environmental Impact:
Presently there is a row of mature evergreen trees behind our building. I urge you to preserve all these trees and the entire small green space behind our building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks should be on the far side of the large trees. These trees serve as a natural screen for the tracks.

Thank you very much in advance for taking these concerns into account and I'm sure that by working together the community, the Massachusetts Department of Transportation and the Glass Factory residents and owners will get the most benefit out of this important project.

Sincerely,

Max E. Malaret

I-209-002

The revised conceptual plan for Lechmere Station, as shown in FEIR Chapter 5, is entirely on MBTA property. This conceptual design does not require any Glass Factory property or the removal of trees and landscaping from Glass Factory property. Station plans will be further developed in the preliminary engineering phase of the Project, with additional consideration given to urban design and the pedestrian environment under the trackway areas. Along the back side of the Glass Factory, fencing is currently proposed to minimize trespassers crossing the existing Glass Factory parking area and will be further evaluated during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

From: 01/08/2010 17:06 #016 P.001

faxed 10:53 AM 1/8/10

January 7, 2010

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA #03886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-210-001 As a resident of the Glass Factory Condominiums, I am deeply concerned about the design and placement of the Green Line Extension and the new Lechmere Station.

TRACKS ARE TOO CLOSE TO OUR BUILDING.
The present design shows the tracks running very close to the rear of our building. We urge your designers and engineers to place the tracks as far to the rear of our building as possible to preserve views & light to the many units that will be severely impacted by the elevated tracks. The design and placement of the tracks and supports should do all it can to minimize the visual impact to those units and also minimize noise & vibration impacts to the whole building as well as the surrounding neighborhood.

LECHMERE STATION.
At present, your designs show the new Lechmere Station so close to the Glass Factory that it appears to be part of our condominium building. Please move the station closer to East Street, where it could be part of the entrance way to the eventual North Point development. The station design needs to be substantially improved so it is not an eyesore but rather an enhancement to this rapidly developing neighborhood. It should reflect the importance of this location as the gateway between Cambridge & Boston.

BUS TRAFFIC.
The many bus lines that converge on Lechmere Station are presently designed to enter at one end of our building, pick up passengers, and emerge at the other end of our condo building. Please do not route bus traffic, directly under our windows. Bus traffic noise, vibrations and fumes are a great concern. Sidewalks where passengers wait, should also be moved farther from our building to preserve our privacy and minimize impacts from noise, light and smoking. If too close, it will feel like we are living in the bus station.

PRESERVE OUR TREES & GREEN SPACE.
Presently there is a row of mature evergreen trees behind our building. I urge you to preserve all these trees and the entire small green space behind our building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks should be on the far side of the large trees. These trees serve as a natural screen for the tracks and busway.

I-210-001

Please see Comment Letter I-013.

MAINTENANCE FACILITY.
I strongly oppose the Mirror H location. It is much too close to the Glass Factory and other residential buildings and will effectively destroy further development in North Point. Putting a maintenance facility on prime land in a desirable, developable location that would generate significant tax revenue to Cambridge simply does not make sense. Of the three options proposed, Option L seems to be the best choice however I would prefer there be no maintenance facility in this area but rather it be at the end of the line.

REDUCE SURFACE PARKING.
The present Lechmere Station is at the end of the Green Line. That will no longer be the case with the new Green Line Extension and the number of parking spaces should be substantially reduced. Please consider using the under-utilized parking garages that are already in this neighborhood. Surface parking is bad urban design and should be minimized in the new North Point neighborhood. One half of our building will overlook the new parking and we request it be carefully designed with this in mind. Ample green space should be included in the design and all lighting should be down lighting that minimizes light pollution to our building.

Thank you for hearing my concerns.

Sincerely,

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles,

I am writing to you as a resident of East Cambridge to express my concerns and those I have heard from neighbors and visitors about the planned move of the Lechmere T station from its current location to a location on the other side of the McGrath Highway.

I-212-001

Lechmere Square and its MBTA station serves as the gateway to East Cambridge and an integral hub of our neighborhood. The station serves the vast bulk of the neighborhood's residents transportation needs as well as serving as a vital link to the Cambridge Galleria, a shopping mall located on First Street which draws well in excess of 1 million visitors annually. The planned relocation of a station serving so many commuters to the other side of a major highway calls for careful consideration of the methods by which commuters will be asked to cross Monsignor O'Brien Highway to reach the new station.

The principal concern with regard to the crossing of Monsignor O'Brien Highway is safety. We have been told that building an elevated pedestrian crossing or pedestrian bridge is too costly for the project so we will have to make do with street level crossings. I will take each of these issues in turn:

I-212-002

1. Elevated Pedestrian Crossing and Costs – The cost of building an elevated crossing to provide for the safe crossing of East Cambridge residents and guests has been described as being too costly and not within the budget of the Lechmere Station relocation plan. I would respectfully request that this analysis be reconsidered in light of recent news reports of an elevated crosswalk being considered for construction in Foxboro to connect two

I-212-001

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. The chapter presents a traffic analysis, a detailed description of pedestrian crossings of O'Brien Highway, and proposed roadway, crosswalk, and sidewalk improvements that are consistent with the NorthPoint development plans. These station and street plans will be further refined in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-212-002

The roadway and pedestrian improvements proposed for O'Brien Highway in the vicinity of Lechmere Station are the same improvements recommended by the NorthPoint development project. A pedestrian overpass was not included in this project. Based on discussions with the City of Cambridge, which was closely involved in the development of the traffic improvements, a pedestrian overpass was considered but eliminated from further consideration due to costs, safety, and practicality concerns. Route 1 at Gillette Stadium/Patriot Place is a high-speed highway with few intersections. O'Brien Highway is a wide urban street near Lechmere Station with signalized intersections.

Page 2

I-212-002

parking lots on either side of Route 1 near Gillette Stadium at a reported cost of $9 million. I would respectfully suggest that the daily safety of the residents of East Cambridge and visitors is more worthy of such a structure than a stadium which will use it for at most a small fraction of the time such a structure would be used in East Cambridge. Surely the great residents of East Cambridge deserve as much, if not more, consideration for a pedestrian overpass than parking lots on Route 1.

I-212-003

2. Street Level Crossing and Pedestrian Safety – The development of the new station will require East Cambridge residents to cross Monsignor O'Brien Highway with its 6+ lanes of traffic if the construction of a pedestrian footbridge (see #1 above) is not feasible. In light of the accident just this morning where a pedestrian was struck in Boston on Tremont Street I would respectfully request that all measures be taken to ensure that street level crossings are implemented with the safety and security of the commuters using the new Lechmere Station in mind. Measures for consideration include:

   a. Timing for Crossing Intersection – Many of our elder residents use the station and require additional time to safely navigate a street level crossing. The age and continued increase in the average age of our residents needs to be heavily factored into the light cycle timings at the new crossings;
   b. Maintenance and Snow Removal – The streets, sidewalks and buildings in the new station plan fall within several jurisdictions that need to coordinate their upkeep and maintenance. These plans need to be developed prior to the station opening so that all parties involved will know who is responsible for which activities so that there can be no confusion after the station opens and the first snow storm hits.
   c. Enforcement – With such a large and expansive crossing on a major highway there will be the need to remain vigilant in monitoring and enforcing traffic rules and regulations. This will be a critical component in keeping the users of the new station safe in their daily crossing of the Monsignor O'Brien Highway. Enforcement plans should be a factored considered when developing the station crossing plans.
   d. Materials and Lighting – I would anticipate the development team utilizing the most appropriate materials for security of footing and visibility when developing the plans for the crossings and the station itself. This will be critical in helping to ensure that the pedestrian crossing is clearly marked and delineated for not only those walking across the Monsignor O'Brien Highway but those driving on it as well.

I-212-004

The design of the new station is also a concern. The preliminary design shown to residents at a recent meeting was not well received. The new Lechmere Station

I-212-003

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. The chapter presents a traffic analysis, a detailed description of pedestrian crossings of O'Brien Highway, and proposed roadway, crosswalk, and sidewalk improvements that are consistent with the NorthPoint development plans. These station and street plans will be further refined in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-212-004

Revised conceptual plans for Lechmere Station, including modifications to the station headhouse and entrances, enclosed automatic fare collection, and other amenities are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-212-004

appears to be the only station on the Green Line Extension Project where patrons will be asked to purchase Charlie Cards outside in the elements as all the other stations appear to have their Charlie Card stations within the station interior safely out of the elements. (This has caused many to question the treatment of East Cambridge vis-à-vis the rest of the Green Line users.) A large part of this issue seems to come from the lack of a lobby in the current Lechmere Station plans. In addition, the entrance of the new Lechmere Station is not convenient to anyone coming from the East Cambridge neighborhood or the Mall. In fact, the only entrance to the new Lechmere Station appears to be in the most inconvenient location possible for the vast bulk of users coming from East Cambridge and the Galleria Mall. I strongly suggest that there needs to be more than one entrance with easy access for the handicapped.

I-212-005

Finally, after many years of promises of a new Lechmere Station, the MBTA has the opportunity not only to build a station that helps enhance the gateway to East Cambridge but also to provide further benefit to the neighborhood of East Cambridge. This benefit would come in the form of the redevelopment of the historic station buildings currently in use into a covered market and outdoor warm weather market that could benefit the entire neighborhood. A small and dedicated group of residents has been working on plans whereby this goal could be accomplished while maintaining the available development potential in terms of buildable square feet. A lively square/market area will make crossing two busy streets easier for those using public transportation and will add to the value of the area. Make Lechmere a destination not a transition point.

Thank you for your consideration.

Charles J. Marquardt

I-212-005

MassDOT has reviewed the suggestions submitted by the East Cambridge Planning Team. Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. These plans, including the pedestrian crossings of O'Brien Highway and associated street, crosswalk, and sidewalk designs will be further refined in the preliminary engineering stage of the Project. As part of the Green Line Extension, MassDOT intends to demolish the existing Lechmere Station and prepare the site for potential future redevelopment. Based on the current requirements of the O'Brien Highway roadway improvements (as shown in FEIR Chapter 5, Lechmere Station), the existing bus shed must be removed.

January 4, 2010

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension, EEA #13886.

I wholeheartedly support the Green Line extension, and urge that it be built in the most practical, beneficial and cost-effective manner. This would include building the project in one phase to a terminus station at Mystic Valley Parkway, locating the Maintenance Facility in an area that not only meets the Green Line's requirements but also takes into account the needs of the neighborhoods effected by the Maintenance Facility as well as the environmental justice and equality of the final location for the Maintenance Facility, and constructing stations and other aspects of the project that provide opportunities for economic development and regional benefits that can last for generations.

I-213-001

I believe that it is in the best interest of the project and the many and varied communities that it serves that the DEIR be accepted as a Final Environmental Impact Report (FEIR) thereby allowing design and other necessary work to begin immediately. However, there remain several issues in the DEIR that have resulted in some to call for the DEIR not to be accepted as the FEIR. I believe that such an approach would add unnecessary delay and cost to this critical project. Rather, I would propose that the items requiring additional analysis and community input and review be handled via either an addendum to the DEIR/FEIR or as a supplement to the DEIR/FEIR.

The issues that require additional consideration as the project continues on its path and warrant further review and analysis and therefore inclusion in an a supplemented DEIR / FEIR include:

I-213-002

- Additional analysis of the location of the Maintenance Facility including the elimination of the Yard 8 Option and the full analysis of Scheme L, Alternate Scheme L and the use of the Boston Engine Terminal (BET) facility;

I-213-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

I-213-002

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-213-003
- Commitment to a significantly enhanced public participation process particularly as it relates to station designs and area mitigation concerns;

I-213-004
- Integration of the Green Line Extension Project with other area development efforts including community paths, neighborhood developments and planned or potential development opportunities at Brick Bottom, Inner Belt, North Point and other neighborhoods;
- Coordinate efforts to ensure that the calming of the McGrath/O'Brien Highway in Cambridge & Somerville is achieved;
- Ensure that the potential opportunities presented by the relocation of the current Lechmere Station and redevelopment of the existing Lechmere Station are achieved in a manner that benefit both the MBTA / MassDOT and the Cambridge / Somerville neighbors;

I-213-005
- Ensure that the complete design and construction of the extension up to and including the Mystic Valley Parkway / Route 16 terminus is part of a single unified project rather than as separate components to be completed at some later date.

These items and other comments are discussed in more detail below.

Integrated Development Plan

I-213-006
The project and DEIR does not include an integrated development plan for the region impacted by the project. The Green Line Extension is a once in a generation project and will most likely be the largest project undertaken by MassDOT and the MBTA this decade. It will intersect or overlap with significant development opportunities across its entire track, including North Point, Brick Bottom, Inner Belt, Union Square and the Medford Hillside to name just a few. As such, this project has the opportunity to greatly benefit the region and these development opportunities if done properly. However, the project also has the capacity to significantly hinder or imperil the development opportunities along its track if not properly coordinated. As there is no integrated development plan at this time, it is my concern that the project would hamper promising development. As such, I strong encourage you to require that the project incorporate an integrated regional development plan to ensure maximization of benefits from this project and its interaction with other development opportunities, public and private.

Integrated Transit Plan

I-213-007
In much the way that the project interacts and impacts the development opportunities along its path so too does it impact transit opportunities along and crossing its planned route. It is my concern that without an integrated transit plan that takes into account all modes of transit along the planned path of the project we will miss opportunities to further benefit the region and move commuters to more environmentally friendly and efficient modes of transportation. The DEIR and project need to consider, among other projects or potential projects, community

I-213-003

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-213-004

DEIR/EA Section 3.9 describes the compatibility of the Green Line Extension with other regional projects, such as the conceptual reconstruction of McGrath Highway and the Urban Ring transit corridor initiative. MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses to ensure, to the extent feasible, consistency with planning and other projects.

I-213-005

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-213-006

Direct and indirect impacts to land use are described in DEIR/EA Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the

I-213-007

paths (bike, walking, etc.), connections between planned and potential development projects (e.g. connecting North Point with the Inner Belt), other MassDOT projects over the coming decades to ensure that consideration for these efforts are incorporated in this project to limit need for future rework and redevelopment.

Achieving Stated Environmental Goals

I-213-008

The achievement of the environmental goals outlined for the Green Line Extension requires service is provided to the Medford Hillside Neighborhood. The goals will not be achieved with the cessation of the extension with a College Ave Station. The goals will be achieved with the complete development of the extension to Mystic Valley Parkway / Route 16. It is critical to the success of the project and the achievement of the environmental mitigation goals provided in the project that MassDOT undertake the extension of the Green Line to Mystic Valley Parkway as a single unified project and not a series of disjointed projects that may or may not get completed and, if completed, would result in additional costs to the state.

Community Involvement

I-213-009

I strongly recommend that the project and MassDOT be required to utilize collaborative planning, with community involvement and public coordination. The project has developed a workable web site and staff availability for questions and related matters has been good. However, as the project moves forward I would recommend staffed field offices be required to address resident concerns and facilitate involvement.

I would expect a Citizens Advisory Group for a project of this size and scope. Yet, there has yet to be one established. Therefore, I would recommend a project-wide Citizens Advisory Group be maintained throughout detailed design, engineering, construction and start-up phases with additional smaller local advisory groups established for specific station design, land use, connectivity, construction and mitigation issues.

Station Design and Location

I-213-010

I strongly encourage the project develop plans to ensure that Green Line stations integrate seamlessly with all other clean modes of transportation, including current and re-routed buses. Station design should accommodate bus drop off and pick-up with maximum integration of transit modes and minimal street disruption.

I-213-011

I strongly encourage station designs that allow for car drop off, but not parking, and present ease of pedestrian and bicycle access by location of stations on major streets whenever possible, with station access from both sides of the street and in all direction of travel with multiple entry and exit points from the stations

presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for sustainable land use, which could further reduce automobile traffic congestion and improve air quality.

I-213-007

DEIR/EA Section 3.9 describes the compatibility of the Green Line Extension with other regional projects, such as the conceptual reconstruction of McGrath Highway and the Urban Ring transit corridor initiative. MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses to ensure, to the extent feasible, consistency with planning and other projects.

I-213-008

As directed by the Secretary's Certificate on the DEIR/EA, the FEIR includes a limited scope of issues related to the Green Line Extension Project. The Proposed Project, with a Medford Branch terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Although an extension to Mystic Valley Parkway/Route 16 is MassDOT's Preferred Alternative, financial constraints prohibit the Commonwealth from progressing the Project beyond College Avenue at this time.

I-213-009

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green

I-213-011

I strongly encourage the use of a formal community process to design the stations to ensure that they fit within the neighborhood and meet with existing and future development plans. Many neighborhoods along the extension have already expressed preferences and proposed modification to the initial station designs to enhance functionality and increase use. This activity should be encouraged as it is one way to grow additional proponents of the plan and drive increased use of the public transit system.

Lechmere Station Relocation, Design and Future Use of Existing Station

I-213-012

Lechmere Square and its MBTA station serves as the gateway to East Cambridge and an integral hub of the neighborhood. The station serves the vast bulk of the neighborhood's residents transportation needs as well as serving as a vital link to the Cambridge Galleria, a shopping mall located on First Street which draws well in excess of 1 million visitors annually. The planned relocation of a station serving so many commuters to the other side of a major highway calls for careful consideration of the methods by which commuters will be asked to cross Monsignor O'Brien Highway to reach the new station.

The principal concern with regard to the crossing of Monsignor O'Brien Highway is safety. The development of the new station will require East Cambridge residents to cross Monsignor O'Brien Highway with its 6+ lanes of traffic I would respectfully request that all measures be taken to ensure that street level crossings are implemented with the safety and security of the commuters using the new Lechmere Station in mind. Measures for consideration include:

I-213-013

a. Timing for Crossing Intersection – Many of our elder residents use the station and require additional time to safely navigate a street level crossing. The age and continued increase in the average age of our residents needs to be heavily factored into the light cycle timings at the new crossings;
b. Maintenance and Snow Removal – The streets, sidewalks and buildings in the new station plan fall within several jurisdictions that need to coordinate their upkeep and maintenance. These plans need to be developed prior to the station opening so that all parties involved will know who is responsible for which activities so that there can be no confusion after the station opens and the first snow storm hits.
c. Enforcement – With such a large and expansive crossing on a major highway there will be the need to remain vigilant in monitoring and enforcing traffic rules and regulations. This will be a critical component in keeping the users of the new station safe in their daily crossing of the Monsignor O'Brien Highway. Enforcement plans should be a factored considered when developing the station crossing plans.

Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-213-010

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

I-213-011

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR,

I-213-013

d. Materials and Lighting – I would anticipate the development team utilizing the most appropriate materials for security of footing and visibility when developing the plans for the crossings and the station itself. This will be critical in helping to ensure that the pedestrian crossing is clearly marked and delineated for not only those walking across the Monsignor O'Brien Highway but those driving on it as well.

The design of the new station is also a concern. The preliminary design shown to residents at a recent meeting was not well received. The new Lechmere Station appears to be the only station on the Green Line Extension Project where patrons will be asked to purchase Charlie Cards outside in the elements as all the other stations appear to have their Charlie Card stations within the station interior safely out of the elements. (This has caused many to question the treatment of East Cambridge vis-à-vis the rest of the Green Line users.) A large part of this issue seems to come from the lack of a lobby in the current Lechmere Station plans. In addition, the entrance of the new Lechmere Station is not convenient to anyone coming from the East Cambridge neighborhood or the Mall. In fact, the only entrance to the new Lechmere Station appears to be in the most inconvenient location possible for the vast bulk of users coming from East Cambridge and the Galleria Mall. I strongly suggest that there needs to be more than one entrance with easy access for the handicapped.

Finally, after many years of promises of a new Lechmere Station, the MBTA has the opportunity not only to build a station that helps enhance the gateway to East Cambridge but also to provide further benefit to the neighborhood of East Cambridge. This benefit would come in the form of the redevelopment of the historic station buildings currently in use into a covered market and outdoor warm weather market that could benefit the entire neighborhood. A small and dedicated group of residents has been working on plans whereby this goal could be accomplished while maintaining the available development potential in terms of buildable square feet. A lively square/market area will make crossing two busy streets easier for those using public transportation and will add to the value of the area. Make Lechmere a destination not a transition point.

Community Access to Open Space

I-213-014

The design and construction of the project must not reduce the access, both during construction and after completion, of residents and visitors to open and recreational spaces. Nor should the project result in any net loss of open or recreational spaces. In fact, the project should endeavor to create additional open, recreation and public use spaces as part of the mitigation efforts of the plan. The redevelopment of the existing Lechmere Station is one example where the project could either add to the vibrancy of the neighborhood and do a great service in enhancing the fabric of the neighborhood or choose some other use for the parcel that negatively impacts the

describes MassDOT's plans for public outreach in the next phases of the Project.

I-213-012

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. The chapter presents a traffic analysis, a detailed description of pedestrian crossings of O'Brien Highway, and proposed roadway, crosswalk, and sidewalk improvements that are consistent with the NorthPoint development plans. These station and street plans will be further refined in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-213-013

Please see responses to comments I-212-003 through I-212-005 in the previous letter.

I-213-014

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

I-213-014

neighborhood. I strongly urge MassDOT to err on the side of enhanced vibrancy and neighborhood fabric whenever possible.

Maintenance Facility Location

I-213-015

YARD 8 MassDOT Preferred Location – MassDOT has continued to propose Yard 8 as their preferred location for the Maintenance Facility. In doing so MassDOT has not only continued to overlook the impacts that the selection of Yard 8 as the site of the Maintenance Facility on the current and future residents of the Brickbottom neighborhood, but has ignored the impact such a location will have on any potential future development in the Inner Belt section of Somerville. In light of the overwhelming negative feedback received from participants in the public process, MassDOT would be seriously negligent should they continue with Yard 8 as their preferred location for the Maintenance Facility.

I-213-016

Boston Engine Terminal Alternative – MassDOT continues to downplay the potential for locating the Maintenance Facility within the existing site occupied by the Boston Engine Terminal (BET). I believe that this site has several key advantages to any of the alternatives proposed by MASS DOT, including Yard 8, Mirror H and Scheme L, and warrants significant additional consideration.

- *Parcel Ownership* – MassDOT has title to the BET site that would reduce the amount of land required to be taken as part of the Maintenance Facility construction.
- *Neighborhood Impact* – BET already is in place and its impacts are known by the neighborhoods and its use would minimize greatly the impacts to these neighborhoods.
- *Operational Simplicity* – At the December meeting in Cambridge it was mentioned that both Yard 8 and Mirror H would require Green Line traffic to be stopped in order for a train to be placed into service. This is because the trains would be required to back onto the track and then reverse direction in order to assume the proper operational positioning. The same goes, only in reverse, for taking a train out of service. Having to stop traffic to either take a train out of service or put one into service does not make operational sense. Utilizing BET would provide MassDOT with the ability to rectify this operational nightmare.
- *Environmental Justice / Equality* – One of the reasons given for needing the Maintenance Facility is to have operational and service capabilities nearer the northern components of the Green Line. While this makes sense, it flies in the face of the fact that the BET performs service on diesel engines that service the southern components of the commuter rail network. It flies in the face of environmental justice and equality that MassDOT would site another

I-213-015

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-213-016

As described in Section 3.3.2 of the DEIR/EA, the Boston Engine Terminal facility is barely adequate for current commuter rail needs. Sufficient space is not available to accommodate the Green Line Extension train storage and maintenance needs. Further, the FTA regulations state that use of both commuter rail and light rail within the same facility is incompatible. However, MassDOT will continue to coordinate with the MBTA to explore possibilities for shared facilities between the Green Line Extension storage and maintenance facility and the BET.

I-213-016

service facility in a neighborhood that already houses a maintenance facility used to service diesel engines from the southern part of the network. In the service of justice and equality, I would recommend MassDOT consider locating the service functions for the southern commuter rail diesel engines south of Boston and use the space made available by such a move to locate the Maintenance Facility for the Green Line within the existing BET footprint.

There has been a lot of good work that has gone into the project to get it to where it is today. There is much more work to be done to bring the project to the next level and ultimately deliver a solution that has far more impact than solely an extension of the Green Line to Medford. This project, done right, has the opportunity to help transform significant parts of Cambridge, Somerville and Medford for the better. You have many willing members of the community working with you to help make this happen. Please do not lose this opportunity.

Thank you for your consideration.

RECEIVED
JAN 8 2010
MEPA

Dear Secretary Ian Bowles,

As a citizen of the Commonwealth, an active member of the Somerville community, and as an entrepreneur and business professional who lives in and runs businesses in Somerville, I am writing you this letter in regard to Draft Environmental Impact Report. (Project Number EEA#13886)

As such, there are several very important issues that were not fully explored or committed to in the Green Line Extension DEIR process. In this letter I will address one of those issues: **The need to review options for Composite Mitigation along the Green Line Extension.**

Based on the points and questions outlined and raised below I believe it is incumbent upon on the Secretary to:

I-214-001

- Require the final Environment Impact Study or a supplementary EIR to include a full review of composite mitigation options applied to all factors contributing to the amount of noise, vibration and diminished air quality along both spurs of the Green Line Extension. These options should especially review:

I-214-002

1. Modifications to the tracks:
   Proposed Green Line tracks as well as existing commuter, freight tracks and the Boston Engine Maintenance spur that ends along side the Brickbottom Building

I-214-003

2. Modifications to the train vehicles:
   Proposed Green Line vehicles as well as vehicles using existing commuter, freight tracks and the Boston Engine Maintenance spur that ends along side the Brickbottom Building

I-214-004

3. Modifications to the usage models and scheduling:
   Proposed Green Line maintenance, storage facilities and their scheduling as well as the usage of existing commuter, freight and Boston Engine Maintenance spur lines that ends along side the Brickbottom Building

1

I-214-001

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

I-214-002

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in DEIR/EA Chapter 6, Draft Section 61 Findings and Mitigation Measures. The mitigation measures required by the Secretary's Certificate on the DEIR are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments. These findings take into account modifications to all railroad tracks in the Project Area.

I-214-003

Operations of all proposed and existing vehicles that operate in the Project Area have been included in the evaluation and identification of mitigation measures are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-214-004

Please see response to Comment I-214-003.

Current Status

I-214-005

The current DEIR, in addition to not conducting complete sound and vibration measurements on the Union Square Line, the mitigation options outlined in the DEIR fell short of being adequate. They failed to consider that mitigation options that made changes to existing contributing factors: Commuter rail, freight and AMTRAK as well as the Green Line itself and physical changes to the surrounding buildings.

Vibration, sound and air quality is additive. By making changes to the existing commuter, freight and Boston Engine Maintenance rail head lines, that ends along Southside of the Brickbottom Building, as well as to the Green Line will help mitigate the combined factors that put some areas, such as the Brickbottom and Glass Factory buildings at environmental risk.

Needed Mitigation: Tracks

I-214-006

- Track Placement: Many Somerville and Medford residents will co-exist with existing commuter rail lines and the new Green Line tracks just 19 -- 25 feet away. This proximity needs to be investigated to see if it is necessary in every case and to more thoroughly identify possible remediations.

I-214-007

- The Boston Engine terminal uses the dead-end spur to pull cars out of their facility and to idle engines at the end of the rail head next to the Brickbottom Building. These tracks and their use should be investigated. It would be possible to move this track and its function so that the Green Line has more space and does not have to take land along side Brickbottom, so that the Green Line would not be 12 feet away from at least 10 residences.

I-214-008

- Track Noise: Design of Green Line tracks, bridges and existing commuter tracks for low-noise and anti-vibration -- also addressing wheel and rail roughness

Needed Mitigation: Vehicles

I-214-009

- Vehicle Noise: One of the greatest sources noise in the system is the air conditioning of the light rail cars. We request that fan-quieting mitigation be implemented on cars stored and used on the Green Line Extension. This can be accomplished by installation of quiet, efficient fans, several new designs are available. Placement of fans on the vehicle can make a significant difference in the noise radiated toward residents closest to the tracks, especially on the Union Square spur.

- Vehicle Noise: Additionally, Green Line railcars should be fitted with acoustical absorption under the cars. This has been demonstrated to provide up to 5 decibels of mitigation for wheel/rail noise. Similarly, vehicle skirts over the wheels can provide 5 decibels of mitigation. By carrying their own noise barriers, vehicles with these features can provide cost-effective noise reduction.

Needed Mitigation: Usage models and scheduling

I-214-010

- Usage Models and Scheduling: The dead-end rail spur along side the Fitchburg commuter rail as currently used by the Boston Engine facility contributes tremendously to existing noise, vibration and air quality issues along South side of the Brickbottom building.

2

I-214-005

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-214-006

The precise alignment for the tracks near the Brickbottom Artists Building will be determined during preliminary engineering and final design. The tracks will be located as far from the building as possible. The minimum clearance will probably be about 15 feet. MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in DEIR/EA Chapter 6, Draft Section 61 Findings and Mitigation Measures. The mitigation measures required by the Secretary's Certificate on the DEIR are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-214-007

Major changes to operations of the Boston Engine Terminal (BET), MBTA Commuter Rail and other railroads, and railroad vehicles are beyond the scope of the Green Line Extension Project. The BET "Drill Track," or the track used to access the BET from the west, will be relocated approximately five feet further from the Brickbottom Artists Building as part of the Green Line Extension Project.

I-214-008

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has

I-214-011 The Green Line will contribute and increase the existing amount of noise and vibration along the Green Line corridor. Since no measurements were taken on the South-side of the Brickbottom building, the DEIR does not take current or additional noise, vibration and air quality issues into account. Changes in usage patterns and creative changes to the how these lines are used will have a huge impact on the nearby environment. This needs to be fully investigated.

I-214-012 ***Personal Note:*** *I have included pictures taken within a 24 hour period from my living room showing the commuter rail trains idling along side the Brickbottom building. Video is available if you want to hear and feel the impact these trains have every hour on the hour around 10 times a day, 6 days a week mornings, afternoons and regularly between 10PM and Midnight.*

Questions and Requests

Based on the information above, I would ask that the Secretary:

I-214-013 - Commit to do a supplemental Environment Impact Review that fully explores mitigation alternatives across all contributors to noise, vibration and air quality along the Green Line corridor.

I-214-014 - Commit to the establishment of a citizen advisory committee (CAC) to oversee the project and to ensure that mitigation is researched and fully implemented in every awarded contract as well as to provide residents with a process for remediation and, when necessary, arbitration.

I support the Green Line Extension and the benefits that it will deliver, however on its current path the project has not done enough to ensure that the fully range of possible mitigation options have been explored. As outlined in the DEIR, the Green Line Extension places an unjust burden on the residents of Brickbottom and all citizens and business that live and work along the corridor.

I appreciate your continued thoughtful consideration and commitment to environmental justice.

Sincerely,

Peter Marquez
Somerville resident
President 8020 Networks

Suite B151
Somerville, MA 02143
617 628 7112

3

complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

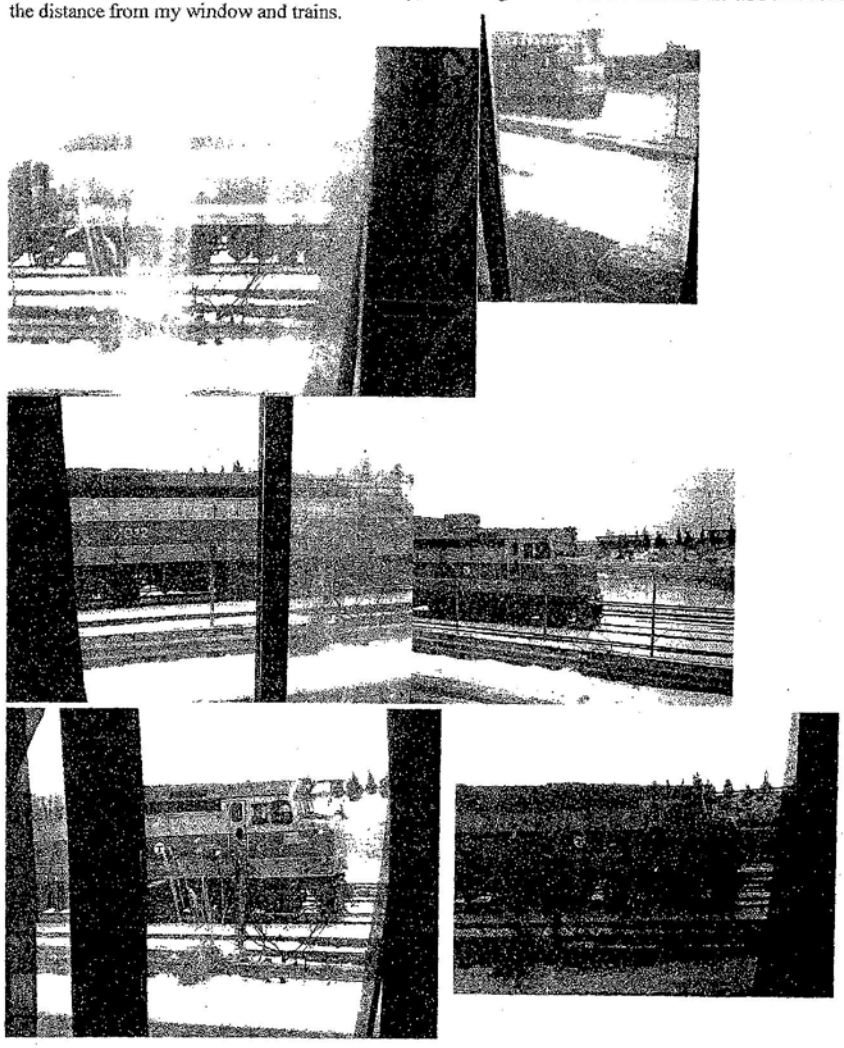
I-214-009

While noise from fans in auxiliary equipment such as air-conditioners on transit cars is a significant noise source for stationary trains, the greatest source of noise on moving trains is generated at the wheel-rail interface. Installing quieter fans could be effective in reducing noise emissions from Green Line cars while stationary, such as when they are in the maintenance yard being prepared for revenue service. However, this mitigation measure would not be effective in reducing the noise generated by moving Green Line cars or the total noise generated by both Green Line and commuter trains. Noise barriers proposed for the Project would be more effective in reducing the noise from both Green Line and commuter trains.

The potential retrofit of Green Line cars with vehicle skirts including acoustical absorption behind the skirt and underneath the car may reduce noise levels from Green Line cars. However, the project corridor is generally dominated by noise from existing commuter trains and such a mitigation measure would not be effective in reducing the total noise generated by both noise sources. Noise barriers proposed for the Project would be more effective in reducing the noise from both Green Line and commuter trains.

Specific modifications to existing Green Line vehicles would be a systemwide effort and may be beyond the scope of the Project. As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has

24 hours outside of my living room and office. Boston Engine Maintenance engines idling next to my window. The noise, vibration and diesel exhaust created by this practice and the use of the closest line by Pan Am for freight creates an elevated baseline that the Green Line will contribute to. This needs to be measured and taken into account. Additionally, the taking of land for the Green Line will cut in half the distance from my window and trains.



complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes proposed mitigation measures and next steps pertaining to mitigation.

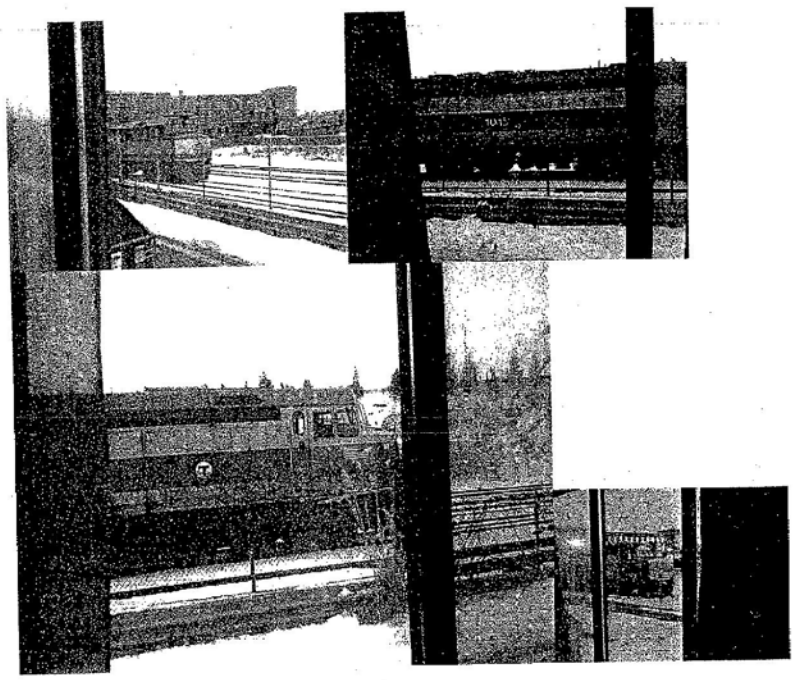
I-214-010

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-214-011

Potential noise and vibration impacts were assessed for the southwest facade of the Brickbottom Artists Building, which abuts the existing MBTA Fitchburg Commuter Rail line. Because the northeast façade represents the location of the building with a potential for more severe noise impact, findings for the southwest façade were not originally reported in the DEIR/EA. These findings have been included in FEIR Chapter 8. All noise projections take into account proposed changes to the topography of the alignment, including things such as retaining walls and grading.

The Green Line Extension will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling



assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality. As required by the Secretary's Certificate on the DEIR/EA, the FEIR includes a narrative clarifying the relationships of air quality modeling data to MassDEP and EPA requirements for State Implementation Plan (SIP) consistency.

I-214-012

MassDOT has noted and considered your comment.

I-214-013

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

I-214-014

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

The Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge St, Suite 900
Boston, MA 02114

Dear Secretary Ian Bowles,

I am writing you this letter in regard to the Draft Environmental Impact Report (project Number EEA#13886) as a citizen of the Commonwealth, an active member of the Somerville community, and as an entrepreneur and business professional who lives in and runs my businesses from the Brickbottom Building in Somerville.

As a 24-hour resident of the Brickbottom Building, the additive environmental impact of the Green Line extension is extremely important to my business, my family's quality of live and health.

As such, there are several very important issues that were not fully explored -- and in some cases completely omitted -- during the Green Line Extension DEIR process. In this letter I will address one of those issues: **The need for a full and complete Environmental Impact Study.**

Based on the points and questions outlined and raised below,I believe it is incumbent upon on the Secretary to:

I-214-015

- Require a full Environment Impact Study on all aspects of the Green Line Extension that impact the Brickbottom/Inner Belt area, especially
  1. The Union Square Line on the South side of the Brickbottom building which was not fully studied in the DEIR and
  2. All possible impacts derived from the proposed maintenance and storage facilities

Current Status

As outlined in the current DEIR, sound and vibration measurements are required to establish the additive impact of the new lines. With the introduction of the Green Line Extension, residents of the Brickbottom Artists Building will live with two Green Line spurs on either side of the building. Full investigations need to be done on both lines and sides of the building to fully understand their impact.

I-214-016

However, the south side of Brickbottom was not fully studied. Noise and vibration measurements were only taken on the north side of the Brickbottom Artists Building. The south side of the building – which is currently severely impacted by the existing Fitchburg commuter line, Boston Engine terminal rail head, used hourly by Amtrak, MDOT and Pan Am

I-214-015

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

I-214-016

Potential noise and vibration impacts were assessed for the southwest facade of the Brickbottom Artists Building, which abuts the existing MBTA Fitchburg Commuter Rail line. Because the northeast façade represents the location of the building with a potential for more severe noise impact, findings for the southwest façade were not originally reported in the DEIR/EA. These findings have been included in FEIR Chapter 8. All noise projections take into account proposed changes to the topography of the alignment, including things such as retaining walls and grading.

The Green Line Extension will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality. As required by the Secretary's Certificate on the DEIR/EA, the FEIR includes a narrative clarifying the relationships of air quality modeling data to MassDEP and EPA requirements for State Implementation Plan (SIP) consistency.

I-214-016 – has not been given adequate study to establish a baseline for current noise, vibration and air quality, nor to fully establish possible mitigation strategies.

I-214-017 Additionally, sound and vibration measurements need to take into account the impact of hourly use of the Boston Engine terminal rail head 6 days a week from 9 am to 11 PM where large diesel engines used to drag trains from the facility idle next to the Brickbottom building.

Personal Note: *Whether I am on the phone, in a business meeting or in my bed, the noise and vibration of the current commuter rail and (even more powerful) the regular idling of trains on the Boston Engine Spur 25 feet from my window disrupt and disturbs normal life.*

Additional Study Outcomes

I-214-018 A full and complete environment baseline must be established, to which anticipated Green Line impacts can be added. The current DEIR does not do enough document these factors. Additionally study will allow the Secretary to:

- Establish the current and anticipated levels of Environment Injustice on the residents of Brickbottom and others along the Fitchburg line / Union Square Green Line Spur
- Determine what Green Line mitigation is appropriate to remediate the level of injustice based on anticipated sound and vibration impacts
- Outline what mitigation can be done on the commuter, Grand Junction and Boston Engine Spurs to lower composite impact and levels of environmental injustice based on existing sound, vibration and air quality
- Determine the impact mitigation, such as air-tight noise-reduction windows in old industrial building like the Glass factory and Brickbottom, will have on indoor air quality.

Questions and Requests

Based on the need for additional measurements I would ask that the Secretary:

- Commit to a complete Environment Impact Review and not accept the DEIR as a final study.
    - I-214-019 Include in the final Environmental Impact Review a complete study of the Fitchburg Line, Union Square Spur, Boston Engine rail head, Grand Junction, the South-side of the Brickbottom Building for sound, vibration and air quality.
    - I-214-020 Include in the final Environmental Impact Review the impact of the Union Square Line with regard to land taking and proposed track placement for total noise, vibration and air quality impact on the South side of the Brickbottom Building, as this was not done in the DEIR.
    - Include in the final Environmental Impact Study a full exploration of moving the Boston Engine Terminal Rail head to create more room for the Green Line and not have to take land from the Brickbottom Building on the South side of the building.
    - I-214-021 Include in the final Environmental Impact Review a site-specific study to incorporate the benefits of noise barriers that takes into account the combined benefits of sound and air quality that they can provide.

I-214-017

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-214-018

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA. The Secretary's Certificate found that the DEIR/EA adequately documented the environmental baseline and impacts. FEIR Chapter 8 describes specific proposed mitigation measures, plans for monitoring after construction, and next steps pertaining to mitigation. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-214-019

Potential noise and vibration impacts were assessed for the southwest facade of the Brickbottom Artists Building, which abuts the existing MBTA Fitchburg Commuter Rail line. Because the northeast façade represents the location of the building with a potential for more severe noise impact, findings for the southwest façade were not originally reported in the DEIR/EA. These findings have been included in FEIR Chapter 8. All noise projections take into account proposed changes to the topography of the alignment, including things such as retaining walls and grading. Operations of the Boston Engine Terminal (BET), MBTA

I-214-022
- A study by NOAA and EPA found that sound barriers also reduce the amount of pollutants, such as soot from diesel exhaust that reaches area residents

I-214-023
- Contrary to the DEIR, the Federal government's 2006 Transit Noise and Vibration Impact Assessment (FTA-VA-90-1003-06) states that sound barriers, despite the height of the building, can still provide meaningful sound absorption. "Where the barrier is very close to the transit vehicle or where the vehicles travel between sets of parallel barriers, barrier effectiveness can be increased by as much as 5 decibels by applying sound-absorbing material to the inner surface of the barrier."

I-214-024
- Include in the final Environmental Impact Review a study of all mitigation options including all of those that can applied to the Green Line, Commuter, Freight, Boston Engine maintenance and Amtrak activity.

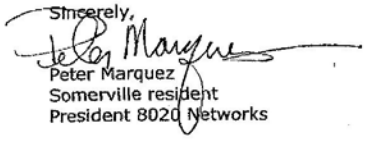
I-214-025
- Include in the final Environmental Impact Review a study of the impact that proposed mitigation will have on indoor air.
  - The sealing of homes along the Green line corridor -- air-tight noise-reduction windows, etc --- will have undetermined impact on health. According to the US EPA most homes have more than one source that contributes to indoor air pollution. There can be a serious risk from the cumulative effects of these sources. Air-tight noise-reduction windows exacerbate these issues.

I-214-026
- Commit to the establishment of a citizen advisory committee (CAC) to oversee the project, to ensure that mitigation is implemented in every awarded contract and to provide residents with a process for remediation and, when necessary, arbitration.

I support the Green Line Extension and the benefits that it will deliver. However, on its current path, the project has not done enough to ensure that an unjust burden is not placed on the residents of Brickbottom and all citizens and business that live and work along the Green Line extension.

I appreciate your continued thoughtful consideration and commitment to environmental justice.

Sincerely,



Peter Marquez
Somerville resident
President 8020 Networks

Somerville, MA 02143
617 628 7112

Commuter Rail and other railroads, and railroad vehicles are beyond the scope of the Green Line Extension Project.

I-214-020

DEIR/EA Section 5.3 describes the Project's potential temporary and permanent acquisitions. MassDOT will evaluate opportunities to minimize these property impacts.

The Green Line Extension will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality. As required by the Secretary's Certificate on the DEIR/EA, the FEIR includes a narrative clarifying the relationships of air quality modeling data to MassDEP and EPA requirements for State Implementation Plan (SIP) consistency.

I-214-021

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-214-022

While sound barriers are considered to have minor benefits for air

pollution, new fuel standards from EPA will result in more significant reductions in train, automobile, and bus emissions.

I-214-023

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-214-024

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

I-214-025

The Green Line Extension will have a positive impact on outdoor air quality within the study area. Indoor air quality is unique to each individual building, and is outside the scope of this project.

I-214-026

In accordance with the Secretary’s Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT’s plans for public outreach in the next phases of the Project.

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA #03886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-215-001 As a resident of the Glass Factory Condominiums, I am deeply concerned about the design and placement of the Green Line Extension and the new Lechmere Station.

TRACKS ARE TOO CLOSE TO OUR BUILDING.
The present design shows the tracks running very close to the rear of our building. We urge your designers and engineers to place the tracks as far to the rear of our building as possible to preserve views & light to the many units that will be severely impacted by the elevated tracks. The design and placement of the tracks and supports should do all it can to minimize the visual impact to those units and also minimize noise & vibration impacts to the whole building as well as the surrounding neighborhood.

LECHMERE STATION.
At present, your designs show the new Lechmere Station so close to the Glass Factory that it appears to be part of our condominium building. Please move the station closer to East Street, where it could be part of the entrance way to the eventual North Point development. The station design needs to be substantially improved so it is not an eyesore but rather an enhancement to this rapidly developing neighborhood. It should reflect the importance of this location as the gateway between Cambridge & Boston.

BUS TRAFFIC.
The many bus lines that converge on Lechmere Station are presently designed to enter at one end of our building, pick up passengers, and emerge at the other end of our condo building. Please do not route bus traffic, directly under our windows. Bus traffic noise, vibrations and fumes are a great concern. Sidewalks where passengers wait, should also be moved farther from our building to preserve our privacy and minimize impacts from noise, light and smoking. If too close, it will feel like we are living in the bus station.

PRESERVE OUR TREES & GREEN SPACE.
Presently there is a row of mature evergreen trees behind our building. I urge you to preserve all these trees and the entire small green space behind our building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks should be on the far side of the large trees. These trees serve as a natural screen for the tracks and busway.

I-215-001

Please see Comment Letter I-013.

MAINTENANCE FACILITY.
I strongly oppose the Mirror H location. It is much too close to the Glass Factory and other residential buildings and will effectively destroy further development in North Point. Putting a maintenance facility on prime land in a desirable, developable location that would generate significant tax revenue to Cambridge simply does not make sense. Of the three options proposed, Option L seems to be the best choice however I would prefer there be no maintenance facility in this area but rather it be at the end of the line.

REDUCE SURFACE PARKING.
The present Lechmere Station is at the end of the Green Line. That will no longer be the case with the new Green Line Extension and the number of parking spaces should be substantially reduced. Please consider using the under-utilized parking garages that are already in this neighborhood. Surface parking is bad urban design and should be minimized in the new North Point neighborhood. One half of our building will overlook the new parking and we request it be carefully designed with this in mind. Ample green space should be included in the design and all lighting should be down lighting that minimizes light pollution to our building.

Thank you for hearing my concerns.

Sincerely,

Lena Matranga

Boston, MA 02114

5th January 2010

Dear Secretary Bowles,

As a resident of East Cambridge and the Vice President of the East Cambridge Planning Team, I am writing to express my and my wife's comments and ideas about the planned move of the Lechmere T station across McGrath Highway. As you know the proposed station will be both further away from the East Cambridge neighborhood than it is now, and on the other side of six lanes of traffic, causing us concerns for safety, and accessibility.

I-216-001

We feel that if the new station is planned as an integral part of a revitalized Lechmere Square we can mitigate the safety issues and create a more vibrant, safe, and welcoming gateway to Cambridge and approach to the new station. These ideas are contained in the design proposals for Lechmere Square presented by the East Cambridge Planning Team to your staff, including Mark Boyle, Joe Cosgrove, Kate Fichter, and attached to this letter. We have had nothing but positive feedback from your staff, the City of Cambridge staff and elected officials, neighbors and local business leaders. We urge you to consider these ideas, we believe they represent a way of developing the station and adjacent parcels owned by Mass DOT that will be good for everyone and with the increased development on some parcels should incur no net extra cost.

Sincerely,

Chris and Taco Matthews
26 Sixth Street
Cambridge MA 02141

I-216-001

MassDOT has reviewed the suggestions submitted by the East Cambridge Planning Team. Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. These plans, including the pedestrian crossings of O'Brien Highway and associated street, crosswalk, and sidewalk designs will be further refined in the preliminary engineering stage of the Project. As part of the Green Line Extension, MassDOT intends to demolish the existing Lechmere Station and prepare the site for potential future redevelopment. Based on the current requirements of the O'Brien Highway roadway improvements (as shown in FEIR Chapter 5, Lechmere Station), the existing bus shed must be removed.

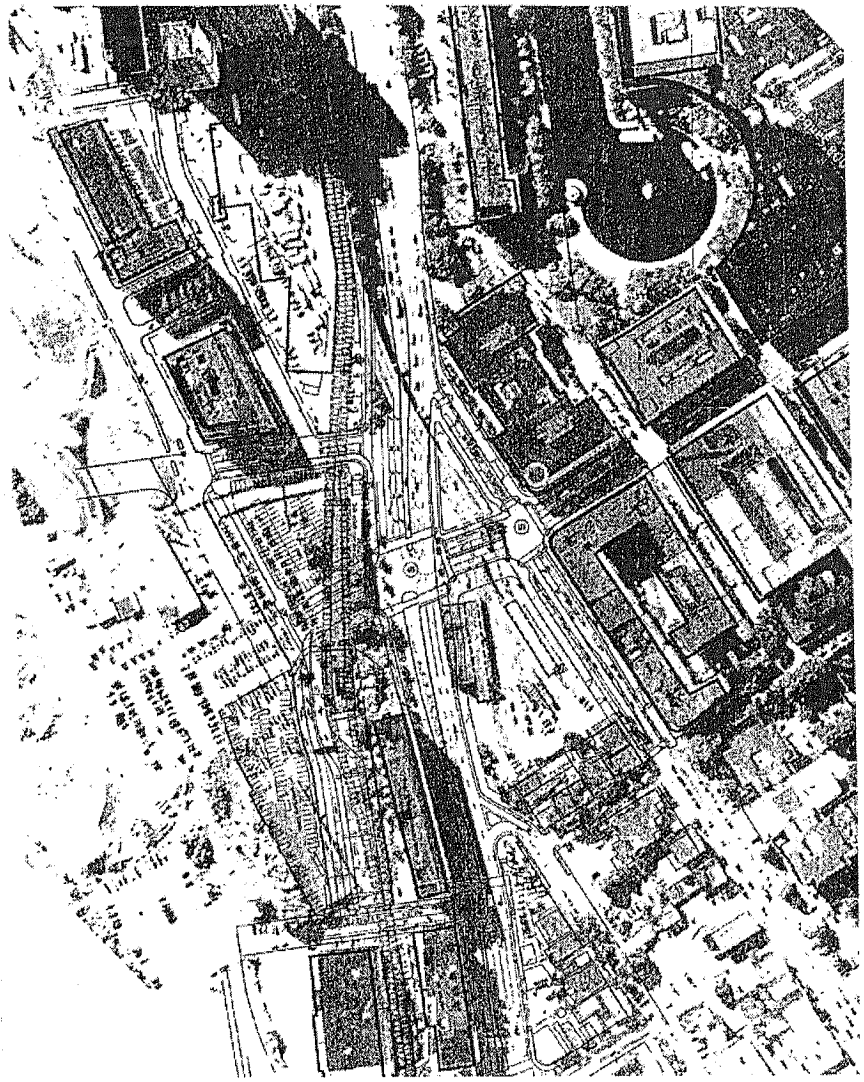
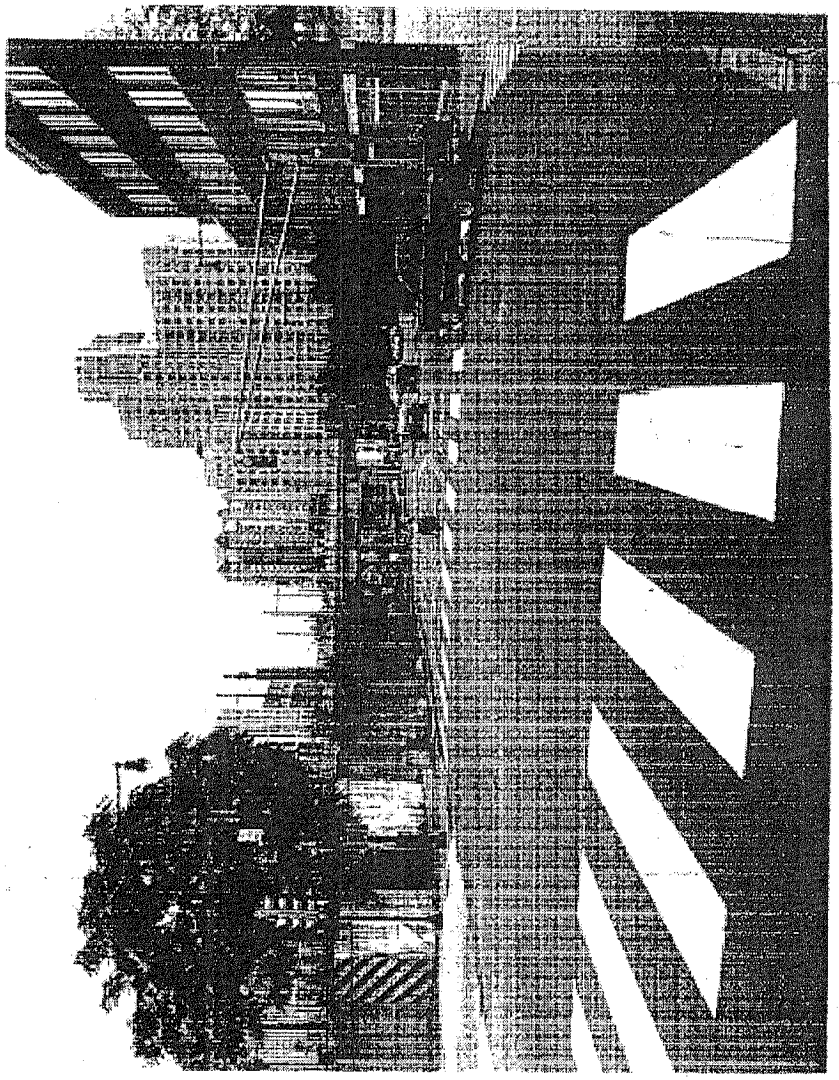
OVERVIEW:

Green Line Extension and Relocation of Lechmere Station.



BORN IN IRELAND. RAISED IN BOSTON.



5 KEY ISSUES at Lechmere Square

1. **Redevelop Lechmere Square As A Major Gateway To East Cambridge And An Integrated Hub Of The Neighborhood.**

2. **Improve Pedestrian Connections and Road Crossings, Especially at Monsignor O'Brien Highway.**

3. **Preserve the Historic Station Buildings and Redevelop Around a New Public Market Square with New Restaurants, Retail and a Hotel.**

4. **Improve Station Entrances and Lobby.**

5. **Integrate the Green Line and Bus Station Design with the Future North Point Street Grid.**

First, Lechmere Square...

December 9 , 2009

The Executive Office of Energy & Environmental Affairs
MEPA Office
Att: Holly Johnson MEPA Analyst
EEA #13886
100 Cambridge St Suite 900
Boston MA 02114

Dear Secretary Ian Bowles:
Holly Johnson

RE: **Executive Office of Transportation (EOT)** Maintenance Facility & Storage Yard proposed for "Yard 8" Somerville : Proposal to build an **11-acre maintenance facility** on the parcel known as "**Yard 8**

I am writing you on an urgent issue: Urgent because there is a pressure of deadlines; u rgent because the Executive Office of Transportation, EOT, hasn't come up with alternatives despite a year of meetings with objections raised and discussed not only by «GreetingLine» residence but by the Somerville Mayor's office and adjacent communities. There is documentation that supports other workable solutions at locations referred to as Mirror H and Option L that meet the EOT's requirements for acreage and proximity without incurring costs.

So my first request is to ask you to research this problem: the pressure of deadline approaching with no alternatives offered by the EOT is unacceptable and frankly suspect.

I am one of the founding members of the two building «GreetingLine» Condo and Studios complex which established 200 residences and studios twenty -two years ago . We are a residential community , families with growing children living here. Over these past two decades we developed an annual Open Studios weekend event , free to the public. We have become a vital cultural center for Somerville , Cambridge and for the Greater Boston area. Having a maintenance facility abutting our property introduces environmental toxins, including air, sound and physical vibration which would **destroy** our quality of life, our property values and a renown cultural institution. This is egregious!

I-217-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-217-002

DEIR/EA Sections 5.7, Noise, and 5.8, Vibration, describe the noise and vibration impacts, respectively, expected from the Project. Pursuant to FTA-established guidelines, these impacts have been identified and evaluated for moderate and severe impacts to sensitive receptors. FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments, describes the mitigation measures that would be implemented to eliminate, minimize, or offset impacts above regulatory thresholds.

CYNTHIA MAURICE
Studio
One Fitchburg St. C323, Somerville, MA 02143
617-628-2450 / www.cynmaurice.com / email: cynnym@rcn.com

Based on my visit to the Riverside Maintenance Yard in Newton, I note how much space is required for trains and tracks surrounding a maintenance facility. A Maintenance facility in Yard 8 would take up vast acreage and cut off future land development with long term consequences for the growth for the city of Somerville. A huge loss for the city.

I-217-001 In sum, I am requesting a halt to EOT's proposed use of Yard 8 . That is, a decision that states that Yard 8 is not an option. I would like o have in writing an agreement that they are working to commit to an alternative plan. I would also like flexibility in current deadlines. The consequences are too grave to make a hasty decision under pressure.

I-217-002 I request that you research a more extensive cost analysis of noise, vibration for both construction phase and the permanent phase of such a project with dates of construction and completion. Even if this project is relocated to the alternative Mirror H or L its proximity will have environmental consequences for all of us unless it is planned and monitored well.

Thank you in advance for your assistance. I appreciate your help,

Yours respectfully,

«GreetingLine»
Resident and a founding member of «GreetingLine» Condos

Dear Secretary Ian Bowles ,
Holly Johnson:

RE: **Executive Office of Transportation** (EOT) Maintenance Facility & Storage Yard
Proposal to build a Maintenance facility on the parcel known as "Yard 8 Somerville :

I am writing you on an urgent issue: urgent because there is a pressure of deadlines; urgent because the Executive Office of Transportation, EOT hasn't come up with alternatives despite a year of many meetings with various community groups, Somerville political representatives and Brickbottom residents. In all thses meetings we all have raised objections to the Maintenance Facility proposed for Yard 8. There is documentation that supports alternatives, other workable solutions at locations referred to as Mirror H and Option L that meet the EOT's requirements for acreage and proximity without incurring costs.

So my first request is to ask you to address the problem: Pressure of deadlines approaching with no alternatives offered by the EOT.

I am one of the founding members of the two building Brickbottom Artists Condo and Studios complex which established 200 residences and studios twenty -two years ago . We are a residential community , families with growing children living here. Over these past two decades we developed an annual Open Studios free to the public. We have become a vital cultural center for Somerville, Cambridge and for the Greater Boston area. Having a maintenance facility abutting our property introduces environmental toxins, including air, sound and physical vibration which would **destroy** our quality of life, our property values and a renown cultural institution. This is egregious!

CYNTHIA MAURICE
Studio
One Fitchburg St. C323, Somerville, MA 02143
617-628-2450 / www.cynmaurice.com / email: cynnym@rcn.com

Based on my visit to the Riverside Maintenance Yard in Newton, I note how much space is required for trains and tracks surrounding a maintenance facility. A Maintenance facility in Yard 8 would take up vast acreage and cut off future land development with long term consequences for the growth for the city of Somerville. A huge loss for the city.

In sum, I am requesting a halt to EOT's proposed use of Yard 8. That is, a decision that states that Yard 8 is not an option. I would like o have in writing an agreement that they are working to commit to an alternative plan. I would also like flexibility in current deadlines. The consequences are too grave to make a hasty decision under pressure.

I request that you research a more extensive cost analysis of noise, vibration for both construction phase and the permanent phase of such a project with dates of construction and completion. Even if this project is relocated to the alternative Mirror H or L its proximity will have environmental consequences for all of us unless it is planned and monitored well.

Thank you in advance for your assistance. I appreciate your help,

Yours respectfully,
Cynthia Maurice

Subject: RE Green line extension Draft EIR (EEA#13886)

to secretary Ian Bowles, attn Holly S. Johnson

Dear Mr. Ian Bowles,

I-218-001 Please consider extending the Somerville Community Path to Cambridge and Boston. The Community Path and the Green Line extension should be considered together.

Thank you very much.

Sincerely,

Jennifer Mazer

jmmazer@gmail.com

I-218-001

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-219-001

I have lived in Medord all my life and am now a senior citizen. ***I strongly oppose the extension to Rte # 16.***
With no plans for a parking facility and such a congested area already near Whole Foods it will be a complete nightmare!
Many folks in the area are Seniors and can not walk very far especially in inclement weather. Prevaling thought seems to be everyone will just hop on the trains and that will eliminate traffic congestion. Nothing could be further from the truth! MVPkwy and Boston Ave is a very busy, dangerous intersection on a good day and with walkers and cars dropping off and picking up it will be **a mess!** Also folks from other towns already park in Medford all day hindering residents trying to do business in the city. We pay taxes here, not surrounding towns yet we are being ignored. Where will commuters park? Also it will depress the West Medford area with transients, just as the area is trying to improve. Please think about this. I watch the proceedings on Medford cable and this is being shoved down our throats. **Let it STOP at Tufts!!!!!.**
Sincerely,
K. McCarte

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. The Proposed Project, with a terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Additionally, FEIR Chapter 4 includes a detailed description of College Avenue Station functioning as a terminal station.

Dear Green Line Extension Friends -
This is a reminder that the Massachusetts Department of Transportation (MassDOT), formerly the Executive Office of Transportation, will present findings and recommendations from the Draft Environmental Impact Report/Environmental Assessment (DEIR/EA) at a **Public Hearing** on **November 18, 2009 at 6:00 pm at Somerville High School - Auditorium, 81 Highland Avenue, Somerville, MA 02143**.
Members of the public, agency representatives, and other project stakeholders are invited to attend the hearing and to make comments on the project. MassDOT anticipates that a large number of people will comment at the meeting, so a time limit on remarks will be set, based on the turnout. We appreciate your cooperation with helping the meeting run smoothly.
Written comments may also be submitted to the MEPA office at:

Email: Holly.S.Johnson@state.ma.us
In response to public requests, the comment period has been extended to January 8, 2010. MEPA intends to announce its decision on the Green Line Extension DEIR on January 22, 2010.
The DEIR/EA for the project was filed with the Massachusetts Policy Act Office on October 15, 2009. It is is now available on the project website. Click hereto download the document. Copies of the document are still available by request from Regan Checchio by phone at 617-357-5772 x 14 or by email.
For more information on the project, please visit the project website at www.mass.gov/greenlineextension . To contact the project team, please email Kate Fichter. Please share this message with others who may be interested.
Thank you for your interest in and support of the Green Line Extension project.
The Green Line Extension Project Team

I-220-001

The Green Line Extension would not build a new light rail alignment within streets. Instead, the Project proposes to build new light rail transit lines primarily within the existing MBTA rights-of-way along the MBTA Lowell Line and Fitchburg Line commuter rail corridors.

I-221-001

Dear Ms. Johnson- I live right next to the existing commuter rail line in Somerville. At present, the noise from the trains is tolerable, as they do not run that frequently, and do not run late at night. If the green line trains are indeed to be extended through Somerville, I would like some consideration to be given to noise control and pollution levels for those many people who live alongside the railroad tracks. I have lived on Richdale Avenue for many years, and have enjoyed the quiet of the neighborhood.While I understand that for most people this is not a major issue, I hope that everything possible will be done to minimize disruption to our lives.
Thank you,
Sarah R. McClellan

I-221-001

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-222-001

A conceptual Green Line extension to Arlington would be a major new transit corridor well beyond the scope of the Green Line Extension project. As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

Dear Secretary Bowles and Ms. Johnson:

I am pleased to be able to comment on the Draft Environmental Impact Report prepared for the Green Line Extension Project, EEA #13886. I've long favored the Green Line Extension to Somerville and Medford, and have served on the citizen advisory groups to both the Beyond Lechmere MIS and the recent Green Line Extension Project.

First, I'd like to congratulate the project team on publishing the DEIR, albeit over ten months beyond its scheduled date. After so many delays following the original agreements in 1991 that allowed the CA/T project to proceed, every new delay raises questions about the Commonwealth's commitment to this project. I believe it is very important to push forward so that the Extension can begin operation by December 31, 2014, as required by the SIP. To meet that schedule, the storage / maintenance facility should be separated from the rest of the Green Line Extension Project, and defined in a Supplemental DEIR, or by some other means, to allow progress on the remainder of the project.

I-223-001

General station design issues

Even though the station designs in the DEIR are only at the conceptual stage, there are some general design issues that I wish to comment upon.

I-223-002

Several stations (College Avenue, Ball Square, Lowell Street and Union Square) are located where a roadway bridge crosses over the at-grade railway right-of-way. None of those proposed stations provide access on both sides of their bridge, instead putting two elevators, stairs and escalators on the same side. As a result it is likely that many pedestrians will attempt to cross the roadway near the station, and they will be at high risk because drivers cannot see well over the crest of these bridges. It would be much safer to have one elevator and stairs/escalator on each side of a bridge, and I strongly urge that this be required.

I-223-001

The Green Line Extension storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the Project. Chapter 2 of the FEIR fully describes the environmental impacts of the proposed storage and maintenance facility. The facility must be constructed in the vicinity of the Green Line Extension right-of-way to maximize operating efficiencies.

I-223-002

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-223-003 The proposed stations apparently designed to be staffed, perhaps because the MBTA has normally had staff where elevators or escalators are present. I believe staffing is not needed at all stations, many of which are essentially just roofed platforms, and adds both capital costs and operating expenses that could be better used elsewhere.

I-223-004 For efficient intermodal connections to bus service, the optimal locations of bus stops and the pedestrian routes between those stops and the Green Line station must be analyzed and station design should reflect that understanding. Only the proposed relocated Lechmere station addresses this now, but (as noted below) it has other serious design drawbacks.

I-223-005 The amount of bike parking proposed, equal to about one percent of projected boardings, is not enough. Bike storage for at least three percent of the projected boardings should be available at each station, and as much as possible of this storage should be covered to encourage use in bad weather. Where demand is likely to be greatest – namely, Mystic Valley Parkway / Route 16, Lowell Street, and Union Square – more storage should be provided, preferably equal to five percent of the expected boardings at that station.

Specific station concerns

Union Square station:

In selecting the Fitchburg Line alignment over the McGrath Highway / Somerville Avenue options, it was acknowledged that access and visibility to the Union Square business district would be compromised. The station's design, and associated signage, must make obvious the stop's presence and the route to and from Union Square.

I-223-006 A major advantage of the Fitchburg Line station site is that it could eventually be extended to Porter Square serving large areas of both Somerville and Cambridge near the right-of-way. To allow for this without having to rebuild the station, the Green Line tracks should not collide with the Webster Avenue and Prospect Street bridge supports if extended. Allowing for this would require moving the commuter rail tracks to the south in the vicinity of the station, but might reduce the property taken in the Kiley Barrel area just north of the station.

I-223-007 The five bus routes now serving Union Square require safe, short and attractive pedestrian routes between their stops and the Union Square station. Note that Prospect Street and Webster Avenue are slated to become two-way roads within the next several years, so planning for pedestrian, bicycle and bus access must accommodate this. Once Prospect Street is two-way, it will not be safe to have crosswalks near its bridge because its rise will restrict how far drivers can see ahead.

While access from the Prospect Street Bridge will serve pedestrian coming from the south, it would be very desirable to have pedestrian (and bicycle) connections towards the heart of Union Square that do not involve a level change. The proposed station has such a pedestrian route paralleling Prospect Street on the east, but a similar path would be valuable on the other (west) side of Prospect Street. If possible,

I-223-003

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. These stations are designed to be consistent with MBTA standards and compliant with ADA. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-223-004

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

I-223-005

The amount of bicycle storage at each station is based on ridership projections developed by CTPS. DEIR/EA Appendix D includes the methods CTPS used to analyze demand for bicycle parking. Detailed bicycle parking designs will be further developed during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

I-223-006

As the Project advances into preliminary engineering, further

an ideal pedestrian connection would be an elevated walkway from the corner of Newton Street and Webster Avenue.

Lechmere station:

I-223-008 The conceptual station design that was inherited from the North Point project, and then cost-reduced in the DEIR, serves that stalled development at the expense of the existing, larger East Cambridge community. The station needs an entrance on the west side of the station at North First Street, with generously-sized sidewalks leading to the O'Brien Highway. Creating a safe crossing there will be a challenge: while the concept of a ground level crossing is good, it must be combined with a reduction in lanes at that point. A sub-committee of the East Cambridge Planning Team has proposed a station design that is worthy of serious consideration, and their proposal to reuse the current Lechmere station site for a public market and hotel is also very attractive.

I-223-009

I-223-010 I am puzzled by the retention of hundreds of parking spaces in the relocated station design. This will simply provide cheap parking for early morning commuters who drive from the northern suburbs and then park to take the Green Line for the last mile to work. These spaces provide no environmental benefits but instead subsidize undesirable transportation choices. I suggest that the MBTA sell this land so it can be developed for uses more valuable than parking. The proceeds could offset a small portion of the Lechmere station relocation cost.

Brickbottom station:

I-223-011 In the near future (until Inner Belt is redeveloped) most users of this station will either travel by bus, or will arrive on foot or bicycle from north or northeast of the station location. Given this, the station's proposed location 250 feet south of Washington Street needlessly lengthens the distance these riders must traverse. It has been said that this location was selected because of the willingness of the property owner to sell; if so, this is not a good enough reason for this choice.

The Brickbottom station should be located right on the south side of Washington Street, or perhaps on the railway bridge over Washington Street, to provide better access. Safe and efficient pedestrian crossings of this heavily-traveled roadway must be integrated into the design.

I-223-012 Medford Street station:

This station is not proposed in the DEIR, but the Union Square branch should be designed to facilitate its future construction between Route 28 and Medford Street. A station there would serve two nearby shopping centers and support the development of the southeast portion of Boynton Yards, recently zoned for intensive transit-oriented development.

Storage / maintenance facility

Somerville carries a disproportionate burden from regional transportation, including I-93, Route 28, and multiple diesel rail lines with no local service. These rights-of-way divide the city and limit mobility, slow

consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

I-223-007

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-223-008

Revised conceptual plans for Lechmere Station, including modifications to the station headhouse and entrances, enclosed automatic fare collection, and other amenities are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

emergency response, inhibit economic development and put air pollutants such as ultra-fine particles and diesel soot into the air. The Boston Engine Terminal in Inner Belt, built about 10 years ago and entirely within Somerville, services locomotives for the entire commuter system, most of which serve the region south of Boston. It occupies over 40 acres of land, emits vast amounts of noise, vibration and air pollution, and contributes no property taxes. It would be a cruel irony if the Green Line Extension, a clean electric light rail project that will finally restore some benefits from two of the railway rights-of-way crossing the city, would increase the inequitable transportation burdens on an environmental justice population due to a poorly located and designed storage / maintenance facility.

I-223-013 Even though numerous EENF comments pointed out the problems with the Yard 8 location over three years ago, inexplicably the project team delayed serious evaluation of alternatives until after many months had passed. To the despair of many project observers, most of the "alternatives" that the project team proposed and then quickly disposed of were simply too small to ever serve as potential sites, and seemed to have listed only to give the impression that a serious search had been conducted. The first and only potentially viable alternative that they have proposed, Option L, was not published until just before the DEIR.

I-223-014 The DEIR preferred alternative, Yard 8, can be seen as a reasonable choice only in the absence of any real land use planning. The Inner Belt and Brickbottom districts comprise over 100 acres of industrial land perfectly situated for transit-oriented mixed use development. The buildings in Inner Belt were flattened 50 years ago to make way for the ill-conceived highway project of the same name, and it has never recovered. This area has been cut off by the Route 28 McCarthy overpass on the west, the Fitchburg Line on the south, and railways and I-93 on the east, and is sliced up by railway berms carrying the Lowell Line and freight trains.

Although the project team has frequently stated, and does so again in the DEIR, that this area has had railway uses for over a hundred years, the existence of this historic burden does not justify continuing or increasing it. Their argument is absolutely incompatible with the principles of transportation equity and environmental justice.

Three options for the storage / maintenance facility sites are noted in the DEIR: Yard 8 (the preferred alternative), Mirror H and the new Option L. All of these options put the entire facility in Somerville, except for Mirror H where about five percent would be in Cambridge. As noted previously Yard 8 creates an unacceptable barrier to the Inner Belt district from the west, and also imposes noise and vibration on the Brickbottom residences. Mirror H is compatible with Inner Belt development, but may not be acceptable to North Point and other nearby East Cambridge stakeholders. Many of them hoped that structured garages to be built in that location as part of the North Point project would shield them from the BET. The City of Cambridge has expressed firm opposition to Mirror H as well.

I-223-015 As a result I feel that Option L is the only possible option today. It certainly needs to be studied and improved, but in its current form is not acceptable. One problem is that much of the train storage is located near to Brickbottom, along with the switches and other special track work that generates vibration. It also takes valuable commercial properties, and may interfere with connections for the

I-223-009

MassDOT has reviewed the suggestions submitted by the East Cambridge Planning Team. Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. These plans, including the pedestrian crossings of O'Brien Highway and associated street, crosswalk, and sidewalk designs will be further refined in the preliminary engineering stage of the Project. As part of the Green Line Extension, MassDOT intends to demolish the existing Lechmere Station and prepare the site for potential future redevelopment. Based on the current requirements of the O'Brien Highway roadway improvements (as shown in FEIR Chapter 5, Lechmere Station), the existing bus shed must be removed.

I-223-010

Although Lechmere Station will no longer function as a terminal station, there is still a demonstrated demand for existing parking. Nonetheless, parking at the relocated Lechmere Station was reduced in the revised conceptual design. These revised plans are included in FEIR Chapter 5, Lechmere Station.

I-223-011

The conceptual plan for the Brickbottom Station will be refined during the preliminary engineering stage, taking into consideration municipal, neighbor, and other stakeholder concerns to the extent practical. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

I-223-012

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

I-223-015

Community Path, Urban Ring and potential roadways between Inner Belt and North Point. As a start, I believe this facility can be made smaller, thereby reducing land takings, capital costs and lost tax revenue for Somerville, and also the area of impervious surfaces created by access roads and parking.

I-223-016

The reason the facility can and should be made smaller, or at least its car storage and employee parking areas, is to recognize that the amount of storage called for by the DEIR, 72 to 80 cars, far exceeds the cars used to provide Green Line service beyond North Station. At most 22 cars can be in service on the Green Line and the Extension north of North Station (this assumes the stated travel times with 5 minute headways, and two car trains.) Another way to calculate the equitable storage capacity is to add the 20 cars now stored at Lechmere to the 27 to be purchased for the extension for a total of 47. This result indicates that Lechmere is now storing cars used in Boston or elsewhere in the system, and that the number of new cars to be purchased for the Extension may be somewhat inflated.

Even as the DEIR proposes to store cars in Somerville that will not serve the northern branches of the Green Line, the MBTA is soliciting development proposals for surplus land at its Riverside maintenance facility, and there is talk of closing the Reservoir and Cleveland circle storage locations. To residents of Somerville, this seems to perpetuate a long-established pattern of shifting transportation burdens from wealthier communities onto us.

I-223-017

It may take a number of months to reach an acceptable resolution of the many issues surrounding the storage / maintenance facility, and this would almost certainly delay completion of the Green Line Extension Project unless this work is in some way separated from the rest of the project. Proponent asks that the DEIR should be accepted as a Final EIR, and that they will file a Notice of Project Change when (and if) they decide to pursue a different option for the facility. Unfortunately, past experience with the way that this issue has been treated by the project team makes it hard for me, and for many others, to accept their assurance that they will diligently and fairly apply their best efforts. Therefore I request the Secretary require development of a Supplemental EIR for the storage / maintenance facility to permit the rest of the Green Line Extension project to move forward.

<u>Medford branch terminus</u>

I-223-018

It would be tragic if the Green Line Extension Medford branch was cut short at College Avenue. First, because College Avenue cannot plausibly be represented as within Medford Hillside, or even on the edge of Medford Hillside, the project would not conform to the SIP. Second, College Avenue is ill-suited as a terminus due to its roadway configuration: in addition to depriving Medford Hillside of transit service, would also burden it with added traffic. Finally, the value to the Commonwealth of the Green Line Extension, whether measured in air quality improvement, better mobility, or economic benefits, would be greatly reduced by truncating this branch.

I-223-019

I-223-020

I-223-021

I realize this decision was primarily motivated by the lack of funding for a project recently burdened with the costs of the Lechmere station relocation. Since the City of Cambridge and Pan Am Systems (Guilford) are the primary beneficiaries of this relocation, ideally some way should be found for them to pay for a portion of the costs to carry out commitments orlginally made by the North Point developers.

I-223-013

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-223-014

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-223-015

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the

I-223-022 Assuming the terminus will be at Mystic Valley Parkway / Route 16, the station need not take the commercial buildings at 200 and 220 Boston Avenue as proposed in the DEIR, nor does it need extra acreage for a possible parking structure. (In spite of explicit direction to the contrary in the EENF Certificate, the project team persisted in advocating a 300 to 500 car structure at this location until just before the DEIR was released.) The Medford Green Line Neighborhood Alliance (MGNA) has produced an alternative plan that avoids these takings, and the project team is said to have told the Medford City Council that they were working on a similar design, but have not provided any details.

I-223-023 I think the MGNA design has merit, but i would like to see it amended to facilitate a possible future extension of that Green Line branch across the Mystic River. This calls for a slight change in the terminal track alignment but should be feasible.

Public process

I-223-024 It will be important to establish a Citizen's Advisory Committee for the project as a whole, as well as distinct CACs for the storage/maintenance facility, the Union Square station, the Mystic Valley Parkway / Route 16 station, and one for mitigation to abutters and others seriously impacted by the project. Based on the limitations that emerged with the prior Advisory Group, these CACs should function as described by MEPA section 11.09. I feel strongly that a CAC able to set its own agenda, meet when it deems it necessary, will be more effective in resolving issues such as the storage / maintenance facility location. In addition, there needs to be early and continuing outreach with stakeholders for each of the other stations. With the aggressive schedule needed to begin operation by the end of 2014, it is critical that this project implement more effective ways to get community input and to resolve controversy.

Sincerely,

James A. McGinnis

evaluation, Option L is identified as the preferred maintenance facility site.

I-223-016

The Green Line Extension storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the Project. Chapter 2 of the FEIR fully describes the environmental impacts of the proposed storage and maintenance facility. In order to maximize operating efficiencies, the facility must be constructed within the same timeframe as the Green Line Extension Project, in the vicinity of the Green Line Extension right-of-way, and north of downtown Boston.

The storage and maintenance facility alternatives include storage for Green Line Extension vehicles and replacement of the existing Lechmere Station vehicle storage. Storage capacity is also provided for vehicles currently stored in trackways between Lechmere Station and Government Center; this storage will be lost due to the Green Line Extension.

I-223-017

The Green Line Extension storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the overall Project. Chapter 2 of the FEIR fully describes the environmental impacts of the proposed storage and maintenance facility. The facility must be constructed adjacent to the Green Line Extension to maximize operating efficiencies and be constructed within the same time frame as the Project.

I-223-018

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the

Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-223-019

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-223-020

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. The Proposed Project, with a terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Additionally, FEIR Chapter 4 includes a detailed description of College Avenue Station functioning as a terminal station.

I-223-021

Project cost estimates are based on the current, conceptual level of design, and will be further refined as the Project progresses through preliminary engineering. It is anticipated that Green Line Extension construction would be financed with a combination of funds from federal and state sources. Efforts to engage a developer for the North Point development will continue as this Project moves into the next phases of design.

I-223-022

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-223-023

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

I-223-024

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

EEA #03886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-224-001 As a resident of East Cambridge, I am concerned about the design and placement of the Green Line Extension and the new Lechmere Station and the effect it will have on my friends & neighbors at the Glass Factory.

TRACKS ARE TOO CLOSE TO THE GLASS FACTORY.
The present design shows the tracks running very close to the rear of the building. We urge your designers and engineers to place the tracks as far to the rear of the building as possible to preserve views & light to the many units that will be severely impacted by the elevated tracks. The design and placement of the tracks and supports should do all it can to minimize the visual impact to those units and also minimize noise & vibration impacts to the whole building as well as the surrounding neighborhood.

LECHMERE STATION.
At present, your designs show the new Lechmere Station so close to the Glass Factory that it appears to be part of the building. Please move the station closer to East Street, where it could be part of the entrance way to the eventual North Point development. The station design needs to be substantially improved so it is not an eyesore but rather an enhancement to this rapidly developing neighborhood. It should reflect the importance of this location as the gateway between Cambridge & Boston.

BUS TRAFFIC.
The many bus lines that converge on Lechmere Station are presently designed to enter at one end of the Glass Factory, pick up passengers, and emerge at the other end of the building. Please do not route bus traffic, directly under people's windows. Bus traffic noise, vibrations and fumes are a great concern. Sidewalks where passengers wait, should also be moved farther from the building to preserve privacy and minimize impacts from noise, light and smoking.

PRESERVE OUR TREES & GREEN SPACE.
Presently there is a row of mature evergreen trees behind the Glass Factory. I urge you to preserve all these trees and the entire small green space behind the building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks should be on the far side of the large trees. These trees serve as a natural screen for the tracks and busway.

I-224-001

Please see Comment Letter I-013.

MAINTENANCE FACILITY.
I strongly oppose the Mirror H location. It is much too close to the Glass Factory and other residential buildings and will effectively destroy further development in North Point. Putting a maintenance facility on prime land in a desirable, developable location that would generate significant tax revenue to Cambridge simply does not make sense. Of the three options proposed, Option L seems to be the best choice however I would prefer there be no maintenance facility in this area but rather it be at the end of the line.

REDUCE SURFACE PARKING.
The present Lechmere Station is at the end of the Green Line. That will no longer be the case with the new Green Line Extension and the number of parking spaces should be substantially reduced. Surface parking is bad urban design and should be minimized in the new North Point neighborhood. One half of the building will overlook the new parking and we request it be carefully designed with this in mind. Ample green space should be included in the design and all lighting should be down lighting that minimizes light pollution to the building.

Thank you for hearing my concerns.

Sincerely,

Marie Mclaro

Boston, MA 02114

Dear Secretary Bowles:

I-225-001 As a resident of the Glass Factory Condominiums, I am deeply concerned about the design and placement of the Green Line Extension and the new Lechmere Station.

TRACKS ARE TOO CLOSE TO OUR BUILDING.
The present design shows the tracks running very close to the rear of our building. We urge your designers and engineers to place the tracks as far to the rear of our building as possible to preserve views & light to the many units that will be severely impacted by the elevated tracks. The design and placement of the tracks and supports should do all it can to minimize the visual impact to those units and also minimize noise & vibration impacts to the whole building as well as the surrounding neighborhood.

LECHMERE STATION.
At present, your designs show the new Lechmere Station so close to the Glass Factory that it appears to be part of our condominium building. Please move the station closer to East Street, where it could be part of the entrance way to the eventual North Point development. The station design needs to be substantially improved so it is not an eyesore but rather an enhancement to this rapidly developing neighborhood. It should reflect the importance of this location as the gateway between Cambridge & Boston.

BUS TRAFFIC.
The many bus lines that converge on Lechmere Station are presently designed to enter at one end of our building, pick up passengers, and emerge at the other end of our condo building. Please do not route bus traffic, directly under our windows. Bus traffic noise, vibrations and fumes are a great concern. Sidewalks where passengers wait, should also be moved farther from our building to preserve our privacy and minimize impacts from noise, light and smoking. If too close, it will feel like we are living in the bus station.

PRESERVE OUR TREES & GREEN SPACE.
Presently there is a row of mature evergreen trees behind our building. I urge you to preserve all these trees and the entire small green space behind our building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks should be on the far side of the large trees. These trees serve as a natural screen for the tracks and busway.

I-225-001

Please see Comment Letter I-013.

MAINTENANCE FACILITY.
I strongly oppose the Mirror H location. It is much too close to the Glass Factory and other residential buildings and will effectively destroy further development in North Point. Putting a maintenance facility on prime land in a desirable, developable location that would generate significant tax revenue to Cambridge simply does not make sense. Of the three options proposed, Option L seems to be the best choice however I would prefer there be no maintenance facility in this area but rather it be at the end of the line.

REDUCE SURFACE PARKING.
The present Lechmere Station is at the end of the Green Line. That will no longer be the case with the new Green Line Extension and the number of parking spaces should be substantially reduced. Surface parking is bad urban design and should be minimized in the new North Point neighborhood. One half of our building will overlook the new parking and we request it be carefully designed with this in mind. Ample green space should be included in the design and all lighting should be down lighting that minimizes light pollution to our building.

Thank you for hearing my concerns.

Subject: Somerville Community Path---comments on the DEIR

Dear Secretary Bowles and Ms. Johnson,

I support the extension of the the Green Line to Somerville and Medford and the extension of the Somerville Community Path along with it.

I urge that the following be incorporated into the DEIR:

I-227-001 • The DEIR should clearly state that the extension of the Community Path will be designed by MassDOT's contractors as agreed to in a February 24, 2009 letter from the former EOT.

• That for cost efficiencies and technical necessities, the Green Line and Community Path extensions will be constructed as one project and must clearly be described as such by MassDOT.

I-227-002 • MassDOT should commit to work with the City and other State and Federal agencies to obtain the necessary funding to build the Community Path extension as part of the Green Line extensions (as was done with the Linear Park as part of the Red Line and the Southwest Corridor path as part of the Orange Line), including applying for Federal New Starts funding that allows bicycle and pedestrian access costs.

Thank you,

Eve Melnechuk
30 Avon Street
Somerville, MA 02143

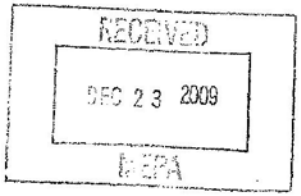
100 Cambridge Street, Suite 900
Boston, MA 02114



Dear Secretary Ian Bowles,

As a twenty three year resident of Brickbottom, I am delighted at the prospect of the Green Line extending to our neighborhood and to Somerville. Since our first days here, the biggest drawback many of us consider when describing our neighborhood is its non-pedestrian friendly nature. The Green Line would change that aspect, make this area more livable, accessible, walkable, and "green". Along with these changes, there is the hope that the industrial nature would gradually give way to more exciting and creative development for Somerville.

I-228-001

These possibilities for our immediate area are crushed by the Yard 8 plan, and one wonders how we here at Brickbottom would survive with the constant noise and whatever other conditions were created as a result of this facility being placed there. There seems to be very little mitigation planning. What would the Facility placement at Yard 8 do to potential development for Somerville? How thorough is the DEIR? These two factors alone make it worth considering Scheme H and Scheme L.

I-228-002

It has been enlightening to see this project studied, discussed, and to see it evolve through community meetings and involvement. It seems most important that a Community Advisory Committee be instrumental in each step. The stakeholders in the neighborhoods most affected are the most important voices to be heard as this project moves forward.

I appreciate your further study in this matter, and continuing consideration of alternatives to Yard 8.

Sincerely, Chris Mesarch
Chris Mesarch
1 Fitchburg Street
C306
Somerville, MA. 02143

I-228-001

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-228-002

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project. As stated in Section 6.4, MassDOT and the MBTA will convene a Green Line Extension Design Working Group. This group will advise the agencies on design workshops, participate in the workshops and serve as a corridor advisory group during design.

To: Johnson, Holly S (ENV)
Subject: Extend the Green Line to Route 16

Dear Secretary Bowles:

I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

I-229-001 I strongly support the Green Line extension and urge that it be built in the most practical, beneficial and cost-effective manner – that is, to construct the entire project in one phase, with a terminus station at Mystic Valley Parkway (Route 16), by December 31, 2014. I had hoped it would extend to West Medford Station to serve that neighborhood, but I am happy to still have a station that is in walking distance at Route 16. College Avenue would not serve my needs.

The DEIR is encouraging in that it concludes that the Route 16 station would provide the most benefits according to all project criteria, including air quality and environmental justice. However, MassDOT states that it is incapable of building (and funding) the entire "Preferred Alternative," so it only intends to build the extension to College Avenue in the Tufts University area of Medford, by its deadline of December 31, 2014.

I-229-002 In my opinion, the DEIR as currently written does not serve the best interests of the project. More importantly for your review, it was not done in a way that "adequately and properly" complies with the state environmental regulations, nor with the December 1, 2006 MEPA certificate that defined the requirements of the DEIR.
For the following reasons, I strongly urge you to not accept the DEIR as the Final EIR and require further environmental analysis of the project by MassDOT:

1. A two-phased approach is unacceptable. The Route 16/Mystic Valley Parkway Station should be built as part of a single-phase project to minimize costs and negative impacts and achieve the maximum benefits with regard to ridership, vehicle mile travel reduction, air quality improvements, and service to environmental justice communities.
The recommendation as outlined in the DEIR is for the Route 16/Mystic Valley Parkway station to be a separate stand-alone Phase II project with no funding source identified. This means, Route 16 may never be built.

I-229-003 2. College Avenue should not be a terminus. The College Avenue station is not designed for the additional requirements of a terminus. The neighborhood cannot sustain the impact of a terminus station operations and traffic volume and the potential environmental damage is of serious concern.

I-229-004 3. The Route 16 station design is inadequate. The DEIR offers only a "worst case scenario" (MassDOT's description) for the Route 16 station design, while offering optimized station designs for all other Green Line extension stations. The Route 16 station design must be revisited. The Medford Green Line Neighborhood Alliance, a volunteer citizen group, has offered an alternative station design that prevents two major commercial property acquisitions and the resulting job displacement, preserves $182,000/year in property taxes for the City of Medford, optimizes traffic flow and better serves the integrity of the station's surroundings. MassDOT apparently has been exploring similar improved designs, which should be presented to the public for comment. A $1 billion project deserves a higher caliber design than a "worst case scenario."

To summarize, there is much more work to be done on the Environmental Impact report, and I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis in order to make the Green Line extension the best project it can be, and MUST be. I look forward to the Green Line extension to better serve Boston and the surrounding towns of Medford, Somerville and adjacent towns.

I-229-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-229-002

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

I-229-003

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-229-004

All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may

Thank you.

Regards,

Kevin Mitchell
88 Monument Street
Medford

achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

Johnson, Holly (EEA)

To: Johnson, Holly S (ENV)
Subject: Comments on the Green Line Extension Draft EIR (EEA #13886)

January 8, 2010
Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs MEPA Office
Attn: Holly Johnson, MEPA Analyst

RE: Green Line Extension Draft EIR (EEA #13886)

Dear Secretary Bowles,

I-230-001 I strongly support the construction of the Green Line Extension to Route 16 on the Medford/Somerville line and to Union Square in Somerville. I am writing you to recommend approval of MassDOT's DEIR as the final EIR with the caveat that some critical issues lacking mention or sufficient planning are resolved in the next phase of the project.

I-230-002 Station design
==========
I strongly recommend that the station designs accommodate bus drop off and pick-up areas with the best possible integration of transit modes with minimal impact to the street. The DEIR does not mention bus connections to the stations. As was done for the Red Line Harvard-Alewife extension, bus routes in Somerville will need to be aligned to optimize connections to Green Line stations simultaneous with the start of Green Line Extension service.

The overall plan for this extension is to encourage neighborhood commuting and connections; thus good design of bus, pedestrian, and bike connections is paramount. See the Davis Sq Red Line station as an example of a station that accommodates its percentage of ridership traveling to the station by bus, foot, and bike. (The current ped/bike connections to some of the stations in the DEIR are poorly designed; the relocated Lechmere station described in the DEIR is an example of poor design.) Also the amount of bike parking in the DEIR is insufficient. Stations should provide adequate sheltered bike storage.

I-230-003 Community Path
==========
I appreciate that MassDOT will include the design on the Community Path and its connections to the stations in its plans. As it will serve as an important direct carfree means of getting to the stations, the Path should be built concurrently with the Green Line Extension.

The Community Path will provide important off-road bicycle and pedestrian access to the stations, offering great connections to the neighborhoods which in turn will attract more riders in a cost-effective way.

The Path is a prime example of the new Federal Transit Administration policy on ped/bike access to public transportation, which recognizes the importance of maximizing multi-modal access.

Maintenance Facility

1

I-230-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

I-230-002

Current MBTA bus routes are described in DEIR Section 4.5.1, Existing Bus Services, and shown in Figure 4.5-1, Existing and Proposed MBTA Bus and Transit System. MBTA regularly evaluates and revises bus routes to accommodate service needs; the most recent evaluation is provided in the MBTA's *Preliminary 2008 Service Plan*. In accordance with the Secretary's Certificate on the DEIR, bus routes in the Green Line Extension service area will be evaluated during the Project's preliminary engineering phase. MassDOT will coordinate with MBTA and the Green Line Extension Advisory Group to consider modifying routes to improve access to Green Line Extension stations and maximize bus and rail ridership. Convenience and accessibility of the bus/rail transfer points will also be considered.

In accordance with the Secretary's Certificate on the DEIR, emphasis will be placed on bicycle, pedestrian, and bus access as station designs are refined during preliminary engineering. Access for environmental justice and disability populations will be carefully evaluated in compliance with federal and state access laws, regulations, and codes. Automobile access, including drop off/pick up areas, station parking, and station area parking policies will also be taken into consideration as they relate to local traffic concerns and station designs. The Public Involvement Plan, Chapter 6 of the FEIR, details MassDOT's plans for public outreach in the next phases of the Project.

I-230-003

MassDOT has committed to complete the final design of the proposed

I-230-004

==========
I strongly recommend that the Yard 8 Option for the Maintenance Facility be eliminated as per the City of Somerville's and Somerville citizens' longstanding strong opposition to this option from the day it was unveiled. The Green Line Extension is meant to encourage economics development. In placing the Maintenance Facility in the sole undeveloped area of Somerville, it denies the potential use of that area as economically viable. The Boston Engine Terminal already sits on huge tax-free area in Somerville; all along we have encouraged MassDOT to analyze the use of some of that area for the Maintenance Facility. I was encouraged by MassDOT's recent unveiling of Option L, and recommend that option be pursued for the siting of the Maintenance Facility.

I-230-005

Route 16 Terminus
==========
I strongly recommend that the Route 16 terminus be designed and built at the same time as the rest of the Green Line project.

I appreciate the opportunity to make these comments. As a car-free resident of Somerville for 23 years, I recognize the tension between getting this project done versus getting it done well. This Green Line Extension will outlive us all and serve many future generations. Let's make sure it results in a transit project done in the best way possible to serve both current needs and those future generations of transit riders.

Thank you for your consideration.

Sincerely,

Karen Molloy
197 Highland Ave.
Somerville, MA

==========
karenmolloy@gmail.com

Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-230-004

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-230-005

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. The Proposed Project, with a terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), “Determination of Air Quality Emission Reductions.” These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Additionally, FEIR Chapter 4 includes a detailed description of College Avenue Station functioning as a terminal station.

RE: Green Line Extension Draft EIR (EEA #13886)

Dear Secretary Bowles:

I strongly support the construction of the Green Line Extension to Route 16 on the Medford/Somerville line and to Union Square in Somerville and believe its positive environmental impacts greatly exceed the potential negative impacts.

I-231-001

However, because of shortcomings and omissions in the design, I cannot support this Draft EIR becoming the Final EIR unless a Supplemental EIR or Addendum is performed to correct the deficiencies. I also request that a Citizens Advisory Committee public process be instituted to help guide these necessary design improvements.

To avoid the significant delay that a separate FEIR would entail, the most critical issues with the DEIR could either be addressed in a Supplemental EIR, or in Addenda to the FEIR.

My comments on these issues are in three sections: on the Somerville Community Path, the maintenance and support facility and finally, other issues. Thanks you very much for considering them in your analysis.

A. INTEGRATION OF THE GREEN LINE AND COMMUNITY PATH EXTENSIONS

Main points on Design, Funding and Construction (followed by details):

I-231-002

- I think that the Community Path design from Lowell St. to Washington St. as shown in Appendix E of the DEIR is excellent. Its implementation will be a great benefit for the Green Line and its ridership as well as an asset to Somerville and the region. As the location of the support facility is finalized, the route of the Community Path from Washington St. to Lechmere in Cambridge should be re-evaluated.

I-231-003

- The DEIR should clearly state that the extension of the Community Path will be designed by MassDOT's contractors as agreed to in a February 24, 2009 letter from the EOT.
- That for cost efficiencies and technical necessities, the Green Line and Community Path extensions will be constructed as one project and must clearly be described as such by MassDOT.
- MassDOT should commit to work with the City and other State and Federal agencies to obtain the necessary funding to build the Community Path extension as part of the Green Line extensions (as was done with the Linear Park as part of the Red Line and the Southwest Corridor path as part of the Orange Line), including applying for Federal New Starts funding for allowed bicycle and pedestrian access costs.

I-231-004

- The planned amount of bicycle parking is insufficient and pedestrian connections to some of the stations could be better designed. Also, the DEIR does not show at all how bus connections

I-231-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

I-231-002

MassDOT is committed to completing all planning, design, and engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community Path between Lowell Street and Inner Belt Road. MassDOT is not able at this point to commit to funding the construction of the Community Path. The limits of the path were predicated on the connections to Lechmere being made through the Inner Belt area via Inner Belt Road and the proposed Urban Ring Bridge into the Lechmere area. However, the cessation of planning for the Urban Ring Project has changed the timing of this anticipated connection. MassDOT is unable to assume responsibility for designing the Urban Ring Bridge as part of the Green Line Extension Project. That being said, MassDOT is committed to working with the City of Somerville, residents and businesses in the Brickbottom and Inner Belt neighborhoods, and Community Path advocates to design the Path to create improved connectivity within the Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension.

I-231-003

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-231-004

will be made to the new stations. I look forward to those improvements during the final design process.

Details:

Funding and the Importance of the Community Path – If funding is not available at the right time such that the Community Path can be constructed along with the Green Line, it likely will never be built as it will cost many times more to construct it as a separate project. The City of Somerville has about $3 million for the $15 - $20 million Community Path extension estimated cost. The reasons that I feels that this request for State and Federal transit funding is reasonable and appropriate are as follows:

- The Community Path will provide desirable off-road bicycle and pedestrian access to the stations, offering superior connections to the neighborhoods (like in Davis Sq. where 60% of the residents use public transportation and thousands walk and bike to the station each day), thereby attracting more riders in a very cost-effective manner. More riders means a greater change of getting federal New Starts funding.
- In the vicinity of Lowell St., Gilman Sq. and Washington St. stations, the Community Path is in integral part of the station access, allowing the Davis Square station success to be replicated.
- The only way the Path can realistically be constructed is together with the Green Line extension.
- Other infrastructure not absolutely needed for the Green Line extension have been included (car drop-offs, redundant elevators and escalators, storage for twice as many Green Line cars as necessary, station fare collection rather than on-board, etc.) So it's also reasonable that Community Path costs also be included.
- The FTA has recently proposed a policy that "pedestrian improvements located within one-half mile and all bicycle improvements located within three miles of a public transportation stop ... may be eligible for FTA funding" http://edocket.access.gpo.gov/2009/E9-27240.htm
- There are at least two transit precedents in the Boston area for community paths constructed by the MBTA transit projects with State and federal funding:
  - The Linear Path over the Red Line Paths with the Red and Orange line extensions that were part of the overall transit construction project
  - The Southwest Corridor Path alongside and over the Orange Line

There are many recent examples around the country of paths being built together with mass transit expansions:

- The Capital Crescent trail alongside the planned light-rail Purple Line in suburban Washington DC includes trail construction is part of the project and the cost estimates that will be submitted for New Starts funding from the federal government.

  http://purplelinemd.com/images/stories/purpleline_documents/deis/deis/10_chapter5.pdf
  http://purplelinemd.com/images/stories/purpleline_documents/deis/Conceptual%20Plans%2009%202008.pdf

- Bicycle and pedestrian path alongside the light-rail Expo line in Los Angeles:
  http://buildexpo.org/gallery.php
  http://metro.net/projects_programs/exposition/feis.htm

I-231-004

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

- A world-class bikeway was built alongside and integrated with stations on the 14-mile Orange Line BRT corridor in LA:

  http://www.streetfilms.org/las-orange-line-bus-rapid-transit-plus-bike-path/

The Somerville Community Path is a critical piece of the following regional and State-wide bicycle and greenway plans.

- The Massachusetts Bicycle Transportation Plan (page 30 and 45 and Figure 4): http://www.massbikeplan.org/_docs/Massachusetts%20Bicycle%20Plan%20with%20Links%20to%20Graphics.pdf
- The Somerville Community Path as part of the critical 104-mile east-west Mass Central Rail Trail (Figures 4.1 and 4.2): http://www.masscentralrailtrail.org/
- The City of Somerville's Open Space and Recreation plans list the Community Path
- The Mystic Valley Case Statement for Active Transportation for the Mystic River Communities: http://www.railstotrails.org/resources/documents/whatwedo/case_statements/Vision%20for%20July%2010th%20draft.pdf
- The 2007 MAPC Regional Bicycle Plan - http://www.mapc.org/transportation/trans_alternatives/Bike_plan_PDFs/Bike_Plan_FINAL_version_3-14-07.pdf

I-231-005 | *Community Path from Lowell St. to Route 16*: The MEPA certificate said that the environmental review would include evaluation of continuing the Community Path west of the Lowell St. station to Medford. The study results that were presented (Appendix E of the DEIR) concluded that the width of the ROW was insufficient to provide such a continuous Path. However, since there are some sections where there is enough width; a route, perhaps with connection to local streets, should be studied further.

I-231-006 | *Community Path from Route 16 to West Medford*: Section 3.2.3 of the RFP said that VHB should study "*Using the bikeway/pathway guidelines, consider options for providing pedestrian connections to the West Medford commuter rail station and evaluate the viability and potential impacts of including a community path in this section of the project area.*" This seems not to have been done but should be. Such a Path would make a transfer connection from Route 16 to West Medford. Therefore MassDOT should plan for a community path to connect the Route 16 terminus to West Medford via an overpass of Route 16, a bridge over the Mystic River and a route along the Lowell commuter rail tracks.

I-231-007 | *Access to Route 16 Station* - The plans in the DEIR document do not show how Green Line riders will safely access the Route 16 station from Arlington and Medford and from the Alewife Brook paths that are being improved as part of a $3.6 million ARRA stimulus project. A multi-use path for pedestrians and bicyclists to the station should be included in the design from the Alewife paths to the station. Please request that MassDOT perform this design.

I-231-008 | *Bicycle Parking* - The amount of bicycle parking presently described in the plans (270 spaces) is very welcome but will be insufficient for the expected number of bicyclist coming to the stations. 270 spaces is only about 1% of the expected ridership. Based on the present parking at Red line stations, bike parking at 3-5% of ridership will soon be needed. Therefore I request that the amount of bike parking be increased to approximately 5% at the Union Square, Route 16 and Lowell St. (major intersection with Community Path) stations and 3% at the remainder. Also, the location of the bicycle parking (where specifically shown in the plans) are good at some locations but not at others. The bicycle parking locations should be as close to as possible to the entrance and in well lit and safe locations. Lastly, bicycle parking should be covered if at possible.

I-231-005

DEIR/EA Section 3.8.2 and Appendix E include an analysis of this potential community path connection to Medford. As presented in the analysis, a community path along the Green Line Extension Medford Branch corridor north of Lowell Street Station is not viable due to right-of-way constraints. The analysis also concluded that adjacent Boston Avenue has insufficient pavement width for a community path or on-street bicycle lanes.

I-231-006

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16.

I-231-007

Please see response to Comment I-231-006.

I-231-008

The amount of bicycle storage at each station is based on ridership projections developed by CTPS. DEIR/EA Appendix D includes the methods CTPS used to analyze demand for bicycle parking. Detailed bicycle parking designs will be further developed during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

Improved pedestrian and bicycle access – access could be vastly improved at some of the stations by having more than one entrance or access point such as:

I-231-009

- a direct connection from the Gilman Square station to the Somerville High School/Library/City Hall complex)
- the Washington St. station design which seems particularly poor in this regard for riders coming from the west and north. This could be greatly improved by locating the station directly above Washington St. where direct access via elevator would be possible (earlier designs included such a layout).
- station designs (specifically College Ave and Washington St.), where drop-off (kiss and ride) stops are directly in front of the entrance while pedestrian access is a long and involved route.

I-231-010

- Lowell St. station where a direct connection to the platform from the Path coming from Cedar St. would be possible via a safe crossing of one track. MassDOT has said this would not be allowed because of safety concerns even though every light rail system in the US (including in Boston: Longwood stop on the Green Line and Milton and Butler stops on the Mattapan line) allows crossing of tracks for access. Even if MassDOT will not allow this access point at this time, the Lowell St. station platform should be designed for such future access.
- In general, pedestrian and bicycle access should be given higher priority in these "community-based" station designs that motor vehicles connections.

I-231-011

Community Path costs – I understood that the marginal (extra) costs for constructing the Community Path between the stations was to be provided but I don't see them in the DEIR. They should be provided.

I-231-012

Community Path Route from Washington St. to Lechmere - the Somerville Community Path route should connect the Washington St./Brickbottom station, the Brickbottom community and Inner Belt to Lechmere. The present plans do not make these connections. If the proposed Yard 8 location for maintenance and storage facility is "dropped", better routes for the Community Path (such as along the Green Line to Brickbottom and over the former Red Bridge location) that do make these connections are possible. The Green Line extension plans should state that this re-evaluation will be done.

B. PROPOSED GREEN LINE MAINTENANCE AND STORAGE (SUPPORT) FACILITY

I-231-013

In addition to the specific facility location issue, there are other troubling issues that relate to the provision of this new support facility within the Green Line Extension project:

- Double the number of green line train cars than are necessary for the extension are being planned for the support facility. This adds costs as well as impacts because of the increase size of the storage facility.
- The provision of additional repair capabilities in the support facility than are really necessary (also increasing costs).
- The further concentration of existing rail and rail support facilities in Somerville that will significantly negatively impact economic development possibilities.
- The various support facility reports purport to show that the 10-11 acre design is very reasonable considering that other light rail support facilities around the country are all larger. This analysis ignores the fact that all these other facilities are in outlying areas of the light rail

I-231-009

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project. A pedestrian bridge is proposed to Gilman Square Station as part of the Cummunity Path Project to be constructed by others.

I-231-010

For safety reasons, the MBTA, the future owner and operator of the Green Line Extension, has required that this portion of the Green Line be entirely separated from vehicular, pedestrian, and bicycle traffic. This separation would not allow at-grade track crossings for pedestrians and/or bicyclists at any point. Plans for Lowell Station and the Community Path connection will be further refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the design process for stations, trackways, and the Community Path.

I-231-011

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path. Cost for the cummunity path is presented in Section 3.8.1 of the DEIR/EA.

I-231-012

MassDOT is committed to completing all planning, design, and

system where there is available, low value property. Placing this facility in the urban core is already a poor choice for location.

While these design requirements are understandable from the MBTA's perspective they ignore the many negative aspects. Seeing that they are likely to become reality, the consideration of their impact on Somerville's economic future must be taken very seriously in order that the impacts be minimized or mitigated through design changes (smaller footprint) and location selection.

The Support Facility location

I-231-014

The preferred Yard 8 location for the Green Line Extension support facility may be understandable from the MBTA's point of view but it is an economic disaster for the future of Somerville (and immediately for the Brickbottom community because of the construction and operation noise impacts). This is because it will continue the isolation of the Inner Belt area and prevent the economic redevelopment that Somerville and the region greatly needs. Yard 8 will prevent east-west access from Joy St. and use land with a higher development potential.

Since there are other alternatives that "work" for engineering and operational needs and which are also cost-effective, the Yard 8 location should be dropped as the preferred location and the Mirror H and Option L alternatives should be studied further as follows:

I-231-015

Mirror H - The Mirror H option along the Somerville/Cambridge border between NorthPoint and the commuter rail facility (BET) is significantly better than Yard 8. However, some stakeholders in Cambridge oppose because they feel it will compromise the NorthPoint development. This possible drawback can be minimized by moving the facility further east to the Charlestown bridge and under the Big Dig entrance and exit ramps as shown in the attached drawing and Google map: http://tinyurl.com/ybyrtxt

Option L - The recently studied Option L is across (west) the "Valley" tracks from the BET facility. While this option is also much better for Somerville than Yard 8 in many aspects, it still requires taking taxable property that is in active commercial use. It also increases even further the use of Somerville land for rail facilities. Taking this property also makes this option an expensive one.

I-231-016

Option L BET - So I would like to propose a new option - "Option L BET" - a plan that solves many of the problems with the other options for Somerville and for other parties as well. Basically it moves the Valley tracks so that the Green Line maintenance facility is on the existing BET property, thereby not requiring the expensive of taking of taxable properties. In my written submission, I've included color copies of my proposed design for MassDOT to consider as an alternative option. It can also be seen in the following link to a Google map (not every detail is seen in the printed image, so please go to the Google map to move around and zoom in):

http://tinyurl.com/y8hptp9

Advantages of this Option L BET (not in any priority):

- not next to Brickbottom
- not in Yard 8 so future street connections to Inner Belt can be made from Joy St. across/under the new Green Line tracks
- doesn't use any of NorthPoint development land (unlike like Mirror H)

engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community Path between Lowell Street and Inner Belt Road. The limits of the path were predicated on the connections to Lechmere being made through the Inner Belt area via Inner Belt Road and the proposed Urban Ring Bridge into the Lechmere area. However, the cessation of planning for the Urban Ring Project has changed the timing of this anticipated connection. MassDOT is unable to assume responsibility for designing the Urban Ring Bridge as part of the Green Line Extension Project. That being said, MassDOT is committed to working with the City of Somerville, residents and businesses in the Brickbottom and Inner Belt neighborhoods, and Community Path advocates to design the Path to create improved connectivity within the Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension. The connection from Brickbottom to the southern tip of Inner Belt Road is feasible regardless of the maintenance facility option chosen.

I-231-013

The Green Line Extension storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the Project. Chapter 2 of the FEIR fully describes the environmental impacts of the proposed storage and maintenance facility. In order to maximize operating efficiencies, the facility must be constructed within the same timeframe as the Green Line Extension Project, in the vicinity of the Green Line Extension right-of-way, and north of downtown Boston.

The storage and maintenance facility alternatives include storage for Green Line Extension vehicles and replacement of the existing Lechmere Station vehicle storage. Storage capacity is also provided for vehicles currently stored in trackways between Lechmere Station and Government Center; this storage will be lost due to the Green Line Extension. Some additional capacity is provided for future system

I-231-016

- much of the 8 acres land is already owned by the State (no private, existing buildings to be taken – only some slivers of land need to be acquired)
- 4 acre support facility Site
- 60,000 SF support facility building
- only small takings of taxable Somerville land
- 4 acre storage facility for 80 light rail vehicles
- Green Line extension tracks don't have to cross the Valley tracks, only the Fitchburg line
- 2-track connection from Grand Junction to Valley track can be used by CSX until some future date when not needed and be converted into 2-way Urban Ring route (35' width)
- leads from Union Square branch as well as Medford branch go directly to storage tracks and the Support facility so that vehicles from both branches can access it without reversing directions (no other option had this)
- Doesn't impact future North-South rail link northern portal (like Mirror H might)
- Saves ~ $50 million to buy the 2 buildings to be taken in Option L.
- My cost estimate for this Mirror L BET is $100 million (possibly less – see 3rd bullet) as follows:
  - Real estate acquisition: $5 million (VHB used $8 million for the North Point land acquisition)
  - Building: $38 million (VHB's amount for every option)
  - Structured/roof parking: $13.5 Million (150% of the high end range of structured parking cost estimate of $25-30,000 per space, 300 spaces). *NOTE: this cost could be saved by using numerous surface parking lots.*
  - Track: $33 million (same as VHB's estimate for Option L)
  - Infrastructure: $3 million (this is the maximum used by VHB of the 3 options)
  - Earthwork: $5 million (same as Option L)

Using the Table 4-1 rating system in the 12/9/09 report on the various support facility options, I get a score of +1 (compared to 0 for Yard 8, -3 for Mirror H and 0 for Option L).

I also show a location for an Urban Ring bridge can also be used for Community Path and (if desired) street access from Inner Belt to Cambridge

Another possible trackage change (though somewhat independent of the support facility location proposal) is to provide a new connection for Pan Am (B&M) trains to the NH Line from the Lowell Line instead of the northern track (Lead 10) that the present plans include. This also means that the Lead 10 (which also divides Inner Belt) can be abandoned. This should also be studied.

Please direct MassDOT to study this Option L BET alternative.

OTHER ISSUES

I-231-017

Maintenance and Storage Facility - Current use of the Boston Engine Terminal for the maintenance of diesel engines serving the commuter rail network south of Boston needs to be phased out and a new facility built south of Boston to eliminate the unsustainable and unjustifiable shuttling of trains through Cambridge.

I-231-018

Public Participation - Commit MassDOT to a collaborative public process for the next phase that would provide oversight and station area participation and develop a process for addressing

growth. The Option L location abuts BET to minimize impacts to future Inner Belt redevelopment.

I-231-014

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-231-015

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Mirror H location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-231-018 mitigation concerns. A project-wide Citizens Advisory Group should be maintained throughout detailed design, engineering, construction and start-up phases with smaller local advisory groups established to work with the MBTA and consultants to address specific station design, land use, connectivity, and construction and mitigation issues.

I-231-019 McGrath/O'Brien Highway (Route 28) - Coordinate the Green Line extension with calming of the McGrath/O'Brien Highway in Cambridge & Somerville.

I-231-020 Medford Branch Terminus - Design and construct the Mystic Valley Parkway / Route 16 terminus at the same time as the rest of the project. I don't see any economic sense in doing this in 2 phases. It only creates a risk that it will never be extended to Route 16. The terminus at Route 16 should incorporate MGNA's ideas for minimizing takings.

I-231-021 Union Square Branch –Union Square would be better served with the loop option that would bring trains directly into the square and allow for stops along Somerville Ave. Also, this would need only a single track along the narrow Fitchburg line right-of-way. As I understand that not many others strongly agree with me, the location of the Union Sq. station on the Fitchburg line must be designed with easy, friendly and clear access to Union Square for all uses.

I-231-022 Commuter Rail interchange - The DEIR does not provide for the important connection between the Green Line extension and the Lowell commuter rail line. The fallback to this is to provide a path along the Lowell tracks from the Route 16 station to West Medford for the 8 minute walk. Please request that MassDOT perform this design.

I-231-023 Lechmere Station - Design for the relocated Lechmere Station should pay particular attention to the East Cambridge Planning Team's pedestrian-friendly area design ideas and old Lechmere Station re-use suggestions. Route 28 should be depressed for a short section at the station (like Massachusetts Ave. at Huntington, Commonwealth Ave. and Storrow Drive in order to allow for a better pedestrian crossing and to not impede traffic.

I-231-024 Future Stations – Location, track design and construction should enable the addition of future stations between Lechmere and Washington St. at Brickbottom, between Lechmere and Union Square at Twin City plaza, between College Avenue and Route 16, and along a future Green Line extension to Porter Square that could serve both Cambridge and Somerville neighborhoods.

I-231-025 Re-Design of four stations for better pedestrian and bicycle access:

- Washington St. – should be above Washington St. with direct elevator service up from Washington St.

I-231-026
- Ball Sq., Lowell St., and College St. – should be under the bridges with long ADA compliant ramps and elevators, alleviating the need and expense of escalators

In conclusion, while I realize that a 10% design stage cannot contain all the details everyone would like, I feel that your review should address these many necessary improvements in the Final or Supplemental EIR in order to achieve a first class transit system.

Thank you very much for considering these comments.

Sincerely,

Alan Moore
23 Cherry St.
Somerville, MA 02144
23cherry@gmail.com

I-231-016

As explained in FEIR Chapter 2, MassDOT has explored opportunities for the Green Line Extension storage and maintenance facility to share resources with the Boston Engine Terminal. The independent needs and constraints of these facilities limit opportunities for shared resources. MassDOT will coordinate with the MBTA during preliminary engineering to maximize efficient land utilization between these storage and maintenance facilities, if possible.

A detailed response to the "Mirror-L" storage and maintenance facility concept is included in the Appendices to the FEIR. An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, Option L is identified as the preferred maintenance facility site.

I-231-017

The Boston Engine Terminal (BET) and its operations are beyond the scope of the Green Line Extension Project.

I-231-018

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-231-019

DEIR/EA Section 3.9 describes the compatibility of the Green Line Extension with other regional projects, such as the conceptual reconstruction of McGrath Highway and the Urban Ring transit corridor initiative. MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses to

ensure, to the extent feasible, consistency with planning and other projects.

I-231-020

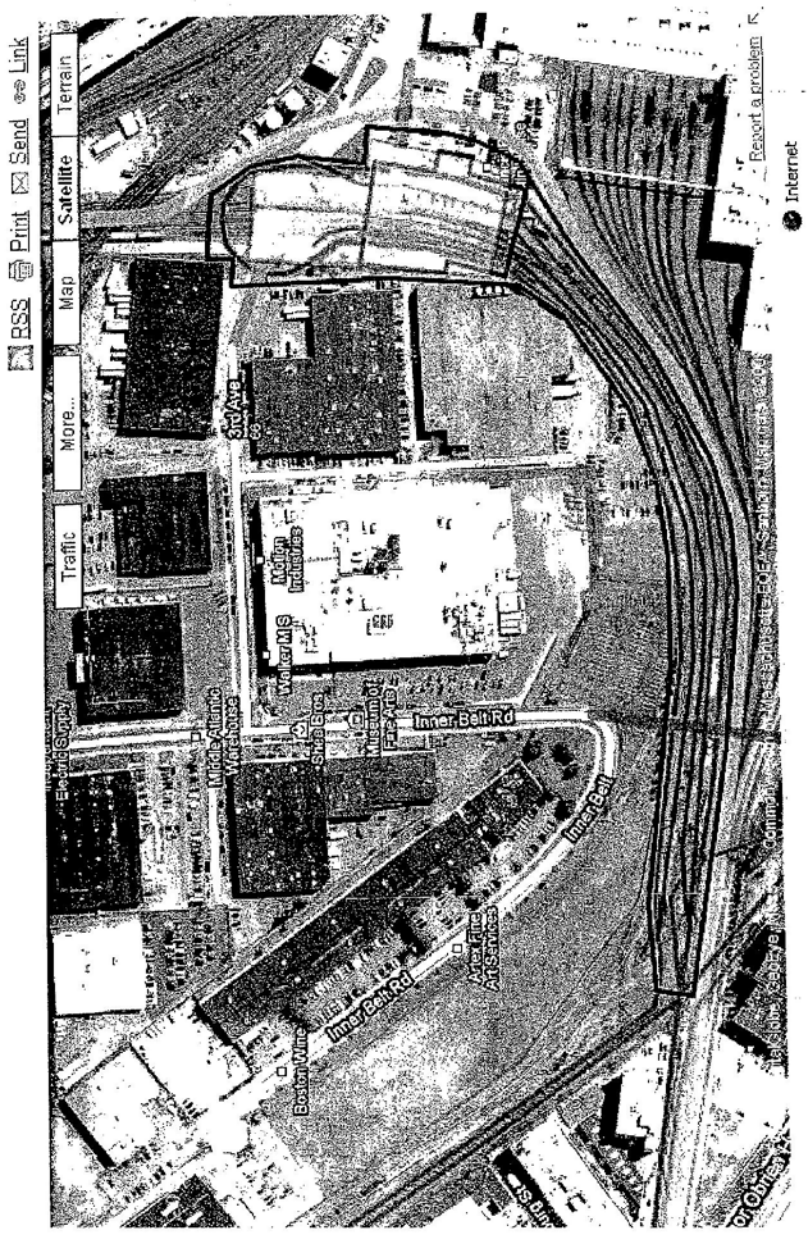
As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. The Proposed Project, with a terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Additionally, FEIR Chapter 4 includes a detailed description of College Avenue Station functioning as a terminal station.

I-231-021

Alternatives considered for the Union Square Branch are detailed in Appendix B of the DEIR/EA. The Fitchburg railroad corridor alignment was determined to be the most feasible. The property impacts and the traffic impacts for the Somerville Ave. loop alternative made it an undesireable option. The Fitchburg corridor is able to support the souble-track configuration within limited property impacts.

I-231-022

Opportunities for a shared station between the Green Line Extension (on the Medford Branch) and MBTA Commuter Rail were evaluated for the Project. This connection was ultimately dismissed, as described in DEIR/EA Section 3.3, and Appendix B. While the potential for a joint



OPTION 1 - RET with roof top parking

station at Union Square would need to be studied further, it is not currently part of the Proposed Project. A connection currently exists between the Green Line and Commuter Rail at North Station; this connection would remain. However, as the Project advances into preliminary engineering, opportunities for future additions and extensions of service will be considered.

I-231-023

MassDOT has reviewed the suggestions submitted by the East Cambridge Planning Team. Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. These plans, including the pedestrian crossings of O'Brien Highway and associated street, crosswalk, and sidewalk designs will be further refined in the preliminary engineering stage of the Project. The conceptual design does not include a grade separation of Route 28/O'Brien Highway. MassDOT intends to demolish the existing station and prepare the site for future reuse. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement throughout the Project design process.

I-231-024

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

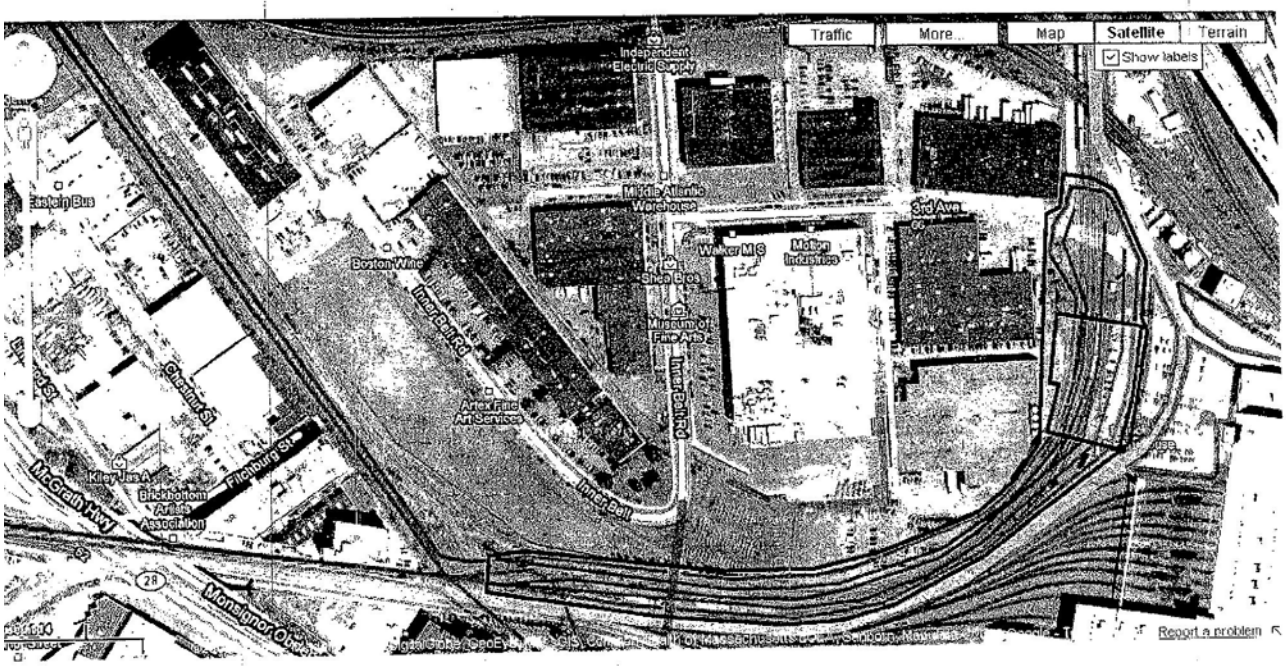
I-231-025

The conceptual plan for the Brickbottom Station will be refined during the preliminary engineering stage, taking into consideration municipal, neighbor, and other stakeholder concerns to the extent practical. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

I-231-026

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

Proposing a platform over or under an existing roadway would require two headhouses. Each headhouse would require stairs, escalator, and redundant elevators resulting in station costs that approach twice the cost of the current station designs with marginal benefit to the Project.



OPTION L-BET with surface parking

Subject: Comments on Green Line DEIR (EEA #13886)

Hi -

I'm very happy to submit comments on the Green Line DEIR, a critical document that represents a huge step forward for this important project. Though I know you get a ton of complaints about the DEIR, I applaud everyone involved in producing it. While there are items that need fine-tuning, the overall direction of the Green Line Extension is excellent, and I am among thousands who can't wait for the end of 2014.

I'll try to be succinct in my comments, since you're likely hearing many of these from others as well. But because it's important that we build the Green Line right (we have one chance to do so, after all), I wanted to list my comments below:

I-232-001 For the maintenance facility, thank you for exploring Mirror H and Option L in more detail and for holding the recent hearing. Yard 8 is clearly not going to work, and it's disappointing that it's still being considered. It's too close to Brickbottom and hinders economic development. We already have one wall through that area of Somerville (McGrath); we can't add another. I approve of either Mirror H or Option L, though I urge you to find a way to make them work on as little real estate as possible. I believe Alan Moore has some good ideas about how to make Option L work even better.

Regarding the station locations and designs, a few brief comments:

I-232-002 - Build to Route 16 as part of Phase 1 if at all possible. I'm concerned that if it isn't done all at once, it never will be. I'm also concerned that the New Starts application isn't as strong without the benefits of a Route 16 terminus.

I-232-003 - Don't spend tons of money on elaborate indoor stations with bathrooms, too much space, or even escalators. Simple platforms will work well.

- However, multiple headhouses are critical, especially where pedestrian street-crossings are dangerous. I'm thinking in particular of Union Square, where a headhouse on each side of Prospect St is essential. Make pedestrian access easy to encourage maximum ridership.

I-232-004 - Please also work with the city and MBTA to ensure that streets get reconfigured and bus routes and stops are moved to work efficiently with the new stations. This seems obvious, but it's not clear to me who is responsible for ensuring that this kind of true collaboration actually occurs.

- Bus and car dropoff is good, but no parking at the new stations please!

- Bicycle storage at each station is critical, and there should be plenty of it.

Moving forward, there are clearly issues still to be ironed out, particularly the maintenance facility. I urge you to go with a Supplemental EIR or Addenda to the FEIR for these issues. A separate FEIR would mean delays that are unnecessary at this point. The end of 2014 is approaching fast.

1

I-232-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-232-002

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-232-003

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. These stations are designed to be consistent with MBTA standards and compliant with ADA. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-232-004

Current MBTA bus routes are described in DEIR Section 4.5.1, Existing Bus Services, and shown in Figure 4.5-1, Existing and Proposed MBTA

I-232-005

Also, please create a design and build process that allows regular community participation. I would like to see a citizens advisory group that exists throughout the entire process and can work closely with you on design, land use, construction, and mitigation issues.

Thanks for the opportunity to comment and for your hard work.

Steve Mulder
42 Stone Ave
Somerville

2

Bus and Transit System. MBTA regularly evaluates and revises bus routes to accommodate service needs; the most recent evaluation is provided in the MBTA's *Preliminary 2008 Service Plan*. In accordance with the Secretary's Certificate on the DEIR, bus routes in the Green Line Extension service area will be evaluated during the Project's preliminary engineering phase. MassDOT will coordinate with MBTA and the Green Line Extension Advisory Group to consider modifying routes to improve access to Green Line Extension stations and maximize bus and rail ridership. Convenience and accessibility of the bus/rail transfer points will also be considered.

The Project is intended, in part, to relieve traffic congestion, as described in DEIR Chapter 2, Purpose and Need. Some station access points for parking or passenger drop-off/pick-up are likely to impact local traffic flow, as outlined in DEIR Section 5.5, Traffic. These impacts will be minimized to the extent practical during preliminary engineering, which will be conducted in concert with the local communities. The Public Involvement Plan, Chapter 6 of the FEIR, describes how MassDOT will coordinate with municipalities and neighbors to address traffic and parking concerns.

The amount of bicycle storage at each station is based on ridership projections developed by CTPS. DEIR/EA Appendix D includes the methods CTPS used to analyze demand for bicycle parking. Detailed bicycle parking designs will be further developed during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

I-232-005

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green

Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

Dear Secretary Ian Bowles,

I-233-001

I write to you with great concern regarding the DEIR for Project EEA #13886, specifically the report on the Maintenance Facility and Storage Yard alternatives, and the impact that choices regarding these could cause to the community of individuals and families that lives and works in the Brickbottom Artists complex. I appreciate that you have invited our opinions, but I do appeal to your commitment to creating an optimal environment for all citizens concerned, as you consider the impact of the choices at the heart of the DEIR.

The Yard 8 alternative is deeply disturbing to me personally as a 16-year resident of Brickbottom. I am a Clinical Psychologist, employed part-time by Boston College. I am also an artist. I collect disability benefits for handicaps due to Multiple Sclerosis, and I live on very limited means. With great effort I have been able to pay off my mortgage, knowing that I am on the brink of being totally disabled and unable to work to support myself. I am 50 years old, and I am frankly frightened at what is at risk if the security of my home and quality of life at Brickbottom are threatened—which I feel they most certainly are by the actions and priorities of the DOT.

I moved to Brickbottom in 1993, after a crippling MS attack which precluded living any longer in my fourth-floor walk-up apartment in Boston. I was and still am lucky to have found Brickbottom. It is a place where I have both affordable and handicap-accessible housing, and where I am close enough to public transportation, medical facilities and other conveniences which I require. Brickbottom also, very significantly, offers a rare community-living setting, with a rare urban garden courtyard, and a rare collection of highly talented and diverse inhabitants. The place is a bright patch of life in the neglected end of Somerville, a city which itself is easily seen as Boston's neglected neighbor.

I am very pleased that the MBTA green line will be extended through Somerville. I understand that sacrifices must be made. I understand there is no ideal solution for where to locate the needed maintenance facility. However, I am worried about the trashing of my environment and home that II believe will be caused by locating the maintenance facility at Yard 8.

I trust you have received letters from my neighbors underscoring the economic losses that Somerville will take by locating the facility at Yard 8. For us as individuals at Brickbottom, it is frightening to consider the loss of value in our homes that will occur. It also seems shortsighted to jeopardize the economic potential of this area, just as it is becoming timely.

At Brickbottom we already live surrounded by waste and pollution, literally: from the highways (28 and 93), from the various train rails running by Brickbottom, from the waste transfer station, and from the other industrial operations adjacent to us. I really don't know that residents could tolerate the introduction of new and greater toxins to our living space that will be unavoidable with a maintenance facility next door. It would be home-taking on a huge scale to locate the maintenance facility adjacent to Brickbottom.

Brickbottom residents have been active from their start (in 1988) in contributing to Somerville and to our neighborhood. We have added to the value of Somerville, largely through the generous personal

I-233-001

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

• Page 2 January 3, 2010

efforts of our residents. Culturally, environmentally and educationally, Somerville is a better place for the existence of the Brickbottom community. I am concerned that a decision to locate the maintenance facility at Yard 8 will be made expeditiously, and heedless of the talent "trust" that exists at Brickbottom. It would be a terrible waste.

I-233-002

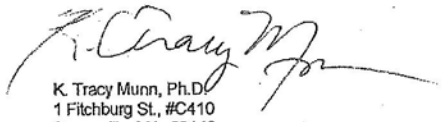
The standards of the Mass DOT (see the Secretary's Certificate EENF Environmental Justice, pg 7) state: "no segment of the population should be denied environmental benefits, or should bear a disproportionate burden of environmental impacts". The Brickbottom community includes at least two dozen children, as well as 220 residents. Among these 220 residents are individuals living below the poverty level, elderly persons and disabled persons. Many minority populations are represented here.

I grant that I am not privy to all the factors at play in the DOT's decision-making, but I cannot help but wonder: what exactly are the competing values at hand here? Why is there not greater concern about wasting what is so hard to come by in terms of community and human capital. And where does fairness count? There are two other sites under question for the maintenance and storage facility (besides Yard 8). I plead with you to make certain that all options are examined honestly and with diligence.

This is a time to be truly thoughtful of the resources at hand and at stake, and how best to sustain them.

Thank you,

Sincerely,



K. Tracy Munn, Ph.D
1 Fitchburg St., #C410
Somerville, MA 02143

I-233-002

Impacts to environmental justice populations are described in DEIR/EA Section 5.4, Environmental Justice. Additionally, the Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes specific outreach efforts to the environmental justice community that will be made as the Project progresses through its next phases.

Subject: Proposed Green Line extension

Dear Ms. Johnson,

I-234-001

I would like to sign onto GLAM's comments regarding the proposed Green Line extension to West Medford. The Route 16 site is not a good location for the terminus, and the surrounding roads are not capable of handling increased traffic.
Thank you for your consideration.

Raymond Nagem

I-234-001

As described in DEIR/EA Section 3.7, Build Alternatives, although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. The Proposed Project, with a terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Additionally, FEIR Chapter 4 includes a detailed description of College Avenue Station functioning as a terminal station.

Dear Ms. Johnson,

I-235-001

I am writing to express my opinion on the Draft Environmental Impact Report for the Green extension project. As a resident of Medford who lives very near to the proposed Route 16 site, I am strongly opposed to the extension of the Green Line past College Avenue. I support the Green Line extension to Ball Square and Tufts University, but the proposed extension to Route 16 will have very negative effects on traffic congestion, quality of life for residents, and environmental health and safety. I agree with the City of Medford's request that the DEIR should be sent back for further study, and that the Route 16 site should be eliminated from the Green Line extension project.

Sincerely,

Raymond J. Nagem

MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA #03886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-236-001 I am an owner and resident at the Glass Factory building. I am writing to express my concerns about the Green Line Extension Project. We live on the 4th floor on the side of the building facing the MBTA property. There are several aspects of the proposed plan that are very concerning. The current proposal calls for the tracks to run approximately 30 – 50 feet away from the building, which will have a severe negative impact on our residence. The existence of elevated tracks and associated train/bus station will obscure light to our unit and clearly create extreme noise and vibration problems secondary to the constant flow of trains and buses in such close proximity to our building. The DEIR

I-236-002 lists us as being severely impacted as a result of these issues. I am also very concerned about safety issues, given the proximity of our residence to a high traffic area. The combination of these issues will also affect the property value of the unit, and many of us are likely to have significant decline in property values.

I-236-003 The T currently does not have a comprehensive plan to address these issues. The current proposal does not afford adequate space to build a barrier wall, severely limiting the prospects for meaningful sound mitigation. It is important that the MBTA do everything possible to address these issues. This includes considering the possibility of running the T tracks at ground level at an adequate distance away from the building and having the bus depot remain on Obrien Highway. Unless these issues are addressed in

I-236-004 detail, they will severely impact the daily lives of the current residents. In addition, I strongly oppose the construction of a new maintenance facility behind our building. The existing noise and light are already a current issue, especially on the existing MBTA property. In addition, putting the Mirror H Option behind our building will effectively destroy any further development in North Point. Given this, I support option L as a better choice.

I-236-005 There are several other major issues. First, the proposed station is not of adequate quality for our neighborhood. This will affect existing property values. Next, there is not adequate trees and greenery. The existing trees have served as a nice barrier behind our building. Adding more parking (i.e. the corner of East Street & O'Brien should not be surface parking) and eliminating the trees will exacerbate this problem.

I-236-001

FEIR Chapter 5 describes the revised conceptual plans for Lechmere Station, including station design, track alignment, bus routings, and other elements. Changes to the track alignment depicted in the DEIR/EA were evaluated, but could result in additional impacts on area abutters. Proposed mitigation measures for area abutters are also described in FEIR Chapter 5. During preliminary engineering, specific station design elements will be further developed.

I-236-002

No additional traffic related to the project is anticipated in the vicinity of Lechmere Station. Traffic related to parking or pick-up/drop-off activity already occurs today. The proposed project includes an additional signalized pedestrian crossing directly in front of the Glass Factory building; providing an alternate connection to the East Cambridge neighborhood for both MBTA users and residents of the Glass Factory.

I-236-003

Revised conceptual plans for Lechmere Station, including connecting track structures, bus facilities, bus waiting areas and proposed mitigation measures are included in FEIR Chapter 5, Lechmere Station. These plans will be further refined in the preliminary engineering stage of the Project. In accordance with the Secretary's Certificate on the DEIR/EA, the FEIR includes only conceptual station designs and station design criteria. The Public Involvement Plan, Chapter 6 of the FEIR, proposes a structure for community involvement throughout the station and trackway design process.

I-236-004

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the

I cannot emphasize enough my concerns over the existing MBTA design for the T station and line (tracks and buses). I implore you to deeply consider our concerns as this will have a major impact on our current quality of life.

Please feel free to contact me if there are any additional questions.

Sincerely,

Shriram Nallamshetty
Phone 617 494 8182

evaluation, the Mirror H location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-236-005

The revised conceptual plan for Lechmere Station, as shown in FEIR Chapter 5, is entirely on MBTA property. This conceptual design does not require any Glass Factory property or the removal of trees and landscaping from Glass Factory property. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, outlines how MassDOT will involve residents in developing landscape design.

To: Johnson, Holly S (ENV)
Cc: Wig Zamore; Ellin Reisner
Subject: Somerville Green Line - route comments

Dear Ms. Johnson,

I-237-001

I'm writing to recommend that the proposed Green Line route to Union Square be extended to Porter Square to link with the Red Line and commuter rail at that station. My preferred option would be to place it directly down Somerville Avenue, where it would provide connectivity and convenience for thousands of people living along that densely populated right of way. The visibility and accessability of a true streetcar, running frequently and providing reasonably fast connections with the rest of the system would be a strong draw to get people out of their cars.

Further, this routing would provide an economic stimulus to the businesses along this highly travelled route. People living in adjacent neighborhoods would naturally flow down to Somerville Avenue, with the incentive the streetcar provides.

One has only to study the success of the existing Green Line routes down Beacon Street and Commonwealth Avenue to see how the model works
-- or look to cities like Portland or Denver to see how with a little vision you could have a first class transportation system.

A spur line that merely shuttles back and forth between Lechmere and Union Square is a start, but makes little sense in the long term and would be hard to justify except as better than nothing, perhaps.

Best,

Bob Nesson

Subject: RE: Green Line Extension Draft EIR (EEA #13886)

January 7, 2010

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson (holly.s.johnson@state.ma.us)
100 Cambridge Street, Suite 900
Boston, MA 02114

RE: Green Line Extension Draft EIR (EEA #13886)

Dear Secretary Bowles:

I strongly support the construction of the Green Line Extension to Route 16 on the Medford/Somerville line and to Union Square in Somerville and believe its positive environmental impacts greatly exceed the potential negative impacts. However, I cannot support the Draft EIR because of various shortcomings and omissions in the design.

I will be submitting my comments on the design and the Draft EIR in more than one letter, this one concentrating on the extension of the Somerville Community Path and bicycle and pedestrian issues. Thanks you very much for considering these comments.

First the main points on Design, Funding and Construction (followed by details):

I-238-001
- I think that the Community Path design from Lowell St. to Washington St. as shown in Appendix E of the DEIR is excellent. Its implementation will be a great benefit for the Green Line and its ridership as well as an asset to Somerville and the region. As the location of the support facility is finalized, the route of the Community Path from Washington St. to Lechmere in Cambridge should be re-evaluated.

I-238-002
- The DEIR should clearly state that the extension of the Community Path will be designed by MassDOT's contractors as agreed to in a February 24, 2009 letter from the EOT.
- That for cost efficiencies and technical necessities, the Green Line and Community Path extensions will be constructed as one project and must clearly be described as such by MassDOT.
- MassDOT should commit to work with the City and other State and Federal agencies to obtain the necessary funding to build the Community Path extension as part of the Green Line extensions (as was done with the Linear Park as part of the Red Line and the Southwest Corridor path as part of the Orange Line), including applying for Federal New Starts funding for allowed bicycle and pedestrian access costs.

I-238-003
- The planned amount of bicycle parking is insufficient and pedestrian connections to some of the stations could be better designed. Also, the DEIR does not show at all how bus connections will be made to the new stations. I look forward to those improvements during the final design process.

Now the details:

I-238-004
Funding and the Importance of the Community Path – If funding is not available at the right time such that the Community Path can be constructed along with the Green Line, it likely will never be built as it will cost many times more to construct it as a separate project. The City of Somerville has about $3 million for the $15 - $20

1

I-238-001

MassDOT is committed to completing all planning, design, and engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community Path between Lowell Street and Inner Belt Road. MassDOT is not able at this point to commit to funding the construction of the Community Path. The limits of the path were predicated on the connections to Lechmere being made through the Inner Belt area via Inner Belt Road and the proposed Urban Ring Bridge into the Lechmere area. However, the cessation of planning for the Urban Ring Project has changed the timing of this anticipated connection. MassDOT is unable to assume responsibility for designing the Urban Ring Bridge as part of the Green Line Extension Project. That being said, MassDOT is committed to working with the City of Somerville, residents and businesses in the Brickbottom and Inner Belt neighborhoods, and Community Path advocates to design the Path to create improved connectivity within the Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension.

I-238-002

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-238-003

The amount of bicycle storage at each station is based on ridership projections developed by CTPS. DEIR/EA Appendix D includes the methods CTPS used to analyze demand for bicycle parking. Detailed bicycle parking designs will be further developed during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR,

million Community Path extension estimated cost. The reasons that I feels that this request for State and Federal transit funding is reasonable and appropriate are as follows:

- The Community Path will provide desirable off-road bicycle and pedestrian access to the stations, offering superior connections to the neighborhoods (like in Davis Sq. where 60% of the residents use public transportation and thousands walk and bike to the station each day), thereby attracting more riders in a very cost-effective manner. More riders means a greater change of getting federal New Starts funding.
- In the vicinity of Lowell St., Gilman Sq. and Washington St. stations, the Community Path is in integral part of the station access, allowing the Davis Square station success to be replicated.
- The only way the Path can realistically be constructed is together with the Green Line extension.
- Many other amenities not absolutely needed for the Green Line extension have been included (car drop-offs, redundant elevators and escalators, storage for twice as many Green Line cars as necessary, station fare collection rather than on-board, etc.) So its also reasonable that Community Path costs also be included.
- The FTA has recently proposed a policy that "pedestrian improvements located within one-half mile and all bicycle improvements located within three miles of a public transportation stop ... may be eligible for FTA funding" http://edocket.access.gpo.gov/2009/E9-27240.htm
- There are at least 2 precedents in the Boston area for community paths constructed and paid for by transit projects:
  - The Linear Path over the Red Line Paths with the Red and Orange line extensions that were part of the overall transit construction project
  - The Southwest Corridor Path alongside and over the Orange Line

There are many recent examples around the country of paths being built together with mass transit expansions:

- The Capital Crescent trail alongside the planned light-rail Purple Line in suburban Washington DC includes trail construction is part of the project and the cost estimates that will be submitted for New Starts funding from the federal government.

  http://purplelinemd.com/images/stories/purpleline_documents/deis/deis/10_chapter5.pdf
  http://purplelinemd.com/images/stories/purpleline_documents/deis/Conceptual%20Plans%2009%202008.pdf

- Bicycle and pedestrian path alongside the light-rail Expo line in Los Angeles:

  http://buildexpo.org/gallery.php
  http://metro.net/projects_programs/exposition/feis.htm

- A world-class bikeway was built alongside and integrated with stations on the 14-mile Orange Line BRT corridor in LA:

  http://www.streetfilms.org/las-orange-line-bus-rapid-transit-plus-bike-path/

The Somerville Community Path is a critical piece of the following regional and State-wide bicycle and greenway plans.

- The Massachusetts Bicycle Transportation Plan (page 30 and 45 and Figure 4): http://www.massbikeplan.org/_docs/Massachusetts%20Bicycle%20Plan%20with%20Links%20to%20Graphics.pdf
- The Somerville Community Path as part of the critical 104-mile east-west Mass Central Rail Trail (Figures 4.1 and 4.2): http://www.masscentralrailtrail.org/
- The City of Somerville's Open Space and Recreation plans list the Community Path

2

proposes a structure for community involvement during the station design process.

I-238-004

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

- The Mystic Valley Case Statement for Active Transportation for the Mystic River Communities: http://www.railstotrails.org/resources/documents/whatwedo/case_statements/Vision%20for%20July%2010th%20draft.pdf
- The 2007 MAPC Regional Bicycle Plan - http://www.mapc.org/transportation/trans_alternatives/Bike_plan_PDFs/Bike_Plan_FINAL_version_3-14-07.pdf

I-238-005 Community Path from Lowell St. to Route 16: The MEPA certificate said that the environmental review would include evaluation of continuing the Community Path west of the Lowell St. station to Medford. The study results that were presented (Appendix E of the DEIR) concluded that the width of the ROW was insufficient to provide such a continuous Path. However, since there are some sections where there is enough width; a route, perhaps with connection to local streets, should be studied further.

I-238-006 Community Path from Route 16 to West Medford: Section 3.2.3 of the RFP said that VHB should study "*Using the bikeway/pathway guidelines, consider options for providing pedestrian connections to the West Medford commuter rail station and evaluate the viability and potential impacts of including a community path in this section of the project area.*" This seems not to have been done but should be. Such a Path would make a transfer connection from Route 16 to West Medford. Therefore MassDOT should plan for a community path to connect the Route 16 terminus to West Medford via an overpass of Route 16, a bridge over the Mystic River and a route along the Lowell commuter rail tracks.

I-238-007 Access to Route 16 Station - The plans in the DEIR document do not show how Green Line riders will safely access the Route 16 station from Arlington and Medford and from the Alewife Brook paths that are being improved as part of a $3.6 million ARRA stimulus project. A multi-use path for pedestrians and bicyclists to the station should be included in the design from the Alewife paths to the station. Please request that MassDOT perform this design.

I-238-008 Bicycle Parking - The amount of bicycle parking presently described in the plans (270 spaces) is very welcome but will be insufficient for the expected number of bicyclist coming to the stations. 270 spaces is only about 1% of the expected ridership. Based on the present parking at Red line stations, bike parking at 3-5% of ridership will soon be needed. Therefore I request that the amount of bike parking be increased to approximately 5% at the Union Square, Route 16 and Lowell St. (major intersection with Community Path) stations and 3% at the remainder. Also, the location of the bicycle parking (where specifically shown in the plans) are good at some locations but not at others. The bicycle parking locations should be as close to as possible to the entrance and in well lit and safe locations. Lastly, bicycle parking should be covered if at possible.

I-238-009 Improved pedestrian and bicycle access – access could be vastly improved at some of the stations by having more than one entrance or access point such as:

- a direct connection from the Gilman Square station to the Somerville High School/Library/City Hall complex)
- the Washington St. station design which seems particularly poor in this regard for riders coming from the west and north. This could be greatly improved by locating the station directly above Washington St. where direct access via elevator would be possible (earlier designs included such a layout).
- station designs (specifically College Ave and Washington St.), where drop-off (kiss and ride) stops are directly in front of the entrance while pedestrian access is a long and involved route.
- Lowell St. station where a direct connection to the platform from the Path coming from Cedar St. would be possible via a safe crossing of one track. MassDOT has said this would not be allowed because of safety concerns even though every light rail system in the US (including in Boston – see the Longwood stop on the Green Line and stops on the Mattapan line) allows crossing of tracks for access. There s Even if MassDOT will not allow this access point at this time, the Lowell St. station platform should be designed for such future access.
- In general, pedestrian and bicycle access should be given higher priority in these "community-based" station designs that motor vehicles connections.

I-238-010 Community Path costs -- I understood that the marginal (extra) costs for constructing the Community Path between the stations was to be provided but I don't see them in the DEIR. They should be provided.

3

I-238-005

DEIR/EA Section 3.8.2 and Appendix E include an analysis of this potential community path connection to Medford. As presented in the analysis, a community path along the Green Line Extension Medford Branch corridor north of Lowell Street Station is not viable due to right-of-way constraints. The analysis also concluded that adjacent Boston Avenue has insufficient pavement width for a community path or on-street bicycle lanes.

I-238-006

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-238-007

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout and access at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-238-008

The amount of bicycle storage at each station is based on ridership projections developed by CTPS. DEIR/EA Appendix D includes the methods CTPS used to analyze demand for bicycle parking. Detailed

I-238-011

Community Path Route from Washington St. to Lechmere - the Somerville Community Path route should connect the Washington St./Brickbottom station, the Brickbottom community and Inner Belt to Lechmere. The present plans do not make these connections. If the proposed Yard 8 location for maintenance and storage facility is "dropped", better routes for the Community Path (such as along the Green Line to Brickbottom and over the former Red Bridge location) that do make these connections are possible. The Green Line extension plans should state that this re-evaluation will be done.

In conclusion, while I realize that a 10% design stage cannot contain all the details everyone would like, I feel that stating these many improvements is necessary for the final EIR and the subsequent final design in order to achieve a first class transit system.

Thank you very much.

Sincerely,

James O'Keefe
25 Moore St.
Somerville, MA 02144
jokeefe@jamesokeefe.org.

4

bicycle parking designs will be further developed during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

I-238-009

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-238-010

MassDOT is committed to completing all planning, design, and engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community Path between Lowell Street and Inner Belt Road. MassDOT is not able at this point to commit to funding the construction of the Community Path. The limits of the path were predicated on the connections to Lechmere being made through the Inner Belt area via Inner Belt Road

and the proposed Urban Ring Bridge into the Lechmere area. However, the cessation of planning for the Urban Ring Project has changed the timing of this anticipated connection. MassDOT is unable to assume responsibility for designing the Urban Ring Bridge as part of the Green Line Extension Project. That being said, MassDOT is committed to working with the City of Somerville, residents and businesses in the Brickbottom and Inner Belt neighborhoods, and Community Path advocates to design the Path to create improved connectivity within the Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension.

I-238-011

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

DEC 23

Reference to the Project Number EEA#13886

Dear Secretary Ian Bowles,

As a 22 year founding resident of Brickbottom Artist Building, I am looking forward to the Green Line finally extending beyond Lechmere Station. I am however, completely opposed to the "Yard 8" location for the maintenance and storage facility.

I-239-001 This proposed facility will take 11.5 acres of land from the City of Somerville, a city that is in need of development that will add to its future commercial tax base. Since "Yard 8" was first proposed in early 2008, it has been opposed by the City of Somerville, community groups and residents. At a recent DEIR public hearing at the Cambridge Multicultural Arts Center (December 16, 2009), there was unanimous opposition to "Yard 8". So, for two years "Yard 8" has been opposed, with citizens and public officials standing up at meetings and writing letters against this site. Furthermore, two alternative locations, "Mirror Scheme H" and "Option L" have been introduced for consideration. Yet, as of the December 16th meeting, it appears that neither alternative has been seriously looked at. Besides the impact to the City of Somerville and the neighborhood (creating a permanent barrier by dissecting the Inner Belt from Brickbottom), it will have a devastating effect on the 220 residents living in the Brickbottom Artist Building. Many people at Brickbottom, artists and entrepreneurs, work and live in the same space. They will never get away from the noise, vibration, light and compromised air quality. There are also families, many with young children that add a great deal to the vitality of life at Brickbottom. I am certain (with the construction of "Yard 8") that new families will not consider Brickbottom a suitable environment for raising a child.

When we started developing this building in 1986, we knew we were moving into an industrial area surrounded by train tracks. We live now with commuter rail, traffic from McGrath Highway and general city noise. The addition of the Green Line trains passing on both sides of the building will impact us further. The added burden of a maintenance and storage facility operating 24 hours a day constitutes a disproportionate burden of environmental impact on the quality of life in this community.

I-239-002 I hope that you will take my concerns seriously and move on to investigate the proposed alternatives. I also request that a citizen advisory committee be established to oversee the rest of the project and to ensure that the community has a voice in this process.

Thank you in advance for addressing these issues.
Sincerely,

I-239-001

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-239-002

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

Boston, MA 02114
E-Mail Holly.S.Johnson@state.MA.US

My name is Kevin F. Oliver. I live at 125 Boston Avenue, Somerville, MA right next to the Commuter Rail Corridor for the proposed Green Line Extension, close to Ball Square.

I would like to make two general comments and one specific comment concerning the home we own on Boston Avenue.

GENERAL COMMENTS:

I-240-001 (1) The proposed extension of the green line has one major problem that must be addressed if it is to be a success--the fixing of the Central Tunnel through Boston. Currently during peak periods, the present configuration produces gridlock from North Station through Kenmore Square in both directions. How can we possibly add more than 60 vehicles going through the Central Tunnel without gridlock all day??? The MBTA needs to either fix the Central Tunnel (very costly) or find another alternative.

I-240-002 One possibility would be to extend the Blue Line from Bowdoin through North Station to Lechmere and beyond. The advantage to this plan would be the balancing of the Blue Line with its sole easterly stops with new westerly ones, provide rapid transit extension that could eventually carry a load sufficient to reach 128, and prevent any gridlock within the Green Line system.

I-240-003 (2) If the state determines that it must continue with the current Green Line plan, it should scale back phase I so that the extension terminates just before Cedar Street with a stop there. This would allow Somerville to receive 90% benefit of the extension without having to rebuild the bridges at Cedar, Ball Square, Harvard Street, College Avenue and the tracks between these points. The cost would be dramatically reduced. This alone would allow the state to build out the project by the December 2014 deadline. Medford, who has mixed feelings about the project, would be taken out of the equation. The only reason the project is proposed to end at College Avenue on its first phase is Tufts University's desire to have a direct transportation connection to its downtown medical facilities. Tufts can use other means to achieve this goal; they currently run a private bus service to Davis Square for their staff and students. They could re-route this system so it could

I-240-001

The Green Line Extension does not add vehicles through the Central Subway system. The proposed operating plan extends existing Green Line service at existing headways and frequencies. The D Branch would extend to College Avenue, and the E Branch would extend to Union Square. Therefore, there would be no adverse impact to the Central Subway system.

I-240-002

The MBTA Blue Line is a heavy rail transit service that uses a different transit technology than Green Line light rail. The two technologies are not compatible, in that they cannot operate along the same tracks. A separate Red Line/Blue Line Connector Study evaluates extending the Blue Line to the Red Line at Charles/MGH Station. This analysis is beyond the scope of the Green Line Extension project.

I-240-003

The Project's Purpose and Need is described in DEIR/EA Chapter 2, Purpose and Need. The Project is needed to comply with the State Implementation Plan (SIP), which includes requirements for this Project as well as other transit projects to meet the air quality and transit commitments established as a result of the Central Artery/Tunnel project.

I-240-003

stop at a Cedar Street Station. The commuter rail could stop at Tufts as it has done in the past.

I-240-004

The Community Path could still be built between College Avenue and/or Ball Square to the Cedar Street Station to allow access by foot and bicycle. The current bus routes # 89 and 80 can easily be re-routed to a Cedar Street stop. Franey Road only services the DPW. There is a small playground that could be used for the stop and it could be moved across the street to an empty closed store and parking area. It seems a no-brainer to me if we intend to build this project before 2050. Phase 2 could still include the rest of the project to Route 16 as funds become available.

PERSONAL COMMENTS

I-240-005

As I said earlier, I live at 125 Boston Avenue right next to the current right of way proposed for the extension. I noted on the map shown at the public meeting of November 18, 2009, at Somerville High School that a new retaining and sound barrier is proposed from Ball Square to one house to the north away from my property and a new retaining and sound barrier is proposed from two houses east toward Boston all the way to Cedar Street. Why is there no retaining and sound barrier behind our house??? My wife and I feel that we must have at least some protection from the noise and vibration of the street cars going every 5-10 minutes behind our house. What other mitigations will you provide during construction and afterwards for vibrations, noise, and possible damages to our property?

Kevin Oliver
125 Boston Avenue
Somerville, MA 02144-2218
oliver.massed@rcn.com

I-240-004

DEIR/EA Section 3.8.2 and Appendix E include an analysis of this potential community path connection to Medford. As presented in the analysis, a community path along the Green Line Extension Medford Branch corridor north of Lowell Street Station is not viable due to right-of-way constraints. The analysis also concluded that adjacent Boston Avenue has insufficient pavement width for a community path or on-street bicycle lanes. A station at Cedar Street has not been considered as part of the Proposed Project.

I-240-005

As shown in FEIR Section 5.1, Fig. 5.7-4, a noise barrier is proposed to extend along the entire west side of the alignment, along Boston Avenue between Cedar Street and Broadway. It is important to note that retaining walls, which are required at certain locations to retain the soil along slopes of the corridor, are not necessarily the same locations as proposed noise barriers.

Johnson, Holly (EEA)

Subject: Comments on Green Line Extension DEIR

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I am writing to urge that the Draft Environmental Impact Report (DEIR) for the Green Line Extension Project NOT be accepted as the Final Environmental Impact Report (FEIR), for the reasons set forth below.

I-241-001

1. The DEIR must specify the Green Line Extension to Mystic Valley Parkway/Route 16 as a single project. Ending the Extension at College Ave will put a large burden on the Medford Hillside neighborhood, due to greatly increased traffic on Boston Ave, without effectively serving it.
The DEIR fails to properly analyze the effects that ending the Extension at College Ave will ave on Medford Hillside.

2. In addition, MassDOT should re-analyze locating the station at Winthrop Street rather than College Avenue. This location will serve Medford Hillside far more effectively than would College Avenue.

I-241-002

3. The DEIR calls for the taking and demolition of the commercial properties at 200 and 222 Boston Avenue, for the sake of a tiny sliver of space supposedly needed for the track approach to the Mystic Valley Parkway/Route 16 station. The Medford Green Line Neighborhood Alliance has published a proposal for a track and station design that does not require taking those properties, and MassDOT claims to have come up with one as well.
Taking and demolishing those properties would a) be costly to the project, b) deprive Medford of a significant source of property tax revenue, and c) displace several hundred jobs that would otherwise suddenly become a lot more T-accessible.

I-241-003

4. The Mystic Valley Parkway/Route 16 station should include a pedestrian connection to West Medford Square along the Lowell Line right-of-way.
Doing so will make the station far more accessible to residents of West Medford. West Medford Square is a quarter of a mile from the station location in a straight line, but making the trip on foot is nearly twice that distance, and involves a difficult crossing of Route 16. From the Google Maps images, it appears that both the Rte. 16 bridge and the Mystic River bridge have room for a 10'-wide pedestrian path and a suitably beefy fence separating it from the commuter rail tracks.

I-241-004

5. More trivially, "Mystic Valley Parkway/Route 16" is a cumbersome name for the station. I submit "Mystic Valley" or "Mystic River" as alternatives.

I-241-005

6. The extension of the Somerville Community Path alongside the Green Line must be designed and constructed as an integral part of the Green Line Extension project. If this is not done, it will become much more difficult and costly to build the Community Path extension at a later time. The DEIR should include an analysis of the environmental, traffic etc. impacts of

1

I-241-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

As described in DEIR/EA Appendix B, Section 4.5, MassDOT's analysis and understanding of the ridership market potential concluded that the Winthrop Street area would be best served by a single station in the vicinity of College Avenue and Winthrop Street. As explained in DEIR/EA Section 3.7, the preferred station location is at College Avenue.

I-241-002

All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-241-005

the Community Path, particularly in regard to its providing increased accessibility for the Green Line stations.

I-241-006

7. The Green Line Maintenance Facility should not be located at Yard 8, and the DEIR should not call that location out as the preferred alternative. Of the locations currently under consideration, I find Option L the best alternative, despite involving the acquisition of some commercial property.

I-241-007

8. Section 3.7.6 of the DEIR remarks that the Broadway Bridge in Somerville will be closed and detoured during its reconstruction. Based on my experience when the City of Somerville closes that bridge for the Independence Day fireworks at Trum Field every year, I must recommend in the strongest possible terms that, if it is truly necessary to close the bridge, the detour route be carefully thought out and have ample signage. The route most people take eastbound during the closure for the fireworks is Boston Ave to Prichard Ave to Kidder Ave to Boston Ave to Morrison Ave to Cedar St to Highland Ave. Most of these are narrow residential streets, with at least two turns that are impassable for 18-wheeler trucks. And, during rush hour, the traffic light at Highland and Cedar backs up all the way to the north end of Prichard Ave. Willow Ave to Highland Ave to Cedar St is one possible detour, as is Harvard Street to Medford Street (though this route already sees heavy traffic). In addition, careful consideration must be given to the likely impact of the closure on Ball Square businesses. And, needless to say, similar care should be taken for any other bridges that need to be detoured.

Respectfully,
Chip Olson
80 Prichard Ave
Somerville, MA

2

I-241-003

Please see response to Comment I-241-002.

I-241-004

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

I-241-005

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-241-006

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-241-007

Construction impacts of the Project are described in each environmental resource section in DEIR/EA Chapter 5, Environmental Consequences. Detailed construction plans will be developed in the next phase of the Project. Affected bridges are described in DEIR/EA Section 3.7.2. Detour routes and emergency access during construction will be developed during preliminary engineering as part of the Traffic Management Plan. At least one bridge will need to be closed during construction (Medford Street). A temporary bridge may be able to maintain a single lane of

traffic at the Broadway Bridge. For all other bridges, at least one lane will be maintained during construction. Pedestrian and vehicular access to abutting properties will be maintained at all times. Project bridge designs and construction staging plans will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during design and construction.

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA #03886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-243-001 As a resident of the Glass Factory Condominiums, I am deeply concerned about the design and placement of the Green Line Extension and the new Lechmere Station.

TRACKS ARE TOO CLOSE TO OUR BUILDING.
The present design shows the tracks running very close to the rear of our building. We urge your designers and engineers to place the tracks as far to the rear of our building as possible to preserve views & light to the many units that will be severely impacted by the elevated tracks. The design and placement of the tracks and supports should do all it can to minimize the visual impact to those units and also minimize noise & vibration impacts to the whole building as well as the surrounding neighborhood.

LECHMERE STATION.
At present, your designs show the new Lechmere Station so close to the Glass Factory that it appears to be part of our condominium building. Please move the station closer to East Street, where it could be part of the entrance way to the eventual North Point development. The station design needs to be substantially improved so it is not an eyesore but rather an enhancement to this rapidly developing neighborhood. It should reflect the importance of this location as the gateway between Cambridge & Boston.

BUS TRAFFIC.
The many bus lines that converge on Lechmere Station are presently designed to enter at one end of our building, pick up passengers, and emerge at the other end of our condo building. Please do not route bus traffic, directly under our windows. Bus traffic noise, vibrations and fumes are a great concern. Sidewalks where passengers wait, should also be moved farther from our building to preserve our privacy and minimize impacts from noise, light and smoking. If too close, it will feel like we are living in the bus station.

PRESERVE OUR TREES & GREEN SPACE.
Presently there is a row of mature evergreen trees behind our building. I urge you to preserve all these trees and the entire small green space behind our building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks should be on the far side of the large trees. These trees serve as a natural screen for the tracks and busway.

I-243-001

Please see Comment Letter I-013.

MAINTENANCE FACILITY.
I strongly oppose the Mirror H location. It is much too close to the Glass Factory and other residential buildings and will effectively destroy further development in North Point. Putting a maintenance facility on prime land in a desirable, developable location that would generate significant tax revenue to Cambridge simply does not make sense. Of the three options proposed, Option L seems to be the best choice however I would prefer there be no maintenance facility in this area but rather it be at the end of the line.

REDUCE SURFACE PARKING.
The present Lechmere Station is at the end of the Green Line. That will no longer be the case with the new Green Line Extension and the number of parking spaces should be substantially reduced. Surface parking is bad urban design and should be minimized in the new North Point neighborhood. One half of our building will overlook the new parking and we request it be carefully designed with this in mind. Ample green space should be included in the design and all lighting should be down lighting that minimizes light pollution to our building.

Thank you for hearing my concerns.

Sincerely,

Harpreet

Dear Secretary Ian Bowles,

As one of the original artist group that developed the Brickbottom Artists Building at 1 Fitchburg Street, Somerville some 21 years ago, I am both delighted that the Green Line will be extended to Medford and shocked that the DOT would consider placing the Maintenance Facility and Storage Yard, in what is called Yard 8, so close to the Brickbottom Buildings and Inner Belt Area of Somerville. At recent open meetings held by DOT there was almost total opposition to this plan. In addition, there are viable alternatives to this plan. The noise and vibration as well as the negative impact on the further development of this area, would be unfortunate.

I-244-001

I urge you to choose the city's preferred alternative, "Mirror H" and to continue community involvement for this project which will have such a large impact on the lives of those of us who live and/or work here.

I-244-002

Thank you,
Marilyn Pappas

RE: Green Line Yard 8 Plan

January 6, 2010

Dear Ms. Johnson

I-245-001 I am a Brickbottom resident facing North and East on the second floor. Our unit is level with the ground, and we would be directly impacted by any activity in Yard 8, creating problems of noise, vibration, pollution, and light blockage. What are the plans to address those impacts?

For a number of reasons, the proposed maintenance facility and storage yards are ill advised in this location:

I-245-002 The location would prevent future economic development in the area, which our city desperately needs and deserves, it would create a reckless expansion of the industrial rail zone, instead of combining facilities to reduce impact and quite possibly costs due to potential sharing of equipment and facilities. We know such an expansion would present challenges, but we expect the government to thoroughly explore such avenues, rather than embark on shortsighted solutions.

Sincerely,

Piotr Parda

P. Parda

I-245-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site. Mitigation for the Proposed Project is discussed in FEIR Chapter 8.

I-245-002

Socioeconomic impacts, including projected effects on businesses, jobs, tax revenues, and community disruptions, are described in DEIR/EA Section 5.3, Socioeconomic Impacts. Effects on land use and transit access are discussed in DEIR/EA Section 5.2, Land Use, and Section 5.15, Indirect and Cumulative Effects. As required by the Secretary's Certificate on the DEIR/EA, additional analysis of the socioeconomic effects of the maintenance facility alternatives are described in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. A series of Project workshops will provide opportunities to discuss broader impacts of the Project on job creation, economic development, housing affordability, and other community impacts.

Subject: Green Line Extension Project DEIR feedback

January 4, 2010

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA #03886
100 Cambridge St., Suite 900
Boston, MA 02114

Secretary Bowles,

My name is Christopher Park and I live and own one of the units at the Glass Factory building located at 169 Monsignor O'Brien Highway. While I am enthused about the Green Line project overall, I would like to voice my concerns about the new Lechmere station and the potential effects it may have on our building. Specifically, three areas:

I-246-001

1) **Noise Impact** After reading the DEIR report recently published, I am concerned about insufficient data provided in this analysis. It listed our building as one of the few that would be "severely impacted" by noise. While it is good to see that you recognize the effects of the tracks being so close to our building, the solutions presented in detail to combat noise impact (sound barriers) are not applicable to our building as it has been determined it is not feasible at our location. Therefore, you have individually identified our building as potentially qualifying for "sound insulation". Possibilities listed that are relevant to our building include: extra layer of glazing to windows, by sealing any holes in exterior surfaces that act as sound leaks. However, what concerns me are the following points:

a. You have not taken the time to inspect our building exterior surface (how do we seal holes on the backside of our brick-face building?) so sound insulation may not even be feasible.

b. You list an estimated budget of $50K per unit, but again, have not inspected our building. What is this figure based upon? How did you determine the cost to insulate each unit by window glazing and additional panes? (without any prior knowledge of the window structure)

I-246-002

2) **Parking.** I do not understand why the new Lechmere stop requires as many parking spots as the current station, *when it is no longer at the end of the line*. Having this large lot seems unnecessary because T conductors and bus drivers will not be starting their shift at the Lechmere station. More importantly, it defeats the purpose of having public transportation. In my experience, when public parking is offered, people will use it for a variety of reasons other than its intended purpose. (much cheaper to park here and go to the Museum of Science or TD BankNorth Garden as opposed to their $20+ private lots) As you may already know, there is a major traffic problem where Rt 28 and Cambridge St. merge, and this large parking lot would aggravate to what is already a congested situation. Please reconsider decreasing the size of the lot (reducing the number of parking spots) or allocating smaller parking areas around the East Cambridge area. Large parking areas can be

1

I-246-001

As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds. The estimated budget of $50K per unit is based on the typical costs per residence for sound insulating single-family and multi-family properties. The stakeholder coordination process for project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-246-002

Although Lechmere Station will no longer function as a terminal station, there is still a demonstrated demand for existing parking. Nonetheless, parking at the relocated Lechmere Station was reduced in the revised conceptual design. These revised plans are included in FEIR Chapter 5, Lechmere Station.

I-246-002

refuge for the homeless and potential criminal activity at night. This designated space could be used in a more productive manner for retail and commercial businesses – originally slated in the North Point project.

I-246-003

3) **Track and Station Proximity to Building** Finally, I would like to implore you to try to move the station as far away from the Glass Factory building as possible. I realize that due to engineering limitations, a sweeping curve around the building is not possible, but every foot away from our building would help. Even if moved an additional 5 or 10 feet away from our building, it may open the possibility of using a sound barrier wall, along with options for unit owners to retain some of their privacy by having trees planted in between. Again, I am supporter of the Green Line project, but I ask you to take into account the location of the tracks and station on behalf of myself and the other residents of the Glass Factory

Thank you for taking the time to read this letter and if you have any questions or wish for me to elaborate on any point, please feel free to contact me.

Best,

Christopher Park

I-246-003

FEIR Chapter 5 describes the revised conceptual plans for Lechmere Station, including station design, track alignment, bus routings, and other elements. Changes to the track alignment depicted in the DEIR/EA were evaluated, but could result in additional impacts on area abutters. Proposed mitigation measures for area abutters are also described in FEIR Chapter 5. During preliminary engineering, specific station design elements will be further developed.

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA #03886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles,

I-247-001 I am an owner and resident of the Glass Factory Condominiums, and have also been a long time resident of City of Cambridge in the area of East Cambridge since 1991. I have the following concerns about the Green Line Extension Project.

(1) TRACKS ARE LITERALLY NEXT TO OUR BUILDING

The currently proposed design indicates the tracks running extremely close to the rear of our building. Please place the elevated tracks as far to the rear of our building as possible to preserve lights and privacy, and minimize noise and vibration. My unit is located at the back of the building, and will be severely impacted by the elevated tracks if they are too close to our building.

(2) LECHMERE STATION PLACEMENT

The current design indicates the new Lechmere Station will be relocated so close to our building that it appears to be part of our condominium building. It will make much more sense to move the station closer to East Street, where it could be part of the entrance way to the eventual North Point development. The North Point is an important location as the gateway between Cambridge and Boston, and therefore the Lechmere station design should be substantially enhanced to be a part of this rapidly developing neighborhood.

(3) BUS ROUTE & TRAFFIC

The currently proposed design routes bus traffic too close to our building as if our building is a part of the bus station. I'm greatly concerned about bus traffic noise, vibrations, fumes, and intrusion of privacy by passengers waiting at the sidewalks.

(4) PRESERVE OUR TREES & GREEN SPACE

Presently there is a row of mature evergreen trees behind our building. I urge you to preserve all these trees and the entire small green space behind our building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks should be on the far side of the large trees. These trees serve as a natural screen for the tracks and busway.

(5) MAINTENANCE FACILITY LOCATION

I strongly oppose the Mirror H location since it is much too close to our building and other residential buildings and will effectively destroy further development in North Point. I could not understand why a maintenance facility should be placed on this prime land in a desirable, developable location that would generate significant tax revenue to Cambridge. It will make sense to put it at the end of the Green Line not at the Lechmere station. If it is required to put it at the Lechmere station, Option L seems to be the best choice.

I appreciate hearing my concerns.

Sincerely,

Taeshin Park

RE: Green Line Extension Draft EIR (EEA #13886)

Dear Secretary Bowles:

The following three proposals have been identified many times during both several public meetings and in the form of comment letters. The three proposals have been a "common sense" repeated series of suggestions during the many aggregate and "snowballing" series of questions.

ISSUES

The proposals derive from the following three issues. The issues, obviously, require unbundling in a manner beyond the several public comments and responses to date. This is why the following three issues seem to only become more paramount as the Jan 8th date approaches:

I-248-001

1. Public advisory process has been constructive with public comments and MassDOT responses creating a strong "back and forth" narrative. But it is clear some issues are more complicated than the latter process allows for, such as evolving the many desire lines into stations, the inclusion of improvements to the surrounding sidewalks, streets and bus stops, etc.
2. Proposing design alternatives such as the maintenance/support facility, has proven a "good start" at larger public meetings. Then subsequently, trying to create a clear consensus has been harder. For example, the process has cultivated groups being pitted against each other, as they support opposing alternatives. Yet more evolved solutions such as "option L BET" have recently surfaced. But they need more extensive unbundling and collaborative community feedback.
3. The extent of revisions between the DEIR and the FEIR have become an unwieldy laundry list and subsequently harder to digest both from the community and the probably the state consultants. What is being revised? to what level? and what is merely being continued forward? The latter will require a lot of decision making relative to scope even before the work is executed.

PROPOSALS

The following three proposals can provide a clear and persuasive strategy to address the above issues that can be more productive and eventually more efficient.

1. Initiate an Advisory group as per MEPA guidelines for Green Line Extension Project comprised of the obvious representative groups. such as advocacy groups, community groups, city representatives, and private abutters. etc, as well as being open to the general community.

I-248-002

2. Initiate a Supplemental Environment Impact Report (SEIR) for the maintenance/storage facility.

I-248-003

3. The existing "Environmental Impact Report" (EIR) can become the Final Environmental Impact Report" (FEIR) with "supplementals". This would allow certain portions of EIR such as the transportation volume counts to be carried through without revisions as well provide other immediate cost and time savings. Some obvious supplementals would include economic and land use planning, public/private coordination with existing permitted projects as, coordination with the reconstruction of Route 28, etc. The above noted MEPA advisory committee could evolve this list of supplementals for presentation at the larger public meetings.

Please consider this letter, a coalition letter "exclusive" of the individual letters by the noted endorsers/ advocacy groups, noted below. I appreciate the opportunity to comment on this regional project.

Sincerely,
Bhupesh Patel

Page 1 of 2 prepared by Bhupesh Patel

I-248-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-248-002

The Green Line Extension storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the overall Project. Chapter 2 of the FEIR fully describes the environmental impacts of the proposed storage and maintenance facility. The facility must be constructed adjacent to the Green Line Extension to maximize operating efficiencies and be constructed within the same time frame as the Project.

I-248-003

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

Group members who have discussed the above issues concur with the proposals:

Livable Streets Alliance, Charlie Denison

Somerville Community Corporation, Danny LeBlanc

Dear Ms Johnson and Secretary Bowles,

Attached for your review is a letter regarding the new Lechmere Station as part of the proposal for the Green Line extension. Residents, businesses, shoppers and tourists will all be highly impacted by the new project. East Cambridge residents like myself are very concerned. We will insist on a proposal which will enhance the quality, needs and safety of the community and look forward to working together with you to ensure that result.

Thank you for your consideration,

John Paul

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles,

I am writing to you with respect to the proposed Green Line station at Lechmere. I am a resident of East Cambridge, and an architect who uses the existing station for daily commutes to work and elsewhere in the Boston area. As such I've had a pretty good chance to review the patterns of use at the current station, as well as to anticipate the qualities of proposals for the new station. Additionally, I am an East Cambridge Planning Team participant, and have also attended the meetings where the new Lechmere station proposals have been presented.

The importance of the station as a well used gateway to and from the neighborhood cannot be stressed enough. In addition to the many people like me traveling from our homes here to Boston and beyond, there are the great numbers of workers coming in for the tech industries, the service industries in our hotels etc. and the visitors to the Cambridgeside Galleria. The Galleria alone sees upwards of one million visitors in a year. Additionally a great number of foreign and domestic travelers use the current Lechmere station to get to and from the hotels along the river and on the Obrien Hwy. Our primary concerns are for the safety and convenience to the users, the impact of the station design on the neighborhood, and its ability to shape and accommodate anticipated future urban development. The numbers of people using the Lechmere station can be expected to substantially increase with the Green Line extension.

I-249-001

- Safety: The station's location across Monsignor Obrien Hwy presents some obvious challenges to safety, but the location is understood by most residents to be an inevitable part of the greater benefits of the Green Line extension. That said, extraordinary measures must be taken which to address safety with revisions to the design of the highway for traffic calming. Essential elements are a reduction in the number of lanes and overall width of the highway, along with traffic calming, signals and well designed pedestrian crossings. Note that even the current crossing at Cambridge Street is poor, with challenges between car traffic and pedestrians on the way toward the Galleria – the Obrien Hwy. presents much bigger problems.

I-249-002

- Station Design: The proposed station plans presented to the neighborhood were frankly awful. As a response, a group of East Cambridge residents took it upon themselves to make a counter proposal which has been circulated and which I am sure you have seen. I was not a member of the counter proposals design team, but I believe that it includes many qualities which are considered essential for a new station and that it should be considered seriously by your office. The new station must have indoor space for waiting, purchase of Charlie tickets, etc., it's entrance must be oriented toward the East Cambridge neighborhood as well as North Point, and the bus station must be better integrated into the overall plan. There is no need for the sea of parking shown on the 'official' plan, this is an urban location, NOT a suburban end terminal.

I-249-003

- Urban Redevelopment: Additionally, in the citizens 'counter proposal', the notion of redeveloping the existing Lechmere station area was explored. I support the proposal of market area in conjunction with additional new buildings, including the notion of placing a midrise commercial structure such as a hotel on the triangle of land where Cambridge St. meets Obrien Hwy. Urban density is a practical and visual asset in this location, anchoring this start of Cambridge St, while adding to the vitality and commercial potential of this part of the city.

I hope you will consider the concerns expressed here, and I look forward to working toward a new station which can best serve East Cambridge.

Regards,

John E. Paul
90 Spring Street
Cambridge MA 02141

I-249-001

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. The chapter presents a traffic analysis, a detailed description of pedestrian crossings of O'Brien Highway, and proposed roadway, crosswalk, and sidewalk improvements that are consistent with the NorthPoint development plans. These station and street plans will be further refined in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-249-002

MassDOT has reviewed the suggestions submitted by the East Cambridge Planning Team. Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. These plans, including the pedestrian crossings of O'Brien Highway and associated street, crosswalk, and sidewalk designs will be further refined in the preliminary engineering stage of the Project. As part of the Green Line Extension, MassDOT intends to demolish the existing Lechmere Station and prepare the site for potential future redevelopment. Based on the current requirements of the O'Brien Highway roadway improvements (as shown in FEIR Chapter 5, Lechmere Station), the existing bus shed must be removed.

I-249-003

As part of the Green Line Extension, MassDOT intends to demolish the existing Lechmere Station and prepare the site for potential future redevelopment. Based on the current requirements of the O'Brien Highway roadway improvements (as shown in FEIR Chapter 5, Lechmere Station), the existing bus shed must be removed.

Dear Secty Bowles,

I am writing in regard to the proposed Maintenance Facility + Storage Yard for the Green Line which you propose to build in Somerville.

I-250-001 I would like to state emphatically that I am pposed to the Yard 8 location which you insist on keeping on the drawing board despite opposition voiced by Brickbottom residents, the City of Somerville, elected officials, Somerville residents + Cambridge residents. Can you tell me why our opinions matter so little to the State? Aren't we the State?

Please take Yard 8 off the drawing board + give consideration to other possible locations, including Option L + mirror Scheme H.

Sincerely,
Cynthia Pellegrini
Unit C-117

Re: Green Line Extension Draft EIR (EEA #13886)

The extension of the Somerville Community Path to the Charles River is a critically important milestone in a sustainable future for Massachusetts.

I-251-001

The DEIR should clearly state that the extension of the Community Path will be designed by MassDOT's contractors as agreed to in a February 24, 2009 letter from the former EOT.

For cost efficiencies and technical necessities, the Green Line and Community Path extensions will be constructed as one project and must clearly be described as such by MassDOT.

MassDOT should commit to work with the City and other State and Federal agencies to obtain the necessary funding to build the Community Path extension as part of the Green Line extensions (as was done with the Linear Park as part of the Red Line and the Southwest Corridor path as part of the Orange Line), including applying for Federal New Starts funding that allows bicycle and pedestrian access costs.

Thank you for considering these comments. I support the extension of the Green Line extension to Somerville and Medford and the design of the Somerville Community Path.

Thank you,

George Perkins AIA

Attn: Holly Johnson, MEPA Analyst
Project Number EEA #13886
100 Cambridge Street, Suite #900
Boston, MA 02114

Dear Secretary Bowles:

I am writing in regards to Project number EEA #13886, pertaining of the placement of the MBTA Maintenance and Storage facility as part of the MBTA Green Line Extension Plan. As a supporter of the Green Line Extension plan and a 22-year resident of the Brickbottom Artists Building, which is a vibrant artists/craftspersons' community located in Somerville, I firmly believe that the Yard 8 plan for the MBTA storage and maintenance facility is totally unacceptable for the following reasons:

I-253-001 A) The Brickbottom Artists Building, which was originally a warehouse for the now-defunct A & P Market, was founded by a bunch of artists, who, priced out of, or kicked out of Fort Point, had looked for two years for a warehouse, finding a warehouse down in South Boston that was condemned as unsound, and were forced to look further. The founders of Brickbottom Artists Building finally found the place that we're presently in. We are artists, craftspeople, writers, and other people. We work, write, play music, etc., and we happily live here. We are completely and totally opposed to having a maintenance and storage facility for the MBTA trains that would be a mere 50 feet away from the storage and maintenance facility, and the high amount of noise from the trains, etc. for most of the day, particularly at peak hours, would become unbearable. It would also result in excessive pollution at night, and there'd be loss of natural light and view for many, if not most people residing in the Brickbottom Artists' community.

I-253-002 B) Environmental affects of the Yard 8 Plan, too, would be devastating, as there'd be toxic run-off from the contaminated soil in the area.

I-253-003 C) The Yard 8 plan would not only result in expensive mitigation, such as noise barriers which would completely isolate the Brickbottom community from the Inner Belt area and other places, but even the most expensive mitigation procedures, such as noise and light barriers around the Brickbottom Building and special windows put in would not provide even the slightest bit of relief from the devastating effects on the quality of life for Brickbottom residents, including myself, who are committed to continuing to live and work here. The Yard 8 plan would also cost the proponents of this particular plan much more money as well, as a consequence of these costly mitigation procedures, which, as I pointed out, would not work at all, anyway.

I-253-004 D) It's also clear that the vast majority of people who reside in the City of Somerville and the City of Cambridge alike, including leaders/representatives/congresspeople of the area(s) are also opposed to the Yard 8 plan for the above-mentioned reasons. The Yard 8 plan would also have devastating economic effects on the area. The City of Somerville would lose valuable taxable revenue in the form of land that could/would be used for a certain amount of redevelopment.

I-253-005 E) All of the above having been said, this raises yet another question: If the maintenance facility goes into Yard 8 as you've been proposing, who would want to come to the area? What good would the Green Line Extension be if residents of Brickbottom weren't able to enjoy the fruits of it? These two questions are questions that you must ask yourselves....very seriously, in addition to considering the deleterious environmental and economic affects on the general area, and the deleterious affects on the quality of life for the residents of the Brickbottom Artists Building.

Having said all of the above, Yard 8 MUST be taken off the table entirely and alternatives such as Mirror H and Option L, which is the most acceptable of the alternate solutions, must be considered. Land that's already right near the Boston Engine Terminal must also be looked at. Yard 8 is unacceptable, inappropriate, and unfair to everybody involved, and it must be scrapped.

Thanks very much for your time and attention on this matter.

Sincerely,

Mimi Ann Polumbaum
Brickbottom Artists Building #C406
1 Fitchburg Street
Somerville, MA 02143

I-253-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-253-002

As described in DEIR/EA Section 5.9, the Project would be required to comply with federal and state stormwater discharge permit requirements during both the construction and operational phases. Compliance with these standards would include using Best Management Practices to prevent contamination of stormwater and control erosion and accretion (sedimentation) from stormwater runoff from the railroad alignment, stations, and maintenance facility.

I-253-003

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

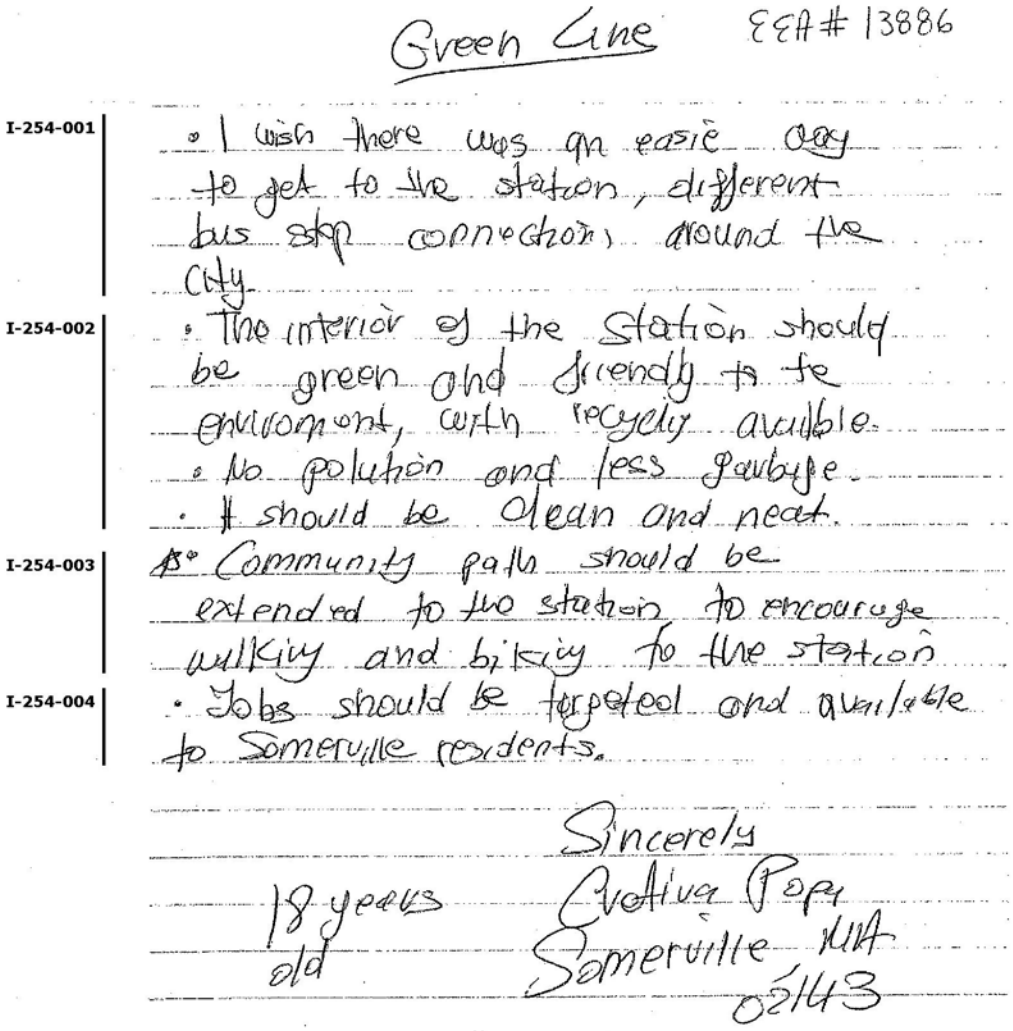
I-253-004

Socioeconomic impacts, including projected effects on businesses, jobs, tax revenues, and community disruptions, are described in DEIR/EA Section 5.3, Socioeconomic Impacts. Effects on land use and transit access are discussed in DEIR/EA Section 5.2, Land Use, and Section

5.15, Indirect and Cumulative Effects. As required by the Secretary's Certificate on the DEIR/EA, additional analysis of the socioeconomic effects of the maintenance facility alternatives are described in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. A series of Project workshops will provide opportunities to discuss broader impacts of the Project on job creation, economic development, housing affordability, and other community impacts.

I-253-005

Please see response to Comment I-253-004.



Green Line EEA# 13886

I-254-001 • I wish there was an easie way to get to the station, different bus stop connection around the city.

I-254-002 • The interior of the station should be green and friendly to the environment, with recycly availble.
• No polution and less garbage.
• It should be clean and neat.

I-254-003 • Community paths should be extended to the station to encourage walking and biking to the station

I-254-004 • Jobs should be targeted and available to Somerville residents.

Sincerely
Cristina Popa
18 years old
Somerville MA
02143

I-254-001

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

I-254-002

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. These stations are designed to be consistent with MBTA standards and compliant with ADA. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-254-003

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-254-004

Socioeconomic impacts, including projected effects on businesses, jobs, tax revenues, and community disruptions, are described in DEIR/EA

Section 5.3, Socioeconomic Impacts. Effects on land use and transit access are discussed in DEIR/EA Section 5.2, Land Use, and Section 5.15, Indirect and Cumulative Effects. As required by the Secretary's Certificate on the DEIR/EA, additional analysis of the socioeconomic effects of the maintenance facility alternatives are described in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. A series of Project workshops will provide opportunities to discuss broader impacts of the Project on job creation, economic development, housing affordability, and other community impacts.

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114
Via email: Holly.S.Johnson@state.ma.us

Dear Secretary Bowles:

I am a Medford resident writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Cambridge, Somerville and Medford, EEA #13886.

I-255-001 | I strongly support the Green Line extension, and urge that it be built in one phase, with a terminus station at Mystic Valley Parkway (Route 16), by December 31, 2014. I ask that you reject the DEIR as written because it does not comply with the December 1, 2006 MEPA certificate and does not satisfy the legal mandate to serve the Medford Hillside neighborhood.

The DEIR concludes that the Route 16 station would provide the most benefits according to all project criteria, including air quality and environmental justice. However, MassDOT states that it is incapable of building (and funding) the entire "Preferred Alternative," so it only intends to build the extension to College Avenue in the Tufts University area of Medford, by its deadline of December 31, 2014. For the following reasons, I strongly urge you to not accept the DEIR as the Final EIR and require further environmental analysis of the project by MassDOT:

I-255-002 | • **A two-phased approach is unacceptable.** The Route 16/Mystic Valley Parkway Station should be built as part of a single-phase project to minimize costs and negative impacts and achieve the maximum benefits with regard to ridership, vehicle mile travel reduction, air quality improvements, and service to environmental justice communities. The recommendation as outlined in the DEIR is for the Route 16/Mystic Valley Parkway station to be a separate stand-alone Phase II project with no funding source identified is a bad idea.

I-255-003 | • **Environmental Justice:** The environmental justice population cited, in part, to justify the project as a whole will largely not be served if the project terminates at College Avenue. There are five separate Environmental Justice sites within walking distance of the Route 16 terminus that will simply not be served by a College Ave terminus.

I-255-004 | • **Legal Mandate:** The state is legally obligated to provide public transit services to Medford Hillside by December 31, 2014, and stopping the extension at College Ave. fails to meet this legal obligation. The vast majority of the Medford Hillside neighborhood will not be served by a College Ave terminus.

I-255-005 | • **The Route 16 station design in the DEIR is inadequate.** The DEIR design for the Route 16 station is deficient and unworkable. It unnecessarily calls for the taking of two existing buildings that should remain intact with a proper design. The Final EIR should show a realistic and workable design for the Route 16 site, which is by far the best location for a terminus for the Green Line Extension.

In conclusion, I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis to go to Route 16 to serve the largest possible population, achieve the maximum ridership, and provide the maximum air quality and environmental benefits to the residents of Cambridge, Somerville, and Medford.

Thank you.

Jordana Psiloyenis
42 Dudley Street Third Floor
Medford, MA 02155

I-255-001

As directed by the Secretary's Certificate on the DEIR/EA, the FEIR includes a limited scope of issues related to the Green Line Extension Project. The Proposed Project, with a Medford Branch terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Although an extension to Mystic Valley Parkway/Route 16 is MassDOT's Preferred Alternative, financial constraints prohibit the Commonwealth from progressing the Project beyond College Avenue at this time.

I-255-002

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-255-003

The Proposed Project offers substantial benefits to environmental justice communities and serves the majority of Study Area environmental justice population zones. As described in DEIR/EA Section 5.4, Environmental Justice, impacts to environmental justice populations would be neither severe nor disproportionate with any of the Build Alternatives.

I-255-004

Please see response to Comment I-255-001.

I-255-005

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

Subject: Green Line Extension

Good Morning,

I understand that today is the last day for comments regarding the Green Line Extension into Medford. I currently live in South Medford and would be a potential user of the proposed College Avenue stop. Even though I would have little use personally for the Route 16 station, I believe that the city needs this stop. Terminating at College Avenue, even for just 2 years, would rob many residents of the opportunity to make use of the line and would do little to improve air quality in the city of Medford. I urge you to take another look at the situation and make every attempt to get the Route 16 stop up and running by 2014.

I-256-001

Thank you for your time.

Michael Quinn

Subject: Comments Re: Green Line Extension Draft EIR (EEA #13886)

Dear Secretary Ian Bowles,

[Executive Office of Energy and Environmental Affairs, MEPA Office]

I-257-001 I support the extension of the Green Line extension to Somerville and Medford and the design of the Somerville Community Path.

I-257-002 This DEIR includes the design of the Community Path but it doesn't commit to design it, pay for it or construct it along with the Green Line extension.

The DEIR should clearly state that the extension of the Community Path will be designed by MassDOT's contractors as agreed to in a February 24, 2009 letter from the former EOT.

For cost efficiencies and technical necessities, the Green Line and Community Path extensions should be constructed as one project and this must clearly be described as such by MassDOT.

I-257-003 MassDOT should commit to work with the City and other State and Federal agencies to obtain the necessary funding to build the Community Path extension as part of the Green Line extensions (as was done with the Linear Park as part of the Red Line and the Southwest Corridor path as part of the Orange Line), including applying for Federal New Starts funding that allows bicycle and pedestrian access costs.

Thank you for considering my comments.

Sincerely,

Barry Rafkind
4 Ossipee Road, Apt 1
Somerville, MA 02144

Subject: Green Line extension

Dear Ms. Johnson,

I attended the forum on the Green Line extension at Somerville High School last week, and it was quite informative. Although I live in Brockton I am considering a move to the Somerville-Medford area, and am very much in favor of this project.

After listening to many impassioned and well constructed arguments, these are the points I came away with.

I-258-001 1. I would not place that maintenance facility near Brickbottom, unless you don't mind paying lawyers for the next several years. It would be a waste of a potentially vibrant, pedestrian-friendly neighborhood that would do better with restaurants and fairly affordable residences. That sounds like a great little artists' colony, and the maintenance garage would be a slap in the face to those people. I think the man who suggested that the garage be placed near the 93 overpass made the most sense.

I-258-002 2. I believe that each of the new stations needs a safe pull-over lane for pick-ups and drop-offs -- especially for babies, senior citizens and people with disabilities.

I-258-003 3. No more parking garages. The traffic pouring in and out of such facilities would defeat the entire purpose of this project -- namely, getting people out of their cars. A garage at Route 16 would draw an influx from Arlington, where upscale commuters are already salivating at this prospect, but would negatively impact traffic in Somerville and Medford along that route. This additional stop was proposed to EASE the stop-and-go traffic along Mystic Valley Parkway -- which is already horrific during the week -- not to add to it. Without a garage, a safer pedestrian environment for Tufts students and other area residents would be assured.

I-258-004 4. Finally, the bike/pedestrian path is a wonderful idea, but some re-routing of bus lines is also essential to ensure frequent connections to all of these stops. Again, the object is fewer cars on the road.

I wish you all the best in implementing this project. Thank you very much.

John Read

1

I-258-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-258-002

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. These stations are designed to be consistent with MBTA standards and compliant with ADA. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-258-003

The preferred alternative does not include construction of a parking garage.

I-258-004

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

Re: Draft Environmental Impact Report (DEIR): Green Line Extension project to Medford, EEA #13886

I-259-001 I support the extension of the MBTA Green Line to the proposed terminus at Mystic Valley Parkway/Route 16. As a local resident, I believe that the proposed Route 16 Station is in the best interests of my family and my community.

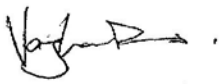
However, I have read the Draft Environmental Impact Report and wish to voice my concerns with its conclusions.

I-259-002 The proposed two-stage approach is a poor solution which will cause delays in implementation and increased costs and disruption to local residents. It is clear that The Route 16 site offers a more suitable option as a terminus and is greatly preferable to the College Avenue site proposed by the DEIR. This solution is not in the interests of the local community.

I-259-003 I am concerned that the DEIR has not fully considered optimal station designs for a Route 16 station. The proposed "worst case scenario" design is inadequate and fails to serve the general public or the needs of the local community.

I strongly urge you to not accept the DEIR as the final EIR. I want you to request a further environmental analysis of the project by MassDOT.

With thanks,
Yours sincerely,



Vaughan W. Rees, PhD

I-259-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-259-002

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-259-003

All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and

layout, neighborhood impacts, economic development, and other area planning issues.

Fax: 617-626-1181
Email: Holly.S.Johnson@state.ma.us

I am writing today to submit my comments regarding the draft environmental report for the Green Line Extension into Somerville and Medford.

The most important thing to me is that the project stay on schedule. There are so many times in the past months and years when I have wished I could walk to the green line and go where I needed to go without driving. I want the green line extended ASAP.

I understand that the Somerville Transportation Equity Partnership (STEP) and Medford Green Line Neighborhood Alliance (MGNA) have some criticisms of the report. I find these two organizations very trustworthy, and suspect their criticisms are all valid and need further review, however, my understanding is that this report is not meant to have fully designed concepts, and that it is meant as an early-in-the-design-process evaluation of environmental impacts only. I suspect that some of STEP's and MGNA's criticisms are things that would be addressed in future design development regardless of whether STEP and MGNA mentioned them at this stage of design. I request that you keep their criticisms in mind during design development though.

I-260-001

Most of the concerns I have right now are about my city's government (Medford), and their lack of involvement and enthusiasm for this project. I want you to be aware that there are Medford residents who fully support this project and are eager to see it completed. I have prepared a draft letter to the City of Medford City Council and Mayor that I have not yet sent to them, but which I have pasted below to let you know my opinion regarding anti-green line comments I've heard at meetings, and my responses including where I think the CITY OF MEDFORD needs to take action:

- Land takings: First, the residential property that might be taken are, as I understand it, tiny slivers, likely 6 inches trimmed off the edge of a property. Second, while I do feel compassion for those who might be affected by land takings, this project is the exactly the type of project that eminent domain is appropriate for. It brings tremendous benefit (transportation related, environmental, financial, etc.) to thousands of Medford residents, while having a negative impact on very few (who already previously chose to live or work along existing railroad tracks). I would like to see the project designed to minimize land takings as much as possible, especially for residential properties, but there might be a limit to what the project designers can do to get rid of property takings. I strongly disagree with the councilors who have been suggesting that the project "should not take ANY property in Medford". If land needs to be taken, then as long as the property owners get fair

I-260-002

1

I-260-001

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-260-002

DEIR/EA Section 5.2 describes the Project's potential acquisitions. MassDOT is currently conducting detailed property surveys to obtain more specific data. MassDOT will continue to evaluate opportunities to minimize these property impacts.

I-260-002

market value for the land taken, I think it is appropriate to take land to make this particular project a reality. For businesses I feel somewhat less compassion… I've worked for companies that have relocated. I can say from experience that the "pain" of relocating a business is very temporary and short duration. I would, however, like to see the CITY OF MEDFORD make proactive advances toward these businesses to try to find places for them to relocate within Medford, and to assist in making sure any property owners with land taken get fair market value.

I-260-003

- Increased traffic and parking: The CITY OF MEDFORD desperately needs to establish a parking department similar to Somerville's and make strictly enforced resident only parking zones throughout the city, especially near proposed green line stations, to prevent the green line project from increasing parking problems. So long as permit parking is addressed and enforced, and the project's designers don't include parking lots at stations, I can't see how the project will increase traffic and parking. I would expect it to DECREASE traffic as locals choose the green line over driving.

I-260-004

- Noise: I would like to see the CITY OF MEDFORD actively seek noise barriers wherever needed, but I do not think this issue should impact the progress of the extension. Abutters already chose to live next to an active commuter rail line… you can't move in next to noisy train tracks and then complain too much about noise. With noise barriers, there is a potential to reduce noise levels from present levels even with the addition of the green line trolleys.

I-260-005

- Increased pollution: I think this is a completely bogus argument. Any property along the commuter rail is undoubtedly ALREADY experiencing the maximum pollution they could. The green line is electric and will not produce any additional pollution. Moving the commuter rail a few feet will not affect their already maximized level of pollution. The only thing that could change their level of pollution is if the commuter rail were changed to a clean fuel, such as by electrification. The anticipated reduction in local street traffic should improve local air quality. I do not think the City of Medford needs to take any action on this issue.

I-260-006

- Decreased property values: I cannot imagine how this project would decrease property values… living near a subway stop is extremely desirable. I believe property values will increase, not decrease.

- (increased property values leading to) gentrification: For those who own their property, they don't have to sell. For those who do sell their property to cash in on increased home value due to proximity to subway, that is their choice, and there may be some gentrification caused by their own desires for profit. That is not something the City of Medford needs to be terribly concerned about. Renters, on the other hand, could see big problems with increased rents. It will be up to the CITY OF MEDFORD to decide whether some sort of low income housing laws are enacted. The CITY OF MEDFORD needs to proactively investigate likely future scenarios, and how we want to address them through legislation. I have no opinion on how to proceed, I just want to know that my government officials are thinking seriously about this issue.

I-260-007

- The MBTA is too cash strapped to do this project: First of all, the MBTA's finances don't directly affect Medford residents as far as I can tell. Second, this project is a legal commitment for the state, and will provide an opportunity to greatly improve the lives and livelihoods of Medford residents, so it is worth the investment to Medford. Third, adding riders they didn't have before is an opportunity to add income for the MBTA in the future and improve their financial state. Fourth, my understanding is that a big part of the reason why the MBTA has a deficit is a two-fold funding problem in that they forward funded without realistically estimating future expenses, and that they are trying to make the MBTA self-sustaining. Given that, other than MAYBE toll roads, the highways and roads throughout the state do not make any money despite gas taxes, but rather are a financial burden to

2

I-260-003

DEIR Table 6-1, Project Mitigation Commitments, lists the traffic and parking measures to which MassDOT has committed to mitigate impacts. These mitigation measures address (among other things) parking enforcement coordination. The project is expected to reduce overall regional traffic levels.

I-260-004

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-260-005

The Green Line Extension will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality. As required by the Secretary's Certificate on the DEIR/EA, the FEIR includes a narrative clarifying the relationships of air quality modeling data to MassDEP and EPA requirements for State Implementation Plan (SIP) consistency.

I-260-006

Socioeconomic impacts, including projected effects on businesses, jobs, tax revenues, and community disruptions, are described in DEIR/EA Section 5.3, Socioeconomic Impacts. Effects on land use and transit

I-260-007

cities and the state, I have no problem with the MBTA not being profitable either. Highways and roads increases pollution, clean energy public transportation does not… I'm happy to throw state money at the clean projects rather than the polluters.

Thank you for your time and consideration,

Jeff Reese

Boston, MA 02114

Dear Secretary Ian Bowles,

As a founding member of the Brickbottom Artists Bldg. (converted from the former A&P building in 1988) I am strongly opposed to placing the GL Storage Yard & Maintenance Facility in Yard 8. It would have a severe negative impact on the quality of life here, especially with the noise, dust, and vibrations.

I-261-001

There are a few alternative sites that should be considered, that would not directly affect residential areas.

I ask the DIR/EA and others:

"WOULD YOU LIKE THIS IN YOUR BACKYARD?"

Thank you for your consideration of Alternatives to Yard 8.

Sincerely,

Felice Regan

I-261-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

RE: EEA #13886

Dear Secretary Bowles:

I am very excited about the coming of the green Line to Somerville! I also want it to be done right – equitably, sustainably and with full appreciation of the impact on this and future generations of residents of Somerville, Cambridge and Medford.

I-262-001 To meet the SIP commitment of completing the project by December 31, 2014 design and construction must proceed expeditiously, but thoughtfully so that the extensions are done well. This can be accomplished by ensuring that critical factors discussed below are addressed through either requiring a supplemental EIR or addressing these issues through addendums to the FEIR. This must be done efficiently with the collaboration of the communities and citizens.

I-262-002 First, I strongly urge you to **eliminate the Yard 8 Option for the Maintenance Facility** and to require Mass DOT to carry out a full analysis of the Option L alternatives and Option H for siting the Maintenance Facility.

Yard 8 is opposed by the cities of Somerville and Cambridge and community residents. It would impose an onerous transportation infrastructure burden on the city that would negatively impact quality of life and preclude economic development of Brick Bottom/Inner Belt. The Secretary's Certificate to conduct the DEIR specifically warned against increasing such burdens on Somerville and its residents.

I-262-003 Second, it is critically important that in approving the FEIR there is a requirement to **establish a REALLY collaborative public participation process** with the cities of Somerville, Cambridge and Medford and community representatives for the next phases of the Green Line extensions to ensure that design and construction decisions maximize current and future use. To make this collaboration most effective we strongly urge the **establishment of a staffed field office in Somerville.**

I-262-004 Third, the **Community Path must be fully integrated into the design, planning, and construction of the Green Line extension.** The Path exemplifies the Federal Transit Administration's new policy on bicycle/pedestrian access to public transportation recognizing the importance of maximizing multi-modal access. The proposed policy states:

I-262-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

I-262-002

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-262-003

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-262-004

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

For purposes of determining whether a pedestrian or bicycle improvement has a physical or functional relationship to public transportation, regardless of whether it is funded as a capital project or public transportation enhancement, all pedestrian improvements located within one-half mile and all bicycle improvements located within three miles of a public transportation stop or station shall have a de facto physical and functional relationship to public transportation. According to a test of activity and use, pedestrian and bicycle improvements beyond these threshold distances may be eligible for FTA funding if the improvement is within the distance most people can be expected to safely and conveniently walk or bicycle to use that particular transit service. Federal Register: November 13, 2009 (Volume 74, Number 218), http://edocket.access.gpo.gov/2009/E9-27240.htm.

I-262-005 Fourth, the **Mystic Valley Parkway / Route 16 terminus should be designed and constructed at the same time as the rest of the project.**

I-262-006 Lastly, **construction of the Green Line extension should be coordinated with traffic calming of McGrath/O'Brien Highway.** In Somerville this would involve eliminating the Washington St. overpass to make the roadway a boulevard that would open up Union Square to East Somerville and facilitate economic development for the area. The overpass has been identified as needing reconstruction and funding has been identified in the Boston MPO RTP. The community does not want this burdensome transportation infrastructure monstrosity rebuilt and the time to address this is when the Green Line is being designed. In Cambridge traffic calming will be required along McGrath-O'Brien Highway to accommodate pedestrians going to the relocated Lechmere Station.

Specific concerns in the DEIR that should be addressed in addenda to the FEIR that are not discussed above include:

Station Design & Siting

I-262-007 • Green Line station designs should accommodate bus drop off and pick-up with **maximum integration of transit modes and minimal street disruption.** Bus routes in Somerville must be aligned to optimize connections to Green Line stations simultaneous to the start of Green Line service, as was done for the Red Line northwest extension.

I-262-008 • Station designs should locate **headhouses on major streets** whenever possible, with station access from both sides of the street and in all directions of travel. Design should allocate space for bus transfers and allow car drop off, but not parking

I-262-009 • Stations should provide **adequate bicycle storage** calculated on 3 to 5% of boardings at the stations. Bicycle storage should be sheltered from the elements.

I-262-010 • New station platforms should be constructed for ADA-compliant level boarding for new low-floor Green Line cars that have sliding rather than accordion doors currently used on Green Line cars.

I-262-005

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-262-006

DEIR/EA Section 3.9 describes the compatibility of the Green Line Extension with other regional projects, such as the conceptual reconstruction of McGrath Highway and the Urban Ring transit corridor initiative. MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses to ensure, to the extent feasible, consistency with planning and other projects.

I-262-007

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

I-262-011 • **Station and station area designs must be developed through a formal and interactive community participation process** to ensure that they fit into existing neighborhoods and support appropriate future mixed use development. Takings should be minimized to save the state money and to preserve land uses.

I-262-012 • Design for the relocated Lechmere Station should pay particular attention to the East Cambridge Planning Team's pedestrian-friendly area design ideas and old Lechmere Station re-use suggestions. The terminus at Route 16 should incorporate the Medford Green Line Neighborhood Alliance's design ideas that minimizing takings.

I-262-013 • Station design and siting should involve active participation of knowledgeable transportation accessibility advocates to **ensure accessibility requirements are adequately addressed.**

Community Path Integration & Preservation of Corridor Transit Potential

I-262-014 • **Track design and construction should enable adding future stations** – between Lechmere and Washington Street/Union Square, between College Avenue and Route 16, and along a future Green Line extension from Union Square to Porter Square that could serve both Cambridge and Somerville neighborhoods.

I-262-015 • **The Community Path and its important station connections must be designed and constructed simultaneously with the Green Line extension** in order to facilitate direct pedestrian and bicycle access to the stations and to ensure a safe, attractive, and highly-functional Community Path.

Economic Development & Regional Corridor Planning

I-262-016 • Making the project succeed regionally requires collaboration of Mass DOT and the MBTA, the Executive Office of Community and Economic Development and the Executive Office of Energy and Environmental Affairs with the cities of Somerville, Cambridge and Medford and its community representatives.

I-262-017 • Track, station and Green Line corridor area designs must provide full roadway and community access to Brickbottom Inner Belt and Lechmere Station through reconstruction of Route 28 as a neighborhood and local business friendly surface boulevard that serves pedestrians and bicyclists as well as cars. Improved connectivity between both sides of Route 28 is crucial for economic development, pedestrian station access, and improved quality of life.

I-262-018 • The design and siting of the maintenance facility should not prevent development of a street grid in Inner Belt/Brick Bottom that enables access from North Point, McGrath-O'Brian Highway and Washington St.

I-262-019 • State and other leading Transit-Oriented Development guidelines should be utilized to promote strategic regional economic development within a mixed use context in the Brickbottom Inner Belt and Union Square Boynton Yard districts.

I-262-008

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. These stations are designed to be consistent with MBTA standards and compliant with ADA. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-262-009

The amount of bicycle storage at each station is based on ridership projections developed by CTPS. DEIR/EA Appendix D includes the methods CTPS used to analyze demand for bicycle parking. Detailed bicycle parking designs will be further developed during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

I-262-010

The Green Line Extension Project is being designed for fully accessible stations in compliance with ADA requirements. However, the issue of systemwide level boarding on the Green Line and modifications to existing vehicles is beyond the scope of this Project.

I-262-011

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-262-012

MassDOT has reviewed the suggestions submitted by the East

I-262-020 Maintaining diversity in people and businesses while improving the natural environment is critical. Access to open space and greenery promotes health.

Maintenance Facility & Regional Environmental Justice

I-262-021 • As noted above, more detailed analysis of Mirror H, Option L and the Option L alternative is necessary. The siting of the maintenance facility and storage yards should not increase the transportation infrastructure and environmental burdens in Somerville or interfere with proposed economic development in the Brickbottom Inner Belt area.

I-262-022 • Current use of the Boston Engine Terminal for the maintenance of diesel engines serving the commuter rail network south of Boston needs to be phased out and a new facility built south of Boston to eliminate the unsustainable and unjustifiable shuttling of trains through Cambridge.

Public Participation

I-262-023 • A project-wide Citizens Advisory Group should be maintained throughout detailed design, engineering, construction and start-up phases with smaller local advisory groups established to work with the MBTA and consultants to address specific station design, land use, connectivity, and construction and mitigation issues.

I-262-024 • A procedure for determining remedies and/or compensation, incorporating community representation, should be required to handle instances when project mitigation proves insufficient to meet pre-agreed impact standards for noise, vibration, pollution and other environmental burdens.

• MEPA should require collaborative planning, with community involvement and public coordination that should intensify immediately, before this project progresses and require that senior project staff work out of a centrally located field office to maximize access.

I appreciate the opportunity to make these comments on this critically important project.

Sincerely,

Mary Regan

Cambridge Planning Team. Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. These plans, including the pedestrian crossings of O'Brien Highway and associated street, crosswalk, and sidewalk designs will be further refined in the preliminary engineering stage of the Project. MassDOT intends to demolish the existing station and prepare the site for future reuse. The Public Involvement Plan, Chapter 6 of the FEIR, proposes a structure for community involvement throughout the Project design process.

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. In the interim, MassDOT proposes a community planning process for the area of a future Mystic Valley Parkway/Route 16 station to cover issues relating to station design and layout, neighborhood impacts, attendant economic development, and other area planning issues.

I-262-013

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. Designs for each station will be further developed during the Project's preliminary engineering stage. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. Specific design details and station elements will be further developed during preliminary engineering. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access. The process for stakeholder coordination during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-262-014
As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

I-262-015
MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-262-016
MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses. This will help ensure compliance with legal requirements and, to the extent feasible, consistency with planning and other projects.

I-262-017
DEIR/EA Section 3.9 describes the compatibility of the Green Line Extension with other regional projects, such as the conceptual reconstruction of McGrath Highway and the Urban Ring transit corridor initiative. MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses to ensure, to the extent feasible, consistency with planning and other projects.

I-262-018
An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter

2, Maintenance Facility Alternatives Analysis. The evaluation considers land use and connectivity impacts and opportunities associated with each maintenance facility site alternative.

I-262-019

Direct and indirect impacts to land use are described in DEIR/EA Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for sustainable land use, which could further reduce automobile traffic congestion and improve air quality.

I-262-020

Anticipated indirect and cumulative effects the Project, including economic development, natural systems, and open space impacts, are described in DEIR/EA Section 5.15, Indirect and Cumulative Effects. As stated in FEIR Section 6.4.4, MassDOT and the MBTA will conduct a series of public workshops to gather input on land use and facility design issues from the communities. These workshop offer an opportunity to discuss how facility design can influence indirect and cumulative effects. The Project broadens access to open spaces in the corridor.

I-262-021

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility

alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-262-022
The Boston Engine Terminal (BET) and its operations are beyond the scope of the Green Line Extension Project.

I-262-023
In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-262-024
MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

Johnson, Holly (EEA)

From: Arnold G. Reinhold [reinhold@world.std.com]

To: Holly.S.; Johnson@state.ma.us
Subject: Comments on the Green Line extension DEIR/EA

I would like to comment on the Draft Environmental Impact Report/Environmental Assessment for the Green Line extension to Somerville. I believe this is an important project that should go forward. However I have some areas of concern.

I-263-001

1. Lack of automobile parking.
One lesson of the MBTA's expansion since the 1980s has been the value of anchoring new lines with parking facilities. I realize that the Route 16 station is being deferred until phase II, but I deplore the elimination of parking from the plans for this station. Without some parking, the line mainly benefits people in walking distance of the stations. Parking at Route 16 would draw more riders from Medford and relieve overflow demand at the nearby Alewife Garage. While Route
16 is crowded at rush hour, drivers who would travel on it to park at the Route 16 T station would not add to the traffic burden on roads closer to Boston. Thus the limited capacity of Route 16 is better employed moving cars to a Green Line terminus parking facility. Also note that having a family member drop a passenger off at the station requires twice as much car travel as if the passenger parks at the station. Commercial parking facilities near some of the stations located in industrial areas should also be encouraged.

I-263-002

2. Lack of assured funding for the Somerville Community Path.
I believe the Somerville Community Path should be built in parallel with the Green Line extension. By facilitating bike commuters, the path would substantially increase the area that the new Green Line serves and redress some of the concerns I expressed above about the lack of parking along the line. The Community Path is relatively inexpensive compared to the overall project and would significantly improve its use.

I-263-003

3. Bus connections.
At some proposed stations, local bus stops are located several hundred feet from the station. I think every station that has local bus service should be provided a stop as close as possible to the station. Local bus connections extend the area served by the new Green Line and they should be facilitated. Bus shelters should also be provided for Green Line passengers who are transferring to a bus.
A few exposed waits for a bus home on a cold, dark and wet winter day will send many passengers back to their cars.

I-263-004

4. Poor pedestrian connections at Route 16.
The natural location of the Route 16 station requires circuitous pedestrian routes into Medford, either via Boston Ave or Auburn St.
People who live quite close to the station will have to walk 5-8 blocks to get there. Consideration should be given in Phase II to a pedestrian bridge over Alewife Brook and short pedestrian/bike path along the MBTA right of way to Canal Street or even to Route 60. Pedestrian access should also facilitated for the VNA Senior Housing complex at Capen Ct, preferably not along Alewife Brook Parkway, but using a more senior-friendly "inland" route via Capen and Stoughton Streets.

I-263-005

5. Lack of bike parking quantification.
The DEIR/EA description for each station says bicycle parking will be provided. But I did not find any statement about how many bike parking spots will be provided. Such numbers are essential for the public to determine whether sufficient bike parking will be available. I

I-263-001

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-263-002

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-263-003

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

I-263-005

would also like to see provision for expansion of bike parking at each station if demand justifies it.

Again I do support this project overall.

Respectfully submitted,

Arnold Reinhold
14 Fresh Pond Place
Cambridge, MA 02138

Boston, MA 02114

RE: **EEA #13886**

Dear Secretary Bowles:

I-264-001 I am very appreciative of the efforts of Mass DOT to move the project forward with the release of the Draft EIR and am writing you to recommend approval of the DEIR as a Final EIR under the condition that a number of critical issues are addressed in the next phase of the project.

To meet the SIP commitment of completing the project by December 31, 2014 design and construction must proceed expeditiously, but thoughtfully so that the extensions are done well. This can be accomplished by ensuring that critical factors discussed below are addressed through either **I-264-002** requiring a supplemental EIR or addressing these issues through addendums to the FEIR. This must be done efficiently with the collaboration of the communities and citizens.

I-264-003 First, I strongly urge you to eliminate the Yard 8 Option for the Maintenance Facility and to require Mass DOT to carry out a full analysis of the Option L alternatives and Option H for siting the Maintenance Facility.

Yard 8 is opposed by the cities of Somerville and Cambridge and community residents. It would impose an onerous transportation infrastructure burden on the city that would negatively impact quality of life and preclude economic development of Brick Bottom/Inner Belt. The Secretary's Certificate to conduct the DEIR specifically warned against increasing such burdens on Somerville and its residents.

I-264-004 Second, it is critically important that in approving the FEIR there is a requirement to establish a REALLY collaborative public participation process with the cities of Somerville, Cambridge and Medford and community representatives for the next phases of the Green Line extensions to ensure that design and construction decisions maximize current and future use. To make this collaboration most effective we strongly urge the establishment of a staffed field office in Somerville.

1

I-264-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

I-264-002

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-264-003

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-264-004

Please see response to Comment I-264-002.

I-264-005

Third, the Community Path must be fully integrated into the design, planning, and construction of the Green Line extension. The Path exemplifies the Federal Transit Administration's new policy on bicycle/pedestrian access to public transportation recognizing the importance of maximizing multi-modal access. The proposed policy states:

> For purposes of determining whether a pedestrian or bicycle improvement has a physical or functional relationship to public transportation, regardless of whether it is funded as a capital project or public transportation enhancement, all pedestrian improvements located within one-half mile and all bicycle improvements located within three miles of a public transportation stop or station shall have a de facto physical and functional relationship to public transportation. According to a test of activity and use, pedestrian and bicycle improvements beyond these threshold distances may be eligible for FTA funding if the improvement is within the distance most people can be expected to safely and conveniently walk or bicycle to use that particular transit service. Federal Register: November 13, 2009 (Volume 74, Number 218), http://edocket.access.gpo.gov/2009/E9-27240.htm.

I-264-006

Fourth, the Mystic Valley Parkway / Route 16 terminus should be designed and constructed at the same time as the rest of the project.

I-264-007

Lastly, construction of the Green Line extension should be coordinated with traffic calming of McGrath/O'Brien Highway. In Somerville this would involve eliminating the Washington St. overpass to make the roadway a boulevard that would open up Union Square to East Somerville and facilitate economic development for the area. The overpass has been identified as needing reconstruction and funding has been identified in the Boston MPO RTP. The community does not want this burdensome transportation infrastructure monstrosity rebuilt and the time to address this is when the Green Line is being designed. In Cambridge traffic calming will be required along McGrath-O'Brien Highway to accommodate pedestrians going to the relocated Lechmere Station.

Specific concerns in the DEIR that should be addressed in addenda to the FEIR that are not discussed above include:

Station Design & Siting

I-264-008

- Green Line station designs should accommodate bus drop off and pick-up with maximum integration of transit modes and minimal street disruption. Bus routes in Somerville must be aligned to optimize connections to Green Line stations simultaneous to the start of Green Line service, as was done for the Red Line northwest extension.

I-264-009

- Station designs should locate headhouses on major streets whenever possible, with station access from both sides of the street and in all directions of travel. Design should allocate space for bus transfers and allow car drop off, but not parking

I-264-010

- Stations should provide adequate bicycle storage calculated on 3 to 5% of boardings at the stations. Bicycle storage should be sheltered from the elements.

I-264-011

- Consideration should be given to design new Green Line stations with elevators but not escalators, which are expensive to install and maintain. Wide staircases and redundant ADA elevator access would more reliably meet accessibility needs.

I-264-012

- New station platforms should be constructed for ADA-compliant level boarding for new low-floor Green Line cars that have sliding rather than accordion doors currently used on Green Line cars.

2

I-264-005

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-264-006

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-264-007

DEIR/EA Section 3.9 describes the compatibility of the Green Line Extension with other regional projects, such as the conceptual reconstruction of McGrath Highway and the Urban Ring transit corridor initiative. MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses to ensure, to the extent feasible, consistency with planning and other projects.

I-264-008

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and

I-264-013 • Station and station area designs must be developed through a formal and interactive community participation process to ensure that they fit into existing neighborhoods and support appropriate future mixed use development. Takings should be minimized to save the state money and to preserve land uses.

I-264-014 • Design for the relocated Lechmere Station should pay particular attention to the East Cambridge Planning Team's pedestrian-friendly area design ideas and old Lechmere Station re-
I-264-015 use suggestions. The terminus at Route 16 should incorporate the Medford Green Line Neighborhood Alliance's design ideas that minimizing takings.

I-264-016 • Station design and siting should involve active participation of knowledgeable transportation accessibility advocates to ensure accessibility requirements are adequately addressed.

Community Path Integration & Preservation of Corridor Transit Potential

I-264-017 • Track design and construction should enable adding future stations – between Lechmere and Washington Street/Union Square, between College Avenue and Route 16, and along a future Green Line extension from Union Square to Porter Square that could serve both Cambridge and Somerville neighborhoods.

I-264-018 • The Community Path and its important station connections must be designed and constructed simultaneously with the Green Line extension in order to facilitate direct pedestrian and bicycle access to the stations and to ensure a safe, attractive, and highly-functional Community Path.

Economic Development & Regional Corridor Planning

I-264-019 • Making the project succeed regionally requires collaboration of Mass DOT and the MBTA, the Executive Office of Community and Economic Development and the Executive Office of Energy and Environmental Affairs with the cities of Somerville, Cambridge and Medford and its community representatives.

I-264-020 • Track, station and Green Line corridor area designs must provide full roadway and community access to Brickbottom Inner Belt and Lechmere Station through reconstruction of Route 28 as a neighborhood and local business friendly surface boulevard that serves pedestrians and bicyclists as well as cars. Improved connectivity between both sides of Route 28 is crucial for economic development, pedestrian station access, and improved quality of life.

I-264-021 • The design and siting of the maintenance facility should not prevent development of a street grid in Inner Belt/Brick Bottom that enables access from North Point, McGrath-O'Brian Highway and Washington St.

I-264-022 • State and other leading Transit-Oriented Development guidelines should be utilized to promote strategic regional economic development within a mixed use context in the Brickbottom Inner Belt and Union Square Boynton Yard districts. Maintaining diversity in people and businesses while improving the natural environment is critical. Access to open space and greenery promotes health.

Maintenance Facility & Regional Environmental Justice

I-264-023 • As noted above, more detailed analysis of Mirror H, Option L and the Option L alternative is necessary. The siting of the maintenance facility and storage yards should not increase the

3

Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

I-264-009

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-264-010

The amount of bicycle storage at each station is based on ridership projections developed by CTPS. DEIR/EA Appendix D includes the methods CTPS used to analyze demand for bicycle parking. Detailed

I-264-023

transportation infrastructure and environmental burdens in Somerville or interfere with proposed economic development in the Brickbottom Inner Belt area.

I-264-024

- Current use of the Boston Engine Terminal for the maintenance of diesel engines serving the commuter rail network south of Boston needs to be phased out and a new facility built south of Boston to eliminate the unsustainable and unjustifiable shuttling of trains through Cambridge.

Public Participation

I-264-025

- A project-wide Citizens Advisory Group should be maintained throughout detailed design, engineering, construction and start-up phases with smaller local advisory groups established to work with the MBTA and consultants to address specific station design, land use, connectivity, and construction and mitigation issues.

I-264-026

- A procedure for determining remedies and/or compensation, incorporating community representation, should be required to handle instances when project mitigation proves insufficient to meet pre-agreed impact standards for noise, vibration, pollution and other environmental burdens.

I-264-027

- MEPA should require collaborative planning, with community involvement and public coordination that should intensify immediately, before this project progresses and require that senior project staff work out of a centrally located field office to maximize access.

I appreciate the opportunity to make these comments on this critically important project.

Sincerely,

Ellin Reisner

Ellin Reisner, Ph.D.
reisnere51@gmail.com

4

bicycle parking designs will be further developed during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

I-264-011

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. These stations are designed to be consistent with MBTA standards and compliant with ADA. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-264-012

The Green Line Extension Project is being designed for fully accessible stations in compliance with ADA requirements. However, the issue of systemwide level boarding on the Green Line and modifications to existing vehicles is beyond the scope of this Project.

I-264-013

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project. As stated in Section 6.4, MassDOT and the MBTA will convene a Green Line Extension Design Working Group. This group will advise the agencies on design workshops, participate in the workshops and serve as a corridor advisory group during design.

I-264-014

MassDOT has reviewed the suggestions submitted by the East

Cambridge Planning Team. Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. These plans, including the pedestrian crossings of O'Brien Highway and associated street, crosswalk, and sidewalk designs will be further refined in the preliminary engineering stage of the Project. As part of the Green Line Extension, MassDOT intends to demolish the existing Lechmere Station and prepare the site for potential future redevelopment. Based on the current requirements of the O'Brien Highway roadway improvements (as shown in FEIR Chapter 5, Lechmere Station), the existing bus shed must be removed.

I-264-015

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-264-016

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. Designs for each station will be further developed during the Project’s preliminary engineering stage. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. Specific design details and station elements will be further developed during preliminary engineering. In general, current station concepts include two elevators, escalators, and

stairs, and meet the MBTA's requirements for access. The process for stakeholder coordination during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-264-017

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

I-264-018

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-264-019

MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses. This will help ensure compliance with legal requirements and, to the extent feasible, consistency with planning and other projects.

I-264-020

DEIR/EA Section 3.9 describes the compatibility of the Green Line Extension with other regional projects, such as the conceptual reconstruction of McGrath Highway and the Urban Ring transit corridor initiative. MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses to ensure, to the extent feasible, consistency with planning and other projects.

I-264-021

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. The evaluation considers land use and connectivity impacts and opportunities associated with each maintenance facility site alternative.

I-264-022

Direct and indirect impacts to land use are described in DEIR/EA Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for sustainable land use, which could further reduce automobile traffic congestion and improve air quality.

I-264-023

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's

preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-264-024

The Boston Engine Terminal (BET) and its operations are beyond the scope of the Green Line Extension Project.

I-264-025

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project. As stated in Section 6.4, MassDOT and the MBTA will convene a Green Line Extension Design Working Group. This group will advise the agencies on design workshops, participate in the workshops and serve as a corridor advisory group during design.

I-264-026

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

I-264-027

Please see response to Comment I-264-025.

Johnson, Holly (EEA)

To: Johnson, Holly S (ENV)
Subject: Green Line extension

I-265-001

To Whom It May Concern:
It is essential that the Green Line extension be guaranteed to Route 16 in Medford. This greatly increases those who have access to the line. I could leave my car at home and walk a 1/2 mile to the train. At the moment, there is no reliable, convenient access. Ideally a heated station would transform transportation here. If it made any sense we would hope for a station that connected to the West Medford station, but that intersection is already stressed and dangerous. Short of a solution to that, we require that a Rt. 16 station be guaranteed. Please find a way to do this.

There is a train that rarely runs and is expensive. There is a bus that is unreliable and requires one to wait outside with no shelter for long periods of time. I have lived in Porter Square and by far, of all the methods of transportation there, the T is the most efficient, reliable and constant transportation. Even if it was an outside station, it would be a much shorter wait and the connections are so much easier and underground.

If you want to people to use public transportation and minimize pollution it has to meet some basic needs noted above and be easily accessible.

Jill Richard
291 High Street, Medford, MA 02155

I-265-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

Johnson, Holly (EEA)

To: Johnson, Holly S (ENV)
Subject: MBTA green line extension

Dear Ms. Johnson,

I am writing to offer my qualified support of the proposed green line extension. I think this is a very important project, and an important step toward reducing car use and pollution in these densely populated sections of Somerville and Medford.

But I would like to underline the qualifications. I believe that the plan must:

I-266-001 -extend until route 16. This would permit access from the Medford Hillside neighborhood, as required, and greatly increase access to the residential communities in the area, not just Tufts University (which surrounds most of the area near the College Ave. stop).

I-266-002 -minimize the taking of residential land

I-266-003 In addition, I think that the Ball Street station should have a north side access. South Medford is Medford's most densely populated area. Providing an access on the side across from Boston Ave., on one of the side streets to Winchester Street, would greatly facilitate access to South Medford residents. With access only on the south side (Broadway and Boston Ave.) this is helpful to the many Somerville residents and businesses, but not to the MANY people of South Medford. Even a footbridge across the tracks, or a tunnel like that at Lechmere, would make a big difference by these busy streets.

Thank you,

Dr. Rachel Rockenmacher
41 Marion Street
Medford, MA 02155

Subject: Green Line Extension in Somerville

Dear Ms. Johnson,

I-267-001

I am writing to express my strong support for the Green Line extension in Somerville. As a Somerville resident and parent, and as an environmental scientist, I am in support of this project on many levels. As one of the most dense residential areas in New England, Somerville is an ideal location for effective public transportation. Yet, we are currently woefully under-served in this area. As the need to curtail Massachusetts' greenhouse gas emissions becomes more urgent, we need to improve public transit options, especially in places like Somerville where public transit is efficient and in high demand. I would happily support moves to reduce our subsidies of automobile transport, as well as increased gas taxes, in order to move forward with the public transit projects that we need now and that will create a healthier environment for our children.

Sincerely,

Juliette Rooney-Varga

Subject: Green Line extension

Dear Ms. Johnson,

I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

I-268-001 As a resident of West Medford living within walking or biking distance of Rt. 16 and Boston Ave, I strongly support the Green Line extension going all the way to this juncture. It would allow me to get out of my car and take the T much more often.

I-268-002 In my opinion, the DEIR as currently written does not serve the best interests of the project. More importantly for your review, it was not done in a way that "adequately and properly" complies with the state environmental regulations, not with the December 1, 2006 MEPA certificate that defined the requirements of the DEIR.

I strongly urge you to not accept the DEIR as the Final EIR and require further environmental analysis of the project by MassDOT.

Sincerely,

Lynn Rosenbaum
30 Pitcher Ave
Medford, MA 02155

I-268-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. Subject: comments about the Greenline extension

I-269-001
I-269-002

Thank you for taking our comments. No program is going to be perfect. We need this extension and we need to get it done by the deadline for the funding. Your department needs to make sure that there is at least the basic extension completed through the College Ave., Medford stop. Please do not let this project not happen. Somerville is only 4 square miles. I don't understand why the MBTA cannot locate an alternative site for their garage/repair lot in a community that has more land to spare.

Happy New Year.

To: Johnson, Holly S (ENV)
Subject: Comment EEA #13886

I-270-001 I-270-002

Hello. I am a resident of Somerville who commutes via an MBTA bus route to my workplace near Lechmere Station. I would like to comment in particular about pedestrian access to the relocated Lechmere Station. I looked through the East Cambridge Planning Team's pedestrian-friendly area design ideas and was impressed with their thoroughness, but I wanted to note that many people making the crossing to get to the station from the Galleria Mall or the Courts and Registry are elderly or mobility impaired. It would be very important to make more generous estimates than those given in the design suggestions about the time needed to make a crossing as wide as Monsignor O'Brien Highway particularly during the many months of challenging weather conditions. I support the suggestion of having bus route loops that minimize the need for crossing the highway by having both inbound and outbound connections on the Cambridge Street side of the highway, specifically the suggestion that the routes will all end by turning left on First Street from Cambridge Street and then crossing the O'Brien Highway into the bus terminal before traveling west through the terminal, exiting by way of Water Street and then turning right onto O'Brien Highway.

-Carolyn Ross
7 Dartmouth Street
Somerville

1

I-270-001

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. The chapter presents a traffic analysis, a detailed description of pedestrian crossings of O'Brien Highway, and proposed roadway, crosswalk, and sidewalk improvements that are consistent with the NorthPoint development plans. These station and street plans will be further refined in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-270-002

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

January 5, 2010 Fax to 617-626-1181 P.1 of 2

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

RECEIVED
JAN 8 2010
MEPA

Dear Secretary Bowles:

I-271-001 I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

First of all, I strongly support the Green Line extension, and urge that it be built in the most practical, beneficial, and cost-effective manner—that is, to construct the entire project in one phase, with a terminus station at Mystic Valley Parkway (Route 16), by December 31, 2014.

The DEIR is encouraging in that it concludes that the Route 16 station would provide the most benefits according to all project criteria, including air quality and environmental justice. However, MassDOT states that it is incapable of building (and funding) the entire "Preferred Alternative," so it only intends to build the extension to College Avenue in the Tufts University area of Medford, by its deadline of December 31, 2014.

In my opinion, the DEIR as currently written does not serve the best interests of the project. More important for your review, the DEIR was not done in a way that "adequately and properly" complies with the state environmental regulations, nor with the December 1, 2006 MEPA certificate that defined the requirements of the DEIR.

For the following reasons, I strongly urge you to not accept the DEIR as the Final EIR and to require further environmental analysis of the project by MassDOT:

1. A two-phased approach is unacceptable. The Route 16/Mystic Valley Parkway Station should be built as part of a single-phase project to minimize costs and negative impacts and achieve the maximum benefits with regard to ridership, vehicle mile travel reduction, air quality improvements, and service to environmental justice communities.

The recommendation as outlined in the DEIR is for the Route 16/Mystic Valley Parkway station to be a **separate** stand-alone Phase II project with no funding source identified. **This provision means that the Route 16 segment and station may never be built.**

There are many, many problems with the two-phase approach, including:

- **Risk.** Without an identified funding source there is a very high probability that the Route 16 segment and station will never be built and the implications of this are critical.
- **Terminus Impact.** Without a Route 16 Station, the College Avenue stop (designed and intended to be an interim station) would become the de facto terminus for the Green Line extension. It is not designed to be a terminus and due to the traffic flow and neighborhood density, as well as the lack of opportunity for transit-oriented development at College Ave., it is not a good location for a terminus.
- **Cost.** The two-phased approach is fiscally irresponsible and by MassDOT's own

I-271-001

Please see Comment Letter I-002.

estimates will inflate the cost by $55 million over a single-phase approach. Severing a single stop (less than one mile of track) from the project as a whole will cost the state, and thus the taxpayers, significant additional money. There are obvious ways to easily reduce costs in the overall project and provide enough additional funds to include Route 16 as part of a single, complete project. This is the most prudent approach, and also would ensure that the project produces the air quality improvements the Commonwealth must achieve to come into compliance with the Clean Air Act.

- **Project Management.** There are significant efficiencies to be gained from completing the project in one phase, rather than the starts and stops required to execute on separate, multi-stage efforts for such a small add-on project as a single station stop.
- **Environmental Justice.** The environmental justice population cited, in part, to justify the project as a whole will largely not be served if the project terminates at College Avenue. The negative aspects of this project will affect them most, while they will receive the least benefit without service to a Route 16 terminus.
- **Legal Mandate.** The state is legally obligated to provide public transit services to Medford Hillside by December 31, 2014, and stopping the extension at College Ave. fails to meet this legal obligation. At a minimum, this incurs significant mitigation costs required if the obligation is not met.

2. **College Avenue should not be a terminus.** The College Avenue station is not designed for the additional requirements of a terminus. The neighborhood cannot sustain the impact of a terminus station's operations and traffic volume; and the potential environmental damage ts of serious concern.
3. **The Route 16 station design is inadequate.** The DEIR offers only a "worst case scenario" (MassDOT's description) for the Route 16 station design, while offering optimized station designs for all other Green Line extension stations. The Route 16 station design must be revisited. The Medford Green Line Neighborhood Alliance, a volunteer citizen group, has offered an alternative station design that prevents two major commercial property acquisitions and the resulting job displacement, preserves $182,000/year in property taxes for the City of Medford, optimizes traffic flow and better serves the integrity of the station's surroundings. MassDOT apparently has been exploring similar improved designs, which should be presented to the public for comment. A $1 billion project deserves a higher caliber design than a "worst case scenario."

In summary, there is much more work to be done on the Environmental Impact report, and I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis in order to make the Green Line extension the best project it can be, and MUST be. I will very much appreciate your constructive attention to these important needs.

Sincerely yours,

Sallyann Roth

January 8, 2010

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA #03886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles:

We have been owners at the Glass Factory Condominiums since 2005 (unit 602). We were excited to buy a property in the heart of an up and coming neighborhood. The original plans included a large park behind our building among new commercial and residential buildings. As residents of the Glass Factory through summer 2008, we followed the evolution of those plans during regular board meetings for residents. We are shocked to learn about the poor status of the Green Line Extension Project, especially as we begin to think about the resale value of our unit.

I-272-001 Our unit faces north toward the proposed station and rail line extension. The station in its current design is too close to our building (right behind our outdoor parking) and will block light and obstruct views. The station's proximity means our tenants will have to endure an exorbitant amount of noise and vibration from the passing trains, buses, cars (of commuters parking in the huge lot there), and general noise and pollution from the hustle/bustle of riders. We feel strongly that the station should be moved toward East Street away from our building.

I-272-002 We are also concerned about ceding the limited green space and trees we currently have behind our building.

I-272-003 Overall, as compared with the previous design, this one seems of much poorer quality in terms of aesthetics and function. Nobody wants to buy a condo next door to an eyesore and traffic nightmare.

We look forward to working with our building action committee to help steer this project in a better direction for the sake of the entire neighborhood.

:erely,

I-272-001

FEIR Chapter 5 describes the revised conceptual plans for Lechmere Station, including station design, track alignment, bus routings, and other elements. Changes to the track alignment depicted in the DEIR/EA were evaluated, but could result in additional impacts on area abutters. Proposed mitigation measures for area abutters are also described in FEIR Chapter 5. During preliminary engineering, specific station design elements will be further developed.

I-272-002

The revised conceptual plan for Lechmere Station, as shown in FEIR Chapter 5, is entirely on MBTA property. This conceptual design does not require any Glass Factory property or the removal of trees and landscaping from Glass Factory property. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, outlines how MassDOT will involve residents in developing landscape design.

I-272-003

Please see response to Comment I-272-001.

Boston, MA 02114

Dear Secretary Bowles:

I-273-001 I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

First of all, I strongly support the Green Line extension, and urge that it be built in the most practical, beneficial and cost-effective manner – that is, to construct the entire project in one phase, with a terminus station at Mystic Valley Parkway (Route 16), by December 31, 2014.

The DEIR is encouraging in that it concludes that the Route 16 station would provide the most benefits according to all project criteria, including air quality and environmental justice. However, MassDOT states that it is incapable of building (and funding) the entire "Preferred Alternative," so it only intends to build the extension to College Avenue in the Tufts University area of Medford, by its deadline of December 31, 2014.

In my opinion, the DEIR as currently written does not serve the best interests of the project. More importantly for your review, it was not done in a way that "adequately and properly" complies with the state environmental regulations, nor with the December 1, 2006 MEPA certificate that defined the requirements of the DEIR.

For the following reasons, I strongly urge you to not accept the DEIR as the Final EIR and require further environmental analysis of the project by MassDOT:

1. A two-phased approach is unacceptable. The Route 16/Mystic Valley Parkway Station should be built as part of a single-phase project to minimize costs and negative impacts and achieve the maximum benefits with regard to ridership, vehicle mile travel reduction, air quality improvements, and service to environmental justice communities.

The recommendation as outlined in the DEIR is for the Route 16/Mystic Valley Parkway station to be a **separate** stand-alone Phase II project with no funding source identified. **This means, Route 16 may never be built.**

There are many, many problems with the Phase II approach, including:

- **Risk.** Without an identified funding source there is a very high probability that Route 16 will never be built and the implications of this are critical.
- **Terminus Impact.** Without a Route 16 Station, the College Avenue stop (designed and intended to be an **interim station**) would become the de facto terminus for the Green Line extension. It is not designed for a terminus and due to the traffic flow and neighborhood density, as well as the lack of opportunity for transit-oriented development at College Ave., it is not a good location for a terminus.
- **Cost.** The two-phased approach is fiscally irresponsible and by MassDOT's own

I-273-001

Please see Comment Letter I-002.

estimates will inflate the cost by $55 million over a single-phase approach. Severing a single stop (less than one mile of track) from the project as a whole will cost the state, and thus the taxpayers, significant additional money. There are obvious ways to easily reduce costs in the overall project and provide enough additional funds to include Route 16 as part of a single, complete project. This is the most prudent approach, and also would ensure that the project produces the air quality improvements the Commonwealth must achieve to come into compliance with the Clean Air Act.

- **Project Management.** There are significant efficiencies gained from completing the project in one phase, rather than the starts and stops required to execute on separate, multi-stage efforts for such a small add-on project as a single station stop.
- **Environmental Justice:** The environmental justice population cited, in part, to justify the project as a whole will largely not be served if the project terminates at College Avenue. The negative aspects of this project will affect them most, while they will receive the least benefit without service to a Route 16 terminus.
- **Legal Mandate:** The state is legally obligated to provide public transit services to Medford Hillside by December 31, 2014, and stopping the extension at College Ave. fails to meet this legal obligation. At a minimum, this incurs significant mitigation costs required if the obligation is not met.

2. College Avenue should not be a terminus. The College Avenue station is not designed for the additional requirements of a terminus. The neighborhood cannot sustain the impact of a terminus station operations and traffic volume and the potential environmental damage is of serious concern.

3. The Route 16 station design is inadequate. The DEIR offers only a "worst case scenario" (MassDOT's description) for the Route 16 station design, while offering optimized station designs for all other Green Line extension stations. The Route 16 station design must be revisited. The Medford Green Line Neighborhood Alliance, a volunteer citizen group, has offered an alternative station design that prevents two major commercial property acquisitions and the resulting job displacement, preserves $182,000/year in property taxes for the City of Medford, optimizes traffic flow and better serves the integrity of the station's surroundings. MassDOT apparently has been exploring similar improved designs, which should be presented to the public for comment. A $1 billion project deserves a higher caliber design than a "worst case scenario."

To summarize, there is much more work to be done on the Environmental Impact report, and I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis in order to make the Green Line extension the best project it can be, and MUST be.

Thank you.

100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I am writing to comment on the Draft Environmental Impact Report for the Green Line Extension project to Medford, EEA #13886.

I am very strongly in support of the Greenline extension because I believe it will provide enormous transportation benefit to West Medford where I am a resident. I was however troubled to learn that the Draft Environmental Impact Report recommends not continuing the extension past College Avenue at Tufts University area and relegating the continuation of the Green Line to Route 16 to a later project phase.

I-274-001 The reason for delaying construction of a terminus station at Route 16 is apparently cost. It seems to me that it is much more efficient and therefore cost efficient to include it in a single phase of construction. I also firmly believe that there are design possibilities for a Route 16 station that would mitigate costs and minimize the impact on nearby businesses and residences. I support the analysis produced by the Medford Green Line Neighborhood Alliance and would strongly support either their alternative design for the Route 16 station or a comparable alternative that accomplishes the same results.

I-274-002

The draft report makes clear that a Route 16 terminus (described as the "preferred full-build alternative") provides the maximum benefits in terms of ridership, reduced vehicle miles in the area served, and the environmental impact and economic benefit to businesses in the area. I agree, and feel strongly that further analysis should be undertaken to realize this alternative.

I-274-003 Therefore, please DO NOT accept the Draft Environmental Impact Report in its current form. The Massachusetts Department of Transportation should be instructed to undertake further environmental analysis in order to optimize the Green Line extension project that I believe must include a terminus at Route 16 in Medford.

Thank you for your consideration.

Roy Rudolph

78 Chandler Road
Medford, MA 02155

I-274-001

Project cost estimates are based on the current, conceptual level of design, and will be further refined as the Project progresses through preliminary engineering. It is anticipated that Green Line Extension construction would be financed with a combination of funds from federal and state sources. Efforts to engage a developer for the North Point development will continue as this Project moves into the next phases of design.

I-274-002

All stations for the Green Line Extension project were designed to comply with the MBTA's design standards. The station descriptions in the DEIR/EA identify the full extent of potential impacts of the Project on the surrounding area, in compliance with MEPA review requirements. Although a redesigned Mystic Valley Parkway / Route 16 station may achieve some reductions in property takings, there is still much evaluation of design, operations, and environmental impacts that would be required. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-274-003

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

Ian A. Bowles, Secretary
Executive Office of Energy and Environmental Affairs
MEPA Office

December 28, 2009

Dear Secretary Bowles,

My name is Laurel Ruma and I am an immediate abutter to the planned College Avenue/Tufts University station on the proposed Green Line Extension (GLE). From my living room window at the end of Burget Avenue, I can see, feel, and hear the commuter, Amtrak, and freight trains (herein referred to as the industrial trains) pass by 40 feet away. I shut my blinds to avoid the light pollution from the Tufts parking garage through the trees, hear the pedestrians voices carry as they walk down Boston Avenue, and can tell what time it is with the passing of the early morning commuter trains. We lived in Medford as renters for five years and then had the opportunity to buy our modest home here three years ago. The GLE was a factor in our purchase--we are excited to live in a neighborhood with public transportation, and direct access to Boston will be a jewel in Medford's crown. We are not from here, but we chose to live here, we are committed to Medford. We have fantastic neighbors, a pretty good relationship with Tufts, and we support the Green Line Extension to Route 16/Mystic Valley Parkway (herein referred to as Rt. 16) and wholesale reject a College Avenue/Tufts University terminus ("temporary" or not).

I-275-001

I have been learning about the project and attending the GLE Advisory and public meetings for almost two years. It's no small feat to leave work early to get to a 4pm meeting, or even a 6pm meeting, but we do it because it's important—because we are investing in a better Medford, a better transit system, and a better Massachusetts. I understand that the project is what it is—there is no tunnel, no elevated-monorail, and no way around reconstructing all those bridges. MassDOT (well, here I mean Kate Fichter) has been responsive to our requests for more information and to attend neighborhood meetings. I've organized two Burget Avenue neighborhood meetings for Tufts and abutters on Burget, Charnwood, Hume, and Brookings streets, as well as our neighbors in South Medford. This has meant leafleting every house twice and stapling signs to telephone poles—it is not easy to get in touch with people, but again, I do it because this is important. As MassDOT has said: this is a 100-year project and I am determined to help make it the best project possible, which means a transparent and open planning, procurement, construction, and documentation process. We're not quite there yet.

I-275-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

See, I'm a reasonable person. I want MassDOT to be fair to me, my neighbors, and the citizens who will benefit from the construction of the GLE to Rt. 16. Therefore, it is my position that MassDOT must construct the Preferred, Full-Build Alternative for the Green Line extension to Medford with a terminus station at Route 16/Mystic Valley Parkway in one phase by December 31, 2014, in order to achieve the maximum environmental benefits of the project and to fulfill the requirement to serve the Hillside. For these reasons, the Draft Environmental Impact Report (DEIR) should not be accepted as the Final Environmental Impact Report (FEIR), because the DEIR fails to fulfill the requirements of the December 1, 2006 MEPA Certificate that determined the scope of the project.

I-275-002

The MEPA Certificate requires the GLE to go to the Medford Hillside. And according to the people that live here in Medford, hundreds of years of maps, and really everyone except MassDOT, Medford Hillside is defined as Winthrop Street/Boston Avenue to Rt. 16/Boston Avenue. Tufts University and the intersection of Boston and College Aves (remember, that's where I live) does not constitute the Medford Hillside. The only build alternative that includes the Medford Hillside is the full-build option to Rt. 16.

Now, let's take a look at the proposed station stops for all of Medford:

- The Ball Square station will be on the border of Somerville and Medford. It's a lovely square with lots of businesses, so there's enormous economic possibility as well as many neighborhoods that will easily access the station. The station at Ball Square will serve Somerville.

- The College Avenue/Tufts University station will be at the base of Tufts University. The surrounding land to the station stop is all owned by Tufts University (there's a map of this in the DEIR, forgive me for not pointing it out, but that document is an unholy mess). There are no economic opportunities here, except for and by Tufts University. The Burget Avenue neighborhood is the only neighborhood that directly abuts Tufts. The Tufts students and adjoining neighborhoods will access this station by foot and bike. However, the only direct access my neighborhood has to College/Boston Avenues is to cut across Tufts property (a busy parking lot). There is no guarantee that Tufts will keep this "bunny path" open to random citizens considering the liability. The College Avenue/Tufts University station will serve Tufts.

- The Rt. 16/Mystic Valley Parkway station will be in a commercial area at the junction of Rt. 16 and Boston Avenue. This area is a unique confluence of Arlington, Medford, and Somerville. The environmental justice populations in this area are many and the possibilities to take cars off the road are the greatest here. With a viable Rt. 16 plan, one can easily imagine a fantastic urban center where people shop and access by bike or foot. The Rt. 16/Mystic Valley Parkway station will truly serve Medford and the Medford Hillside as directed by the MEPA certificate.

I-275-002

As directed by the Secretary's Certificate on the DEIR/EA, the FEIR includes a limited scope of issues related to the Green Line Extension Project. The Proposed Project, with a Medford Branch terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Although an extension to Mystic Valley Parkway/Route 16 is MassDOT's Preferred Alternative, financial constraints prohibit the Commonwealth from progressing the Project beyond College Avenue at this time.

So, why not go along with MassDOT's plan for a two-phase plan with a "temporary" terminus at College Ave/Tufts University? There are many reasons:

1) It doesn't serve the Medford Hillside, or really Medford at all.
2) There is no boon to having a "temporary" terminus at College Ave/Tufts University. We have an exquisite once-in-a-lifetime opportunity to improve public transportation to a large community and stopping at College Ave/Tufts University is a waste—a downright waste of an opportunity for MassDOT to truly serve many, many citizens for many decades to come.
3) The traffic is horrendous at College and Boston Avenues. I know the City of Medford has pointed out in its comments that this 4-legged intersection needs to be rehabilitated, but that's putting it mildly. There needs to be drop-off areas for both sides of Boston and College Avenues (east and west) as well as north and south bound. Yes, there must be eight drop-off areas to properly serve this station stop. There also must be more bike racks than the now-proposed 40-bike parking. To think that only 40 people will ride their bikes to this station every morning and expect to find parking is absurd. The point of this project is to take cars off the road—therefore, an emphasis on bike parking is mandatory. Pedestrian walk-up access is also a very important subject. Cars do not stop for pedestrians at the College and Boston Avenue intersection as it is now. One option for better enforcement could be red-light cameras that issue tickets to offenders.
4) The College Avenue/Tufts University station stop is in a residential neighborhood. The burden of having back-to-back construction projects from now until 2020 is unacceptable. A one-phase project to Rt. 16 equally distributes the burden and creates more environmental benefits for the entire corridor. Actually, the environmental benefits of terminating at College Avenue/Tufts University are greatly reduced compared with extending the line all the way to Rt. 16.
5) My neighborhood mitigation needs will not be the same as the abutters at Ball Square. There needs to be a line item in the budget for noise/sound/light mitigation for each station stop in the FEIR. The current DEIR does not address the actual budget costs for mitigation, just estimates and recommendations. I endorse the full noise/vibration/light mitigation options as outlined in the DEIR, the cost of which must be included in the FEIR.
6) MassDOT has not had a College Ave/Tufts University station stop meeting with the neighborhood or city of Medford. We have seen only one plan for the "temporary" terminus at College Ave/Tufts University. This is unacceptable.
7) The train storage and staging area at the College Ave/Tufts University "temporary" terminus will put an undue burden on the Burget Avenue neighborhood. Remember, I already hear the 4am commuter train. With the two-phase plan I'll be able to watch the trains pile up at 4am as they start the day's run and as they idle at 12am after dropping off the last passengers. If there's a disabled train, it will be sitting on the other side of my fence until retrieved and hopefully towed back to the maintenance facility, but could also be worked on right there.
8) MassDOT has not explained to the abutters on Burget, Brookings, and Charnwood Streets that they may not get any mitigation relief at all even though

the industrial tracks are moving closer to their homes. Only a portion of Burget, and none of Brookings or Charnwood Streets will have sound barriers, but they will be taking on the brunt of the "temporary" terminus construction. With a full-build to Rt. 16, these neighbors will get the proper mitigation efforts that are due to them. The "temporary" terminus plan pits neighbors against neighbors. I realize we are not mitigating for the industrial train use, but if MassDOT is putting in sound barriers, it should line the entire corridor with them.

9) Let's be honest. The likelihood of MassDOT going back after the first-phase of construction is done (or even during) and starting the second-phase is not only unrealistic, but improbable and, frankly, a waste of money. The EIR is being done now, and it needs to properly reflect the project in its entirety to Rt. 16. To go back and do a new EIR and spend more money to build a mile-long section from College Ave/Tufts University to Rt. 16 is not going to happen. Again, we have an opportunity now to do this right the first time.
10) The two-phase project has never been presented to the public at large in a meeting. The last public meeting showed a College Ave/Tufts University, a Brookings Avenue stop, a Winthrop stop, and a Rt. 16 stop. The city has not been presented a College Ave/Tufts University only project. Right now, as I see it, this project doesn't have a physical starting point nor a terminus—the DEIR cannot be considered the FEIR until those two crucial points are settled.

Before the FEIR is released, I would like to see:

I-275-003
1) A public hearing for the proposed "temporary" terminus at College Ave/Tufts University and a separate hearing for Rt. 16 terminus, just like the one held for the maintenance facility in Somerville.

I-275-004
2) A very complete plan showing all the impacts (traffic, environmental, and mitigation, including the staging and storage of trains) for the surrounding neighborhood at the College Ave/Tufts University and Rt. 16 station stops specifically. The current DEIR barely examines the Rt. 16 stop.

I-275-005
3) Three different plans for the Rt. 16 terminus. None of which should contain the seizure of 200 or 222 Boston Avenue. These buildings provide revenue and jobs to the city. They could also be the base of a significant revitalization. MassDOT has never submitted an honest plan for Rt. 16 during this entire process. We've seen plans for a parking garage, a maintenance facility, and now MassDOT's own publicly-admitted "worst-case scenario" of the seizure of buildings at 200 and 222 Boston Avenue.

I-275-006
4) MassDOT meet with the mayor of Medford and city council to once and for all explain the project and what the effects it will have on the city.

I-275-007
5) A true budget of what the project will cost.
6) The true costs and requirements of implementing a two-phase plan, including inflation.

Thank you for your time. Feel free to stop by anytime for coffee and I'll give you a tour of the neighborhood.

Sincerely,

I-275-003

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-275-004

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-275-005

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-275-006

MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses. This will help ensure compliance with legal requirements and, to the extent feasible, consistency with planning and other projects.

Laurel R.T. Ruma

Dear Secretary Bowles:

I-276-001 I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

First of all, I strongly support the Green Line extension, and urge that it be built in the most practical, beneficial, and cost-effective manner—that is, to construct the entire project in one phase, with a terminus station at Mystic Valley Parkway (Route 16), by December 31, 2014.

The DEIR is encouraging in that it concludes that the Route 16 station would provide the most benefits according to all project criteria, including air quality and environmental justice. However, MassDOT states that it is incapable of building (and funding) the entire "Preferred Alternative," so it only intends to build the extension to College Avenue in the Tufts University area of Medford, by its deadline of December 31, 2014.

In my opinion, the DEIR as currently written does not serve the best interests of the project. More important for your review, the DEIR was not done in a way that "adequately and properly" complies with the state environmental regulations, nor with the December 1, 2006 MEPA certificate that defined the requirements of the DEIR.

For the following reasons, I strongly urge you to not accept the DEIR as the Final EIR and to require further environmental analysis of the project by MassDOT:

1. A two-phased approach is unacceptable. The Route 16/Mystic Valley Parkway Station should be built as part of a single-phase project to minimize costs and negative impacts and achieve the maximum benefits with regard to ridership, vehicle mile travel reduction, air quality improvements, and service to environmental justice communities.

The recommendation as outlined in the DEIR is for the Route 16/Mystic Valley Parkway station to be a separate stand-alone Phase II project with no funding source identified. **This provision means that the Route 16 segment and station may never be built.**

There are many, many problems with the two-phase approach, including:

- **Risk.** Without an identified funding source there is a very high probability that the Route 16 segment and station will never be built and the implications of this are critical.
- **Terminus Impact.** Without a Route 16 Station, the College Avenue stop (designed and intended to be an interim station) would become the de facto terminus for the Green Line extension. It is not designed to be a terminus and due to the traffic flow and neighborhood density, as well as the lack of opportunity for transit-oriented development

I-276-001

Please see Comment Letter I-002.

at College Ave., it is not a good location for a terminus.
- **Cost.** The two-phased approach is fiscally irresponsible and by MassDOT's own estimates will inflate the cost by $55 million over a single-phase approach. Severing a single stop (less than one mile of track) from the project as a whole will cost the state, and thus the taxpayers, significant additional money. There are obvious ways to easily reduce costs in the overall project and provide enough additional funds to include Route 16 as part of a single, complete project. This is the most prudent approach, and also would ensure that the project produces the air quality improvements the Commonwealth must achieve to come into compliance with the Clean Air Act.
- **Project Management.** There are significant efficiencies to be gained from completing the project in one phase, rather than the starts and stops required to execute on separate, multi-stage efforts for such a small add-on project as a single station stop.
- **Environmental Justice.** The environmental justice population cited, in part, to justify the project as a whole will largely not be served if the project terminates at College Avenue. The negative aspects of this project will affect them most, while they will receive the least benefit without service to a Route 16 terminus.
- **Legal Mandate.** The state is legally obligated to provide public transit services to Medford Hillside by December 31, 2014, and stopping the extension at College Ave. fails to meet this legal obligation. At a minimum, this incurs significant mitigation costs required if the obligation is not met.

2. College Avenue should not be a terminus. The College Avenue station is not designed for the additional requirements of a terminus. The neighborhood cannot sustain the impact of a terminus station's operations and traffic volume; and the potential environmental damage ts of serious concern.
3. The Route 16 station design is inadequate. The DEIR offers only a "worst case scenario" (MassDOT's description) for the Route 16 station design, while offering optimized station designs for all other Green Line extension stations. The Route 16 station design must be revisited. The Medford Green Line Neighborhood Alliance, a volunteer citizen group, has offered an alternative station design that prevents two major commercial property acquisitions and the resulting job displacement, preserves $182,000/year in property taxes for the City of Medford, optimizes traffic flow and better serves the integrity of the station's surroundings. MassDOT apparently has been exploring similar improved designs, which should be presented to the public for comment. A $1 billion project deserves a higher caliber design than a "worst case scenario."

In summary, there is much more work to be done on the Environmental Impact report, and I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis in order to make the Green Line extension the best project it can be, and MUST be. I will very much appreciate your constructive attention to these important needs.

Email: Holly.S.Johnson@state.ma.us

Dear Ms. Holly Johnson:

I-277-001

I am writing to voice my concerns regarding the Green Line Extension, #13886. I am presently limited with mobility and am receiving services from the Ride. I anticipate using the T over the next year. However, I am concerned with the proposed access plan to the East Cambridge Neighborhood. I ask how I am to cross a highway safely? For this reason alone, I am requesting a foot bridge or over the street access similar to that of Cambridge Street entering Harvard Square.

Please note that there are major housing units dedicated to seniors and Persons with Disabilities in East Cambridge. Safety and accessibility should be the T's major concerns.

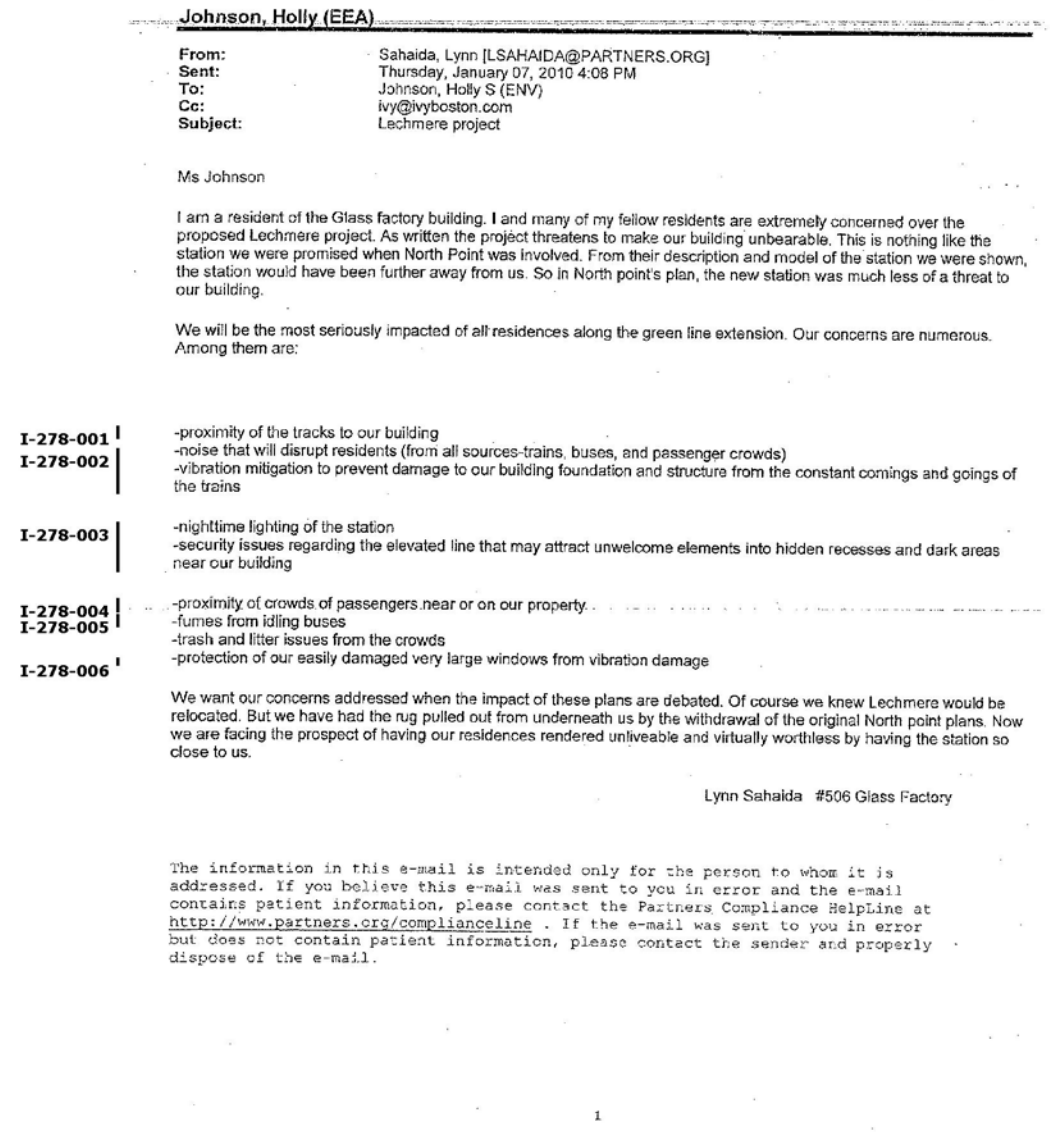
I trust you will address my concern. Another option might be to leave the T where it has been for the past century or change the design to accommodate the neighborhood.

Yours truly,

Betty Lee Saccoccio

I-277-001

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. The chapter presents a traffic analysis, a detailed description of pedestrian crossings of O'Brien Highway, and proposed roadway, crosswalk, and sidewalk improvements that are consistent with the NorthPoint development plans. These station and street plans will be further refined in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.



Johnson, Holly (EEA)

Subject: Lechmere project

Ms Johnson

I am a resident of the Glass factory building. I and many of my fellow residents are extremely concerned over the proposed Lechmere project. As written the project threatens to make our building unbearable. This is nothing like the station we were promised when North Point was involved. From their description and model of the station we were shown, the station would have been further away from us. So in North point's plan, the new station was much less of a threat to our building.

We will be the most seriously impacted of all residences along the green line extension. Our concerns are numerous. Among them are:

I-278-001 -proximity of the tracks to our building
I-278-002 -noise that will disrupt residents (from all sources-trains, buses, and passenger crowds)
-vibration mitigation to prevent damage to our building foundation and structure from the constant comings and goings of the trains

I-278-003 -nighttime lighting of the station
-security issues regarding the elevated line that may attract unwelcome elements into hidden recesses and dark areas near our building

I-278-004 -proximity of crowds of passengers near or on our property
I-278-005 -fumes from idling buses
-trash and litter issues from the crowds
I-278-006 -protection of our easily damaged very large windows from vibration damage

We want our concerns addressed when the impact of these plans are debated. Of course we knew Lechmere would be relocated. But we have had the rug pulled out from underneath us by the withdrawal of the original North point plans. Now we are facing the prospect of having our residences rendered unliveable and virtually worthless by having the station so close to us.

Lynn Sahaida #506 Glass Factory

I-278-001

FEIR Chapter 5 describes the revised conceptual plans for Lechmere Station, including station design, track alignment, bus routings, and other elements. Changes to the track alignment depicted in the DEIR/EA were evaluated, but could result in additional impacts on area abutters. Proposed mitigation measures for area abutters are also described in FEIR Chapter 5. During preliminary engineering, specific station design elements will be further developed.

I-278-002

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-278-003

FEIR Chapter 5 describes the revised conceptual plans for Lechmere Station, including station design, track alignment, bus routings, and other elements. Changes to the track alignment depicted in the DEIR/EA were evaluated, but could result in additional impacts on area abutters. Proposed mitigation measures for area abutters are also described in FEIR Chapter 5. During preliminary engineering, specific station design elements will be further developed.

Along the back side of the Glass Factory, fencing is currently proposed to minimize trespassers crossing the existing Glass Factory parking area and will be further evaluated during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

As reported in FEIR Section 5.4, the existing outdoor-to-indoor noise reduction of the Glass Factory Condominiums has been measured and the resulting interior noise level projections have been assessed against appropriate interior noise criteria. As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds. These proposed measures include a noise barrier on the elevated structure near Glass Factory.

I-278-004

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

I-278-005

Revised conceptual plans for Lechmere Station, including bus facilities and bus waiting areas, are included in FEIR Chapter 5, Lechmere Station. Bus layover has been shifted further to the east and away from the Glass Factory Condominiums in the revised Lechmere Station design. Signs will be posted to limit idling of buses, in conformance with MBTA standards.

I-278-006

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-279-001 I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

First of all, I strongly support the Green Line extension, and urge that it be built in the most practical, beneficial, and cost-effective manner—that is, to construct the entire project in one phase, with a terminus station at Mystic Valley Parkway (Route 16), by December 31, 2014.

The DEIR is encouraging in that it concludes that the Route 16 station would provide the most benefits according to all project criteria, including air quality and environmental justice. However, MassDOT states that it is incapable of building (and funding) the entire "Preferred Alternative," so it only intends to build the extension to College Avenue in the Tufts University area of Medford, by its deadline of December 31, 2014.

In my opinion, the DEIR as currently written does not serve the best interests of the project. More important for your review, the DEIR was not done in a way that "adequately and properly" complies with the state environmental regulations, nor with the December 1, 2006 MEPA certificate that defined the requirements of the DEIR.

For the following reasons, I strongly urge you to not accept the DEIR as the Final EIR and to require further environmental analysis of the project by MassDOT:

1. A two-phased approach is unacceptable. The Route 16/Mystic Valley Parkway Station should be built as part of a single-phase project to minimize costs and negative impacts and achieve the maximum benefits with regard to ridership, vehicle mile travel reduction, air quality improvements, and service to environmental justice communities.

The recommendation as outlined in the DEIR is for the Route 16/Mystic Valley Parkway station to be a **separate** stand-alone Phase II project with no funding source identified. **This provision means that the Route 16 segment and station may never be built.**

There are many, many problems with the two-phase approach, including:

- **Risk.** Without an identified funding source there is a very high probability that the Route 16 segment and station will never be built and the implications of this are critical.
- **Terminus Impact.** Without a Route 16 Station, the College Avenue stop (designed and intended to be an interim station) would become the de facto terminus for the Green Line extension. It is not designed to be a terminus and due to the traffic flow and neighborhood density, as well as the lack of opportunity for transit-oriented development

I-279-001

Please see Comment Letter I-002.

at College Ave., it is not a good location for a terminus.
- **Cost.** The two-phased approach is fiscally irresponsible and by MassDOT's own estimates will inflate the cost by $55 million over a single-phase approach. Severing a single stop (less than one mile of track) from the project as a whole will cost the state, and thus the taxpayers, significant additional money. There are obvious ways to easily reduce costs in the overall project and provide enough additional funds to include Route 16 as part of a single, complete project. This is the most prudent approach, and also would ensure that the project produces the air quality improvements the Commonwealth must achieve to come into compliance with the Clean Air Act.
- **Project Management.** There are significant efficiencies to be gained from completing the project in one phase, rather than the starts and stops required to execute on separate, multi-stage efforts for such a small add-on project as a single station stop.
- **Environmental Justice.** The environmental justice population cited, in part, to justify the project as a whole will largely not be served if the project terminates at College Avenue. The negative aspects of this project will affect them most, while they will receive the least benefit without service to a Route 16 terminus.
- **Legal Mandate.** The state is legally obligated to provide public transit services to Medford Hillside by December 31, 2014, and stopping the extension at College Ave. fails to meet this legal obligation. At a minimum, this incurs significant mitigation costs required if the obligation is not met.

2. College Avenue should not be a terminus. The College Avenue station is not designed for the additional requirements of a terminus. The neighborhood cannot sustain the impact of a terminus station's operations and traffic volume; and the potential environmental damage is of serious concern.

3. The Route 16 station design is inadequate. The DEIR offers only a "worst case scenario" (MassDOT's description) for the Route 16 station design, while offering optimized station designs for all other Green Line extension stations. The Route 16 station design must be revisited. The Medford Green Line Neighborhood Alliance, a volunteer citizen group, has offered an alternative station design that prevents two major commercial property acquisitions and the resulting job displacement, preserves $182,000/year in property taxes for the City of Medford, optimizes traffic flow and better serves the integrity of the station's surroundings. MassDOT apparently has been exploring similar improved designs, which should be presented to the public for comment. A $1 billion project deserves a higher caliber design than a "worst case scenario."

In summary, there is much more work to be done on the Environmental Impact report, and I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis in order to make the Green Line extension the best project it can be, and MUST be. I will very much appreciate your constructive attention to these important needs.

Sincerely,

Carole Samworth

EEA #13886

Dear Secretary Ian Bowles,

I am both a supporter of and a user of public transportation. I welcomed the decision to extend the Green Line and give Somerville long overdue access to the MBTA rail system. However, the plan as outlined in the DEIR has triggered concerns about the potential negative impact on my community, both Somerville as a whole and in particular, the Brickbottom Artist's Studios, where for the past 21 years, I have worked, lived and raised a family. It is important that the project is built right for the future and that the plan includes further environmental assessments, mitigation commitments and a more holistic view of our metro transportation infrastructure with the station designs, bus links, pedestrian bicycle access, community paths and, and integration with automobile corridors, particularly McGrath/O'Brien highway.

I-282-001 The entire Brickbottom Artist building is predicted to have noise and vibration levels that go beyond what is considered severe because of the extreme proximity of the proposed train tracks and the mitigation as outlined in the DEIR is both vague and insufficient.

I-282-002 Our lofts are zoned as live/work spaces, with over two hundred residents, and we need both the construction of and the daily coexistence with the trains not to impinge on our commercial and cultural endeavors or to be detrimental to our quality of life. While all three buildings and our outdoor communal space are listed in the DEIR as being severely impacted by noise and vibration, the mitigation measures to the Brickbottom community seem insufficient and vague– soundproofing is allocated to only 40 out of the 155 residences. I urge MassDOT to take every step in lessening the environmental impact of the extension not only in my neighborhood, but in the other close residential abutters, such as the Glass Factory. While the existing rail bed might be the easiest path for the Green Line, the environmental impact on the residences should be taken in consideration, and every effort should be made to site the line further away than the proposed 19 feet at Brickbottom to lessen the impact.

I-282-003 MassDot needs to establish a clear procedure, incorporating community representation, for determining and meeting noise and vibration targets and compensation if those targets are not met. A full assessment of the Brickbottom area is needed create an accurate baseline for current noise, vibration and air quality in order to calculate the extension's full impact. Additionally, funding needs to be in place for future needs to enable the MBTA to provide adequate upkeep, repair and employ new technologies as they become available to keep the mitigation infrastructure effective.

I-282-004 I oppose the Yard 8 location for both the maintenance facility and storage yard. The plan fails to meet the Somerville's criteria for quality of life, transportation access and economic development. The impact from these two facilities would be an addition burden both to the Brickbottom Artist residents and to the Somerville community as a whole. The proposed site would negatively impact the quality of life for the residential abutters. It also places an unfair economic burden on Somerville, which already houses the large commuter rail maintenance facility. The entire community has been unanimous in their disapproval of the plan, and I encourage MassDOT to continue to pursue further options. While both the Mirror Scheme H and Scheme L would lessen the impact on my immediate neighborhood, I believe that MassDOT should achieve operational efficiencies by utilizing the existing 47 acres already committed to train infrastructure, the MBTA Boston Engine Terminal, rather than creating a second distinct facility in Somerville.

I-282-001

As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds. FEIR Chapter 8 describes specific proposed mitigation measures, plans for monitoring after construction, and next steps pertaining to mitigation. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-282-002

FEIR Chapter 5 describes the revised conceptual plans for Lechmere Station, including station design, track alignment, bus routings, and other elements. Changes to the track alignment depicted in the DEIR/EA were evaluated, but could result in additional impacts on area abutters. Proposed mitigation measures for area abutters are also described in FEIR Chapter 5. During preliminary engineering, specific station design elements will be further developed.

I-282-003

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

I-282-004

As explained in FEIR Chapter 2, MassDOT has explored opportunities for the Green Line Extension storage and maintenance facility to share resources with the Boston Engine Terminal. The independent needs and constraints of these facilities limit opportunities for shared resources.

I-282-005 With Somerville being the most densely populated municipality in New England, the proposed storage yard also must be designed in a way that integrates with the neighborhood. It should be scaled down and accommodate the number of cars necessitated by the extension, essentially half the currently proposed number in the DEIR. I've been to Riverside and also viewed the bus depot close to the Forest Hill station. These are both complete eyesores, with dirty lots surrounded by chain link fence topped with razor wire. If the storage yard needs to be sited in Somerville, it must be done in a way that lessens the visual impact on the dense neighborhood and its evolving future.

I-282-006 Likewise, the station design needs to be appropriate to the dense metro quality of Somerville. The proposed stations are more kin with the suburban stations one see in Needham than the meto stations of Boston. It is important that the station be designed to promote pedestrian, bicycle and bus access. MassDot needs to have a fuller planning process and promote designs that are aligned with the current density and anticipate future development. The designed car drop off area at the Brickbottom station will only exacerbate traffic problems that already exist at the Joy St. and Washington intersection and will impede access/egress in my neighborhood, The station plans need to be developed with community input.

I-282-007

I-282-008

Both cars and pedestrians currently use the Somerville Avenue extension, the one-way street (listed as unnamed) that runs along and then under the McGrath highway and borders Russell's and the tow lot that is marked for acquisition for the extension. The DEIR needs to commit to our continued ability to access our neighborhood through this important route and provide more information about the proposed land acquisition.

I-282-009 The state needs to implement an integrated transportation plan that aligns the Green Line extension with pedestrian and bicycle access, along with planning improvements to the McGrath Highway. The Green Line extension needs to be implemented in a way that improves the quality of life for our community, now and for the future, while facilitating transportation in the Commonwealth.

Alyson Schultz

Alyson Schultz
1 Fitchburg St C209
Somerville MA
02143

MassDOT will coordinate with the MBTA during preliminary engineering to maximize efficient land utilization between these storage and maintenance facilities, if possible.

I-282-005

The Green Line Extension storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the Project. Chapter 2 of the FEIR fully describes the environmental impacts of the proposed storage and maintenance facility. In order to maximize operating efficiencies, the facility must be constructed within the same timeframe as the Green Line Extension Project, in the vicinity of the Green Line Extension right-of-way, and north of downtown Boston.

The storage and maintenance facility alternatives include storage for Green Line Extension vehicles and replacement of the existing Lechmere Station vehicle storage. Storage capacity is also provided for vehicles currently stored in trackways between Lechmere Station and Government Center; this storage will be lost due to the Green Line Extension.

I-282-006

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-282-007

The conceptual plan for the Brickbottom Station will be refined during the preliminary engineering stage, taking into consideration municipal, neighbor, and other stakeholder concerns to the extent practical. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

I-282-008

MassDOT and the MBTA conducted a series of public workshops to gather input on land use and facility design issues from the communities. The workshops were organized around facility locations or groups of locations. All were well-advertised, open to the public and in accessible venues.

I-282-009

DEIR/EA Section 3.9 describes the compatibility of the Green Line Extension with other regional projects, such as the conceptual reconstruction of McGrath Highway and the Urban Ring transit corridor initiative. MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses to ensure, to the extent feasible, consistency with planning and other projects.

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-283-001 I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

First of all, I strongly support the Green Line extension, and urge that it be built in the most practical, beneficial and cost-effective manner – that is, to construct the entire project in one phase, with a terminus station at Mystic Valley Parkway (Route 16), by December 31, 2014.

The DEIR is encouraging in that it concludes that the Route 16 station would provide the most benefits according to all project criteria, including air quality and environmental justice. However, MassDOT states that it is incapable of building (and funding) the entire "Preferred Alternative," so it only intends to build the extension to College Avenue in the Tufts University area of Medford, by its deadline of December 31, 2014.

In my opinion, the DEIR as currently written does not serve the best interests of the project. More importantly for your review, it was not done in a way that "adequately and properly" complies with the state environmental regulations, nor with the December 1, 2006 MEPA certificate that defined the requirements of the DEIR.

For the following reasons, I strongly urge you to not accept the DEIR as the Final EIR and require further environmental analysis of the project by MassDOT:

1. A two-phased approach is unacceptable. The Route 16/Mystic Valley Parkway Station should be built as part of a single-phase project to minimize costs and negative impacts and achieve the maximum benefits with regard to ridership, vehicle mile travel reduction, air quality improvements, and service to environmental justice communities.

The recommendation as outlined in the DEIR is for the Route 16/Mystic Valley Parkway station to be a separate stand-alone Phase II project with no funding source identified. **This means, Route 16 may never be built.**

There are many, many problems with the Phase II approach, including:

- **Risk.** Without an identified funding source there is a very high probability that Route 16 will never be built and the implications of this are critical.
- **Terminus Impact.** Without a Route 16 Station, the College Avenue stop (designed and intended to be an interim station) would become the de facto terminus for the Green Line extension. It is not designed for a terminus and due to the traffic flow and

I-283-001

Please see Comment Letter I-002.

neighborhood density, as well as the lack of opportunity for transit-oriented development at College Ave., it is not a good location for a terminus.

- **Cost.** The two-phased approach is fiscally irresponsible and by MassDOT's own estimates will inflate the cost by $55 million over a single-phase approach. Severing a single stop (less than one mile of track) from the project as a whole will cost the state, and thus the taxpayers, significant additional money. There are obvious ways to easily reduce costs in the overall project and provide enough additional funds to include Route 16 as part of a single, complete project. This is the most prudent approach, and also would ensure that the project produces the air quality improvements the Commonwealth must achieve to come into compliance with the Clean Air Act.
- **Project Management.** There are significant efficiencies gained from completing the project in one phase, rather than the starts and stops required to execute on separate, multi-stage efforts for such a small add-on project as a single station stop.
- **Environmental Justice:** The environmental justice population cited, in part, to justify the project as a whole will largely not be served if the project terminates at College Avenue. The negative aspects of this project will affect them most, while they will receive the least benefit without service to a Route 16 terminus.
- **Legal Mandate:** The state is legally obligated to provide public transit services to Medford Hillside by December 31, 2014, and stopping the extension at College Ave. fails to meet this legal obligation. At a minimum, this incurs significant mitigation costs required if the obligation is not met.

2. **College Avenue should not be a terminus.** The College Avenue station is not designed for the additional requirements of a terminus. The neighborhood cannot sustain the impact of a terminus station operations and traffic volume and the potential environmental damage is of serious concern.

3. **The Route 16 station design is inadequate.** The DEIR offers only a "worst case scenario" (MassDOT's description) for the Route 16 station design, while offering optimized station designs for all other Green Line extension stations. The Route 16 station design must be revisited. The Medford Green Line Neighborhood Alliance, a volunteer citizen group, has offered an alternative station design that prevents two major commercial property acquisitions and the resulting job displacement, preserves $182,000/year in property taxes for the City of Medford, optimizes traffic flow and better serves the integrity of the station's surroundings. MassDOT apparently has been exploring similar improved designs, which should be presented to the public for comment. A $1 billion project deserves a higher caliber design than a "worst case scenario."

To summarize, there is much more work to be done on the Environmental Impact report, and I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis in order to make the Green Line extension the best project it can be, and MUST be.

Thank you.

Subject: Green Line Extension

January 4, 2010

Secretary Ian Bowles

Executive Office of Energy and Environmental Affairs

MEPA Office

Attn: Holly Johnson, MEPA Analyst

EEA #13886

100 Cambridge Street, Suite 900

Boston, MA 02114

Dear Secretary Bowles:

I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

I-284-001

First of all, I strongly support the Green Line extension, and urge that it be built in the most practical, beneficial and cost-effective manner – that is, to construct the entire project in one phase, with a terminus station at Mystic Valley Parkway (Route 16), by December 31, 2014.

The DEIR is encouraging in that it concludes that the Route 16 station would provide the most benefits according to all project criteria, including air quality and environmental justice. However, MassDOT states that it is incapable of building (and funding) the entire "Preferred

I-284-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

Alternative," so it only intends to build the extension to College Avenue in the Tufts University area of Medford, by its deadline of December 31, 2014.

I-284-002

In my opinion, the DEIR as currently written does not serve the best interests of the project. More importantly for your review, it was not done in a way that "adequately and properly" complies with the state environmental regulations, nor with the December 1, 2006 MEPA certificate that defined the requirements of the DEIR.

For the following reasons, I strongly urge you to not accept the DEIR as the Final EIR and require further environmental analysis of the project by MassDOT:

1. A two-phased approach is unacceptable. The Route 16/Mystic Valley Parkway Station should be built as part of a single-phase project to minimize costs and negative impacts and achieve the maximum benefits with regard to ridership, vehicle mile travel reduction, air quality improvements, and service to environmental justice communities.

The recommendation as outlined in the DEIR is for the Route 16/Mystic Valley Parkway station to be a **separate** stand-alone Phase II project with no funding source identified. **This means, Route 16 may never be built.**

There are many, many problems with the Phase II approach, including:

- **Risk.** Without an identified funding source there is a very high probability that Route 16 will never be built and the implications of this are critical.
- **Terminus Impact.** Without a Route 16 Station, the College Avenue stop (designed and intended to be an **interim station**) would become the de facto terminus for the

I-284-002

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

Green Line extension. It is not designed for a terminus and due to the traffic flow and neighborhood density, as well as the lack of opportunity for transit-oriented development at College Ave., it is not a good location for a terminus.

I-284-003

- **Cost.** The two-phased approach is fiscally irresponsible and by MassDOT's own estimates will inflate the cost by $55 million over a single-phase approach. Severing a single stop (less than one mile of track) from the project as a whole will cost the state, and thus the taxpayers, significant additional money. There are obvious ways to easily reduce costs in the overall project and provide enough additional funds to include Route 16 as part of a single, complete project. This is the most prudent approach, and also would ensure that the project produces the air quality improvements the Commonwealth must achieve to come into compliance with the Clean Air Act.
- **Project Management.** There are significant efficiencies gained from completing the project in one phase, rather than the starts and stops required to execute on separate, multi-stage efforts for such a small add-on project as a single station stop.

I-284-004

- **Environmental Justice:** The environmental justice population cited, in part, to justify the project as a whole will largely not be served if the project terminates at College Avenue. The negative aspects of this project will affect them most, while they will receive the least benefit without service to a Route 16 terminus.

I-284-005

- **Legal Mandate:** The state is legally obligated to provide public transit services to Medford Hillside by December 31, 2014, and stopping the extension at College Ave. fails to meet this legal obligation. At a minimum, this incurs significant mitigation costs required if the obligation is not met.

I-284-006

2. College Avenue should not be a terminus. The College Avenue station is not designed for the additional requirements of a terminus. The neighborhood cannot sustain the impact of a terminus station operations and traffic volume and the potential environmental damage is of

I-284-003

Project cost estimates are based on the current, conceptual level of design, and will be further refined as the Project progresses through preliminary engineering. It is anticipated that Green Line Extension construction would be financed with a combination of funds from federal and state sources. Efforts to engage a developer for the North Point development will continue as this Project moves into the next phases of design.

I-284-004

The Proposed Project offers substantial benefits to environmental justice communities and serves the majority of Study Area environmental justice population zones. As described in DEIR/EA Section 5.4, Environmental Justice, impacts to environmental justice populations would be neither severe nor disproportionate with any of the Build Alternatives.

I-284-005

As directed by the Secretary's Certificate on the DEIR/EA, the FEIR includes a limited scope of issues related to the Green Line Extension Project. The Proposed Project, with a Medford Branch terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Although an extension to Mystic Valley Parkway/Route 16 is MassDOT's Preferred Alternative, financial constraints prohibit the Commonwealth from progressing the Project beyond College Avenue at this time.

I-284-006

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR

I-284-006

serious concern.

I-284-007

3. The Route 16 station design is inadequate. The DEIR offers only a "worst case scenario" (MassDOT's description) for the Route 16 station design, while offering optimized station designs for all other Green Line extension stations. The Route 16 station design must be revisited. The Medford Green Line Neighborhood Alliance, a volunteer citizen group, has offered an alternative station design that prevents two major commercial property acquisitions and the resulting job displacement, preserves $182,000/year in property taxes for the City of Medford, optimizes traffic flow and better serves the integrity of the station's surroundings. MassDOT apparently has been exploring similar improved designs, which should be presented to the public for comment. A $1 billion project deserves a higher caliber design than a "worst case scenario."

To summarize, there is much more work to be done on the Environmental Impact report, and I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis in order to make the Green Line extension the best project it can be, and MUST be.

Thank you.

Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-284-007

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

Hi Holly,

I-285-001

How are you today? I just wanted to write a quick note to you and let you know that I support the Green line extension to Rt. 16 in Medford. My wife and I just became first time home buyers in the City; the Green line extension was one of the reasons for this.

Feel free to contact me if you have any questions.

Thank you,

John Shayeb

100 Cambridge St, Suite 900
Boston, MA 02114

Dear Secretary Ian Bowles,

I-286-001 I am writing in regards to the Draft Environmental Impact Report on project Number EEA#13886. I am very pleased with the more detailed evaluation of the alternate sites for siting the Green Line maintenance facility and train storage yard, Option L and Mirror H, with comparisons to Yard 8. I would like to see a more detailed comparative cost analysis of noise and vibration mitigation costs for both the construction and permanent phases of the project considered in the selection of sites for the maintenance facility and train storage yard.

I-286-002 I am particularly concerned that the noise and vibration level from the storage yard as it impacts the Brickbottom Artists Building and surrounding businesses does not seem to be adequately studied. The noise and vibration levels at the storage yard at the Riverside facility especially during peak hours is significantly higher than the noise levels from the maintenance facility. The DEIR report's current mitigation provisions in the case of the Brickbottom Artists Building at 1 Fitchburg Street does not allow for noise barriers or containment in relation to the storage yard and only 40 out of 155 residences are designated for soundproofing. I would like to see the mitigation requirements be more adequately studied for construction and permanent impact with a complete cost analysis and deadlines for fulfillment.

I-286-003 I am opposed to siting the Green Line Train Storage Yard and Maintenance Facility in Yard 8. In addition to noise and vibration concerns as cited above, the Yard 8 location would build a barrier between the Inner belt and Brickbottom areas and would impact the potential for future development in the region. The Storage Yard and Maintenance facility would have a direct impact on future tax revenue as it impacts adjacent property value and future growth potential.

I support the Green Line Extension but feel like the Train Storage Yard and Maintenance Facility add an unjust additional burden to The Brickbottom district and to Somerville. I appreciate your continued thoughtful consideration of alternatives to Yard 8.

Sincerely,

Julia Shepley

I-286-001

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

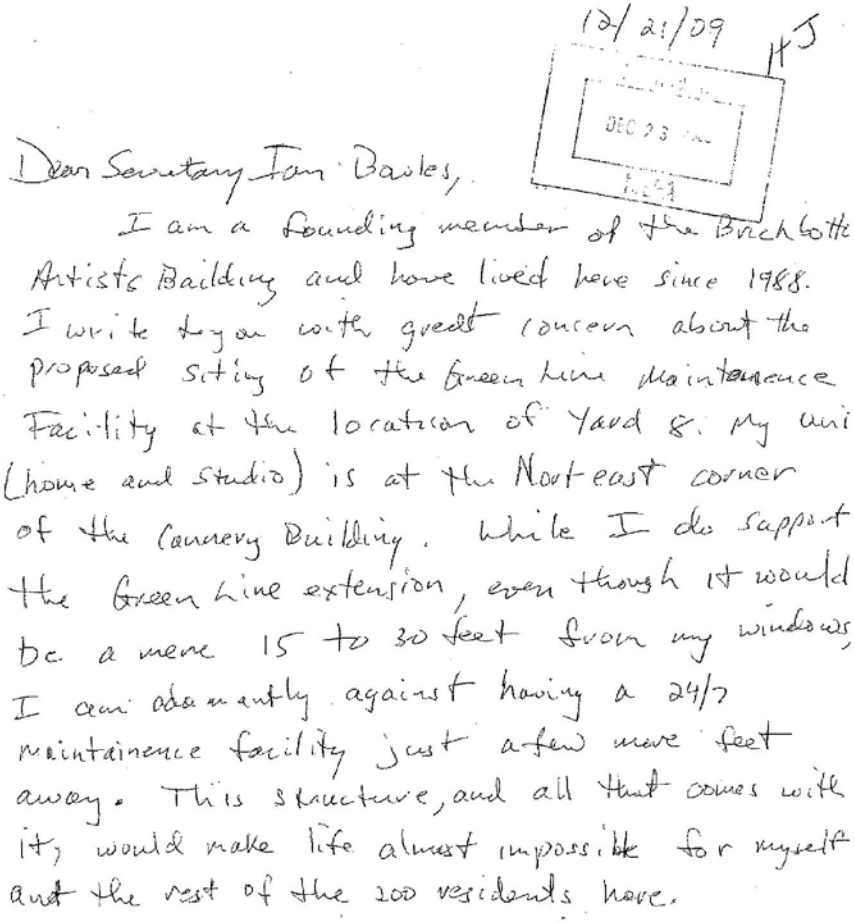
I-286-002

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-286-003

An expanded technical and environmental analysis of the light rail

storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.



12/21/09

DEC 23

Dear Secretary Ian Bowles,

I am a founding member of the Brickbottom Artists Building and have lived here since 1988. I write to you with great concern about the proposed siting of the Green Line Maintenance Facility at the location of Yard 8. My unit (home and studio) is at the Northeast corner of the Gannery Building. While I do support the Green Line extension, even though it would be a mere 15 to 30 feet from my windows, I am adamantly against having a 24/7 maintainence facility just a few more feet away. This structure, and all that comes with it, would make life almost impossible for myself and the rest of the 200 residents here.

I-287-001

I-287-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

There are ligitimate alternatives (Scenario H and Option L) to yard 8. I am hoping that the Executive Office of Energy and Environmental Affairs will take yard 8 off the list of potential sites. Thank you.

Sincerely,

David Sholl

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

I-288-001

As a resident of the Medford Hillside community, I strongly support the Green Line extension, but I also urge that that it be built in a single phase, with the terminus station at Mystic Valley Parkway/Route 16 being completed by the end of 2014.

The DEIR is encouraging in that it concludes that the Route 16 station would provide the most benefits according to all project criteria, including air quality and environmental justice. However, MassDOT states that it is incapable of building and funding the entire "Preferred Alternative," so it only intends to build the extension to College Avenue in the Tufts University area of Medford, by its deadline of December 31, 2014.

I-288-002

For several reasons, the proposed division of the project into two phases does not comply with the state environmental regulations, nor with the December 1, 2006 MEPA certificate that defined the requirements of the DEIR.

By dividing the project into two phases, the state is not meeting its obligation to provide public transit services to Medford Hillside by December 31, 2014. The Medford Hillside community has historically been defined to cover the corridor along Boston Avenue reaching from Warner Street to Route 16. The location at College Avenue covers only the first third of that corridor, ending nearly a full mile from the outer boundaries of the Hillside community, and therefore would not satisfy this legal obligations to serve the community by the 2014 deadline.

Moreover, there is a very real risk that the Route 16 station will never in fact be built, as the DEIR has not identified any funding source for the completion of the proposed second phase to build that station. If this were to occur, a terminus at College Avenue would create a number of deficiencies, including:

I-288-003

- A College Avenue terminus fails to adequately meet the obligation of serving the environmental justice population, which would be better served by a terminus at Route 16.

I-288-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-288-002

As directed by the Secretary's Certificate on the DEIR/EA, the FEIR includes a limited scope of issues related to the Green Line Extension Project. The Proposed Project, with a Medford Branch terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Although an extension to Mystic Valley Parkway/Route 16 is MassDOT's Preferred Alternative, financial constraints prohibit the Commonwealth from progressing the Project beyond College Avenue at this time.

I-288-003

The Proposed Project offers substantial benefits to environmental justice communities and serves the majority of Study Area environmental justice population zones. As described in DEIR/EA Section 5.4, Environmental Justice, impacts to environmental justice populations would be neither severe nor disproportionate with any of the Build Alternatives.

I-288-004

- The proposed College Avenue station is located adjacent to the already overburdened and difficult-to-navigate intersection of College and Boston Avenue, and siting a terminus there, even temporarily between the construction of the two phases, would only exacerbate the issues at that intersection.

- The intent of this project is to improve air quality by reducing the number of vehicles traveling in the Medford Hillside community. A College Avenue terminus, however, may in fact increase vehicular traffic by bringing an increased number of vehicles onto the narrow roadways of the community to drop off passengers, and also increased bus trips to and from the terminus location.

- The proposed location of the College Avenue is a densely-populated, residential neighborhood, making it ill suited to serve as a terminus location. The more heavily commercial neighborhood of the proposed Route 16 station is more appropriate for a terminus station. Its proximity to Route 16 also creates better opportunities for connectivity to other forms of transportation, and transit oriented development.

I-288-005

In addition, even if funding is found for the second phase to complete the station at Route 16, the two phased approach will significantly increase the costs of the project over a single-phased approach.

I-288-006

Finally, even if built, the proposed Route 16 station design contained in the DEIR is inadequate. MassDOT has acknowledged that the design presented is a "worst case scenario". Alternative designs (such as the one proposed by the Medford Green Line Neighborhood Alliance) would eliminate the need for acquiring two major commercial properties, significantly reducing the property tax and job losses in the community. Such alternative designs should be presented for public review and comment.

In short, a two-phased approach to the Green Line extension is unacceptable, and does not comply with the legal mandate for the project. The Route 16/Mystic Valley Parkway Station should be built as part of a single-phase project to minimize costs and negative impacts and achieve the maximum benefits with regard to ridership, vehicle mile travel reduction, air quality improvements, and service to environmental justice communities.

Based on the foregoing, I strongly urge you to not accept the DEIR as the Final EIR and to require further environmental analysis of the project by MassDOT.

Thank you for your attention.

Yours very truly, .

Laurel Siegel
39 Chester Avenue, Medford

2

I-288-004

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-288-005

Project cost estimates are based on the current, conceptual level of design, and will be further refined as the Project progresses through preliminary engineering. It is anticipated that Green Line Extension construction would be financed with a combination of funds from federal and state sources. Efforts to engage a developer for the North Point development will continue as this Project moves into the next phases of design.

I-288-006

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

Subject: Please extend Green Line to Route 16

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs--MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886

Dear Secretary Bowles:

I'm very much in favor of extending the Green line to Route 16. As an Arlington resident, a T station there would be very convenient. As a member of Sustainable Arlington, we surveyed the town a few years ago to determine public transportation usage. Not surprisingly, upwards of 90% of residents who lived closest to the Alewife station used public transportation, as compared to much less than half through the rest of Arlington where only the bus was nearby. When the subway is easily reached, it offers a fast, convenient and expedient solution for reducing ones carbon footprint. For these reasons, I'd love to see the green line extended to Route 16.

I-289-001 Construction, however, must pay close attention to its affects on the local watershed, and mitigate any damage. The construction of the Alewife T Station still wreaks havoc on Alewife Brook, Spy Pond and other water bodies in the Mystic River Watershed. We must learn from our mistakes there and ensure that our waterways are cared for so we can continue restoration of our lakes, ponds, rivers and brooks to a swimmable and fishable condition.

I-289-002 I-289-003 Parking, traffic and other factors will also need to be properly designed so as to mitigate stress on nearby neighborhoods. Safe pedestrian walkways and bike routes along with plenty of bike racks would help me and many others to be car-free and use this nearby public transportation.

Based on the recommendation of STEP, I'd also like to request the following:

I-289-004 + Design and construct the Mystic Valley Parkway / Route 16 terminus at the same time as the rest of the project.

I-289-005 + Eliminate the Yard 8 Option for the Maintenance Facility and provide a full analysis of Scheme L and the alternate Scheme L designs.

I-289-006 + Commit to a collaborative public process for the next phase that would provide oversight and station area participation and develop a process for addressing mitigation concerns.

I-289-007 + Integrate and extend bike paths, sidewalks, pedestrian cross walks (or add elevated walkways) into the design, planning and funding of the Green Line extension.

Thank you for advocating for this extension to Route 16 as an integral part of the Green Line extension.

1

I-289-001

As described in DEIR/EA Section 5.9, the Project would be required to comply with federal and state stormwater discharge permit requirements during both the construction and operational phases. Compliance with these standards would include using Best Management Practices to prevent contamination of stormwater and control erosion and accretion (sedimentation) from stormwater runoff from the railroad alignment, stations, and maintenance facility.

I-289-002

DEIR/EA Chapter 6 and FEIR Chapter 8 list the traffic and parking measures to which MassDOT has committed to mitigate impacts. These mitigation measures address pedestrian and roadway traffic signal improvement needs, impacts during construction, and parking enforcement coordination. These measures will be further advanced during preliminary engineering.

I-289-003

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary

engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-289-004

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-289-005

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement

during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-289-006

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-289-007

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

Boston, MA 02114

RECEIVED
NOV 17 2009
MEPA

Dear Secretary Bowles,

As a longtime resident of East Cambridge and as President of the East Cambridge Planning Team, I am writing to express my concerns and those I have heard over the years from neighbors about the planned move of the Lechmere T station across McGrath Highway..

I-290-001

Lechmere Square is a major gateway to East Cambridge and an integral hub of our neighborhood. According to reports from those studying area business potential, approximately one million people cross Cambridge Street from the present stop at Lechmere to shop at the Galleria Mall on First Street every year. That number alone, along with residents using public transportation is an inordinate amount of people to cross a major highway.

One of our principal concerns is safety. Crossing a major highway and a busy intersection can present problems for the development of the new station as well as for those using public transportation. We want to be sure that all crossings at Cambridge Street and Monsignor O'Brien Highway are well designed and offer the utmost protection.

I-290-002

Another concern is the design of the station. The preliminary design shown to residents at a recent meeting left much to be desired. Why are we being asked to purchase the Charlie Card while standing out in the elements? There appears to be no lobby in the present plans. Furthermore, the entrance is not convenient to anyone coming from the East Cambridge neighborhood or the Mall. There needs to be more than one entrance and easy access for the handicapped. We sincerely believe that the Green Line and bus station design need to be properly integrated with the future Northpoint street grid. This will further insure safety for those using the bus service and the T.

I-290-003

Last but not least, I would like to see the historic station buildings redeveloped around a new public market square. I firmly believe that this concept could be done with little or no expense to the T. The plan that I am enclosing will minimize the impact on local businesses and residents. A lively square/market area will make crossing two busy streets easier for those using public transportation and will add to the value of the area. Make Lechmere a destination not a transition point.

Thank you for your consideration.

Bette Skandalis
150 Cambridge St. #407
Cambridge MA 02141

I-290-001

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. The chapter presents a traffic analysis, a detailed description of pedestrian crossings of O'Brien Highway, and proposed roadway, crosswalk, and sidewalk improvements that are consistent with the NorthPoint development plans. These station and street plans will be further refined in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-290-002

Revised conceptual plans for Lechmere Station, including modifications to the station headhouse and entrances, enclosed automatic fare collection, and other amenities are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-290-003

As part of the Green Line Extension, MassDOT intends to demolish the existing Lechmere Station and prepare the site for potential future redevelopment. Based on the current requirements of the O'Brien Highway roadway improvements (as shown in FEIR Chapter 5, Lechmere Station), the existing bus shed must be removed.

Boston, MA 02114

Re: Project # EEA # 13886

Dear Secretary Ian Bowles,

As a founding owner and artist of the Brickbottom Artists Buildings I have been living and working here for the past 23 years.
Twenty-five years ago, our community bought these abandoned buildings in an industrial area, bounded on two sides by railroad tracks and towing companies and a waste disposal site on the other side. We have worked hard to change this neighborhood into a vibrant artists community that has transformed this area into a destination for cultural enrichment in Somerville and the Boston area.
We appreciate the possible benefits to our neighborhood of increased access to transportation, as it would save us a twenty-minute walk from the Lechmere train stop. In cold, or stormy weather that twenty-minute walk each way can be brutal, especially for us seniors.
We have been actively involved with this issue since it's inception, have written countless letters, made phone calls, attended meetings, have retained legal counsel, and still it is shocking that Yard 8 is still being considered as a possible maintenance facility.

I-291-001 Has anyone from your organization come out to visit us in our studios and homes here? Have they stood in our homes with our babies and children and heard the existing trains rattle by day and night, or idle on the tracks for an hour or so in the middle of the night? Our building trembles when the trains roll by.
More trains, noise, vibration, and harmful air quality will significantly impact and diminish the already stressful environmental quality of life we have created here.

I-291-002 We are determined to oppose any additional harmful impact on the 220 residents in our community.
Please consider the alternative Mirror H, Option L and other alternate sites.

Cordially,
Beverly Sky

I-291-001

As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds. Additionally, the Project will improve local and regional air quality. The stakeholder coordination process for project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-291-002

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

Johnson, Holly (EEA)

From: naomi slagowski [naomislagowski@gmail.com]
Sent: Thursday, January 07, 2010 9:10 PM
To: Johnson, Holly S (ENV)
Subject: EEA #13886

Dear Ms. Johnson,

I would like to submit comments on the DEIR. The areas that need comment are:

Station Design & Siting

I-292-001 · Green Line stations must connect as seamlessly as possible with all other clean modes of transportation, including current and re- routed buses. Station design should accommodate bus drop off and pick- up (for example, using bus pull-out pockets or curb extensions) with maximum integration of transit modes and minimal street disruption. Optimized bus routes connecting to Green Line stations should be implemented simultaneously with the start of Green Line service, as was done for the Red Line northwest extension.

I-292-002 · Station designs should allow for car drop off, but not parking, and present ease of pedestrian and bicycle access by locating station headhouses on major streets whenever possible, with station access from both sides of the street and in all directions of travel. Sidewalks leading to headhouses should be widened and additional crosswalks considered near stations. This will maximize transit use.

I-292-003 o Mass DOT, working with community representatives should reconsider station designs to maximize ease of access particularly where riders will access stations at overpass bridges to maximize ease of access, efficiency and lower construction costs. Pedestrian and bus access to stations and high station visibility from major streets should be prioritized.

I-292-004 · Stations should provide adequate bicycle storage. This should be calculated based on a percentage of 3 to 5% of boardings at the stations. Bicycle storage should be sheltered from the elements, especially at Route 16, Lowell Street, and Union Square stations, to enable all-weather access.

· The Federal Transit Administration has issued a proposed change to bicycle/pedestrian access to public transportation recognizing the importance of maximizing multi-modal access. The proposed policy states:

For purposes of determining whether a pedestrian or bicycle improvement has a physical or functional relationship to public transportation, regardless of whether it is funded as a capital project or public transportation enhancement, all pedestrian improvements located within one-half mile and all bicycle improvements located within three miles of a public transportation stop or station shall have a de facto physical and functional relationship to public transportation. According to a test of activity and use, pedestrian and bicycle improvements beyond these threshold distances may be eligible for FTA funding if the improvement is within the distance most people can be expected to safely and conveniently walk or bicycle to use that particular transit service. Federal Register: November 13, 2009 (Volume 74, Number 218), http://edocket.access.gpo.gov/2009/E9-27240.htm

·

I-292-005 · The new Green Line stations should be designed with

1

I-292-001

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

I-292-002

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. These stations are designed to be consistent with MBTA standards and compliant with ADA. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-292-003

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

I-292-005 elevators and should not include escalators, which are expensive to install and maintain. Wide staircases and ADA elevator access are sufficient. Reallocate the escalator budget for other station elements recommended in this letter.

I-292-006 · Constructi the new station platforms with ADA-compliant level boarding for low-floor Green Line cars that have sliding rather than accordion doors currently used on Green Line cars.

I-292-007 o System-wide accessibility should be the goal of the MBTA. To accomplish this the MBTA should replace accordion-style Green Line car doors with sliding doors that are compatible with level boarding. Raise all other station platforms in the Green Line system for level boarding, and order sliding doors in the new Type 9 rolling stock and retrofit all existing Green Line cars. This system-wide change would eliminate the need for time-consuming wheelchair ramps and mobile wheelchair lifts, while speeding up all passenger boarding.

I-292-008 · Station and station area designs must be developed through a formal and interactive community participation process to ensure that they fit into existing
I-292-009 neighborhoods and support appropriate future mixed use development. Takings should be minimized to save the state money and to preserve land uses.

I-292-010 · Design for the relocated Lechmere Station should pay particular attention to the East Cambridge Planning Team's pedestrian- friendly area design ideas and old Lechmere Station re-use suggestions. The terminus at Route 16 should incorporate MGNA's ideas for minimizing takings.

I-292-011 · Station design and siting should involve active participation of knowledgeable transportation accessibility advocates to ensure accessibility requirements are adequately addressed.

Community Path Integration & Preservation of Corridor Transit Potential

I-292-012 · Track design and construction should enable adding future stations - between Lechmere and Washington Street / Union Square, between College Avenue and Route 16, and along a future Green Line extension to Porter Square that could serve both Cambridge and Somerville neighborhoods.

I-292-013 · The Community Path and its important station connections must be designed and constructed simultaneously with the Green Line extension in order to facilitate direct pedestrian and bicycle access to the stations and to ensure a safe, attractive, and highly- functional Community Path.

Economic Development & Regional Corridor Planning

I-292-014 · Track, station and Green Line corridor area designs must provide full roadway and community access to Brickbottom Inner Belt and Lechmere Station through reconstruction of Route 28 as a neighborhood and local business friendly surface boulevard that serves pedestrians and bicyclists as well as cars. Improved connectivity between both sides of Route 28 is crucial for economic development, pedestrian station access, and improved quality of life.

I-292-015 · State and other leading Transit-Oriented Development guidelines should be utilized to promote strategic regional economic development within a mixed use context in the Brickbottom Inner Belt and Union Square Boynton Yard districts. Maintaining diversity in people and businesses while improving the natural environment is critical. Access to open space and greenery promotes health.

2

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-292-004

The amount of bicycle storage at each station is based on ridership projections developed by CTPS. DEIR/EA Appendix D includes the methods CTPS used to analyze demand for bicycle parking. Detailed bicycle parking designs will be further developed during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

I-292-005

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. These stations are designed to be consistent with MBTA standards and compliant with ADA. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-292-006

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. Designs for each station will be further developed during the Project's preliminary engineering stage. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities

I-292-016 · The design and siting of the maintenance facility should not prevent development of a street grid in Inner Belt/Brick Bottom that enables access from North Point, McGrath-O'Brian Highway and Washington St.

I-292-017 Maintenance Facility & Regional Environmental Justice
· More detailed analysis of Mirror H, Option L and Option L alternative is necessary. The siting of the maintenance facility and storage yards should not increase the transportation infrastructure and environmental burdens in Somerville or interfere with proposed economic development in the Brickbottom Inner Belt area.

I-292-018 · Current use of the Boston Engine Terminal for the maintenance of diesel engines serving the commuter rail network south of Boston needs to be phased out and a new facility built south of Boston to eliminate the unsustainable and unjustifiable shuttling of trains through Cambridge.

I-292-019 Public Participation
· A project-wide Citizens Advisory Group should be maintained throughout detailed design, engineering, construction and start-up phases with smaller local advisory groups established to work with the MBTA and consultants to address specific station design, land use, connectivity, and construction and mitigation issues.

· A procedure for determining remedies and/or compensation, incorporating community representation, should be required to handle instances when project mitigation proves insufficient to meet pre- agreed impact standards for noise, vibration, pollution and other environmental burdens.

I-292-020 · MEPA should require collaborative planning, with community involvement and public coordination that should intensify immediately, before this project progresses and require that senior project staff work our of a centrally located field office to maximize access.

Public Comment Process
Public comments on the DEIR/EA should be made to the Secretary of Energy and Environmental Affairs, through the Commonwealth's MEPA process. The federal government conducts its own review of the document to ensure adequacy of the document under the federal National Environmental Policy Act (NEPA) process, and accepts public comment to the NEPA process in two ways:

First, the comments made at the November 18 Public Hearing will be included in a transcript that will be submitted to the Federal Transit Administration (FTA).

Second, EOT will compile the comment letters submitted through the MEPA process, along with responses to these comments, and provide them to the Federal Transit Administration after the completion of the DEIR comment period.

There has been considerable discussion about whether to accept the DEIR as a Final Environmental Impact Report (FEIR) or to require that it be treated as a DEIR and demand that changes be made in a subsequent FEIR.

To avoid the significant delay that a separate FEIR would entail, the most critical issues with the DEIR could either be addressed in a Supplemental EIR, or in Addenda to the FEIR. These issues include:

I-292-021 § Eliminate the Yard 8 Option for the Maintenance Facility and

3

Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. Specific design details and station elements will be further developed during preliminary engineering. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access. The process for stakeholder coordination during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-292-007

The Green Line Extension Project is being designed for fully accessible stations in compliance with ADA requirements. However, the issue of systemwide level boarding on the Green Line and modifications to existing vehicles is beyond the scope of this Project.

I-292-008

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-292-009

DEIR/EA Section 5.2 describes the Project's potential acquisitions. MassDOT is currently conducting detailed property surveys to obtain more specific data. MassDOT will continue to evaluate opportunities to minimize these property impacts.

I-292-010

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. In accordance with the Secretary's Certificate on the DEIR/EA, the FEIR (Chapter 5, Lechmere Station) includes only conceptual station designs. Plans for stations, the

I-292-021 require a full analysis of Scheme L and the alternate Scheme L designs.

I-292-022 § Commit to a collaborative public process for the next phase that would provide oversight and station area participation and develop a process for addressing mitigation concerns.

I-292-023 § Integrate the Community Path into the design, planning and funding of the Green Line extension.

I-292-024 § Coordinate the Green Line extension with calming of the McGrath/O'Brien Highway in Cambridge & Somerville.

I-292-025 § Designing and constructing the Mystic Valley Parkway / Route 16 terminus at the same time as the rest of the project.

Thank you,
Naomi Slagowski
Somerville

storage and maintenance facility, and all project elements will be refined during the preliminary engineering stage of the Project. MassDOT intends to demolish the existing Lechmere Station and prepare the site for future redevelopment. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during project design.

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-292-011

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. Designs for each station will be further developed during the Project's preliminary engineering stage. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. Specific design details and station elements will be further developed during preliminary engineering. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access. The process for stakeholder coordination during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-292-012

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

I-292-013

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-292-014

DEIR/EA Section 3.9 describes the compatibility of the Green Line Extension with other regional projects, such as the conceptual reconstruction of McGrath Highway and the Urban Ring transit corridor initiative. MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses to ensure, to the extent feasible, consistency with planning and other projects.

I-292-015

Direct and indirect impacts to land use are described in DEIR Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for smart growth land use, which would reduce automobile traffic congestion and improve air quality.

I-292-016

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. The evaluation considers land use and connectivity impacts and opportunities associated with each maintenance facility site alternative.

I-292-017

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-292-018

The Boston Engine Terminal (BET) and major modifications to its operations are beyond the scope of the Green Line Extension Project. MassDOT will continue to coordinate with the MBTA to explore

possibilities for shared facilities between the Green Line Extension storage and maintenance facility and the BET.

I-292-019

MassDOT and the MBTA conducted a series of public workshops to gather input on land use and facility design issues from the communities. The workshops were organized around facility locations or groups of locations. All were well-advertised, open to the public and in accessible venues.

I-292-020

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-292-021

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-292-022

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-292-023

MassDOT has committed to complete the final design of the proposed

Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-292-024

DEIR/EA Section 3.9 describes the compatibility of the Green Line Extension with other regional projects, such as the conceptual reconstruction of McGrath Highway and the Urban Ring transit corridor initiative. MassDOT has and will continue to coordinate with state and local agencies at appropriate milestones as the Project progresses to ensure, to the extent feasible, consistency with planning and other projects.

I-292-025

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

The Executive Office of Energy and Environmental Affairs
MEPA Office
Attention" Holly Johnson, MEPA Analyst
#13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Ian Bowles,

I am an artist, one of the founders of the Brickbottom Artists' Building, and have been an owner of one of the studios here. While I appreciate all of your efforts on behalf of the community to improve public transportation in this area, I have deep concern regarding the proposal to create a maintenance facility in "Yard 8".

When my fellow artists and I developed this now vibrant artists' community in 1988, the area where this former A & P building is located was indeed an industrial wasteland. Since that time, I have seen huge changes---the parts of Cambridge and Somerville that abut this property have become essential commercial enterprises that serve residents and workers in the area. There are gardens and green spaces here. The city of Somerville has sponsored arts festivals under the McGrath Highway overpass and in Union Square. We have worked to enrich the land in the Brickbottom environs; our open studios events have contributed to the cultural life of this community. What we dared to hope for in establishing viable live-work space for artists is now a reality.

I-293-001

The proposal for siting of Yard 8 has ignored required land use studies and serious consultation with its Citizen's Advisory Group. It will deprive the city of Somerville the possibility for future development and revenue, create noise, vibrations, and poor air and light for its abutters, and drastically change the character of a rich urban community.

I hope that you and your colleagues will seriously reconsider your proposal, keeping in mind the need for including community involvement in this important plan in order to preserve good health, feasible solutions for abutters to a maintenance yard, and respect for the aesthetic and environmental impact of any proposed transportation project. So many of us have worked hard to create a beautiful neighborhood. Placing a maintenance facility and storage yard next to Brickbottom would be ruinous.

Again, thank you for your commitment to public transportation and your willingness to read this letter.

Sincerely,

I-293-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

Johnson, Holly (EEA)

From: irilyth@swarpa.net on behalf of Josh Smift [irilyth@infersys.com]
Sent: Friday, January 08, 2010 12:01 PM
To: Johnson, Holly S (ENV); Fichter, Katherine (DOT)
Subject: Comment on the DEIR for the Green Line Extension

Greetings! I'm a homeowner on Irvington Rd in Somerville, very near Rt 16 and Boston Ave, and I wanted to write in with a comment about the DEIR for the Green Line Extension, EEA #13886.

I-294-001

I'm disappointed that the report recommends terminating the line at College Ave, even temporarily (which often has a danger of becoming "permanently"). Terminating the line at College Ave would not serve my neighborhood, and seems likely to burden my neighborhood with increased traffic congestion, pollution, and additional years of construction impact. The report makes it clear that extending the line to Rt 16 is the preferred option, and I strongly believe that option should not be compromised.

I-294-002

I urge you to please reject the recommendations in this version of the DEIR to terminate the line at College Ave; and to instead require MassDOT to build the full Green Line Extension to Route 16 by December 2014.

Thank you for your time.

-Josh (irilyth@infersys.com)

1

I-294-001

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-294-002

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

Dear Secretary Bowles -

I am writing to express my concern about the Yard 8 location for the maintenance yard / facility next to Brickbottom. First, I want to make clear my support for the green line extension itself. I am thrilled about that. But a maintenance facility RIGHT NEXT to Brickbottom threatens to decimate a long standing community that has contributed for many years to Somerville's economic, artistic, and social well being. I would rather advocate for the Mirror It or Yard L location.

Sincerely,

Sam Smiley

I-295-001

I-295-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

Dear Secretary Bowles:

I am writing in regards to the Draft Environmental Impact Report on project Number EEA#13886.
I am a resident of the Brickbottom Artists Buildings.
The three Brickbottom Artists Buildings do not house just a group of 200+ residents. The residents form a community that for over 20 years has supported environmental protection through our actions and our choice of life style.

I-296-001

It is exciting that the Green Line Extension will finally come to Somerville and beyond. I strongly support the Green Line Extension. I do not support the siting for the Heavy Maintenance and Storage Facility on Yard 8. I am encouraged that in response to community meetings and community feedback, Mirror H and Option L were included as options. Especially as no matter what community group has spoken, Yard 8 remains completely unacceptable. There are several reasons for this consistent and unanimous chorus of "NO".

I-296-002

Somerville has the lowest tax base in Massachusetts. The Inner Belt is the last parcel of land for economic development in Somerville. Yard 8 would preclude successful and inclusive development of the Inner Belt properties. The Inner Belt being completely cut off from the rest of East Somerville would negate Somerville's benefits from the Green Line Extension. In addition to the economic ramifications, the neighborhood would be permanently fractured.

The Secretary's Certification (EENF, Environmental Justice, p.9) states "no segment of population should be denied environmental benefits, or should bear disproportionate burden of environmental impacts.' As one of the 200+ residents of Brickbottom Artists Building, how will I see environmental benefits? As the only residents in the Yard 8 area, we will certainly "bear disproportionate burden of environmental impacts. Toxins dispersed from the ground during construction

I-296-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-296-002

Socioeconomic impacts, including projected effects on businesses, jobs, tax revenues, and community disruptions, are described in DEIR/EA Section 5.3, Socioeconomic Impacts. Effects on land use and transit access are discussed in DEIR/EA Section 5.2, Land Use, and Section 5.15, Indirect and Cumulative Effects. As required by the Secretary's Certificate on the DEIR/EA, additional analysis of the socioeconomic effects of the maintenance facility alternatives are described in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. A series of Project workshops will provide opportunities to discuss broader impacts of the Project on job creation, economic development, housing affordability, and other community impacts.

will compromise my health, which I have so carefully tended to over 60 years. In addition, noise, light, and vibration 24 hours a day, 7 days a week, 50 feet from my building, would force me to stay inside with my windows closed. In order to sit in our beautiful garden, which the residents planted and maintain, I would need earplugs and an environmental mask.

The value of my property will decrease substantially. I knowingly chose to live in a "mixed-use" area. I knew and accepted the current trains and accompanying noise. I personally maintain one of the gardens along the Commuter Rail tracks. No amount of beautification, Love, and care will mitigate the disastrous impact of a Yard 8 siting of the Maintenance Facility on my home. Property values will be driven down and not only will I suffer financially but also my children as will.

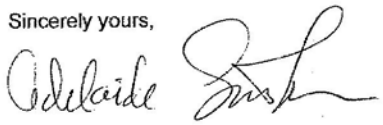
In closing, a couple of questions.

I-296-003 Will you have a Citizen Advisory Committee?
Will you not only listen to feedback but also continue to study Mirror H and Option L to assess the appropriateness of either? As you must be aware, Mirror H is the City of Somerville's choice.

I-296-004 Will you, after considering all the problems in the DEIR, stop the project from going to a Final ETR in regards to the Maintenance Facility? Clearly, there is a vital need for much more research and consideration before a final decision is made on this project.

Thank you for your time and your interest,

Sincerely yours,



Adelaide Smith

I-296-003

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project. As stated in Section 6.4, MassDOT and the MBTA will convene a Green Line Extension Design Working Group. This group will advise the agencies on design workshops, participate in the workshops and serve as a corridor advisory group during design.

I-296-004

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

Re: Green Line Extension DEIR on Project No. EEA#13886

Dear Secretary Bowles:

I am a long-time resident of Somerville and the Brickbottom community on Fitchburg Street (over 20 years). I am very happy to hear of MassDOT's decision to extend the Green Line into Somerville. This will bring new people, home-buyers and businesses, into the area, and it will have quite a beneficial impact on the City of Somerville and our neighborhoods. However, I was and am distressed to learn that a future Green Line maintenance facility is proposed right next door to my property at Brickbottom (Yard 8). This 24-hour facility will produce vibration, light, and sound that will have a negative impact on my life and on the lives of my long-time neighbors—so much so that I fear we will have to leave the area entirely. After 20 years of residency, I do not want to do this. Brickbottom is a wonderful community of over 200 artists, families, and committed citizens. I myself have served on the Somerville Arts Council, and I have been involved in city-wide festivals and YMCA events. Brickbottom brings in hundreds of visitors to its Art Gallery and its two Open Studios events every year. Now many of its residents' very livelihoods are threatened by the Yard 8 expansion, and, by its very presence, that facility will reduce the value of my property (I am a teacher and a writer). I may not be able to recoup my initial property investment, and this is not a happy thought.

However, I am very pleased that you have listened to my and my neighbors' concerns about Yard 8. It gives me great hope that perhaps the alternative sites, Option L and Mirror H, will be explored more fully and evaluated in detail. Option L, although it has yet to be evaluated in any real detail, at face value seems the most thoughtful and logical place for the proposed facility simply

I-297-001

I-297-001

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-297-001

because it would have no obvious negative impact on any present resident of Somerville. Thank you very much for being open to this possibility.

I-297-002

In any case and at the very least, I hope that you will, in your exploration of these alternative facility sites, also consider a detailed cost analysis of noise and vibration mitigation costs for both the construction and permanent phases of the project. Although I do not want to consider the possibility that you will choose to continue with the Yard 8 expansion (I am heartily against it for personal and professional reasons), I do want to do everything possible to mitigate the negative effects of this proposed facility upon my life. The DEIR report currently does not fully allow for noise barriers or containment in relation to the storage yard, and only 40 out of our 155 residences are designated for soundproofing. I hope that you will study the mitigation requirements more fully and consider the permanent impacts by supporting a complete cost analysis with deadlines for fulfillment. Please minimize the impact of this facility and the storage yard on people.

I ask you to think, also, of the potential revenue growth of the Brickbottom area. Not only will the proposed Yard 8 site for the maintenance facility and storage yard produce noise, light, and vibration abhorrent to anyone living around it, but it will build a barrier between Brickbottom and the Inner Belt so that any future businesses and residential development in this area will be stopped cold. There will be no future tax revenues for the City of Somerville, and any adjacent future growth potential (and growing property values) will be irrelevant.

Again, I am very much in favor of the Green Line Extension, but I do feel that the proposed Yard 8 site for its Maintenance Facility and storage yard is not the most beneficial for the City of Somerville and certainly not for the residents (me) of Brickbottom. I so much appreciate your continued consideration of alternatives to Yard 8 and your continued awareness of the impact of any facility such as you suggest on surrounding neighborhoods.

Thanks very much.

Sincerely,

Kate Snodgrass

I-297-002

As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds. FEIR Chapter 8 describes specific proposed mitigation measures, plans for monitoring after construction, and next steps pertaining to mitigation. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

January 7, 2010

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA #03886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-298-001 As a resident of the Glass Factory Condominiums, I am deeply concerned about the design and placement of the Green Line Extension and the new Lechmere Station.

TRACKS ARE TOO CLOSE TO OUR BUILDING.
The present design shows the tracks running very close to the rear of our building. We urge your designers and engineers to place the tracks as far to the rear of our building as possible to preserve views & light to the many units that will be severely impacted by the elevated tracks. The design and placement of the tracks and supports should do all it can to minimize the visual impact to those units and also minimize noise & vibration impacts to the whole building as well as the surrounding neighborhood.

LECHMERE STATION.
At present, your designs show the new Lechmere Station so close to the Glass Factory that it appears to be part of our condominium building. Please move the station closer to East Street, where it could be part of the entrance way to the eventual North Point development. The station design needs to be substantially improved so it is not an eyesore but rather an enhancement to this rapidly developing neighborhood. It should reflect the importance of this location as the gateway between Cambridge & Boston.

BUS TRAFFIC.
The many bus lines that converge on Lechmere Station are presently designed to enter at one end of our building, pick up passengers, and emerge at the other end of our condo building. Please do not route bus traffic, directly under our windows. Bus traffic noise, vibrations and fumes are a great concern. Sidewalks where passengers wait, should also be moved farther from our building to preserve our privacy and minimize impacts from noise, light and smoking. If too close, it will feel like we are living in the bus station.

PRESERVE OUR TREES & GREEN SPACE.
Presently there is a row of mature evergreen trees behind our building. I urge you to preserve all these trees and the entire small green space behind our building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks should be on the far side of the large trees. These trees serve as a natural screen for the tracks and busway.

I-298-001

Please see Comment Letter I-013.

MAINTENANCE FACILITY.
I strongly oppose the Mirror H location. It is much too close to the Glass Factory and other residential buildings and will effectively destroy further development in North Point. Putting a maintenance facility on prime land in a desirable, developable location that would generate significant tax revenue to Cambridge simply does not make sense. Of the three options proposed, Option L seems to be the best choice however I would prefer there be no maintenance facility in this area but rather it be at the end of the line.

REDUCE SURFACE PARKING.
The present Lechmere Station is at the end of the Green Line. That will no longer be the case with the new Green Line Extension and the number of parking spaces should be substantially reduced. Please consider using the under-utilized parking garages that are already in this neighborhood. Surface parking is bad urban design and should be minimized in the new North Point neighborhood. One half of our building will overlook the new parking and we request it be carefully designed with this in mind. Ample green space should be included in the design and all lighting should be down lighting that minimizes light pollution to our building.

Thank you for hearing my concerns.

Sincerely,

Signature

Subject: FW: Somerville resident comments: Green Line Extension Draft EIR (EEA #13886)

January 8, 2010
Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson (holly.s.johnson@state.ma.us)
100 Cambridge Street, Suite 900
Boston , MA 02114
Reference: Green Line Extension Draft EIR (EEA #13886)
Dear Secretary Bowles:
This letter is in reference to the proposed Green Line development into Somerville and Medford.
First: I want to thank you for asking for community input on this project, and for taking the time to read my comments and the comments of my fellow residents. I want to assure you that I strongly support the Green Line extension to Somerville and Medford, as well as the extension of the Somerville Community Path to Lechmere.

I feel, however, that important changes to the proposal are needed to ensure the projects are done in the best way for all concerned.

I-299-001
- First, and perhaps most forcefully, I feel that the Yard 8 option for the T Maintenance facility should be permanently shelved. Placing the maintenance facility at Yard 8 will prevent much-needed economic development of this area, depriving Somerville of the possibility of desperately-needed urban commercial infrastructure in the area. It will also permanently prevent the Inner Belt's integration into the rest of the region. Instead, I strongly urge that there be a full analysis of the other locations: Mirror H option, Option L and the alternate Option L-BET. The placement of this facility is one of the most important issues in this project, and Somerville's and the area's economic, environmental and residential must be front and center when this decision is made.

I-299-002
- Please ensure that the MassDOT clearly states that the Community Path extension will be designed by MassDOT's contractors, as agreed to in a February 24, 2009 letter from the former EOT.
- The Green Line and Community Path extensions should be constructed as one project and must clearly be described as such by MassDOT. This is critical to ensure both projects' cost-efficiency and technical feasibility.

I-299-003
- Please ensure that MassDOT works with Somerville and other state and federal agencies to obtain the necessary funding to build the Community Path extension as part of the Green Line extensions, including applying for federal funding. Note that this was done with the Linear Park as part of the Red Line and the Southwest Corridor path as part of the Orange Line. Please ensure that funding for this project is consistent with the way these others were done!

I-299-004
- Please be sure to design and construct the Mystic Valley Parkway/Route 16 terminus at the same time as the rest of the project. It makes no sense to stop at College Ave. and plan on continuing the T to Rte. 16 in some future "Phase 2." It will only cost more money in the long run. More seriously, it runs the risk that the T Rte. 16 extension won't happen at all.

I-299-005
- Please design and construct the Union Square station so that it can be extended to Porter Sq. in the future, despite the lack of plans and funding for an extension right now. As all developers know, it makes sense to build the right infrastructure for future expansion so that when the will is there, the way will be too.

Again, I thank you very much for taking the time to read these and other comments. The extension of the Green Line and Community Path will give a tremendous boost to our communities' efforts to increase public transportation accessibility, reduce traffic congestion and air pollution, create jobs, enable the development of revenue- and quality-of-life-enhancing infrastructure, and make our communities healthier places to live. I eagerly await the next phase of the project!

Yours truly,
Barbara Steiner, EdM

I-299-001

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-299-002

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-299-003

Please see response to Comment I-299-002.

29 Quincy St., #2
Somerville, MA 02143
bsteiner@partners.org

The information in this e-mail is intended only for the person to whom it is addressed. If you believe this e-mail was sent to you in error and the e-mail contains patient information, please contact the Partners Compliance HelpLine at http://www.partners.org/complianceline . If the e-mail was sent to you in error but does not contain patient information, please contact the sender and properly dispose of the e-mail.

I-299-004

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-299-005

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

Boston, MA 02114

January 3, 2010

Dear Secretary Ian Bowles:

I am writing in reference to Project Number EEA #13886. As an artist resident of the Brickbottom Artists Building, who is in favor of the Green Line extension, I would like to thank you for hearing our opinions as well as those of our neighbors in Somerville, Cambridge and Medford concerning the DEIR report, and for the resulting more detailed evaluation of the Mirror H and Option L alternatives to Yard 8. I believe public involvement is very important to the success of this project and urge you to keep the MEPA process open, so that community participation can continue.

I-300-001

My biggest concern as the project goes forward is the health and quality of life for our unique community of 220 residents - many of whom live, work and raise children here. Before the first bulldozer hits the ground, I would like to see a detailed investigation of hazardous waste and soil contamination. Over the years many trains with asbestos brakes have past and idled on these tracks. Some of these trains had container cars filled with hazardous materials. If there are remaining particulates to be released into the atmosphere, the threat of cancer and other diseases will be increased for our community and to the employees of businesses located in the area. I have already watched my husband suffer from lung cancer and would hate to see this befall anyone else. How will you protect us, if this is a serious danger?

I-300-002

Noise and vibration must also be seriously considered. The addition of tracks 18 feet from the building as well as a Maintenance and Storage Facility would bring more noise to the already existing noise from the commuter lines, the Boston Engine Terminal and the McGrath Highway, which together would make our lives unbearable. I would like to see an in depth study of the potential of hearing loss and other ailments relating to excessive noise and vibration.

I-300-003

In regards to these issues I believe that Yard 8 should be removed from the options. Mirror H is the preferred choice. Option L has potential, but much needs to be clarified and discussed. In conclusion the issues that concern me are the chemical pollution and contamination of the soil from Brickbottom to Lechmere and the noise and vibration from the Greenline Extension and the proposed Maintenance and Storage Facility. Because the Brickbottom buildings will be in the center of this activity, it is imperative that a complete and satisfactory analysis of health hazards and effective mitigation is done before the project proceeds.

Thank you for your consideration.

Sincerely,

Martha Stone

I-300-001

An analysis of hazardous materials potentially present within the Green Line Extension Study Area is provided in DEIR/EA Section 5.14, Hazardous Materials. Additional investigation may be conducted during the next phases of the Project to determine the nature and extent of any contamination and remediate any sites as appropriate. This work would be conducted in accordance with the Commonwealth's Massachusetts Contingency Plan requirements.

I-300-002

As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds. FEIR Chapter 8 describes specific proposed mitigation measures, plans for monitoring after construction, and next steps pertaining to mitigation. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-300-003

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Mirror H location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

Dear Secretary Bowles,

As a founding member of the Brickbottom Artists Building I am writing with my praise and concerns about the Green Line Extension Project (#EEA 13886). While we are delighted to be connected by the MBTA we are horrified to find that our residential building is the site for the proposed maintenance facility and car storage yard.

I have followed the web site information you have provided and looked at the maps. I oppose the siting of the storage yard and maintenance

I-302-001

I-302-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

facility at yard 8. It is too close to people living in Somerville and divides our community, building a barrier between Brickbottom and the Inner belt, impacting potential future development. The noise and vibration issues from this 24 hr. facility and the storage yard (which according to the DEIR report doesn't have noise or containment provisions!) is not acceptable.

The fairest of the options - Minor H would have Cambridge and Somerville sharing the yard and storage area. At sites these structures furthest from residential dwellings. Option L, the alternate option would also work if the parking was reconfigured so that the storage lot could be set further away from Brickbottom. However, this probably will not solve the noise of track switching that will be continuous when cars are stored.

I-302-002

The comment is referring to the double crossover located between Sycamore Street and Central Street. This crossover cannot be on a curve and there are curves to the north and south. This crossover will be used by Green Line vehicles in the rare instances a vehicle is disabled and other vehicles need to pass. There will be no emergency drills or practicing, late night or otherwise, that will involve the double crossover. A noise barrier is proposed on both sides of the ROW to mitigate any track noise in this area.

I-302-003

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-302-004

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement

I also want to speak out about the emergency reverse track cross over that the Green Line proposes between Sycamore and Central Streets. I have the privilege of living on Willoughby St abutting the tracks as well as having a studio at Brick Bottom. The proposed cross-over is literaly in my back yard and I imagine that there will be emergency drills at night when the track is not in use. Can there be an alternative site for this switch and if not - will there be noise mitigation and reasonable rules about practice?

I-302-002

I am asking that the Green Line project continue to meet with the Community and take into account our feed back. The process should

I-302-003

I-302-004

during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-302-004

include a supplemental EIR for the maintenance facility. As I understand it, the project can meet its deadlines separate from the maintenance facility which has grown from the light maintenance originally proposed.

Thank you for giving me an opportunity to comment,

Susan I Strauss

Subject: Green Line Extension Draft EIR (EEA#13888)

Dear Secretary Bowles,

I am looking forward to the Green Line Extension. I want to thank you again (I wrote you a letter as well) and add a postscript e-mail with some further comments concerning the Green Line Extension Draft EIR. (EEA #13886).

I have received an e-mail from the Community Path; bike path folks and I have to say, I agree with them that the design of
the stations and the bike path should be linked. They have lots of practical ideas. After all, the point of the extension is to improve the transportation system, the urban/suburban environment and increase train ridership. If you include funding for the bike path as part of the Green Line Extension Project, the input from bike riders will assist the improvement of the
transportation system around actual rider's needs and experiences, the environment wins and you will get a more functional system and more riders!

I-303-001

In an e-mail from Kate Fitcher for the Green Line, I was told that the designs for the path and Green Line were separate. Therefore, there is no clear way for me to see what my back yard will look like for all the future years I live there! I thought, well that's just the way it is. Now I realize that this is not a good way to to get this project done! I am asking that the final EIR not go forward without further design and that community input continue to shape the design process. I am also asking that the MassDOT obtain funding for the Community Path and that their contractors design the bike path in conjunction with the Green Line Extension as previously agreed to in a letter dated 2-24-09 from former DOT. I believe that joining the two projects, as was done for both the Red and Orange Lines will save money. Finally, homeowners along the path will have improved quality of living instead of resenting unfulfilled promises.

Sincerely,
Susan Strauss

I-303-001

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

The Executive office of Energy and Environmental Affairs
MEPA Office

Boston, MA 02114

December 21, 2009
Dear Secretary Ian Bowles,

I wanted to thank you for the immense amount of work and effort that has gone into the Green Line Extension Project to date. As a long time Somerville resident and a lifelong non-driver, I am pleased to see that real usable public transportation is being seriously considered for East Somerville.

I-304-001 However, as a resident of the East Somerville area, I am seriously concerned about the proposal to place the maintenance facility within 18 yards of Brickbottom, a vibrant community of artists, professors, families, children, health professionals, scientists, and others. We at Brickbottom, hope to be part of a burgeoning community, to realize real community expansion and growth that invites our neighbors from every direction and I envision plenty of pedestrian activity with small businesses such as book stores, coffee shops, and restaurants like many of our neighbors' squares - I do not picture a location for a large maintenance facility that will truncate us from the rest of the city.

I-304-002 And as you can imagine, the proposed location of the 24 hour maintenance facility at Yard 8 will greatly impact our community by adding unwanted noise, pollution, light, and traffic both foot and car during working hours (24 hours!) and even more injuriously, we will be impacted during the building of this facility that we do not want here, especially as we do not have a comprehensive mitigation proposal that is acceptable to the community – only forty windows out of 155 units to get soundproofing is not enough. The current proposal clearly does not fully address the full impact of noise, vibration, dust, pollution, or light that residents will have to tolerate daily and endlessly hereforth should the project be accepted.

Furthermore, this proposal serves to add insult to injury to this diverse community that already is burdened by multiple inequities including noise and pollution from railroad tracks on two sides, highway on one side, a trash facility, and multiple large vehicle sites. While this may seem to be the perfect place to add more unwanted facilities because of just this, I am asking that you curb the inequities this community already tolerates because enough is enough. It is somewhat daunting to think that a committee feels that a site located right next to a community of over 200 residents including children and seniors would be ideal for a large train maintenance facility. It is further appalling to think that the committee wants to place a facility right next to the only residential community in the area when there seemingly appears to be so much around this very area that does not
I-304-003 abut a residential building. I applaud the search for alternative locations and strongly encourage continued study of Mirror H, Option L, and other alternative sites in consideration for our quality of life and for the quality of Somerville's communities.

Thank you for your continued consideration to our concerns.

Sincerely yours,

Pamela Su
1 Fitchburg St. C13
Somerville MA 02143

I-304-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-304-002

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-304-003

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the

evaluation, Option L is identified as the preferred maintenance facility site.

Subject: Green Line Extension

I-305-001

Dear Ms. Johnson,
I support the Green Line Extension to Route 16.
We recently purchased a house in Medford,
and since I don't have a car, part of the house's appeal
was the potential for a Green Line extension.
I am also a voice teacher working out of the home and
it would greatly improve my business if non-driving
students could get to my home more easily.

Thank you,
Anita Suhanin

1

I-305-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

Dear Secretary Bowles:

I-306-001 I am an owner at the Glass Factory Condominiums. When I bought my two units in 2005, I was given a book showing the proposed move of the Green Line Extension which in part influenced my decision to buy in the Lechmere area. It showed a beautiful station with trees and lawn all around. I was impressed as we all know how the existing Lechmere Station looks. I lived in Beacon Hill for 19 years so know the area well.

The whole area was changing for the better with new condominiums replacing derelict old buildings, vast improvement in green space and a beautifully designed new Green Line station. It was a good place to invest. With the current proposed changes to the station/extension, I am sure my property value will be negatively instead of positively affected what with trains, busses, elevated track and masses of parked cars so close to our building. This is not what I expected and planned for and does not have to be.

I am extremely concerned and upset about the proposed changes. When one looks out my windows on the 7th and 8th floors there will be vast parking spaces instead of green space and a less than attractive station. With the station 30-50 feet from the building, the noise level will be intolerable. The plans must be changed.

Following is a detailed list of my concerns:

EXTREME NOISE & VIBRATION

I-306-002 I am extremely concerned about the noise and vibration from trains & busses. The DEIR lists us as SEVERELY IMPACTED. Adequate mitigation may not be possible. The T must do everything it can to reduce impacts. They may need to give us new windows, insulation, etc. since there is not enough space to build a sound barrier wall behind the building. I lived on Beacon Hill when the T had to spend a lot of money trying to

I-306-001

Please see Comment Letter I-013 for responses to this form letter, and the additional response below.

I-306-002

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-306-002

decrease the sqeaking noise made by the trains as they left Charles Street Station and entered the tunnel under Beacon Hill. It would be prudent to avoid the same type of problem and expense by being proactive and changing the existing plans.

TRACKS ARE TOO CLOSE TO OUR BUILDING
The present design shows the tracks running very close to the rear of the Glass Factory building. I urge your designers and engineers to place the tracks as far to the rear of our building as possible to preserve views & light to the many units that will be severely impacted by the elevated tracks. The design and placement of the tracks and supports should do all it can to minimize the visual impact to those units and also minimize noise & vibration impacts to the whole building as well as the surrounding neighborhood.

LECHMERE STATION
At present, your designs show the new Lechmere Station so close to the Glass Factory that it appears to be part of our condominium building. Please move the station closer to East Street, where it could be part of the entrance way to the eventual North Point development. The station design needs to be substantially improved so it is not an eyesore but rather an enhancement to this rapidly developing neighborhood. It should reflect the importance of this location as the gateway between Cambridge & Boston.

BUS TRAFFIC
The many bus lines that converge on Lechmere Station are presently designed to enter at one end of our building, pick up passengers, and emerge at the other end of our condo building. Please do not route bus traffic, directly under our windows. Bus traffic noise, vibrations and fumes are a great concern. Sidewalks where passengers wait should also be moved farther from our building to preserve our privacy and minimize impacts from noise, light and smoking. If too close, it will feel like we are living in the bus station.

PRESERVE OUR TREES & GREEN SPACE
Presently there is a row of mature evergreen trees behind our building. I urge you to preserve all these trees and the entire small green space behind our building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks should be on the far side of the large trees. These trees serve as a natural screen for the tracks and busway.

MAINTENANCE FACILITY
I strongly oppose the Mirror H location. It is much too close to the Glass Factory and other residential buildings and will effectively destroy further development in North Point. Putting a maintenance facility on prime land in a desirable, developable location that would generate significant tax revenue to Cambridge simply does not make sense. Of the three options proposed, Option L seems to be the best choice, however I would prefer there be no maintenance facility in this area but rather it be at the end of the line.

REDUCE SURFACE PARKING.
The present Lechmere Station is at the end of the Green Line. That will no longer be the case with the new Green Line Extension and the number of parking spaces should be

substantially reduced. Surface parking is bad urban design and should be minimized in the new North Point neighborhood. One half of our building will overlook the new parking and we request it be carefully designed with this in mind. Ample green space should be included in the design and all lighting should be down lighting that minimizes light pollution to our building.

This whole area is becoming a wonderful, beautiful addition to the City of Cambridge. The new and/or renovated condominiums, the park by the Charles River, the new hotels and a redesigned Green Line Extension should increase property values, hence tax revenue to the city. The plans as they stand now for the Green Line Extension are unacceptable and need to be changed. Please contact me if you need more input and send me any public notices or updates.

Sincerely,

Linda Tamulaites

I-308-001 I am writing as a planner with more than 25 years of experience, as the former advisor on Sustainable Development to the Office for Commonwealth Development and as a citizen of Somerville. I thoroughly endorse the Greenline extension with one substantial caveat. The Greenline maintenance facility should NOT be located at Yard 8.

I have worked with the city and EOT to consider the different sites. I have listened to presentations on the alternatives and reviewed the analysis of the different sites. I can find NO reasonable justification for the Yard 8 site. Any argument for the Yard 8 site is predicated on the refusal to consider the long term potential for redevelopment of the Inner Belt area.

I-308-002 The Inner Belt area is the largest and best situated piece of underdeveloped land in the Boston area. Over 95 acres, it is five minutes from MIT and MGH and downtown Boston, crossed by the Green and Orange lines, the commuter rail and the future Urban Ring. With those transit connections it will be linked directly to Harvard and the Longwood hospital district. Properly planned and built out, it has the capacity to hold more than 7

1

I-308-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-308-002

Direct and indirect impacts to land use are described in DEIR/EA Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for sustainable land use, which could further reduce automobile traffic congestion and improve air quality.

I-308-002

million square feet of development, create tens of thousands of jobs and generate hundreds of millions in tax revenue. The goals for Inner Belt development have been endorsed by Secretary Bialecki, and Secretary O'Connell before him. However, in spite of Somerville's clear objections, the Executive Office of Transportation has proceeded with plans for siting the Greenline maintenance facility at Yard 8, a choice that would seriously threaten the ability to develop the area now and in the future.

In sum, my professional judgment is that the Yard 8 option is a bad idea for many reasons. For example, it would:

- Place a train maintenance facility within 50 feet of a well-established residential development, the Brickbottom artist cooperative (with more than 100 passionate and vocal families), a community that has been the life blood of this part of the city for 20 years,
    - Extend train storage tracks for the entire length of the site's border to the Union Square district, a swath about a 2,500 feet long and 110 feet wide, cutting off the area from the populous and vibrant Union Square.
    - Require that to reach the site from the Union Square side, pedestrians and cars would have to descend down through dark, pedestrian-unfriendly tunnels, more than a hundred feet long, when the whole concept of opening the site to development is contingent on making a simple and attractive connection to Union Square,
    - Erect a maintenance building that would face the one viable major commercial street with a 300' long façade of grim blank wall.

The plan was originally presented to the community with a deceptive drawing showing the green line and storage tracks decked over with a plaza. It is impossible to understand from these drawings that, in fact, the plaza would be more than three stories above the adjacent street. To reach it, pedestrians would be asked to effectively climb up over an obstacle equal to a three-story house. In addition, this deck would be extremely expensive, and is not accounted for in the budget. The aerial perspective by EOT is wildly misleading and probably not even physically possible.

No one wants to imperil the Greenline, to slow it down or make it more difficult in any way. However, if the EOT Yard 8 scheme goes forward, the whole region will lose a strategically important economic development site, probably forever.

In addition, Somerville will once again be unfairly saddled with the burden of regional infrastructure while sacrificing its own economic interests, including its goal to become less dependent on the state for its financial survival.

There are alternatives. After the repeated prodding of the City of Somerville, EOT developed several alternatives and analyzed their feasibility. Several were quite good and yet, in spite of designing them, EOT claims they are not as viable as Yard 8. Two schemes, known as Mirror H, and L offer real promise. The H scheme:

- Locates the train yards and maintenance in Somerville, in existing train yards, next to the largest train maintenance facility in the state, with potential economies of operation,

- Is operationally feasible, as agreed by the MBTA,
- Saves money and time and is politically popular in Somerville
- Minimally effects the NorthPoint project, since the rail nuisance already exists there and is not leaving, and it uses planned parking garages to buffer the residential and office buildings,
- Would be quickly permitted in Somerville.

Alternative L appears to me to be less ideal but is still preferable to Yard 8. The land adjacent to the elevated highway I-93 is not suitable for residential or mixed use development and would likely be used for parking facilities in a redevelopment scheme for the area. Train repair is a suitable use for that site, although it is more expensive than the Mirror H site.

I would like to challenge some of the assumptions of the alternatives evaluations.

I-308-003

In the DEIR it is stated that "*Yard 8 is a former railroad property located in an industrial area that is currently zoned for this type of a facility*". While true, this statement completely ignores the serious, committed and ongoing planning efforts of the city and private developers to plan for long term development of the site as high intensity mixed use with a substantial jobs base. By contrast the dismissal of the Mirror H scheme hinges on the value of the NorthPoint development as a transit oriented development: "*Together, NorthPoint and the Charles E. Smith development would be important contributors to the Greenline Extension Project... it is crucial to account for their transit ridership contribution to the expanded Green Line ridership increases. It is also important to note that NorthPoint and the Charles E. Smith residential project are transit-oriented developments that can contribute to Green Line Extension Project's objectives to promote a decrease in automobile dependence within the study area.*" This criteria should be applied equally to the Inner Belt area.

Given the long time horizon for design and construction of the Greenline extension and fact that the extension will transform the region for the next century it seems both unfair and short sighted to base this evaluation on the fact that North Point is merely a few years ahead of the Inner Belt area in its evolution. To fairly compare the alternatives should require a longer view of their ultimate potential for redevelopment and job creation. Doing so would make it clear that the alternatives of "Mirror H' or "L" should be preferred over Yard 8.

The Greenline extension will transform East Cambridge, Somerville and Medford, providing important transit access to thousands of residents and workers, lowering the carbon impacts for the region, expanding the community path and ameliorating years of environmental injustice for these populace communities. This can and should all be accomplished without destroying the long term potential of the Inner Belt District. Alternative locations for the maintenance facility will allow Inner Belt to provide jobs, increase Somerville's tax base and address the growth needs of the Commonwealth's most important research and development sectors. Lets get this right from the start.

3

I-308-003

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

Thank you the opportunity to express these concerns.

RECEIVED
JAN 8 2010
MEPA

Dear Secretary Bowles

My name is Randal Thurston. I am writing to comment on the DEIR/EA for the Green Line extension project, EEA #13886. I strongly urge the Mass DOT to site its planned green line Maintenance facility and storage yards away from its intended location on yard 8, reconsider the design of the train stop that will serve our neighborhood and develop a comprehensive mitigation plan for both the construction and use of the extension.

I-309-001

If sited at yard 8, the noise, vibration and attendant stress of the storage yards and maintenance facility would greatly disrupt the lives of approximately 200 residents. Placing these two components of the green line extension so close to our residence would create undue hardship upon the individuals and families who live here. Although yard 8 might be seen as the easiest place to site the yards and facility, the environmental impact will be catastrophic to those of us in the Brickbottom community. The issues of noise, vibration, air pollution and water runoff containing toxic materials clearly demand an alternative site. Both of the two alternative sites, Mirror H and option L should be the subject of further careful study while Yard 8 should be removed from further consideration. I also feel that the MBTA BET facility which already occupies 47 acres is an underutilized resource and should be looked at as an opportunity to create greater efficiencies in siting of the Green line yard and maintenance facility.

I-309-002

With regard to the planned train stop in our neighborhood, I feel strongly that the drop off area should be eliminated. Having a drop off area will encourage commuters to drive to the station and will add significant additional traffic to our narrow streets. I am concerned also because my children walk home from school in the area of the stop and I feel that the additional congestion will be dangerous.

I-309-003

Concerning the actual construction of the project, I recommend that the best soundproofing materials available be used in deference to the surrounding population. I would also like to make sure that the DOT develops a construction schedule that limits as much as possible the disruption to residents who reside near its components. An appropriate and comprehensive plan for mitigation of the effects of construction and usage of the extension must be developed and integrated before construction begins and be continued for the life of the rail service.

I-309-004

The design and planning of the extension, support facilities and the T stop should be carefully integrated into the neighborhood and be mindful of its identity. Careful

I-309-001

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-309-002

The conceptual plan for the Brickbottom Station will be refined during the preliminary engineering stage, taking into consideration municipal, neighbor, and other stakeholder concerns to the extent practical. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

I-309-003

As described in DEIR/EA Section 3.7, construction contractors will be required to comply with state regulations and local ordinances to mitigate air quality, noise, and vibration impacts. On-site resident engineers and

I-309-004

consideration should also be given to the fact that the inner belt and Brickbottom areas represent the last opportunity for significant development left in Somerville and therefore represents our future. Successfully pairing mixed-use development with an intelligently designed and sited public transportation system is critical to our city.

Our building is surrounded on two sides by railroad tracks. The regular noise and smoke from the cars is a problem that we deal with but one we knew we would have when we moved into the area. The trash transfer station, with its odors and ever increasing heavy truck traffic is a neighbor I am sure any community would rather not have. Additionally, we are bordered by the McGrath and O'Brian highway which has seen a steady increase in its usage over the 22 years that I have been a resident.

We are essentially a neighborhood located in a complex of 3 buildings. As one of if not the largest community of its type in the country, Brickbottom has become a focal point of the Arts in the greater Boston area. We are proud of our history and have tried to be a positive influence on the city of Somerville and the state of Massachusetts. While we have flourished in an area of the city that has few amenities, siting the yards and maintenance facility at yard 8 would signal the end of our long history producing and exhibiting art and showcasing related cultural activities.

When the Green line extension was announced, our community vigorously supported it because we believe that it is a fundamentally positive addition to public transportation, creating more access for our city's residents and providing an alternate to the vehicles that crowd our roads. We remain fully supportive of the extension, even though it will border our building on two sides and dramatically increase the noise we already experience. Somerville has been historically underserved by public transportation and the green line extension is a welcome if long overdue effort. The extension needs to be meticulously thought out and designed. We have one opportunity to get this project right and we should all make every effort to do so.

Sincerely yours, Randal Thurston
1 Fitchburg St. # C209
Somerville, MA

Dear Secretary Bowles,

I-310-001

I am writing to express my disapproval along with over 200 immediate neighbors, the City of Somerville, many community groups, and Aldermen, over the use of 11 acres of Somerville land for the Yard 8 Maintenance Facility Siting. As a Brickbottom and Somerville resident, I am happy to see the Green line extension service our area. But the large train storage and maintenance facility as proposed in Yard 8 is a very poor choice and short sighted for us and the city. The impact on the residents will be adverse and any future development of the Inner Belt area for the city will be lost. Yard 8 does not meet the three criteria: quality of life, transportation access and economic development the the CIty of Somerville has requested of the MassDOT.

Please consider more community involvement in moving forward. We need a broader vision to arrive at the best solution for everyone. A citizen advisory committee could be the forum for this purpose.

More study of the Option L and Mirror H alternatives should be fully executed. Why is this not being done?

I-310-002

There needs to be a good process to address the mitigation problems DURING construction and after. Goals have not been stated and residents at Brickbottom are not satisfied with the process thus far.
DEIR Section 5.4.7-3 sound mitigation, page 5-118 states " At some locations projected to be exposed to noise impact, noise barriers may not be a feasible or effective means of mitigation" yet only 40 of the 155 units are designated for soundproofing. Why have the residents of Brickbottom been left short on noise and vibration mitigation?

I-310-003

The Brickbottom/Washington Street T station should be located at Washington street to better connect to East Somerville and access should be from both side of Washington Street not just one. The use of a kiss and ride at this station is a bad thing for the neighborhood. Relocating to Washington Street will also make for easy bus connections, something the proposed Joy Street does not have.

I hope that the in moving forward all parties can be treated fairly and in accordance with all laws. Yard 8 is not an acceptable option for the large storage and maintenance facility, MassDOT should do its job and fully explore Option L and Mirror H.

David Tonnesen
1 Fitchburg Street C-113
Somerville, MA 02143

1

I-310-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-310-002

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-310-003

The conceptual plan for the Brickbottom Station will be refined during the preliminary engineering stage, taking into consideration municipal, neighbor, and other stakeholder concerns to the extent practical. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

Boston, MA 02114

Dear Secretary Bowles,

This letter is in response to the Draft Environmental Impact Report/Environmental Assessment released by the MassDOT for project Number EEA#13886.

My family (myself, husband and ten-month-old daughter) moved into the Brickbottom community in September of 2008. We have had a rich and rewarding experience at Brickbottom to date but feel that our quality of life and long-term prospects for raising a family here will be forever compromised by the placement of the Green Line maintenance facility and train storage yard at the current preferred Yard 8 scheme.

We are part of the new generation of families who see the diversity and dynamism of the creative community as an asset we couldn't find anywhere else in Boston. Four babies were born in Brickbottom over the past year, it is both an established and a growing community of artists, patrons of the arts, families, and residents who all find that Brickbottom offers one of the most unique living environments in all of Boston.

I-311-001 Yard 8 has emerged as an unacceptable option to our community and the communities of Somerville and Cambridge at large, as evidenced by the recent maintenance facility and storage yard review meeting on December 16th, 2009 in Cambridge. We have heard of virtually no voices in support of the Yard 8 scheme from the community or political establishment at large, which causes us to seriously question the decision making behind the project. How does a proposed scheme with near-unanimous negative public feedback still rank so highly as an option?

I-311-002 We would like to see an expansion of the criteria used to weight the various options that reflects the severity of the impact to existing communities and economic development as opposed to one that only speaks to operational criteria that primarily serve the MassDOT's needs.

I-311-003 As an entity created in service of the public good, MassDOT, we believe, should provide much more public involvement in a process that has been opaque to date, and more strongly consider the social and economic impacts of the overall Green Line project.

Notwithstanding the above, we are encouraged by the serious thought finally put towards the Mirror H and Option L schemes, which both present much less impact to the Brickbottom community. However, we are concerned about comparable potential

I-311-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-311-002

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-311-003

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes

impacts to the community and future development presented by Mirror H, to our Cambridge neighbors.

I-311-004

We would like MassDOT to focus on options within its existing controlled land, as well as additional options which have the characteristics of Option L (bordering existing MassDOT land holdings, not directly impacting from residential communities, and not stunting future economic development adjacent to the Green Line). We believe that MassDOT needs to be fair in its dealings and negotiations with any businesses that might be impacted by a maintenance/storage facility and support their relocation and continuity of service.

All along the existing above-ground Green Line we see tremendous economic development and communities that have thrived due to its presence. All we ask for is to be a true extension of the Green Line platform, enabling smart transit oriented development of our city and preserving, if not enhancing, the truly unique cultural and community assets of our town, of which Brickbottom plays a major part.

Sincerely,

12/21/09

Caroline Traugott

MassDOT's plans for public outreach in the next phases of the Project. As stated in Section 6.4, MassDOT and the MBTA will convene a Green Line Extension Design Working Group. This group will advise the agencies on design workshops, participate in the workshops and serve as a corridor advisory group during design.

I-311-004

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, Option L is identified as the preferred maintenance facility site.

Subject: Green Line Extension Comments - 34 Murdock St, Somerville
Attachments: Green Line DEIR Comments - 34 Murdock.pdf

Ms. Johnson and Ms. Fichter,

I-312-001

Please note the attached letter regarding comments on the Green Line Extension Project's DEIR/EA document. I am generally in favor of the Project and I believe you have a well thought out plan overall. I have concerns that the preliminary design did not provide any noise mitigation to my residence despite my belief that my residence will have an increased noise level and already falls above the threshold for relief. I believe these concerns would otherwise be addressed as the design is progressed, but submitting them in the public comment process will help ensure that they are each recorded and considered.

Thank you,
David Tremblay

RE: MBTA Green Line Extension

Dear Sir/Madam,

I am writing on behalf of the condo association at 34 Murdock Street in Somerville. We are generally in support of the Green Line Extension project, however, that support anticipated that the MBTA would provide measures to mitigate any increased noise, vibration and other environmental impacts. After reading the DEIR/EA document and the Noise and Vibration Technical Report, it became clear that the preliminary design does not provide any mitigation for our property despite a foreseeable increase to our noise levels. The Green Line Extension analysis appears to be using outdated base maps and doesn't address several operational changes and ripple effects from other elements of the project design. Although these issues may be addressed as the design progresses, our primary opportunity to voice our concerns and comment on the design is through the DEIR/EA process. Our concerns with the available design information are as follows:

I-312-002

- **The "Base Map" is at least 3 years old and doesn't include new structures like our condo.** The Condo at 34 Murdock St was constructed in 2006/2007. The base map that is shown in many of your documents shows a previous residence that was further from the tracks and also appears to show a structure that could have potentially provided noise mitigation (unclear image). This base map would have hindered the noise and vibration analyses done by Harris Miller Miller & Hanson.

I-312-003

- **Our Property is subject to potential land acquisition.** This was not anticipated by us and could have a significant impact if it reduces the available parking within our property. We assume this will be addressed as part of the land acquisition process; however it's unclear how our property will be valued. A small parcel could render a larger portion unusable for its original purpose. When combined with the likelihood that additional street parking will occur or be restricted due to our proximity to the Lowell St Station, this could be a significant impact. We would hope that the valuation methodology considers more than just square footage.

I-312-004

- **The Preliminary Design indicates a retaining wall will be built at the edge of our property.** Although the wall itself doesn't directly impact us, it appears that an existing fence, vegetation and two or more significant trees would be impacted. These items are currently our only noise mitigation measures and the trees provide a noticeable noise reduction for approximately 6 months out of the year which is especially valuable because they are higher than most noise barriers (and far more attractive). In addition, the retaining wall and land acquisition will reduce our options for any noise mitigation measures that we could install; the wall may include foundations or tie-backs which could interfere with roots or fence posts. An integrated retaining wall and noise barrier would be a more efficient use of the available land, and it was disconcerting that such a structure was not part of the original proposal. In addition to the noise, we would like some assurances that the retaining wall be designed and constructed in a manner that will not impact the water table and cause an increased likelihood of water infiltration into our basement or settlement cracks.

I-312-005

- **The Noise and Vibration Technical Report indicates that the noise level for the Murdock St abutters is among the highest on the proposed green line corridor.** According to Figure 1 on Page 6, 75 dBA is the HUD threshold for Unacceptable Housing Environment and on page 43 the report states that "The Project would mitigate both moderate and severe noise impacts wherever practical and wherever existing noise levels are above 65 dBA." According to Table 7, the Murdock St existing noise level is 80.1 dBA. This is among the highest readings on the proposed extension and even a slight increase would put the noise level in the Severe range. The likely cause of these high readings is the "canyon" effect caused by the sound reflected off the Somerville DPW building across the tracks from Murdock Street. The potential mitigation measures that were

I-312-002

Potential noise impact has been assessed at an exterior location at 34 Murdock Street which is appropriate for the existing building's location on the parcel. Future noise conditions at this location are expected to decrease slightly due to the relocation of the commuter rail tracks further away from this receptor. The Green Line trains do not significantly contribute to noise impacts at this receptor. Therefore, no noise mitigation is proposed for this location.

I-312-003

DEIR/EA Section 5.2 describes the Project's potential acquisitions. MassDOT is currently conducting detailed property surveys to obtain more specific data. MassDOT will continue to evaluate opportunities to minimize these property impacts.

I-312-004

MassDOT will not remove any trees outside of the existing right-of-way or proposed acquisition areas. Retaining walls and noise mitigation measures will be designed during the preliminary engineering phase of the Project.

I-312-005

All noise barriers proposed as mitigation for the Project will be made of an absorptive material to minimize the potential for reflections. The need, feasibility and effectiveness of including absorptive materials on other elements of the Project such as retaining walls will be assessed during the final design of the Project. Generally, potential modification to property outside the right-of-way, such as the Somerville DPW building, is not practical since the property is not owned or maintained by MassDOT.

I-312-005

included in the report did not discuss adding a sound absorbing material to the exterior of the DPW building. Reducing the reflected sound in addition to a noise barrier may prove to be more effective than a noise barrier alone because any noise reflecting off the DPW building is going to be above the noise barriers. It is unclear in the report if innovative options like this were/will be considered.

I-312-006

- **A Noise Barrier is not indicated for our property, however a nearly identical property 3 units away does include a noise barrier.** A nearly identical condominium was constructed 3 parcels north as shown in figures 2 and 3. This condo is also not shown on the base map, however their property does get a noise barrier. Also, two of the four structures on Murdock Street that are shown as having Moderate impact are further from the tracks than our condo unit (as shown in figure 3).

I-312-007

- **The Preliminary Plan indicates adding noise barriers across the tracks from our property that will increase the amount of reflected sound**. According to the Noise Mitigation diagrams, barrier #12 will be constructed from the south end of the DPW building across Charles E. Ryan Rd and continue south. The current DPW building provides reflection of the sound for approximately 60% of our view accross the tracks. The additional wall will add an additional surface to reflect noise from the remaining 40%. In addition to this surface, the trees that currently screen our property from noise originating in this direction will likely be removed by the Project as noted above.

I-312-008

- **No indication that certain operational issues of trains have been considered.** Although operational issues are discussed in the report, there was no indication that operation of the train horns has been considered or addressed. Most trains sound their horns as a warning when they are approaching workers or others who are near the tracks. The analysis doesn't discuss whether the Project anticipates that the Commuter Rail and Amtrak trains are likely to sound their horns when approaching green line platforms. Is the Green Line's outbound track a sufficient separator between the Commuter Rail lines and the Green Line platform so that the horn will not be necessary? Will the Green line trains be sounding a horn every time they approach the station or only when they are bypassing the station? Since we are very close to two stations (Lowell St and Ball Square), these horns from trains going in different directions could cause a significant increase to the "annoyance level" of the passing trains. Have these issues been considered in your Noise report and are the neighboring properties being identified for mitigation efforts?

If you have any questions or need clarification of any of the concerns that I've raised, please don't hesitate to contact me. The following pages have several figures to clarify where 34 Murdock St is and what figures I was referencing from your documents. Hopefully these will expedite your review.

Thank you for considering our concerns with the preliminary design. While we generally support the Commonwealth's efforts to extend the Green Line into our neighborhood and appreciate the work that the project team has done to mitigate its impacts, we do feel that we have been unfairly neglected in these efforts. We hope that you can address our concerns in a satisfactory manner and reassure other abutters that they will also be given fair treatment when the design is further developed.

Sincerely,

David Tremblay
34 Murdock St, Unit C

I-312-006

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-312-007

Please see response to Comment I-312-006.

I-312-008

While commuter and other trains may sound their horns when approaching construction crews, the instances will occur during daytime hours. Commuter, Amtrak and freight trains will not sound their horns due to nearby passenger platforms. A fence will separate light rail tracks and platforms from the commuter/Amtrak/freight railroad. This eliminates potential railroad conflicts and the need for trains to sound horns.

Figure 1 - Existing Conditions from Green Line DEIR/EA documents. Yellow arror highlights 34 Murdock Street parcel. Structure is incorrect. Proposed Retaining wall in Blue.

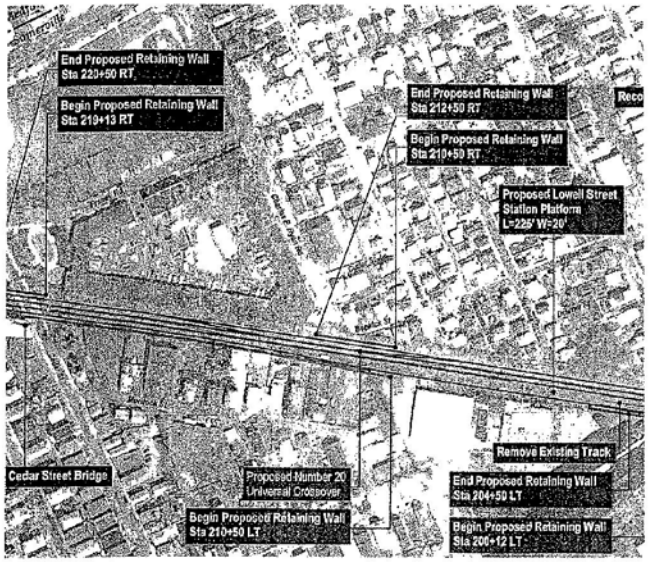

Figure 2 - Current view of 34 Murdock Street.

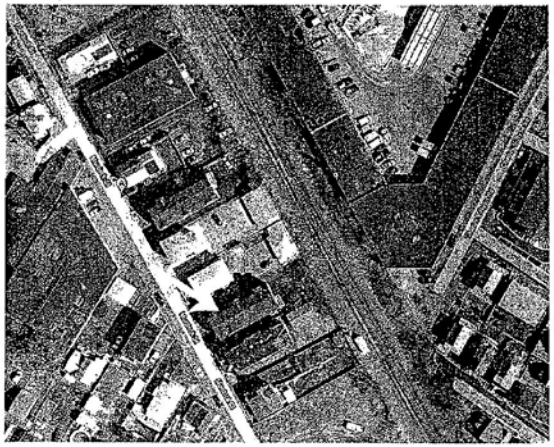

Figure 3 - Updated base map including 34 Murdock St (yellow arrow) and neighboring nearly identical condo. Proposed noise barriers are shown in blue.

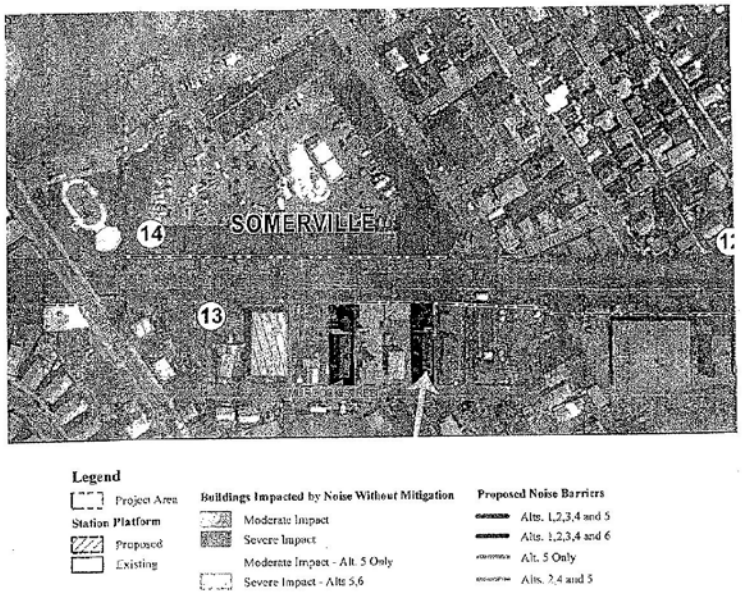

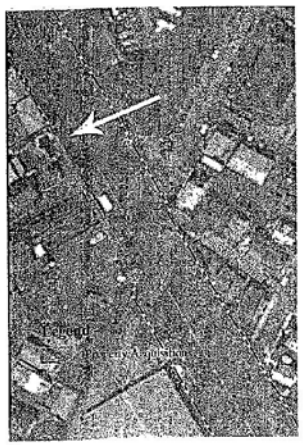

Figure 4 - Proposed property Acquisitions.

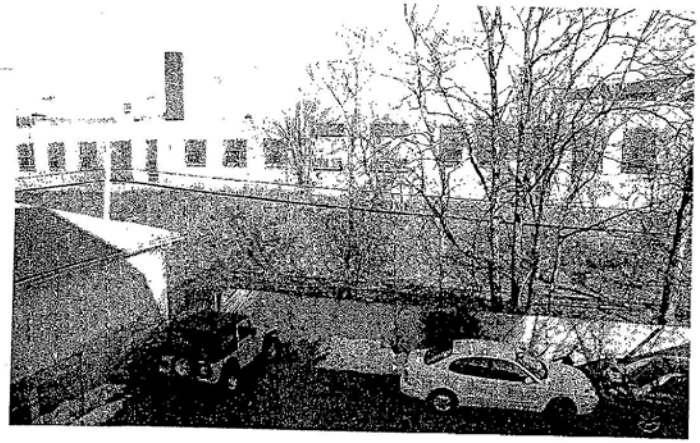

Figure 5 - View from Bedroom window. As tracks are moved away, both commuter rail lines will have unmitigated noise effects. Also trees are at risk when retaining wall is built which further exposes our structure to rail lines.

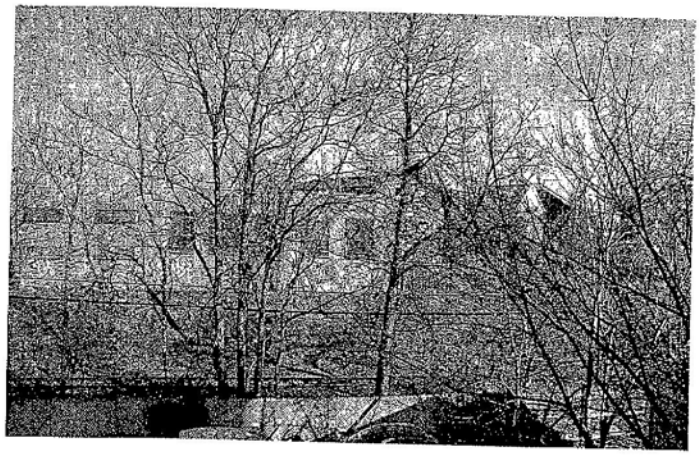

Figure 6 - View from Bedroom window. Additional noise barrier is proposed to extend to the south from the DPW building. Currently screened by trees that are in jeopardy.

January 5, 2010

Secretary Ian Bowles
The Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EE#13886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I am writing to comment on the Draft Environmental Impact Report (DEIR) on project EEA#13886, the MBTA Green Line extension in Somerville and Medford. I look very much forward to the expansion of the Green Line in my community and neighborhood; overall, the project is a considerable victory for the City of Somerville, which has historically been underserved by the MBTA despite its central location and sizable transit-dependent population. I am hopeful that the Green Line extension can become a catalyst for redevelopment and growth in the many neighborhoods it will serve.

I-313-001

However, I have very serious concerns about the project as currently planned, and about the draft report. Many aspects of the project are either poorly or inadequately planned at this stage. The EOT has stated that the design is unfinished and details will be finalized later. However, these details will have a considerable influence on the environmental impact of the project as well as on the lives of the tens of thousands of people who will live near and use the line on a day to day basis.

I-313-002

It is my opinion that the DEIR as written is an insufficient response to the many concerns presented by the City and residents of Somerville, and is not in any way appropriate for adoption as a final Environmental Impact Report. The report fails to respond to major community concerns about the maintenance facility and noise mitigation, and relies in many cases on incomplete or incorrect assumptions to reach entirely untenable conclusions. To fail to address these concerns will imperil the quality of life and well being of scores of Somerville residents, and could set the City's economic development plans back many years. These errors must be corrected, and plans altered accordingly, before the project is allowed to go forward.

<u>The Yard 8 Maintenance Facility is Unacceptable</u>

My primary opposition to the DEIR as written is the EOT's continued reliance on the "Yard 8" site as its preferred option for a Green Line maintenance facility. EOT proposes to build a multi-story maintenance facility, sized to service and store cars for the *entire* Green Line, on a parcel of land immediately adjacent to the Brickbottom Artists Buildings in the Inner Belt neighborhood. As residents of Brickbottom and officials from the City have repeatedly pointed out, the Yard 8 location will have a disastrous impact on the quality of life of those living at Brickbottom – a diverse and well-established

I-313-001

The DEIR/EA and FEIR include conceptual Project designs. Designs for each station, the storage and maintenance facility, and the entire project alignment will be refined during the Project's preliminary engineering stage. The process for coordinating with local communities during Project design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-313-002

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

I-313-003 community of 220 residents, many of whom work and live in the building full time. It is my belief that the Yard 8 maintenance facility fails to meet the requirement that "no segment of the population...should bear a disproportionate burden of environmental impacts" for the project, as stated in the Secretary's Certificate (EENF, *Environmental Justice*, p. 7).

I-313-004 The DEIR as written downplays the impact of the maintenance facility by citing noise levels for Green Line operations, and suggesting that the increased noise from the Maintenance Facility will be incremental. However, the Green Line will operate only from 5am to 12am daily; the planned maintenance facility will operate 24 hours a day, likely with some of its busiest work being done during the hours when the Green Line is not running. The DEIR does not include a projected noise impact for the maintenance facility during those 5 hours a day when the Green Line trains will not be running. Without an analysis of that noise impact, the DEIR does not adequately assess the noise impacts of the project on the Brickbottom community.

I-313-005 The maintenance facility as planned also represents an unfair burden on the City of Somerville. As the City has pointed out, the Inner Belt neighborhood represents one of the City's best options for economic growth and development in the next decade. Business growth in the district has been strong, and the area is an integral part of Somerville's plan to build a more solid commercial base in the coming years. Locating the maintenance facility in the Yard 8 location will divide the district, making it unsuitable for many development projects that have been proposed for the area.

I-313-006 Moreover, the EOT's plan to relocate *all* Green Line maintenance to Somerville is an unnecessary addition to the project which unfairly shifts the burden of maintaining Green Line infrastructure from other communities to Somerville. The DEIR proposes shifting car storage for the B, C, D, and E branches of the Green Line to Somerville, for reasons apparently unrelated to the Extension project. This car storage will create additional noise and occupy additional land in Somerville while providing no benefit to the community – a development in no way consistent with the environmental goals of this project. Somerville is already host to maintenance facilities for MBTA's Commuter Rail infrastructure, despite the fact that Commuter Rail trains do not stop in the city. As such, if any maintenance and storage is to be introduced as part of the extension project, it should be limited to serving the cars and infrastructure necessary to support the extension.

I-313-007 EOT has proposed two alternate maintenance facility locations: "Mirror H" and "Option L." It is my opinion that either of these locations would be a significant improvement over the "Yard 8" site. I feel strongly – as does the Brickbottom community and the City – that **"Yard 8" should be taken off the table immediately** so as to focus energies on the "Mirror 8" and "Option L" alternatives.

Noise Mitigation Recommendations are Insufficient

I-313-008 The DEIR as written also includes the beginnings of plans for the noise mitigation which will be necessary to offset the impacts of the Green Line extension. However, these plans are not sufficiently detailed to be adequate for the final EIR, and are in many cases based on incomplete data or inaccurate assumptions. Prior to the adoption of a final EIR, EOT must provide concrete mitigation proposals, with specific mitigation goals and a process of redress to be employed if those targets are not met.

I-313-009 In the specific case of Brickbottom, the Green Line extension will, at its closest point, run 19 feet from the windows of long-time residents. The DEIR states that impact from the Green Line extension alone would be "severe" according to Federal standards. The document nonetheless proposes mitigation of only 40 of the 155 residences at Brickbottom, and provides neither details of how mitigation is to be

I-313-003

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-313-004

As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds. FEIR Chapter 8 describes specific proposed mitigation measures, plans for monitoring after construction, and next steps pertaining to mitigation. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-313-005

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-313-006

The Green Line Extension storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the Project. Chapter 2 of the FEIR fully describes the environmental impacts of the proposed storage and maintenance facility. In order to maximize operating efficiencies, the facility must be constructed within

I-313-009
I-313-010

performed nor explanation of how the figure of 40 residences was determined. EOT has not engaged in any dialog with our community about mitigation efforts; indeed, in many supporting materials they have gotten basic facts about the Brickbottom complex (such as the number of buildings) wrong. As such, we can only guess at what steps might be taken – but it is difficult to envision that a solution treating only 28% of residences could possibly be adequate given Brickbottom's proximity to both spurs of the Extension. Moreover, the Brickbottom complex is a historic structure eligible for official designation;

I-313-011

modifying windows or other exterior façade elements on only 28% of units would undoubtedly run afoul

I-313-012

of legal protections regarding the appearance of designated historic structures. Finally, not one word of the report address indoor air quality impacts of any element of the project – the extension, the maintenance facility, or indeed, the mitigation. If mitigation is to focus exclusively on windows and soundproofing, as EOT has implied, what are residents to do in warmer months? (The award-winning Brickbottom courtyard, the only outdoor green space in the Brickbottom/Inner Belt neighborhood, has been excluded entirely from mitigation considerations in the DEIR, so gaining relief from the heat there is unlikely to be an option.)

I-313-013

The final EIR must include a comprehensive mitigation strategy for noise, vibration, and air quality impacts on the whole of the Brickbottom community. Targets should be set for maximum noise levels within units, relative to baseline measurements taken before the beginning of the project. There must be a process to ensure that these targets are met, and to provide redress if they are not. And finally, the mitigations at Brickbottom must be done in a manner consistent with the historic integrity of the Brickbottom complex.

The Green Line extension represents a "once in a lifetime" opportunity for Somerville, Medford, and the MBTA – a point which the EOT has underscored in its public comment sessions. With that opportunity, however, comes responsibility: the consequences of poor planning and shortsighted decisions will also be felt for a generation to come. We in Somerville and at Brickbottom cannot afford to carry the burdens of this expansion on our backs alone. I encourage you to refrain from hurrying this process; let's take the time to correct these oversights and build a Green Line extension that can serve our communities without disrupting the community's environment, economic development, and quality of life.

Sincerely yours,
Dan Tremitiere
Dan Tremitiere

the same timeframe as the Green Line Extension Project, in the vicinity of the Green Line Extension right-of-way, and north of downtown Boston.

The storage and maintenance facility alternatives include storage for Green Line Extension vehicles and replacement of the existing Lechmere Station vehicle storage. Storage capacity is also provided for vehicles currently stored in trackways between Lechmere Station and Government Center; this storage will be lost due to the Green Line Extension.

I-313-007

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-313-008

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

I-313-009

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further

consideration and Option L is identified as the preferred maintenance facility site.

I-313-010

As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds. FEIR Chapter 8 describes specific proposed mitigation measures, plans for monitoring after construction, and next steps pertaining to mitigation. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-313-011

Section 6.5.4.7 of the DEIR/EA identifies proposed mitigation measure for historic resources. Mitigation measures would be determined by the FTA and MassDOT in consultation with the Massachusetts Historical Commission and other consulting and interested parties.

I-313-012

The Green Line Extension will have a positive impact on outdoor air quality within the study area. Indoor air quality is unique to each individual building, and is outside the scope of this project.

I-313-013

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

Dear Secretary Ian Bowles:

I am a resident at 183 Boston Ave in Somerville Ma accross from where the proposed long-term green-line terminace will be for the green-line connecting to the West Medford neighborhoods as the second phase of the extension to the green-line upon completion of the Tuffs terminace.

I have owned this property for a little over 20 years. Our property is in Somerville but borders Medford two houses up the street and West Medford about six houses down the street. The proposal of bus destination would require removing at least half or more of our parking to accomidate the proposed third turn-in lane. The not so funny thing is that we would not be able to park up the street or down the street because our Somerville registered car would be parked in Medford.

I know from going to the meetings that we are going to be having some additional noise from being at the end and be the turning point.. The bus depot in and out across from my house will also be both noisy and have some bus orders. I know and appreciate the efforts for trying to keep both of those at a minimum In adddition to that, we have always had easy parking there and now maybe nothing.

My ideas that would have less of an impact direcdly on us would be as follows:

I-314-001 (1) Instead of making the West Medford stop a bus station type drop off / pick up terminace requiring a third lane of traffic, keep that at Tuffs and just have a walk and bike up station leaving us with the green-line turn around but not a lot of bus traffic. This would have less impact on our parking which would be a help to me. This will also save the removal of two large comercial rental buildings saving the State taxpayers the cost to

I-314-001

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-314-001

purchase the properties and also the City taxpayers the loss of real estate taxes from these properties. We would hate to see this happen because the owners have been good neighbors in our neighborhood over the years.

I-314-002

(2) We own a two family and we really require 4 parking spaces somewhere if not on the street because of the third lane then maybe deeded spaces in the garage where the proposed buildings are to be purchased and demolished. You did not want parking at this terminace anyway so if deeded to us instead of demolishing you would become a good neighbor in our nationhood.

I-314-003

(3) On the odd number side of Boston Ave, our houses are close to each other (3 feet on one side and 10 feet on the other). We are also very close to the street and where the proposal of a third lane is in consideration, if you felt deeded parking for us in the current garage would be out of the question then I would ask that we be deeded maybe 10 feet to the front of the 9 houses on the odd side of that Somerville section and allow us to have a pull in driveways in front of our houses. It will require us to remove a portion of our porch but it will be worth it to have the parking.

Thank you in advance for hearing my ideas

Sincerely,

Steven Troian

I-314-002

The Project is intended, in part, to relieve traffic congestion, as described in DEIR/EA Chapter 2, Purpose and Need. Some station access points for passenger drop-off/pick-up are likely to impact local traffic flow, as outlined in DEIR/EA Section 5.5, Traffic. As described in DEIR/EA Chapter 6, these impacts will be minimized to the extent practical. However, with the exception of relocated Lechmere Station, no parking is provided at any of the new Green Line Extension stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes how MassDOT will coordinate with municipalities and stakeholders to address traffic and parking concerns. Additionally, FEIR Chapter 4 summarizes the impacts of College Avenue as a terminal station.

I-314-003

DEIR/EA Section 5.2 describes the Project's potential acquisitions. MassDOT is currently conducting detailed property surveys to obtain more specific data. MassDOT will continue to evaluate opportunities to minimize these property impacts.

January 3, 2010

Dear Secretary Ian Bowles,

I write to address the issue of the proposed DOT Maintenance facility located at Yard 8 in Somerville. I have lived in Somerville for the past 11 years, in and around the Union Square area, currently at Brickbottom on Fitchburg Street. I am an enthusiastic supporter of public transportation and the Green Line extension in particular, as I commute daily to Downtown Boston.

As a practicing licensed architect, I fully understand the need for service facilities for large infrastructure projects. I also understand that proper siting and consideration of urban planning issues is critical for the success of the project now and in the future. Think only of the Central Artery project, which demolished neighborhoods, cut off others from the rest of the city, and destroyed the heart of Boston. At the time, neighborhood concerns were ignored, but only a short few decades later, we spent billions of dollars to tear it all down. This historic example (only one of many) should drive home the need to examine the larger impact of such infrastructure projects within the larger community that they supposedly serve.

There are numerous considerations:

I-315-001
- The land proposed for Yard 8 is currently zoned for development. Given the increasing vitality and development of Somerville, to remove this land from the tax base and from development opportunities is short sited.

I-315-002
- The adjacent Brickbottom community is a longstanding community, a pioneering live/ work neighborhood that has spawned other such communities both in Somerville and in other cities. A maintenance facility would have a significantly detrimental impact on these residents – in contradiction to the specifically stated standards of the Mass DOT (see the Secretary's Certificate EENF Environmental Justice, pg 7) that states " no segment of the population should be denied environmental benefits, or should bear a disproportionate burden of environmental impacts". Please note that this community includes at least two dozen children, as well as 220 residents.

I-315-003
- There are two alternate sites that should be considered, in particular the Mirror H scheme, which is preferred not only by the local community but also the entire City of Somerville. The Green Line Extension should be considered as a way of stimulating the development and rejuvenation of the City of Somerville – it has already stimulated significant growth in property values in the union Square area. The current proposal sacrifices a vast swath of land that is ripe for development and undermines the ability of the east portion of Somerville to continue to develop in a beneficial and economically desireable manner.

I-315-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-315-002

Please see response to Comment I-315-001.

I-315-003

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

I-315-004

- We understand that there is a mandated deadline for the completion of the Green Line Extension, in 2014. However, it is also clear that the design of the maintained yard is not a part of that deadline, and can be evaluated in a more thorough and comprehensive way.

I urge the Urban Planners involved with this project to re-evaluate the many considerations that lead to the decision to site the yard in the current proposed location. Critical evaluation and reevaluation of any proposed design can only make a project stronger -- not only in its physical realization but also in its support from the community around it. I urge the planners to seriously consider the many and complex ramifications of the current plan. This project will last more than the next few years; it will have impacts that will last for generations. Remember the central artery project. And the resulting big dig....

Sincerely,

Catherine Truman AIA, LEED AP

I-315-004

The Green Line Extension storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the overall Project. Chapter 2 of the FEIR fully describes the environmental impacts of the proposed storage and maintenance facility. The facility must be constructed adjacent to the Green Line Extension to maximize operating efficiencies and be constructed within the same time frame as the Project.

Boston, MA 02114

Dear Secretary Bowles:

I am the owner and resident of unit 215 at the Glass Factory Condominiums. This two bed, two bath, renovated condominium is the home closest to the proposed new Lechmere Station and closest to the tracks. I have very serious concerns about the Green Line Extension Project.

Like many owners I purchased my home with the expectation the new station would be the beautiful glass one planned by the North Point developers. I saw the model at North Point which showed the new train going underground and was told the tracks would be underground or at grade. I would never have selected and purchased this condo if I knew you would build elevated tracks right outside my windows. I selected this unit because there are windows all the way across each room and beautiful evergreen trees and birds right outside the windows. It is quiet and peaceful and I love living here.

I-316-001 I was alarmed and outraged to discover you are planning to build elevated tracks and are planning to put them within the green space behind my building. These tracks will be so close to my windows that my home may no longer be inhabitable. The visual impact of tracks so close to the windows will destroy the
I-316-002 appeal of my home. Sunlight will be severely reduced and privacy compromised. I understand the busses will be directly under the tracks. The noise and vibrations from trains and busses right under my windows will be impossible to mitigate. Neighbors in the front of the building tell me they are frequently woken up by the loud noises from groups of people getting off busses and talking, yelling etc. at the current Lechmere station. The busses are currently much farther away that what you are proposing behind the building. Additionally I am severely allergic to cigarette smoke and am very concerned about people smoking while waiting for busses right beneath my windows. This is such a serious health concern that it would force me to move. This would likely mean selling at a loss. That brings us to the next issue, loss of value.

In addition to living here I work as a real estate broker in the Glass Factory. Right now condos facing the back of the building have seen a drop in value of $70,000 + below the value of the front units specifically because of the Green Line Extension Project. It is possible values will be lowered further once the tracks are up, light and views blocked and vibrations felt. Some units in the back have already become unsaleable due to the uncertainty about the location of the tracks behind the building. A 2nd floor

I-316-001

The revised conceptual plan for Lechmere Station, as shown in FEIR Chapter 5, is entirely on MBTA property. This conceptual design does not require any Glass Factory property or the removal of trees and landscaping from Glass Factory property. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, outlines how MassDOT will involve residents in developing landscape design.

I-316-002

Revised conceptual plans for Lechmere Station, including bus facilities and bus waiting areas, are included in FEIR Chapter 5, Lechmere Station. Bus layover has been shifted further to the east and away from the Glass Factory Condominiums in the revised Lechmere Station design. Signs will be posted to limit idling of buses, in conformance with MBTA standards.

From: 01/08/2010 16:31 #014 P.002

I-316-003 one bedroom condo was foreclosed this week for this reason. The DEIR lacks sufficient detail about the location of the tracks. It does say the Glass Factory will be severely impacted but does not show a plan for acceptable mitigation nor state that acceptable mitigation is even possible.

50% of the homes in the Glass Factory building face in the direction of the Green Line Extension. If the new tracks are too close to the building (as you currently propose) the value of these condos will drop even further. Many owners here bought at the height of the market. The significant loss in value resulting from the Green Line Extension will cause financial ruin for many owners. They will not be able to sell their homes for enough to pay off their mortgages. Therefore I propose that acceptable mitigation include paying each owner for the loss in value caused by this project. I estimate the loss of value would be $100,000/unit on the 2nd & 3rd floors and lesser amounts on the higher floors unless sound and vibrations turn out to be severe on the upper floors as well.

I-316-004 I urge you to preserve all the large trees behind the building since they are a more attractive and
I-316-005 effective visual screen that you could ever build. Please move the tracks as far back as possible and do
I-316-006 all you can to reduce the mass of the tracks. At the very least the tracks should be beyond the fence that separates our green space from the T property. Move the busway even farther away from the Glass Factory and put as much attractive landscaping as possible behind our building.

My parking space is located in the outdoor lot. The proposed new station is right behind this parking area and almost against the windows of my bedroom. This is simply too close. I don't want to feel like I am parking and living in a T station. There is plenty of empty land to allow moving the station toward the south east. Why are you putting in right on top of my home?

I-316-007 The design of the new station is entirely unacceptable and will affect this neighborhood negatively for decades. Please build an attractive station. I understand you can't afford the glass structure we were expecting but surely you can do better than the design we were shown. There are brilliant designers out there, why not have a competition like the one that worked so well for Charles MGH?

Additional concerns:
I-316-008 Mirror H Maintenance Facility: Outrageous, absolutely not.
I-316-009 Surface parking: Too much, use existing underutilized garages and create green space instead.
Pedestrian crossings: Unsafe. Don't repeat the mistakes of Leverett Circle.
Bikeways, pedestrian paths: Do it right, make this area pedestrian & bike friendly.

I hope your project managers and engineers will continue to work with Glass Factory owners and residents to make this a better project, to find adequate mitigation and to protect our homes & investments. Thank you for hearing my concerns.

Sincerely,

I-316-003

FEIR Chapter 5 describes the revised conceptual plans for Lechmere Station, including station design, track alignment, bus routings, and other elements. Changes to the track alignment depicted in the DEIR/EA were evaluated, but could result in additional impacts on area abutters. Proposed mitigation measures for area abutters are also described in FEIR Chapter 5. During preliminary engineering, specific station design elements will be further developed.

I-316-004

The revised conceptual plan for Lechmere Station, as shown in FEIR Chapter 5, is entirely on MBTA property. This conceptual design does not require any Glass Factory property or the removal of trees and landscaping from Glass Factory property. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, outlines how MassDOT will involve residents in developing landscape design.

I-316-005

FEIR Chapter 5 describes the revised conceptual plans for Lechmere Station, including station design, track alignment, bus routings, and other elements. Changes to the track alignment depicted in the DEIR/EA were evaluated, but could result in additional impacts on area abutters. Proposed mitigation measures for area abutters are also described in FEIR Chapter 5. During preliminary engineering, specific station design elements will be further developed.

I-316-006

Revised conceptual plans for Lechmere Station, including bus facilities and bus waiting areas, are included in FEIR Chapter 5, Lechmere Station. Bus layover has been shifted further to the east and away from the Glass Factory Condominiums in the revised Lechmere Station

design. Signs will be posted to limit idling of buses, in conformance with MBTA standards.

I-316-007

The revised conceptual plan for Lechmere Station, as shown in FEIR Chapter 5, is entirely on MBTA property. This conceptual design does not require any Glass Factory property or the removal of trees and landscaping from Glass Factory property. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, outlines how MassDOT will involve residents in developing landscape design.

I-316-008

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Mirror H location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-316-009

Although Lechmere Station will no longer function as a terminal station, there is still a demonstrated demand for existing parking. Nonetheless, parking at the relocated Lechmere Station was reduced in the revised conceptual design. These revised plans are included in FEIR Chapter 5, Lechmere Station.

To: Johnson, Holly S (ENV)
Subject: Comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886

January 7, 2010

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-317-001 I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

First of all, I strongly support the Green Line extension, and urge that it be built in the most practical, beneficial and cost-effective manner -- that is, to construct the entire project in one phase, with a terminus station at Mystic Valley Parkway (Route 16), by December 31, 2014.

The DEIR is encouraging in that it concludes that the Route 16 station would provide the most benefits according to all project criteria, including air quality and environmental justice. However, MassDOT states that it is incapable of building (and funding) the entire "Preferred Alternative," so it only intends to build the extension to College Avenue in the Tufts University area of Medford, by its deadline of December 31, 2014.

In my opinion, the DEIR as currently written does not serve the best interests of the project. More importantly for your review, it was not done in a way that "adequately and properly" complies with the state environmental regulations, nor with the December 1, 2006 MEPA certificate that defined the requirements of the DEIR.

For the following reasons, I strongly urge you to not accept the DEIR as the Final EIR and require further environmental analysis of the project by MassDOT:

1. A two-phased approach is unacceptable. The Route 16/Mystic Valley Parkway Station should be built as part of a single-phase project to minimize costs and negative impacts and achieve the maximum benefits with regard to ridership, vehicle mile travel reduction, air quality improvements, and service to environmental justice communities.

The recommendation as outlined in the DEIR is for the Route 16/Mystic Valley Parkway station to be a separate stand-alone Phase II project with no funding source identified. **This means, Route 16 may never be built.**

There are many, many problems with the Phase II approach, including:

- **Risk.** Without an identified funding source there is a very high probability that Route 16 will never be built and the implications of this are critical.

1

I-317-001

Please see Comment Letter I-002.

- **Terminus Impact.** Without a Route 16 Station, the College Avenue stop (designed and intended to be an interim station) would become the de facto terminus for the Green Line extension. It is not designed for a terminus and due to the traffic flow and neighborhood density, as well as the lack of opportunity for transit-oriented development at College Ave., it is not a good location for a terminus.
- **Cost.** The two-phased approach is fiscally irresponsible and by MassDOT's own estimates will inflate the cost by $55 million over a single-phase approach. Severing a single stop (less than one mile of track) from the project as a whole will cost the state, and thus the taxpayers, significant additional money. There are obvious ways to easily reduce costs in the overall project and provide enough additional funds to include Route 16 as part of a single, complete project. This is the most prudent approach, and also would ensure that the project produces the air quality improvements the Commonwealth must achieve to come into compliance with the Clean Air Act.
- **Project Management.** There are significant efficiencies gained from completing the project in one phase, rather than the starts and stops required to execute on separate, multi-stage efforts for such a small add-on project as a single station stop.
- **Environmental Justice.** The environmental justice population cited, in part, to justify the project as a whole will largely not be served if the project terminates at College Avenue. The negative aspects of this project will affect them most, while they will receive the least benefit without service to a Route 16 terminus.
- **Legal Mandate.** The state is legally obligated to provide public transit services to Medford Hillside by December 31, 2014, and stopping the extension at College Ave. fails to meet this legal obligation. At a minimum, this incurs significant mitigation costs required if the obligation is not met.

2. College Avenue should not be a terminus. The College Avenue station is not designed for the additional requirements of a terminus. The neighborhood cannot sustain the impact of a terminus station operations and traffic volume and the potential environmental damage is of serious concern.

3. The Route 16 station design is inadequate. The DEIR offers only a "worst case scenario" (MassDOT's description) for the Route 16 station design, while offering optimized tation designs for all other Green Line extension stations. The Route 16 station design must be revisited. The Medford Green Line Neighborhood Alliance, a volunteer citizen group, has offered an alternative station design that prevents two major commercial property acquisitions and the resulting job displacement, preserves $182,000/year in property taxes for the City of Medford, optimizes traffic flow and better serves the integrity of the station's surroundings. MassDOT apparently has been exploring similar improved designs, which should be presented to the public for comment. A $1 billion project deserves a higher caliber design than a "worst case scenario."

To summarize, there is much more work to be done on the Environmental Impact report, and I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis in order to make the Green Line extension the best project it can be, and MUST be.

Thank you.

Reference to Project Number EEA #13886

Dear Ms Johnson, dear Secretary Bowles,

I write to you regarding a portion of the Green Line extension project. I am a supporter of the extension, even though it will have negative consequences for my home. I understand that there is a greater good that needs to be served. As a resident of Somerville, I am acutely aware of the uneven distribution of services and costs in the public transportation sector – we seem to get too get few benefits (count the T stops in Somerville) and pay dearly. The current extension will add T stops. I write to you about the price.

I-318-001

I write in particular regarding two issues: the plan to locate the maintenance facility and storage yard in what is known as Yard 8, and the planned levels of mitigation for the Brickbottom Artists Building, which the extension will 'embrace' with tracks. Despite many well-attended public meetings in which politicians, residents and concerned citizens responded with near unanimous consensus that Yard 8 was unacceptable, the Department of Transportation to this day prefers to locate its facility and yard there.

The reasons against it are multiple. By the DOT's own metrics, the sound levels would be extreme. They speciously compare the maintenance facility's noise to the sound level of the occasional passing train – but it is not only louder, it will be continuous and unrelenting. The storage yard's main operating hours are at the end of the day (after midnight) and the start of the day (before 5am), with the rest of the day punctuated by trains on both sides of the building. If we are sealed into our building with sound-proofed glass, 150 units will be forced to turn to 24/7 air conditioning – environmentally tragic and financially difficult for many of the artists who live and work in the building.

Despite nearly two years of protest against the Yard 8 plan, the DOT and its predecessor have persisted, refusing to study other proposals until very recently. Now, it's a race against the clock. A decision that will profoundly affect the 200+ residents and workers in this community, and that will for decades to come effectively cut off the Inner Belt area from much needed economic development (and deprive Somerville of a much needed tax base) has been stubbornly – and negligently – skewed in one direction. This

I-318-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

sort of blind expediency will kill a vulnerable artistic community, one that has done much to revitalize the area; and it will kill the chances for economic expansion into the Inner Belt. Paradoxically, a move inspired by environmental concerns has targeted the single location of mass habitation in an otherwise largely empty industrial area, and plans to site a pollution generator 50 or so feet away from it. Constant and intermittent 'extreme' levels of noise, light and chemical run-off are an extraordinarily high price to pay, especially given the alternatives of Mirror Scheme H and possibly Scheme L (if modified). The state has finally begun to look at these alternatives, but I fear that in the haste to make a decision and meet the deadline, expediency will override good sense.

I urge you to listen to the many concerned voices that object to the location of the facility and storage yard in Yard 8. Help us maintain our lives and work and community; help us give Somerville a future; please encourage DOT to take up Mirror Scheme H.

I-318-002

My second point regards mitigation for the Green Line that will run along both sides of the building. Brickbotton is located at the crux of a "Y". I don't know much about mitigation techniques, but would encourage a solution – if possible – that would enable people to open their windows and not rely upon air conditioning. Perhaps sound absorbent barriers or walls would help; certainly some sort of vibration control would seem to be necessary. If additional soundproofing is needed, it would be good if your office ensured that it will be made available in an equitable manner to those who need it.

The DOT has not presented itself as an honest broker, and while it has given us many chances to speak, it appears not to listen. I urge your office to protect our rights and the quality of our lives.

Finally, a word about Brickbottom. I am a professor at MIT, and I have several colleagues from MIT and Harvard who also live in the building, including a Nobel prize winner. The majority of the building's inhabitants are artists, some well-established, some young and struggling. They are a vulnerable population, and yet essential to the hopes and culture of the Union Square side of Somerville. Despite the crisis, the area is slowly coming to life, emerging as a hip, culturally diverse center. The development is fragile, and the issues I have written about can help or destroy that future. Brickbottom is a wonderful community. Please let it survive!

Sincerely,

William Uricchio

I-318-002

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-319-001

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-319-001 I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

First of all, I strongly support the Green Line extension, and urge that it be built in the most practical, beneficial and cost-effective manner – that is, to construct the entire project in one phase, with a terminus station at Mystic Valley Parkway (Route 16), by December 31, 2014.

The DEIR is encouraging in that it concludes that the Route 16 station would provide the most benefits according to all project criteria, including air quality and environmental justice. However, MassDOT states that it is incapable of building (and funding) the entire "Preferred Alternative," so it only intends to build the extension to College Avenue in the Tufts University area of Medford, by its deadline of December 31, 2014.

In my opinion, the DEIR as currently written does not serve the best interests of the project. More importantly for your review, it was not done in a way that "adequately and properly" complies with the state environmental regulations, nor with the December 1, 2006 MEPA certificate that defined the requirements of the DEIR.

For the following reasons, I strongly urge you to not accept the DEIR as the Final EIR and require further environmental analysis of the project by MassDOT:

1. A two-phased approach is unacceptable. The Route 16/Mystic Valley Parkway Station should be built as part of a single-phase project to minimize costs and negative impacts and achieve the maximum benefits with regard to ridership, vehicle mile travel reduction, air quality improvements, and service to environmental justice communities.

The recommendation as outlined in the DEIR is for the Route 16/Mystic Valley Parkway station to be a **separate** stand-alone Phase II project with no funding source identified. **This means, Route 16 may never be built.**

There are many, many problems with the Phase II approach, including:

- **Risk.** Without an identified funding source there is a very high probability that Route 16 will never be built and the implications of this are critical.
- **Terminus Impact.** Without a Route 16 Station, the College Avenue stop (designed and intended to be an **interim station**) would become the de facto terminus for the Green Line extension. It is not designed for a terminus and due to the traffic flow and neighborhood density, as well as the lack of opportunity for transit-oriented development at College Ave., it is not a good location for a terminus.

- **Cost.** The two-phased approach is fiscally irresponsible and by MassDOT's own estimates will inflate the cost by $55 million over a single-phase approach. Severing a single stop (less than one mile of track) from the project as a whole will cost the state,

and thus the taxpayers, significant additional money. There are obvious ways to easily reduce costs in the overall project and provide enough additional funds to include Route 16 as part of a single, complete project. This is the most prudent approach, and also would ensure that the project produces the air quality improvements the Commonwealth must achieve to come into compliance with the Clean Air Act.

- **Project Management.** There are significant efficiencies gained from completing the project in one phase, rather than the starts and stops required to execute on separate, multi-stage efforts for such a small add-on project as a single station stop.
- **Environmental Justice:** The environmental justice population cited, in part, to justify the project as a whole will largely not be served if the project terminates at College Avenue. The negative aspects of this project will affect them most, while they will receive the least benefit without service to a Route 16 terminus.
- **Legal Mandate:** The state is legally obligated to provide public transit services to Medford Hillside by December 31, 2014, and stopping the extension at College Ave. fails to meet this legal obligation. At a minimum, this incurs significant mitigation costs required if the obligation is not met.

2. College Avenue should not be a terminus. The College Avenue station is not designed for the additional requirements of a terminus. The neighborhood cannot sustain the impact of a terminus station operations and traffic volume and the potential environmental damage is of serious concern.

3. The Route 16 station design is inadequate. The DEIR offers only a "worst case scenario" (MassDOT's description) for the Route 16 station design, while offering optimized station designs for all other Green Line extension stations. The Route 16 station design must be revisited. The Medford Green Line Neighborhood Alliance, a volunteer citizen group, has offered an alternative station design that prevents two major commercial property acquisitions and the resulting job displacement, preserves $182,000/year in property taxes for the City of Medford, optimizes traffic flow and better serves the integrity of the station's surroundings. MassDOT apparently has been exploring similar improved designs, which should be presented to the public for comment. A $1 billion project deserves a higher caliber design than a "worst case scenario."

To summarize, there is much more work to be done on the Environmental Impact report, and I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis in order to make the Green Line extension the best project it can be, and MUST be.

Thank you.

Re: EEA #13886, Green Line Extension

Dear Secretary Bowles:

I am writing to comment on the DEIR/EA for the Green Line Extension, EEA # 13886.

I strongly support the Green Line Extension, specifically Alternative 2b, extending it to Route 16 with a spur to Union Square. This project will greatly benefit the communities it will serve in numerous ways including improving air quality and greatly improving transit in an underserved community.

Long promised, this project is also long overdue, but now on a tight timeline with the legal agreement to have it running by December 31, 2014. But as an initiative that is going change of the infrastructure of three cities for decades to come, it's also critical that we get it right.

MAINTENANCE FACILITY

I-320-001

Continuing to move forward with the "Yard 8" maintenance facility alterative is not getting it right. Yard 8 should be removed from consideration and instead the area around the Boston Engine Terminal (BET) facility, including, but not limited to, the "Mirror H" and "Option L" sites, should be farther studied as part of a continuing MEPA process.

As a trustee of the Brickbottom Condominium Trust and a resident of the Brickbottom Artists Building, I live in an amazing community of over 220 people. Twenty-two years ago a group of artists converted an old A&P Foods factory into a live/work space and in doing so became the first residents to move into an area where historically infrastructure has pushed people out.

The DEIR (Section 5.12.3 p 5-145, *Common Effects of the Build Alternatives*) and the earlier *Potential Impacts on Brickbottom Artist Buildings* report (Section 2.4 p.7, *Visual Environment*), discuss "Yard 8" as having historical use as a rail yard as a reason to claim a facility there will have little impact on the character of the surrounding neighborhood. While that is technically accurate, there's more to the story – infrastructure has been pushing residents and businesses out of the area for over a century, a trend it's time to reverse.

In 1816, Massachusetts General Hospital purchased the estate Joseph Barrell had built on Cobble Hill and established the McLean Asylum. From the beginning,

I-320-001

An expanded technical and environmental analysis of light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. This chapter includes real estate impacts and order-of-magnitude capital costs for each maintenance facility alternative. FEIR Section 2.3 provides a comparison summary of environmental impacts for the three maintenance facility alternatives. FEIR Section 2.4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. As a result of the evaluation, Option L was identified as the preferred maintenance facility site. However, it should be noted that even without the use of Yard 8 for the maintenance facility, the main line Green Line tracks will still be located in this area.

Design for the maintenance facility will be developed during the Project's preliminary engineering stage. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during preliminary engineering. Chapter 8 of the FEIR describes proposed mitigation measures and related monitoring after the construction phase.

Increasing rail use in the area was an issue, leading the asylum's first Superintendant, Dr. Luther V. Bell to lament, "The almost constant shriek of the steam whistle was a sound certainly not favorable to jarred nerves and morbid sensibilities. Will so much benevolent and scientific outlay (be sacrificed) to the conveniences of engineering?"[1]

By 1896 the expansion of Boston and Lowell Railroad forced the McLean Asylum out and the railroad purchased the asylum land. B&L promptly tore down 28 buildings, including the former mansion, cut down 1,500 elm and maple trees, and uprooted hundreds of fruit trees and rosebushes, totaling 2,800 trees and plants.

Hemmed in on one side by rail, next came the highways: McGrath Highway (then the Northern Artery) was completed in 1925. It divided an area that had started off as worker housing in the late nineteenth century and had been gradually transformed into a dynamic neighborhood by waves of Italian, Portuguese, and Greek immigrants. Finally, most of what remained in the Brickbottom and Inner Belt areas was cleared in the 1950s for a highway and industrial park that never materialized.

Building a rail maintenance facility and storage yard next to the only residents in the area would just be a continuation of past trends. It's time to do better, plan smarter, and humanize the neighborhood's infrastructure, not add unjust burdens to it.

ALTERNATIVES

I-320-002

While the "Mirror H" site would have the least impact on Brickbottom and on the economic development potential of the Brickbottom/Inner Belt area, "Option L" is the most promising compromise location. However, it needs to be farther studied and refined. One problem with it is that the employee parking lot appears to push the train storage closer to Brickbottom and possibly causes an increase in track curvature (and therefore noise and vibration impacts).

Additional study and design of Option L, Mirror H, and the rest of the area around the BET site should occur as part of a Supplemental EIR and must be required to include thorough economic development and land use planning. Other site variations in that general area should also considered, as should a smaller maintenance program, and a reconfiguration of the BET facility.

MITIGATION

I-320-003

Regardless of the final site of the maintenance facility and storage yard, Brickbottom sits right in between the Green Line Extension main line and Union Sq. spur. With new tracks on two sides of the building, thorough mitigation will be critical. The DEIR's mitigation discussion is insufficient: Brickbottom is identified as having severe

[1] Sources:

- Beyond the Neck: The Architecture and Development of Somerville, Massachusetts, Updated Edition, 1990, by Landscape Research of St. Paul, Minnesota;
- Somerville, Massachusetts: A Brief History, by Dee Morris and Dora St. Martin, The History Press, 2008.

I-320-002

The Green Line Extension storage and maintenance facility is a critical component of the Proposed Project, and must be constructed as part of the overall Project. Chapter 2 of the FEIR fully describes the environmental impacts of the proposed storage and maintenance facility. The facility must be constructed adjacent to the Green Line Extension to maximize operating efficiencies and be constructed within the same time frame as the Project.

I-320-003

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

I-320-003

noise and vibration impacts, but only one side of the building has been studied and no specific mitigation measures for the building have been addressed.

In addition, only 40 of Brickbottom's 155 units are listed as possibly requiring sound proofing (DEIR Section 5.7.3 p. 5-119, *Noise Mitigation*), without any indication which units those are or how they were identified. How was that number reached?

I-320-004

DEIR Table ES-4, *Project Mitigation Commitments,* lists that noise and vibration mitigation measures will not be implemented until completion of construction. This plan should be amended so that whenever possible, noise and vibration mitigation measures are put in place before construction begins, so that those measures can also mitigate the construction process itself.

I-320-005

Before proceeding to a Final EIR, or as part of a supplemental MEPA process, MassDOT should be required to enter into binding written agreements with stakeholders that define specific, quantitative mitigation goals and process for seeking redress if any of those goals are not met.

BRICKBOTTOM STATION

The EENF Certificate for the project required studying a station site that would serve the Brickbottom/Twin Cities Plaza area. However, the proposed station just south of Washington St is almost as far away from the Brickbottom Artists Building as the relocated Lechmere station will be.

Without a closer station I fear that Brickbottom will be absorbing some of the worst impacts of the extension (from both the maintenance facility and storage yards and close proximity to *both* branches of the extension), with little of the benefits. Plus the project will be under-serving not just Brickbottom/Inner Belt businesses, but also the large shopping centers at Twin Cities Plaza and the Target plaza on Somerville Ave.

I-320-006

If an additional station can not be built during this phase of the project, it is important to design the extension now so that one or more infill stations on either line can be easily added in the future.

I-320-007

The station that is proposed is awkwardly sited so that it is not actually on Washington St, but is one building just south of it and is only accessible from Joy St. I'm in favor of a station as close to Brickbottom as possible, but that just doesn't make sense: a station right at Washington St. (ideally with access from both sides of the street) would: serve as a gateway to the Brickbottom District, be easier for other East Somerville residents to access, connect better to bus routes, and be more integrated with the neighborhood.

I-320-008

The Brickbottom station is not the only one that is not as well connected to the surrounding neighborhood as it could be: the Union Sq. and Ball Sq. station designs both require riders to cross a busy street to reach them instead of providing access from both sides of the road. Plus, integration with bus lines is lacking throughout the entire extension. To help solve these issues during the next design phase and to keep working on other things that arise during engineering and construction, continuing community involvement (both formal advisory committees and informal community meetings) will be critical and should be required.

I-320-004

As described in DEIR/EA Section 3.7, construction contractors will be required to comply with state regulations and local ordinances to mitigate air quality, noise, and vibration impacts. On-site resident engineers and inspectors will monitor all construction activities to ensure that mitigation measures are properly implemented.

I-320-005

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

I-320-006

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

I-320-007

The conceptual plan for the Brickbottom Station will be refined during the preliminary engineering stage, taking into consideration municipal, neighbor, and other stakeholder concerns to the extent practical. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

I-320-008

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. These stations are designed to be consistent with MBTA standards and compliant with ADA. Detailed designs for each

COMMUNITY PATH

I-320-009 It was great to see that the initial design for the Community path was done in conjunction with the design of the Green Line Extension. For the extension to have the largest impact, full design and build of the path should be incorporated into the Green Line Extension project.

I-320-010 The path itself should be directly from accessible from Brickbottom so that it serves it not only as the only residential building near that segment of the path, but also the Brickbottom Gallery and the other Open Studios and arts events held here throughout the year.

CONCLUSION

The Green Line Extension is a fantastic project and it is important to keep it moving forward so that it can meet the commitment to be up and running by the end of 2014. I understand that the project team wishes to move directly from Draft EIR to Final EIR and I would not object to that for the extension itself.

I-320-011 However, Yard 8 is completely unacceptable and specific mitigation goals need to be committed to before those aspects of the project are included in a Final EIR. Please require them to be addressed under a continuation of the MEPA process (such as a Supplemental EIR).

This project will help compensate a community that is overburdened by infrastructure. I am asking that you help make sure that those burdens are not unjustly increased on some residents in process.

Sincerely,

Heather Van Aelst

EEA #13886 Comments
January 8, 2010

station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-320-009

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-320-010

MassDOT is committed to completing all planning, design, and engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community Path between Lowell Street and Inner Belt Road. MassDOT is not able at this point to commit to funding the construction of the Community Path. The limits of the path were predicated on the connections to Lechmere being made through the Inner Belt area via Inner Belt Road and the proposed Urban Ring Bridge into the Lechmere area. However, the cessation of planning for the Urban Ring Project has changed the timing of this anticipated connection. MassDOT is unable to assume responsibility for designing the Urban Ring Bridge as part of the Green Line Extension Project. That being said, MassDOT is committed to working with the City of Somerville, residents and businesses in the Brickbottom and Inner Belt neighborhoods, and Community Path advocates to design the Path to create improved connectivity within the Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension.

I-320-011

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

Subject: I support the Green Line extension to Rte 16 by 2014!

January 8, 2010

Dear Secretary Bowles,

My husband and I moved to Medford because we were excited about the proposed Green Line extension to Rte 16 in 2014. We signed a petition along with 2,000 of our neighbors supporting the plan. And now, inexplicably, the price tag has risen astronomically and the Rte 16 stop has been postponed. This disappoints us greatly. A two-phased plan is unacceptable to us and so many of our residents who have waited too long for adequate public transportation to Boston.

I-321-001 Please reconsider the 2-phased approach, and build the Rte 16 stop by 2014 instead. It makes the most sense. If we know the Rte 16 stop will be beneficial, let's do this right and build it as soon as possible. Why wait?

Sincerely,
Diolinda Vaz

LATE COMMENT

1

I-321-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

January 8, 2009

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

The DEIR as currently written does not serve the best interests of the people potentially served by the extension. The findings in the report do not adequately comply with the state environmental regulations, nor with the December 2006 MEPA certificate that defined the requirements of the DEIR.

I-322-001 Our biggest concern is that the part of the extension most critical to West Medford is relegated to an uncertain future construction phase. The Route 16/Mystic Valley Parkway Station should be built as part of a single-phase project to minimize costs and negative impacts and achieve the maximum benefits. Splitting this into two projects simply makes no sense. For one thing, the College Avenue station would have to be refitted to be a terminus, which is a waste of resources.

I-322-002 Finally, we understand that the state is legally obligated to provide public transit services to Medford Hillside by 2014, and stopping the extension at College Avenue fails to meet this obligation.

We have come to accept that the Green Line will not be extended across the Mystic River, but to not go all the way to Route 16 would be a missed opportunity and a massive failure. We strongly urge you to not accept the DEIR as the Final EIR and require further environmental analysis of the project by MassDOT.

Regards,

Marc Verhagen
Ann Gallager

15 Austin Road
Medford, MA

email: marc@cs.brandeis.edu

I-322-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-322-002

As directed by the Secretary's Certificate on the DEIR/EA, the FEIR includes a limited scope of issues related to the Green Line Extension Project. The Proposed Project, with a Medford Branch terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Although an extension to Mystic Valley Parkway/Route 16 is MassDOT's Preferred Alternative, financial constraints prohibit the Commonwealth from progressing the Project beyond College Avenue at this time.

Since the release of the DEIR/EA, a few stakeholders raised concerns that the proposed College Avenue Station, serving as a terminal station for the Proposed Project, would not adequately serve the Medford Hillside neighborhood. Serving this neighborhood was identified as part of the SIP description. To address and resolve these concerns, CTPS prepared a memorandum demonstrating that the College Avenue Station location does adequately serve the walk market area for the Medford

Hillside neighborhood. This memorandum is provided in Appendix C of the FEIR.

Subject: Green Line extension EEA #13886 light pollution comment

To Whom It May Concern:

As a resident of Somerville, I am very excited about the green line extension project and am greatly looking forward to the day I can take my first ride. I am very supportive of the project as a whole.

I-323-001

I wanted to draw attention to one aspect of its development I haven't heard much about -- the lighting that will be used for the station stops and along the track itself. I assume that energy efficient choices will be made. But I also greatly hope that you will go with options that limit light pollution to the bare minimum. There are great options these days that make sure light is almost exclusively directed where it needs to be, minimizing glare and trespass onto other properties or into the sky (where it isn't serving any purpose). Making sure light is focused just where it is useful enhances safety and helps save energy and preserve our dark skies. I'm sure you are up-to-date on this issue, I just wanted to make sure that light pollution is factored into your plans.

Thanks very much for all your work,
Maggie Villiger
62 Sycamore St
Somerville MA 02145

1

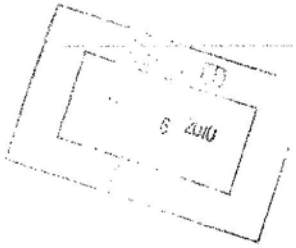
I-323-001

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. Lighting at the station stops will be designed to minimize light pollution to the extent possible. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

ITJ

To: The Executive Office of Energy and Environment Affairs, MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886 100 Cambridge Street, Suite 900 Boston, MA 02114

From: Sylvie Vincent, PhD
Brickbottom Resident, Somerville MA



Reference to the Project Number EEA #13886

Dear Secretary Bowles,

It is a very important moment for the Brickbottom community and I really appreciate the opportunity that you are giving me in expressing my opinion regarding the extension of the green line through Somerville and Medford.

I am deeply in favor of using public transportation, first because it opens the door to locations (especially downtown Boston) that are not easily accessible by cars due the traffic and parking situation and second, because I believe that any effort to reduce pollution and to avoid the use of personal vehicles is a noble goal.

I-324-001 I do recognize that the increased train cars with the green line extension will thus require a maintenance facility. However, I firmly oppose the use of the designated site "Yard 8" as a possible site for that facility. Mister Secretary, you ought to realize that we are one on the rare living building in this area. The development of this artist building 20 years ago lead to the enormous improvement of the area and the development of a new large artist building on Joy Street. The city of Somerville has dedicated money and time to clean and embellish the area. The Building cannot avoid a set down with the presence of a maintenance facility as a neighbor.

I-324-002 I have two children and I will not accept to live in an environment where noises and vibrations are an everyday commodity. Mitigation requirement for the Yard 8 site will be large and inconvenient and should concern all (and not a few) inhabitants of the Brickbottom Building. We are not going to accept deteriorated conditions of living once we know that alternative sites such as the mirror H site would fit all criteria required for the

I-324-003 project with a reduced effect on living population. The extension of the green line should go hand to hand with the extension of the biking path from the existing minuteman trail.

I hope, Mister Secretary, that a common accord will be developed in order to finalize the extension of the green line with limited damages to existing population in Somerville and Medford and limited effect on the potential development of the inner belt.

Sincerely,

Sylvie Vincent

I-324-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-324-002

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

I-324-003

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

January 6, 2010

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

We are writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

In general, we strongly support the Green Line extension and look forward to seeing its benefits in terms of reductions in traffic-related emissions as well as the improvement in access to public transportation along the corridor. We were particularly struck by the extent to which environmental justice populations will have improved access to transportation shown in Figure 4.4-1. However, in order to maximize the benefits of the project, we believe more planning work needs to be done. In particular, we offer the following comments on the DEIR:

I-325-001

1. If the legal requirements of the project include providing public transit services to "Medford Hillside" by December 31, 2014, then terminating the project at College Ave. falls short of the stipulated goal. "Medford Hillside" is generally considered to be the area northwest of Winthrop Street to Mystic Valley Parkway, and much of this area would be more than 0.5 mile from the College Avenue station. We acknowledge the funding issues associated with the "Preferred Alternative" aka the "Future Full-Build Alternative". However, if the true commitment is to extend the project to Route 16, then delaying that aspect of the project will unnecessarily add costs and construction impacts. Many of the charts in the DEIR demonstrate that the emission reduction benefits would be maximized by extending the project to Route 16. Figure 4.4-1 does not extent far enough to the north and west to show the environmental justice populations that would be served by extending the project to Route 16. With a terminus at College Avenue, more traffic is likely to be experienced on Boston Avenue between College Avenue and Route 16 due to increased drop-offs at College Avenue. For these reasons, we believe it is critical to complete the full Preferred Alternative project by the required December 31, 2014 completion date.

I-325-002

I-325-003

2. The station layout at Route 16 needs much more analysis. The alternative presented in the DEIR is a "worst case" layout that maximizes the impact on the properties at 200 and 222 Boston Avenue, and as a result maximizes the impact on tax revenue and job decreases/relocations. This layout has the effect of making the extension of the project to Route 16 seem less attractive. The advocacy group MGNA has identified an alternative that would avoid the need to take the 200 and 222 Boston Avenue properties. That alternative would seem like a good starting point to develop a more optimized layout for the Route 16 station.

I-325-001

As directed by the Secretary's Certificate on the DEIR/EA, the FEIR includes a limited scope of issues related to the Green Line Extension Project. The Proposed Project, with a Medford Branch terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Although an extension to Mystic Valley Parkway/Route 16 is MassDOT's Preferred Alternative, financial constraints prohibit the Commonwealth from progressing the Project beyond College Avenue at this time.

I-325-002

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-325-003

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

3. As a result of the issues raised in comment nos. 1 and 2 above, we strongly urge you to not accept the DEIR as the Final EIR and require further environmental analysis of the project by MassDOT.

We appreciate the opportunity to comment on the DEIR, and as we stated above, we look forward to seeing the benefits of this important project. At the same time, we believe that additional planning work is needed to make sure this project fully meets its stipulated goals and maximizes the benefits to the residents of the communities along the project corridor.

Very truly yours,

Donald E. Walker

I think it is important to state how much I support this project. I have attended many meetings, had many discussions with neighbors, and everyone sees how much the green line extension will add to all our neighborhoods. It will connected neighborhoods that are disjoint now. This letter will outline my concerns with parts of the plan, but in no way do I think this plan should not go forward.

I-326-001 Starting with the Location of the maintenance facility, the facility should be placed in Option L. Mirror H will have a large impact on future development at Northpoint. Yard 8 has many disadvantages. The first and obvious one is the impact on the current Brickbottom development. But more importantly, it will hurt future development of the entire area. Currently the edge of East Cambridge and Inner belt Somerville are under developed. They are cut off from each other, and by building a facility at Yard 8, they will forever be cut off. Northpoint already has initial plans to connect to the inner belt, which will add value to both developments.

Option L is by far the best since it's placed in a current industrial area, and all future plans for the area are also industrial.

I have many concerns on the plans around the Lechmere T stop. I know others have sent in the plans from the East Cambridge Lechmere Working Group (which I am a member of) so I will summarize my concerns. I've attached to this email a single page pdf (which comes from the just mentioned plans) which I will reference.

In general the station is not pedestrian focused. To re-focus this, many things are needed:

I-326-002 1. Mcgrath should not be widened. A wide cross walk should be installed to allow the large amount of pedestrians going to the mall and other places around First Street.

I-326-003 2. The roads should be straightened up around the station to remove the focus from the buses to the pedestrians. The station should have a larger walk around the station.

I-326-004 3. The Charlie card stations should be covered. All the other stations in this plan have these covered.

I-326-005 4. There is no reason to have a large parking lot at the station. A few spots for the workers use is fine, but a large lot is unnecessary and counter constructive towards encouraging public transit usage. This is especially puzzling since this stop is now in the middle of the line. No other "middle of the line" stations have large parking lots associated with them....

I-326-006 5. The T should work with the glassfactory to consider swapping the end of the parking lot to allow better pedestrian access to the station from Mcgrath.

I-326-007 Finally, let me give a few words about the old station site and the triangle park. The aforementioned East Cambridge Lechmere Working Group has put together a plan for redevelopment of these sites. We've presented our ideas to many private and governmental agencies (local business groups, neighbors, representatives in Cambridge Community Development, the Cambridge city manager, EOT representatives, MBTA representatives) and all the above have had praise for our ideas.

I-326-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, Option L is identified as the preferred maintenance facility site.

I-326-002

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. The chapter presents a traffic analysis, a detailed description of pedestrian crossings of O'Brien Highway, and proposed roadway, crosswalk, and sidewalk improvements that are consistent with the NorthPoint development plans. These station and street plans will be further refined in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-326-003

Revised conceptual plans for Lechmere Station, including bus facilities and bus waiting areas, are included in FEIR Chapter 5, Lechmere Station. Bus layover has been shifted further to the east and away from the Glass Factory Condominiums in the revised Lechmere Station design. Signs will be posted to limit idling of buses, in conformance with MBTA standards.

I-326-004

Revised conceptual plans for Lechmere Station, including modifications to the station headhouse and entrances, enclosed automatic fare collection, and other amenities are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. The Public Involvement

I-326-007

I request that the site be left alone for the near future as a plan is drawn up to develop the site. I am especially worried about rumors of a land swap with Pam Am railway over land that has no advantage for the local neighborhood.

Finally, as a homeowner who lived adjacent to a large (5 year) condo construction, I wish to discuss mitigation and noise/vibration/debris issues.

There will be issues. In the best of planning, there will be sub contractors who work outside of legal times, miscommunication over distruptive construction work, etc.

I-326-008

To address this, a properly staffed office must be opened with ownership of all the above issues. There should be a well published contract method (phone/email/office hours) to address all these issues.

This will help both sides. Often many of the issues are due to miscommunication across various responsible parties and having a single contact helps everyone.

Thank for reading my comments and I look forward to seeing this project going forward!

Regards,

Jay Wasserman

Cambridge MA 02141

jayrwasdf@yahoo.com

Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-326-005

Although Lechmere Station will no longer function as a terminal station, there is still a demonstrated demand for existing parking. Nonetheless, parking at the relocated Lechmere Station was reduced in the revised conceptual design. These revised plans are included in FEIR Chapter 5, Lechmere Station.

I-326-006

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

I-326-007

MassDOT has reviewed the suggestions submitted by the East Cambridge Planning Team. Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. These plans, including the pedestrian crossings of O'Brien Highway and associated street, crosswalk, and sidewalk designs will be further refined in the preliminary engineering stage of the Project. As part of the Green Line Extension, MassDOT intends to demolish the existing Lechmere Station and prepare the site for potential future redevelopment. Based on the current requirements of the O'Brien Highway roadway improvements (as shown in FEIR Chapter 5, Lechmere Station), the existing bus shed must be removed.

I-326-008

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

Subject: Green Line Extension DEIR/EA comments

TRACK AND STREET GRADES

When I walk or drive across the Broadway bridge in Somerville, I find the sight lines caused by the height of the bridge annoying. It appears likely to me that at some point in the past, the street crossed the tracks at grade at the present level of the tracks, and that the sight lines were probably much better then than they are now.

Likewise, I have gotten the impression that the present Lowell Street bridge in Somerville is higher than the previous one, and offers poor sight lines for the streets.

I-327-001 The Green Line Extension is already planning to lower the level of the ground on the outer portions of the railroad right of way in many places, and I believe MassDOT ought to be exploring the opportunities to lower not just the outer edge of the railroad right of way, but also the center portion, in order to improve sight lines and wheelchair accessibility for the bridges. The goal should be that wheelchair accessibility for the bridges should be at least as good as wheelchair accessibility for the road in that neighborhood would be if there had never been any railroad or Green Line construction in the vicinity of each bridge.

STATIONS

Fare Gates

I-327-002 Every entrance to every station should have at least two accessible fare gates. Davis Square has only one accessible fare gate, and there was one day when I found it was out of service, blocked off by a cone; it is not acceptable for a single fare gate's failure to prevent wheelchair access to a station. (Why the MBTA didn't make a reasonable effort to accomodate the disabled by simply allowing anyone to pass through that fare gate at no charge until it could be fixed, I do not understand.)

Vehicle Access

I-327-003 I am in favor of adequate automobile pick up and drop off areas being made available at most if not all of the stations along the Green Line Extension. Because automobiles can easily travel from one station to an adjacent station, one question that should be looked at is whether there are minor stations in residential neighborhoods which should be designed to discourage motorists from using them for passenger pick up / drop off, instead of an adjacent station.

I-327-004 Stations which will be served by buses also need adequate bus pullouts. Transfers between buses and stations need to be designed to be wheelchair accessible; I am concerned that, for example, a passenger of the 88/90 buses on Highland Ave may not be able to transfer to the allegedly wheelchair accessible Gilman Square station because of the grades on the streets between the Gilman Square station and the bus stops. I also believe that the distance passengers should be expected to walk when transfering, especially in the cold of winter or heat of summer, should be kept as short as possible.

1

I-327-001

The conceptual track, system, and bridge designs presented in DEIR/EA Section 3.7 will be refined in the preliminary engineering phase of the Project. The process for coordinating with local communities during Project design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-327-002

Revised conceptual plans for Lechmere Station, described in FEIR Chapter 5, include two accessible fare gates at this station. The number of accessible fare gates at other Project stations will be determined during preliminary engineering. The process for coordinating with local communities during Project design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-327-003

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR,

Some thought should be given to adequate parking for the MBTA's non-revenue vehicles at each station. On at least one occasion after the MBTA started running ads saying that people who use bus pullouts as passenger drop off / pick up areas can be fined, I saw an MBTA vehicle which is not used to carry reveune passengers parked in a bus stop at Porter Square, demonstrating that not enough attention has been paid to adequate parking for non-revenue vehicles at existing stations.

I-327-005 I am also strongly in favor of the MBTA striving to hire people who are within reasonable walking distance of each station to work at each station. I recognize that in general, employment law does not allow employers to discriminate on the basis of how an employee commutes to work. However, employment law does allow a trucking company to require its employees to hold an appropriate driver's license, and I believe that MBTA customer service agents who do not do the majority of their travel via MBTA services are not as able to effectively help passengers to navigate the MBTA system.

Pedestrian Bridges

I-327-006 I would like to see the DEIR/EA revised to contemplate the possibility of pedestrian bridges at three stations.

At the new Lechmere Station, such a bridge could provide a connection to the location of the old Lechmere station to mitigate the impacts of the relocation of that station, as well as potentially providing a connection to the CambridgeSide Galleria. I would like to see MassDOT explore the possibility of getting CambridgeSide Galleria to contribute toward the cost of constructing such a pedestrian bridge if CambridgeSide Galleria feels that such a bridge would increase the revenue that the stores at the Galleria collect.

At Gilman Square, a pedestrian bridge connecting the station to the sidewalk near the Somerville Library, Somerville High School, and Somerville City Hall, with the main station elevator having a level even with the ground level of those buildings, might improve wheelchair accessibility between the station and these important city buildings.

At College Avenue Station, a pedestrian bridge above Boston Avenue providing a connection to Tufts might reduce congestion on Boston Avenue and improve safety for passengers travelling to Tufts, and I would like MassDOT and Tufts to explore the question of whether Tufts alumni donations could fund such a bridge, in much the same way that universities are often able to raise funds from alumni to construct buildings.

Commuter Rail Connection

I have heard that the possibility of building commuter rail platforms at a station along the Green Line Extension has been considered, but that the width of the rail right of way at the station is a concern, and travel time for the commuter rail trains is also a concern.

I-327-007 I believe that building a station with one level for the Green Line and the other level for the Commuter Rail is a viable way to address the space issue. Porter Square, South Station, and North Station are all examples of existing MBTA stations with Commuter Rail and subway on different levels. The subway platforms at North Station demonstrate that it is possible to have one parallel track almost directly over another parallel track, where one Green Line track is above another.

I-327-008 Regarding the travel time for Commuter Rail passengers, upgrading to electrified Commuter Rail, with overhead power and/or by adapting the battery technology in the Tesla Roadster to commuter rail, ought to improve the travel time by more than enough to make up for one extra stop.

2

describes MassDOT's plans for public outreach in the next phases of the Project.

I-327-004

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

I-327-005

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

I-327-006

The DEIR/EA and FEIR (Chapter 5, Lechmere Station) include conceptual station designs. These stations are designed to be consistent with MBTA standards and compliant with ADA. Detailed designs for each station will be further developed during the Project's preliminary engineering stage. The process for coordinating with the local communities during station design is described in the Public Involvement Plan (PIP), Chapter 6 of the FEIR.

I-327-007

Opportunities for a shared station between the Green Line Extension (on the Medford Branch) and MBTA Commuter Rail were evaluated for the Project. This connection was ultimately dismissed, as described in

The study also argues that North Station already provides a connection between the Commuter Rail and the Green Line Extension. However, a passenger wanting to get from Ball Square on the Green Line Extension to Lowell Station, the outbound end of the MBTA Lowell Line, is likely to see a substantial improvement in travel time if they do not need to travel all the way to North Station as a part of their trip.

Route 16 Station

I-327-009

Route 16 Station should be designed to not preclude the possibility of transfering to / from a ferry running along the Mystic River, unless a feasibility study of such a ferry has been completed which indicates that such a ferry would not be viable.

In particular, I am thinking of a ferry that would stop at Route 16 Station in Medford on the Green Line, on the north side of the Mystic River at Medford Center, and at the new Assembly Square Station on the Orange Line, whose location should be chosen to make ferry transfers convenient. It may make additional stops between the Green Line and the Orange Line. It may also continue towards Mystic Lake. If Alewife Brook is wide enough or could be made wide enough, it might also continue to Alewife Station.

Some thought should be given to the possibility of having Route 16 Station see a train only about once every 10 minutes, having every other peak time train turn around in a third, center Green Line track just outbound of the College Avenue stop. While I do generally favor frequent service, turning some trains around near Tufts might reduce the size of the station infrastructure needed at Route 16 Station.

Washington Street / Brickbottom

The study considered four possible configurations for Washington Street / Brickbottom station(s).

I certainly support having the Green Line Extension have only one stop in that general area.

I-327-010

My understanding is that the current bridge over Washington Street is wide enough for six tracks, and it only needs to carry four tracks:
two for the Green Line Extension, and two for the Commuter Rail. (I believe there is currently also a freight track, but I believe it would be possible to reconfigure the tracks so that freight trains could operate over the two Commuter Rail tracks, without the need for a dedicated freight track over Washington Street.)

I would like to see the study address the feasibility of using the space left over that could accomodate two extra tracks as space for the platform for the Washington Street Station. What is the width of the existing bridge in feet? Could the bridge be widened further without property takings? If the bridge only carried four tracks with no platform, what is the minimum width that would be required? How much space does this leave for a platform? What is the minimum reasonable platform width to adequately accomodate waiting passengers, escalators, stairs, and elevators?

I would like to see a station designed which would have entrances/exits on both sides of Washington Street.

I would also like to see various options for adjusting the relative height of the road and tracks at Washington Street explored. Would it be feasible to raise Washington Street a bit, and lower the tracks 30-40 feet from their current height, especially if the Lowell Line was rerouted to run nearly parallel to the Green Line route south of Washington Street until it reaches the Fitchburg Line, and then follow the Fitchburg Line route past the Boston Engine Terminal to North Station, instead of crossing above Inner Belt Road?

3

DEIR/EA Section 3.3, and Appendix B. While the potential for a joint station at Union Square would need to be studied further, it is not currently part of the Proposed Project. A connection currently exists between the Green Line and Commuter Rail at North Station; this connection would remain. However, as the Project advances into preliminary engineering, opportunities for future additions and extensions of service will be considered.

I-327-008

The potential future electrification of MBTA Commuter Rail lines in the Study Area is beyond the scope of the Green Line Extension Project. However, the conceptual plans in the DEIR/EA and FEIR do not preclude future electrification of commuter rail.

I-327-009

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-327-010

The conceptual plan for the Brickbottom Station will be refined during the preliminary engineering stage, taking into consideration municipal, neighbor, and other stakeholder concerns to the extent practical. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during the station design process.

Alternatively, would raising the street and the tracks 5-10 feet improve sight lines for users of Washington Street, and would widening the open area under the bridge for Washington Street make sense?

I also believe the study needs to very explicitly explain how transfering between the 86, 91, and CT2 at Washington Street will be made wheelchair accessible.

I-327-011

Lechmere Station

Because passengers traveling between Union Square and the Medford branch will need to change trains at Lechmere to reverse direction, the station should be constructed with an island platform to save those passengers from needing to deal with multiple elevators, escalators, or staircases.

BUS ROUTES

I-327-012

When the Green Line Extension is completed, Somerville will have stops on four different rail transit lines (the Red Line, Orange Line, and the two branches of the Green Line), which do not connect to each other within Somerville. This implies that much travel within Somerville will continue to rely upon bus service.

I believe a major goal in the selection of bus routes should be for each bus route to serve as many different subway lines as possible.

The existing 86 and 91 routes do an excellent job of connecting the different subway lines, serving Sullivan Square on the Orange Line, Washington Street / Brickbottom and Union Square, on the two branches of the Green Line, and Central Square / Harvard Square on the Red Line. All that needs to be done is to ensure that these routes have convenient, wheelchair accessible transfers at the new Green Line stations.

I would like to see some thought given to the possibility of extending the western terminus of route 90 to match route 88's western terminus, adjusting the routing to provide direct transfers to the Green Line at Gilman Square, increasing the frequency of the 90 to be at least as frequent as the 88, and dropping the 88 entirely. I believe that passengers who board west of Gilman Square will prefer the option of frequent service, including weekend and late evening, to Sullivan Square over having the option of staying on the bus past Gilman Square to Lechmere when heading into downtown Boston, and I suspect that other bus routes can adequately cover the stops inbound from Gilman Square.

I would like to see some thought given to the possibility of keeping the 77's route intact outbound of Porter Square, but rerouting the inbound portion to Union Square instead of Harvard Square, or creating a new route to run in addition to the 77 which would be identical to the 77, except for the inbound end of the route past Porter going to Union Square instead of Harvard Square. It should be noted that some riders currently like to board the 1 and transfer the 77, and extending the 1 to Porter might be desireable if 77 service to Harvard is dropped entirely; also, the depth of Porter may mean that having the option of transfering between the 77 and the Red Line at Harvard may be advantageous.

I would like to see the 85 extended to connect with the main branch of the Green Line at Gilman Square and/or Lowell St, possibly with the part of the route outbound of Union Square being rerouted to accomodate this.

I also believe there would be value in splitting the 80 in half where College Ave meets Broadway, and having both halves head down College Ave to terminate at Davis Square, as the current 80 provides connections to the main branch of the Green Line Extension at both Ball Square and College Avenue, and I think that trading away a redundant second Green Line

4

I-327-011

Revised conceptual plans for Lechmere Station, including modifications to the station headhouse and entrances, enclosed automatic fare collection, and other amenities are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-327-012

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

connection in order to gain the option of connecting directly to the Red Line would be valuable.

ADDITIONAL EXTENSIONS

I-327-013

West Medford

I would like to see more exploration of options for a West Medford Green Line station.

I think MassDOT should explore the possibility of building the Green Line with two tracks from Lechmere Station to the Route 16 Station platform, and then just outbound of the platform at Route 16 Station, merge those two tracks into one, running at the same grade as the existing Commuter Rail tracks across the Mystic River on a new bridge styled similarly to the existing bridge that carries the Commuter Rail, then crossing Canal St at grade, and then from Canal Street to High Street, have the Green Line track angled downward, so that it would run under High Street, with High Street maintaining its existing grade.

Just northeast of High Street, the single track would continue for 200-300 feet under the existing Commuter Rail platform for the southwestern track, and once it gets past the large building, it would fan out into two tracks around an underground island platform.

After that underground island platform, the tracks continuing outbound might merge into a single track and continue towards the surface to approximately Newton Rd, beyond which it appears that there is a large area between Grove Street and the tracks which is currently unused, which might be a better place to put a small yard than the vicinity of the Route 16 Station.

While I recognize that the single track between West Medford Station and Route 16 Station would require operating procedures not currently used on the Green Line, I do not think this would be a problem. I believe that if trains operate on five minute headways, and the operating procedure is for an inbound train to depart West Medford immediately after each outbound train arrives at West Medford, the single tracking would not cause any significant delay vs what double tracking would offer.

I-327-014

Porter Square and Watertown

I would like to see MassDOT study the possibility of extending the Union Square branch to have a stop at Somerville's Park Street, a stop at Porter Square, a stop at Sherman Street in North Cambridge, and then follow the Watertown Branch behind the Fresh Pond shopping mall, with a stop either at Huron Ave, or where Belmont St meets Mt Auburn St, and possibly continuing from there into Watertown Square.

I-327-015

Grand Junction

I would like to see MassDOT study the possibility of constructing a third northern Green Line branch along the Grand Junction Railroad.
If space for non-revenue MBTA Commuter Rail moves is a factor, it may not be possible to construct a Green Line branch along the Grand Junction Railroad until after the North South Rail Link is constructed.

Such a branch might have a stop at Cambridge St, another stop at Main Street, perhaps with the existing Kendall Square station on the Red Line moved west a bit to facilitate transfers, possibly a stop at Massachusetts Ave, and possibly a Cambridgeport stop, possibly near Fort Washington Park. It then might cross the Charles River on a new bridge which would carry it over University Road in Boston to provide a connection by which outbound trains departing Cambridgeport could continue outbound on the B branch.

5

I-327-013

As the Project advances into preliminary engineering, further consideration will be given to the compatibility of station, track, and infrastructure design with conceptual future Green Line additions and extensions.

I-327-014

Please see response to Comment I-327-013.

I-327-015

Please see response to Comment I-327-013.

I-327-015

Additionally, it might be possible to run trains from the Medford branch of the Green Line to the Grand Junction branch of the Green Line, bypassing Lechmere, and have them continue inbound to Kenmore once they cross the Charles River.

AIR QUALITY

A major justification for the investment in the Green Line Extension is the expected air quality benefits.

Does this evaluation of air quality benefits assume that over the course of the next several decades, well over 95% of all new automobiles sold will continue to use gasoline and diesel?

When the Tesla Roadster, a lithium ion battery powered car with a range over 200 miles, first became available, it appeared that it was not economically feasible for such vehicles to replace gasoline cars, because it cost over $100,000; at that price, even if electricity were free and gasoline $4/gal, the Tesla Roadster would probably have a total cost of ownership per mile more than double the typical economy gasoline car.

However, Tesla Motors has claimed that within 5-6 years, they will begin selling a lithium ion battery powered car that will cost about $30,000. By the time the energy costs are factored in, I believe it is quite possible that if Tesla succeeds in delivering this, and prices of lithium ion battery powered cars continue to drop after that, that within 10 years, 80-95% or more of new car buyers may prefer electric cars.

I-327-016

I believe the final Green Line Extension environmental impact study should include an air quality impact comparison of the no build option vs the build option for 2030 if starting in 2020, 80% of all new automobiles sold are powered by lithium ion batteries.

I-327-017

I am concerned that the year 2030 air quality impact of continuing to run diesel locomotives on the MBTA Commuter Rail system may be far worse than the air quality impact of commuters operating lithium ion battery powered automobiles in 2030 instead of riding the Green Line Extension, especially if we start building 500 copies of Cape Wind every year in Massachusetts. The MBTA seems determined to replace approximately half the Commuter Rail locomotive fleet with new diesel locomotives within the next few years, and I assume that the plan is to pay for them with 30 year bonds, and keep them running for 30 years. I believe MassDOT and the MBTA should be prioritizing projects in order to make 2030 air quality be as good as it can be.

I-327-018

I also am under the impression that any claimed air quality improvements are based upon the assumption that after the Green Line Extension is built, the road capacity freed up by commuters migrating to the Green Line Extension will not be used by additional commuters commuting from homes that will be built after the Green Line Extension is completed. I would like the study text to explicitly comment on this, as I suspect that in practice, any road capacity freed by the Green Line Extension will eventually become used again as a result of new development.

I-327-019

TRAFFIC SIGNAL PRIORITY

Page 3-7, section 3.3.2, Maintenance Facility, of the DEIR/EA claims that capacity on the Green Line system is contrained by maintenance and layover facilities.

I would like to see the document revised to specifically address the question of whether traffic signal priority technology on the B, C, and E branches could reduce the amount of layover and maintenance facility space needed, by reducing travel times and thus reducing the number of train cars needed to carry a given number of passengers each hour.

6

I-327-016

The Green Line Extension will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality. As required by the Secretary's Certificate on the DEIR/EA, the FEIR includes a narrative clarifying the relationships of air quality modeling data to MassDEP and EPA requirements for State Implementation Plan (SIP) consistency.

I-327-017

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

I-327-018

Please see response to Comment I-327-016.

I-327-019

MassDOT has given some consideration to efficiencies that would be possible should the Green Line signal system be upgraded. Initial analysis indicates that an updated signal system would not reduce the vehicle storage needs at the Green Line Extension storage and maintenance facility. Further analysis on this subject is not within the scope of the FEIR.

I-327-019

I would also like to see the document revised to specifically comment on whether traffic signal priority technology could be used on the B, C, and E branches to make outbound headways on the Medford and Union Square branches more consistent.

I-327-020

FINANCIAL CONSTRAINTS

I understand that the state budget is currently constrained by a poor economy. However, I think it is important to remember that the majority of the construction will not begin immediately, and it is very possible that the economy will be stronger in years when the majority of physical construction occurs. Therefore, I think the design should leave open the possibility of choosing options that provide excellent pedestrian, wheelchair, and bus connections for stations, even if those options add additional costs that would be difficult to pay for if the majority of construction were happening in 2010.

I-327-021

COMMUTER RAIL CLEARANCE

I believe the DEIR/EA should specifically comment on whether double stack freight will be accomodated on the commuter rail tracks. I believe double stack freight operating in areas without catenary requires 21' vertical clearance, and I believe I have seen some smaller number stated somewhere as the target clearance for commuter rail tracks as part of the Green Line Extension project. I believe any commuter rail reconstruction associated with the Green Line Extension should leave adequate space for double stack freight.

Additionally, I believe that if 25 kV catenary is not installed for the Commuter Rail as part of this project, space should be left so that 25 kV catenary can be installed without interfering with clearance for double stack freight or reconstructing bridges yet again.

I believe freight clearance is typically specified as ``Plate _''
where _ is a letter, and I believe the DEIR/EA should explicity state which plate will be accomodated in all commuter rail reconstruction associated with the Green Line Extension project.

Joel N. Weber II
225 Summer St #3
Somerville MA 02143

7

I-327-020

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-327-021

Bridge clearances are limited by approach grades on crossing streets and roadway bridges. Because the community impacts would be great, the conceptual bridge designs to not provide sufficient clearance for double-stacked container freight trains. Future railroad electrification is not precluded by the Green Line Extension. Railroad clearances will be explicitly stated as Green Line Extension plans are further developed.

RECEIVED
JAN 8 2010
MEPA

January 5, 2010

Dear Secretary Bowles:

I am writing you regarding the Green Line Extension to Medford. My property abuts the commuter rail tracks.

I-328-001 I am not in favor of the Extension going through the Hillside neighborhood. This corridor, running parallel to Boston Avenue, from College Avenue to Winthrop Street especially, is a community of 100-year-old single-family homes, beautiful old trees, and quiet streets.

I am concerned that a second railroad would create major problems in our neighborhood:

(1) Additional noise and vibration
(2) Damage to our properties
(3) Loitering and crime
(4) Traffic congestion

The intersection of Boston Avenue and Winthrop Street is already crowded enough. The Winthrop Street bridge would need to be rebuilt to accommodate more trains running beneath it.

I-328-002 As an abutter I am very concerned that my backyard would be compromised---trees taken down, for example. My own plantings, not to mention my privacy, would be in jeopardy.

Finally, ending the Extension at Route 16 makes no sense. This is an area of industry, a small handful of residences, and a beautiful, open greenspace along the Mystic River. Putting the stop in this location will serve very few local people; it will only attract more cars that come to park or to drop off riders from other areas.

I would be very upset to see the parkland along the Mystic disturbed. This is a tranquil place now. If the Green Line comes to Route 16, sooner or later there will be litter, traffic congestion, loitering---and a beautiful place will be needlessly compromised.

It is people who live outside the neighborhood (in Arlington, West Medford, etc.) who are promoting the extension to Route 16---not the Hillside residents. I urge you to consider the people who do live along this corridor. Please do not extend the Green Line beyond College Avenue.

Thank you.

Sincerely,
Margaret Webster

15 Charnwood Road
Medford, MA 02155

I-328-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-328-002

Trees on private property that would not be acquired will not be removed. DEIR/EA Section 5.3 describes the Project's potential temporary and permanent acquisitions. MassDOT will evaluate opportunities to minimize these property impacts.

January 3, 2010

Secretary Ian Bowles

Executive Office of Energy and Environmental Affairs

MEPA Office

Attn: Holly Johnson, MEPA Analyst

EEA #13886

100 Cambridge Street, Suite 900

Boston, MA 02114

Dear Secretary Bowles:

I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green

Line Extension project to Medford, EEA #13886.

I-329-001

As a Medford resident, I speak for my husband and myself when I say that we both strongly support both the Route 16 terminus, and building this terminus at the same time as the rest of the project. I suspect that you will be inundated with letters outlining the reasons, so I'm going to summarize some of the salient points:

* cost. With respect to inflation alone, it will cost less to construct the Route 16 terminus along with College Ave and the other stops on the Green Line extension project. There is also the cost associated with the planning and mitigation associated with two termini. This seems like an unnecessary duplication of effort and a big waste of time and money.

I-329-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-329-002 I understand that the powers that be feel that there is not enough money in the kitty right now to accomplish this, but as a taxpayer, I ask that the smarter fiscal decision is made and that Route 16 be built in the first (and hopefully only) phase of construction. Float a loan, borrow money from other accounts… don't tell me this can't be done.

I-329-003 * quality of life. The plans that I've seen so far both assume a Route 16 terminus and a temporary College Ave terminus, but I get the sense that no one has really thought through what this would mean in terms of parking, engineering, and the quality of life for those near the temporary terminus. A College Ave terminus, however 'temporary', would entail that the trains travel past the station and turn around somehow. And what about train storage? For those who aren't thrilled with the idea of a green line in the first place, this is their worst nightmare. Better that the trains whoosh past on their way to Route 16.

* constituents served. I live near enough to the Route 16 terminus that I would walk or bike there. I can say with a great deal of confidence that it won't be worth my time or effort to make the trek to College Ave. Multiply this by the 10,000 residents near the Route 16 stop, and you've got a lot of people who can't or won't use the College Ave station. It bears noting, as well, that with the Walkling Court housing development and the new assisted living development on Capen Street in Somerville will not be served by the College Ave. station. It also bears noting that much of the population in general around the Route 16 stop are environmental justice households.

I-329-004 * legal mandate. College Ave. is not in Medford Hillside. There are several maps which state this obvious fact. That someone thinks that College Ave does meet that mandate makes me wonder which map he choose to look at.

* the "stop being sneaky" argument. Given that someone, somewhere thinks that College Ave fulfills the legal mandate to serve Medford Hillside, it's easy to assume that the Phase II to Route 16 will suddenly look elective in an era of tight budgets to that same someone. Save the trouble of us mounting a lawsuit and build the Route 16 terminus with the rest of the line.

I-329-005 * The "do your job right" argument. The design for the Route 16 terminus was a joke, and a neighborhood volunteer managed to design a station which did not involve taking the Cummings Buildings at 200 Boston Ave. I have been a reliable supporter for public infrastructure and good government development. I wonder when it will start with respect to the Green line. What does it say when an unpaid group of volunteers can do a better job with station design and advocacy? Perhaps we should 'crowdsource' this project. I do wonder whatever happened to pride in a job well done.

To summarize, there is much more work to be done on the Environmental Impact report, and I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis in order to make the Green Line extension the best project it can be, and MUST be.

Thank you.

I-329-002

Project cost estimates are based on the current, conceptual level of design, and will be further refined as the Project progresses through preliminary engineering. It is anticipated that Green Line Extension construction would be financed with a combination of funds from federal and state sources. Efforts to engage a developer for the North Point development will continue as this Project moves into the next phases of design.

I-329-003

In accordance with the Secretary's Certificate on the DEIR/EA, FEIR Chapter 4, College Avenue Station, describes the ridership model assumptions and anticipated operations, traffic, environmental and access impacts at a College Avenue terminus for the Medford Branch. Mitigation measures for these impacts are described in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Commitments.

I-329-004

As directed by the Secretary's Certificate on the DEIR/EA, the FEIR includes a limited scope of issues related to the Green Line Extension Project. The Proposed Project, with a Medford Branch terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Although an extension to Mystic Valley Parkway/Route 16 is MassDOT's Preferred Alternative, financial constraints prohibit the Commonwealth from progressing the Project beyond College Avenue at this time.

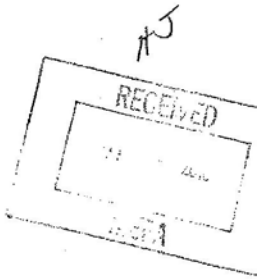
Margaret Weigel

82 Mystic Street

Medford, MA

I-329-005

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.



The Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EE#13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Ian Bowles,

I am a long time resident of Somerville, first living in Union Square and presently at Brickbottom, where we have resided for 22 years. I have two children, born here at Brickbottom, who have attended public schools. One is in college now. I feel that the future well being of our city and for my children's future depends on thoughtfully planned, long-term economic development. We support the positive impact the Green line extension will have in East Somerville, a poorer area of the city. East Somerville has traditionally been short-changed by poor planning, physically isolated by the McGrath highway, a very poorly designed T stop at Sullivan Station and the dumping of cars off of 93 onto Washington Street. So while our family is very happy that the Green Line will be extended past the Brickbottom area, we do not support the 24 hour maintenance facility in Yard 8.

I-330-001 I am writing specifically in response to the Draft Environment Impact Report on project number EE#13886. I am very happy that a more thorough evaluation of the alternative sites for the siting of the Green Line maintenance facility and train storage yard been considered. But I was disappointed that in the face of almost universal community opposition plus strong opposition from all city administrators, Yard 8 is still deemed the recommended place for the maintenance facility.

I-330-002 My first consideration is the negative impact this facility will have on the economic development in the area. A maintenance facility in Yard 8 will be a barrier between Brickbottom and the Inner Belt neighborhood. This will negatively impact future development and tax revenue in a city that

I-330-003 sorely needs to increase its tax base and expand affordable housing. The second is the negative impact on the quality of life to the residents living in the vicinity. I would like to see a more detailed cost analysis of the noise and vibration mitigation costs for both the construction period and permanent phases of the project. Only 40 out of 155 units at BB are designated for soundproofing. This seems unrealistic. The Brickbottom children have already had to contend with inadequate side walks, noise, dirt, and smells from the nearby trash facility, as well as no snow clearance to walk to the Lechmere T station.

The Yard 8 site will only increase the noise and impede neighborhood development. Who will want to live or build housing in an area with a 24 hour maintenance facility in their backyard? I support the Green Line extension but feel the train storage yard and maintenance facility put an unfair burden to the families in our area.

I hope you will continue to explore alternative sites.

Sincerely
Debra Weisberg
Debra Weisberg

I-330-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-330-002

Socioeconomic impacts, including projected effects on businesses, jobs, tax revenues, and community disruptions, are described in DEIR/EA Section 5.3, Socioeconomic Impacts. Effects on land use and transit access are discussed in DEIR/EA Section 5.2, Land Use, and Section 5.15, Indirect and Cumulative Effects. As required by the Secretary's Certificate on the DEIR/EA, additional analysis of the socioeconomic effects of the maintenance facility alternatives are described in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. A series of Project workshops will provide opportunities to discuss broader impacts of the Project on job creation, economic development, housing affordability, and other community impacts.

I-330-003

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

RE: Green Line Extension Draft EIR (EEA #13886)

Dear Secretary Bowles:

First of all a happy 2010! I am writing today as a resident and energy economist with climate change focus in Massachusetts, and in that role to express my strong support of the construction of the Green Line Extension to Route 16 on the Medford/Somerville line and to Union Square in Somerville and in particular the associated extension of the Community Path into downtown Boston. I believe its positive environmental impacts greatly exceed the potential negative impacts and that it will be unnecessarily costly if not impossible for MA to achieve its self-imposed GHG reduction obligations under the MA GWSA without this kind of project. However, I cannot support the Draft EIR because of various shortcomings and omissions in the design.

Thanks you very much for considering these comments.

- I am a frequent user of the Community bike path west-bound, mostly for recreational purposes. I believe the path is one of the more valuable assets in Eastern Massachusetts for recreational purposes such as walking, biking and running. It is clear that were the path connected to Boston, the population that would gain access to the path would increase very substantially. Not only would this have positive effects on the health and happiness of many MA residents, it would also likely lower energy consumption and consequently GHG emissions, as current users of the path without direct access (e.g. say Boston residents driving to Arlington to bike on the path).
- I am also (trying to) commute by bicycle and by doing so expose myself to mortal danger on Massachusetts Avenue every day. It is clear that an extended bike path into Boston would minimize the risk of accident and thereby create a true and very low emissions alternative commuting option for residents in the catch basin of the Community Path working in Boston. I would think that the potential positive impacts of this from a variety of perspectives would be significant.

I-331-001

It seems me that as MA is trying to determine how it will lower its GHG emissions by at least 80% by 2050 under the GWSA, but also as it tries to create the types of vibrant communities that attract the business offering the jobs of this century, projects like an extension of the Community Path are among the lowest hanging fruit out there. I therefore would like to strongly encourage you to aggressively pursue the build-out of the Community Path not just within Somerville, but quickly into downtown Boston. The effect of GHG gas emissions is cumulative, so early action has high pay-offs. Early action also provides MA with more flexibility down the road and would convince residents like me that there is a commitment to action that goes along with a legal

I-331-001

The Project's Purpose and Need is described in DEIR/EA Chapter 2, Purpose and Need. The Project is needed to comply with the State Implementation Plan (SIP), which includes requirements for this Project as well as other transit projects to meet the air quality and transit commitments established as a result of the Central Artery/Tunnel project.

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able at this point to commit to funding the construction of the Community Path.

commitment in principal (the very discussion of whether or not to go ahead with a Green Line extension even though a legal commitment was made many years ago in itself is not reassuring).

Thank you very much.

Sincerely,

Jurgen Weiss
22 Burnside Avenue

January 8, 2010

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

As a resident of Medford Hillside and regular MBTA commuter, I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

I have lived in Medford Hillside for about five and a half years. I work in Back Bay, so I strongly support the Green Line extension, partly because extending the Green Line into Medford will provide a one-seat ride to work. Furthermore, a Green Line extension would increase my use of public transportation to travel in and out of Boston in the evenings and on weekends, when I often attend theater and cultural events. Late night bus service from the Red and Green Lines now is so infrequent that I often choose to drive so that my trip home doesn't take an hour and a half.

I am dismayed, however, over the plan to create a temporary terminus at College Avenue. While I can meet my own transportation needs at either College Ave. or Rt. 16, I feel the impact on the community would be far more positive if the terminus is placed at Rt. 16.

A terminus station at Route 16 will serve more residents of Medford and parts of Somerville. The Route 16 location would not only provide parking space, it would give people in the community access, via convenient transportation, to a number of businesses and services, including the Whole Foods Supermarket and the Workout World Fitness Center. Even the DEIR concludes that the Route 16 station would provide the most benefits according to all project criteria.

Placing the terminus at College Avenue, in contrast, will lead to congestion, pollution, and safety issues by increasing the amount of pedestrian and vehicle traffic at a complex and crowded intersection. Furthermore, a two-phase approach will increase costs and increase the risk the project will never be completed as intended. By MassDOT's own estimates, the two-phase approach will increase the cost of the project by $55 million over a single-phase approach.

I-332-001 Please insist the the Green Line Extension project be carried out as a single-phase project, with a terminus station at Route 16 and Boston Avenues.

Thank you.
Lynne Weiss

1

I-332-001

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

To: Johnson, Holly S (ENV)
Subject: Green Line Extension Comments/Concerns

Hello,
This email is to express my concerns along with the other occupants at the Powderhouse Condos at 616-622 Boston avenue in Medford. This DEIR can't be the final draft, it is too inadequate. I am asking by law that the MEPA process continue until a acceptable final draft with further analysis has been completed. The comments/concerns will be broken into a list below.

I-333-001 1. There are no proposed sound barriers at the Powerhouse complex. I can see one is to be setup on the other side of the tracks, how can only one side get this treatment? There trains will literally 20 feet our less outside our back door and having no sound barrier in place on our side of the track is unacceptable! I am not sure how the surveyors would overlooked this complex.

I-333-002 2. The traffic at the Boston Ave/Harvard Street and Boston Ave/Broadway Street intersections is bad enough as it is, therefore no parking should be built and allowed at the ball square station nor any other interior station. The current conditions can't take anymore traffic and the whole purpose of this project is to get the communities surrounding these stops to use public transportation, not to have people towns away drive into our communities and make it more congested than it already is.

I-333-003 3. I agree with everyone else when the maintenance facility does not belong at Yard 8 in brick bottom. The state needs to look at other alternatives more seriously, which is just one reason why this draft is incomplete! We all know the state wants to use this area because it's cheap for them and less work in the end. I think the state needs to do something right for once and we do only get one shot at this. No one wants to look back in 20 years and have everyone say I told you say since you don't seem to be listening to the community on this matter as it is.

Thank You,
Adam Whelan

620 Boston Avenue STE. 5A
Medford, MA 02155
508-364-2118

1

I-333-001

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

I-333-002

The Project is intended, in part, to relieve traffic congestion, as described in DEIR/EA Chapter 2, Purpose and Need. Some station access points for passenger drop-off/pick-up are likely to impact local traffic flow, as outlined in DEIR/EA Section 5.5, Traffic. As described in DEIR/EA Chapter 6, these impacts will be minimized to the extent practical. However, with the exception of relocated Lechmere Station, no parking is provided at any of the new Green Line Extension stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes how MassDOT will coordinate with municipalities and stakeholders to address traffic and parking concerns. Additionally, FEIR Chapter 4 summarizes the impacts of College Avenue as a terminal station.

I-333-003

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

Subject: Green Line Extension Comment

Dear Mr. Bowles and Ms. Johnson:

I am advocate of the Green Line project and, having grown up in the Davis Sq area in the 70's and 80's realize the potential it would bring. However, I would like to voice my concern regarding the solutions being offered to mitigate noise in my neighborhood. I own my home at 133 Bowdoin Street in South Medford, approximately 100 yards from the current rail line near the Tufts Science & Technology Center on Colby St. According to the Noise Impact Assessment and Mitigation Details presentation, this area's existing and future noise level will be the highest of the entire extension project. Despite this, there are no current plans to provide noise mitigation for this area; only the Tufts building will receive mitigation in the form of sound insulation for their specific building. When I asked the mitigation expert at a recent Green Line meeting about this, he explained the process by which the levels are measured and how their modeling process determines the impact of the surrounding area. According to this process, since our homes are outside the modeling area (<100 feet I believe), this area does not meet the need for mitigation.

I-334-001

Certainly I don't know enough about the federal guidelines or the modeling calculations to know if my neighborhood technically qualifies for the noise barriers being installed elsewhere, but I can tell you that this area will be greatly impacted by the increased proximity and more importantly, increased frequency of trains through our neighborhood. As it stands today, when the windows of my home are open you cannot carry on a conversation in my living room while the train is coming by. This is not hyperbole. In fact, I would welcome any visitors to my home who would like to experience this first hand. While we understood the train noise to be part of the "charm" of the area when we bought the house, the increased noise pollution brought by the additional trains would alter the balance and diminish the entire neighborhood.

My offer to witness this first hand is a genuine one. **I strongly urge the EOT to reconsider this area for noise mitigation and look forward to your response as to next steps.**

Thank you,

Kevin White

I-334-001

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Where appropriate, MassDOT intends to implement these measures prior to construction. FEIR Chapter 8 describes the process by which mitigation measures will be identified and implemented. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

FTA defines potential noise impact based on the increase in future noise levels due to the Project, not an absolute level. Potential noise impact generally only extends to receptors within 100 feet of the east side of the alignment due to the relocation of the commuter lines and the introduction of the Green Line trains. At further distances, such as at 133 Bowdoin Street in Medford, MA (approximately 300 feet from the alignment), the relocation of the commuter tracks and introduction of the Green Line trains would not increase future noise levels significantly and there would not be impact.

Dear Secretary Bowles,

Enclosed is a copy of a previous letter I wrote to Secretary Aloisi and copied to you in June of 2009.

I-335-001

I do not have much to add except that it was good to learn of Option L during the pubic meeting in Cambridge last month. I urge you to take seriously the protesting voices from every quarter and investigate, with the same gusto applied to Yard 8, both Mirror H and Option L.

The idea of siting the maintenance facility so it abuts an established residential building when there are alternatives makes very little sense and I doubt it will prove cost effective over time.

I would also ask, "Where are regular people going to be able to afford to live ...to develop products and services and grow ideas and businesses ...to adapt to a changed economy that experts were unable to see coming or plan for?"

Have you noticed, those aspirational commercial and residential condos in North Point remain rather lonely while Brickbottom remains vibrant and Joy Street still contains businesses.

If you redefine this area as maintenance facility, you are removing the last vast swath of potential affordable live work space in the Boston, Somerville, Cambridge area. Stimulus programs go only so far, we need small businesses to resurrect our economy and how can we have that if space is unaffordable even if one can get a loan.

Sincerely,

Carla Wilbur

Carla Wilbur

I-335-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, Option L is identified as the preferred maintenance facility site.

Carla Wilbur

Somerville, MA 02143

Secretary James Aloisi
The Executive office of Transportation
10 Park Plaza, Suite 3170
Boston, MA 02116

June 4, 2009

Dear Mr. Aloisi,

As a Brickbottom resident, I have been looking forward to the extension of the Green Line into Union Square and the possibilities it would bring for economic renewal in the general area. I am sure you know that this neighborhood has had less public transportation that it did at the turn of the century due to concessions it made for public roads projects. The absence of easy public transportation has diminished the area's economic potential for years. Now, there is possibility again due to the Green Line Extension and The Inner Belt's designation as a "growth district." Please don't condemn the area to economic wasteland by introducing 'Yard 8' into the development scheme. Please consider Mirror H as the better location.

I-335-002

Yard 8 has been designated a "growth area" and is already permitted for small to medium sized businesses. If the Green Line Maintenance Facility were to be sited there, it would overcome this potential. What was promised with the Green Line Extension would be taken away with the maintenance facility. The Mirror H location is not spoken for in this way.

The Mirror H location lies between The Boston Engine Terminal and the proposed parking garages at Northpoint. This area has not been designated a "growth area." A maintenance facility here is more congruent with both existing uses and proposed.

The Mirror H location has inherent advantages for traffic flow between Northpoint, Inner Belt and The McGrath Highway that Yard 8 does not. Yard 8 is situated in such a way that creating this type of connectivity could only be accomplished by contortion. Topographically, yard 8 is elevated and geographically, it segregates Inner Belt from the Mc Grath highway area. I have heard talk of tunnels and overpasses but this sounds expensive to me.

Mirror H presents the possibility of submerging the maintenance facility beneath ground- thereby leaving more land available for future development AND incorporating the facility into the foundation of Northpoint parking garages- long term thinking and an efficient use of resources.

Apart from the fact I live at Brickbottom, the choice seems clear.

And this brings me to my final point... locating the maintenance facility in Yard 8 so that it literally abuts Brickbottom, an established residential community, is going to involve still other significant mitigation expenses that Mirror H would not.

Sincerely,
Carla Wilbur

I-335-002

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Mirror H location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office
Attn: Holly Johnson, MEPA Analyst
EEA #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

I understand that the overriding question being asked by the Environmental Affairs secretary during this crucial comment period is whether the DEIR "adequately and properly" complies with the requirements of the environmental review process, per its guidelines.

As part of the Medford Green Line Neighborhood Alliance (MGNA), I believe it DOES NOT, and that if this crucial environmental document is accepted as submitted, it will give the go-ahead to a project that fails to fulfill the Commonwealth's legal obligations, shortchanges the community, and provides no assurances that the project will ever be fully built.

MGNA members have spent hundreds of hours conducting a detailed review of the 6,060-page DEIR and conclude that it is significantly flawed in certain assumptions, analyses, and recommendations.

As a member of MGNA, I agree with the DEIR's conclusion that the project will provide tremendous benefits to the area – improving corridor mobility and air quality, equitably distributing public transit services, and supporting opportunities for smart growth and sustainable development.

I-336-001 But these benefits will not be fully realized – nor will the state fulfill its legal obligation to provide service to the Medford Hillside neighborhood – by the project as proposed in the DEIR, which only commits to extending

I-336-001

As directed by the Secretary's Certificate on the DEIR/EA, the FEIR includes a limited scope of issues related to the Green Line Extension Project. The Proposed Project, with a Medford Branch terminus at College Avenue (and in conjunction with other programmed transit project commitments), was determined by MassDEP to be consistent with and to meet the emission reduction requirements under 310 CMR 7.36 (8), "Determination of Air Quality Emission Reductions." These requirements are also part of the State Implementation Plan (SIP; MassDEP DEIR/EA comment letter, January 8, 2010). Although an extension to Mystic Valley Parkway/Route 16 is MassDOT's Preferred Alternative, financial constraints prohibit the Commonwealth from progressing the Project beyond College Avenue at this time.

I-336-002

the Green Line as far as College Avenue. **I believe that the DEIR has an obligation to revisit the Route 16 station design and explore alternatives,** including the MGNA's proposed station design, which:

- Prevents two major commercial property acquisitions and the resulting job displacement
- Preserves $182,000/year in property taxes for the City of Medford
- Optimizes traffic flow and better serves the integrity of the station's surroundings

A $1 billion project deserves a higher caliber design process than I believe it's been given by the DEIR.

As a member of MGNA, I feel strongly that the Secretary of Environmental Affairs should NOT accept the Draft Environmental Impact Report as a Final EIR, as Mass DOT is requesting.

Rather, the secretary should require Mass DOT to continue and correct the Environmental Impact analysis, including an evaluation of MGNA's alternative design for the Route 16 station, or a similar one, that would preserve two major office buildings on Boston Avenue, lower the project cost, maximize its benefits, and fulfill the Commonwealth's legal commitment to bring service to the Medford Hillside area by December 31, 2014.

Along with other Medford citizens, I strongly urge you to reject the DEIR in its current form and instruct Mass DOT to perform the required further environmental analysis in order to make the Green Line extension the best project it can be, and MUST be.

Thank you.

Alisa Wolf

I-336-002

A station at Mystic Valley Parkway/Route 16 and associated alignment improvements northwest of the College Avenue Station terminus are not included in the Proposed Project. At such time that the extension beyond College Avenue can be advanced, MassDOT will re-evaluate the proposed station layout at Mystic Valley Parkway/Route 16. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

2010

January 6, 2009

Dear Secretary Ian Bowles:

I-337-001 Thank you for your hard work and dedication to the Green Line Extension Project. This initiative will increase the quality of life for our community and stimulate economic development. In order to fully realize the tireless efforts of your department and countless individuals, I encourage you to oppose the placement of the DOT Maintenance and Storage Facilities in the Somerville Yard 8. The alternate locations (Mirror H and Option L) are not only promising but deserve more attention and design. I also encourage you to explore additional locations. I am thankful for the opportunity to comment on the DEIR report as it did not establish effective and comprehensive mitigations and should be modified with input from the community.

I rent my apartment at the Brickbottom Artist Community and have been asked why I am so involved in the future of a building in which I have no long term economic interest. The reasoning is simple; I am cared for and inspired by my neighbors and feel compelled to support them in return. The residents of Brickbottom are artists, founders of companies, architects, parents, writers, scientists, government officials, philanthropists, cooks, great neighbors and musicians. I consider this community to be a regional treasure and feel very lucky to have the opportunity to live here. The current proposal to place a maintenance facility and storage yard next to this building will have lasting impacts for years to come and permanently cloud the advancements of the green line extension.

Please consider the following points:

Opposition of the use of Yard 8 for a Storage and/or Maintenance Facility.

I-337-002
- There are severe and potentially crippling implications for the City of Somerville if the Yard 8 land is used for a heavy maintenance facility and storage yard. It would eliminate the future development of 11.5 acres of land. This land is less than 2 miles from downtown Boston, countless attractions and businesses, and 1.0 mile from Kendall Square and technology jobs.
- The use of this land would put a permanent barrier to the Inner Belt and result in significant loss of future revenue for the city and state.
- It is entirely possible to decouple the Green Line Extension (which I fully support) from the plans to site the Maintenance facility.

I-337-003
- Although the current proposal reduces the likelihood of land takings, I urge you to minimize and reduce the need for land takings in future designs or design revisions.
- Brickbottom Artist Community: There are 220 residents in 150 residential/work units in three repurposed buildings. The community is extremely active politically and hosts numerous events including one of the longest running Open Studios.

I-337-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-337-002

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. The evaluation considers land use and connectivity impacts and opportunities associated with each maintenance facility site alternative.

I-337-003

DEIR/EA Section 5.2 describes the Project's potential acquisitions. MassDOT is currently conducting detailed property surveys to obtain more specific data. MassDOT will continue to evaluate opportunities to minimize these property impacts.

I-337-004

Mitigation: A maintenance facility would have a detrimental impact to the dwellings and residents near it. The following mitigations should be considered:

- Ensure that the potential impact assessments include noise and vibration impacts added to the existing noise and vibration for the Brickbottom residents.
- Explore means to minimize noise, vibration and pollution through novel and advance technologies. Ensure the trains and rails are equipped to reduce environmental burden.

I-337-005

- If construction were to proceed, be sure that residents can voice their concerns regarding noise and vibration and effective corrective actions will be put in place.

I-337-006

- Investigate how air quality and noise will be impacted inside of the buildings as well as outside.

Community Process:

- This should only be the beginning of the comment for the DEIR. Please be sure that this draft is not mistakenly taken as being complete.

I-337-007

- Please set up a Community Advisory Committee (CAC) to oversee this process.
- Allow the advisory committee to review contracts to ensure that the mitigations identified and yet to be identified are correctly put into place.

I am confident that these points are worth consideration regardless of the placement of the maintenance facility and storage yard. It is vital to the success of this project to ensure we are not only thinking for our generation but for the future of our community. The placement of the maintenance facility and storage yard next to the Brickbottom Artists Builiding, which has grown within the fabric of our community would be a mistake; a mistake that is avoidable. Therefore, I implore you to consider the hopeful alternatives.

Sincerely,

Kimberly Wolfram

I-337-004

As described in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts above regulatory thresholds to sensitive receptors. Chapter 5, Lechmere Station, and Chapter 8, Mitigation of the FEIR describe the process that MassDOT and the MBTA will follow during preliminary design to refine the mitigation measures, and the steps that will be taken following construction to monitor impacts.

I-337-005

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-337-006

The Green Line Extension will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality. As required by the Secretary's Certificate on the DEIR/EA, the FEIR includes a narrative clarifying the relationships of air quality modeling data to MassDEP and EPA requirements for State Implementation Plan (SIP) consistency.

I-337-007

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

Boston, Mass. 02114

Dear Secretary Bowles and Ms. Johnson:

" It's one thing to think you're on the right path, but it is another to think that yours is the only path."
Paulo Coelho, Brazilian writer and philosopher

Let me introduce myself. I am Dr. William Wood and I sit as an EOT Advisory committee member from Medford on the proposed Green Line extension project. I am the only self-identified disability member on the committee.

I-338-001
I-338-002
I-338-003

This letter constitutes my public comments on the DEIR report, EEA number #13886, submitted by EOT to MEPA. Let me state in this public comment letter that at this point and time in the process public comments on this project are not listened to (i.e. financing, use of land or the need for more studies on the human condition). We, the public and Advisory Committee members, need more information across the spectrum on this proposed project. And we need this information gathered and presented in a Final Environmental Impact Report. I still do not believe that EOT has followed good practice in meeting with the general public. Four o'clock meetings were impossible for working people to participate in.

The multitude of meetings EOT claimed they had I cannot comment upon. I can, though, comment upon EOT Advisory Committee meetings and other meetings EOT held in which I was present. I was not invited to certain meetings. I have questioned in public the lack of transparency of these meetings. I have provided written proof of the partiality that EOT demonstrated in this process to certain

I-338-001

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

I-338-002

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

I-338-003

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

groups. This evidence is in a complaint to the Federal Transportation Administration Civil Rights division, case number #09-0350.

I-338-004

The first conception of the government in dealing with the public on this project was a misconception in dealing with the disability community. I believe that the government of the Commonwealth of Massachusetts has not learned from its experiences in the past. I have protested the fact that MEPA would not take verbal comments for public record at its November 18th hearing. But they informed us only at the meeting that may be taking verbal comments. This verbal comment issue may have kept some people away. This means that those in the disability community with writing impairments are not being treated equally to the non-disability community who can write.

Although I have protested this situation in writing, I have not been informed that this situation has been corrected even though Mr. Donald Gomes, the affirmative action officer for the environmental offices, has been informed of this problem. I believe this process has demonstrated a pattern to deny citizen participation for the disability community and those in the environmental justice populations whose preferred form of communication may be verbal. This again shows a preference to provide a privileged partnership with organizations such as STEP and MGNA while leaving out groups of people whom this project is suppose to benefit. This would include Brick Bottom. This inherent pattern of discrimination within the Green Line process is why myself and another GLAM member, who is experienced in civil rights laws and meeting participation techniques, have filed a complaint with the FTA. We have asked that they investigate the fact that people with disabilities have been preyed upon by supporters of the Green Line extension to the point of violence.

Past experiences with the Commonwealth regarding a lack of participation also represents projects such as the West End of Boston whereby multiply families in an all ready integrated neighborhood were completely eradicated. Mr. Jim Campano, the curator of the West End Museum and a former resident of the West End, has stated he sees a parallel between the West End project and the Route 16/MVP project. Not only is the Alternative that includes Route 16/MVP going to take tax dollars away from the City of Medford, it is going to replace this loss with nothing. EOT states it is our responsibility, meaning the City of Medford, to replace business loss, develop land and to stop parking and traffic problems coming in to our city as result of the proposed Green Line that helps Somerville's ridership and create urban sprawl.

After reading the DEIR report EOT would have the public believe that the City of Medford has all the money in the world. You would have to believe that Tufts University is turning over its endowment to the City of Medford to correct the situation that is only going to benefit Tufts University regarding this project.

I-338-005

Route 16/MVP should never be a terminus for this project at any time in the near

I-338-004

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

I-338-005

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-338-005 | or distance future unless future studies are done that show improvement in the local area air quality.

Route 16/MVP would change the whole complexity of an urban area of environmental justice community and people with disabilities. This project will become a developer's dream, encouraging development for expanding Tufts University while providing nothing for the community of Medford. The Mayor of Somerville stated he would like to put a project like the area called Wellington at Route 16/MVP. This shows his lack of knowledge of Medford.

The past also includes The Kendall Square university expansion project, which has been hailed recently as a new home for technologically centered individuals. I sat on the Kendall Square Task Force. As one who practices political ethnographic inquiry, I have been schooled by people such as Mr. Jim Morse, a person with a disability, and others, like Mr. Campano, about the psychological impact of development and the scars and trauma it leaves on groups of people it affects. Not for those who moved to and currently live in areas such as Kendall Square or the West End or moved there soon after development. Not for those who make money on development projects that suits university expansion. But for those who are forced to sell their homes because taxes get too high or the neighborhood demographic changes and performs behavior modifications upon a community that excludes the long-term resident community. This impact includes increased rent and home prices above the financial capability of the average environmental justice and disability populations. Has this been identified in the EOT meetings as a social economic problem that the state must endure? Or identified as what the state must help resolve prior to the development of this project? The answer is yes, but not reported. This impact includes the HUD housing program in Medford called Walkling Court and its need for better air quality and health studies on diesel impact and so on.

Does the abstract theory, upon which almost the entire proposed Green Line project is based, have empirical facts that back it up? The answer to that question is in limbo since the empirical facts must show that the social impacts I described above do not happen. But the fact is that these impacts do occur. The fact is that the West End displacement happened in Boston and that the Kendall Square displacement project happened in Cambridge as part of university expansionism. It was recently documented that newer development at Porter Square changed the entire complexity of both Davis Square and Porter Square. When did the government get into developing transportation to move people out of their homes? It should have been learned many years ago by the state that this is a bad habit. The state has lost population, which leads to less support for federal dollars, and has driven up the cost of living in the state.

Is there political pressure involved in the Green Line decision? It appears there is. Is it coincidental that the first Mayor to back Deval Patrick's candidacy gets everything he wants while the Mayor of Medford has to pay for it through the loss

of property tax revenue? This issue is a good question for a reporter to investigate. Are developers and political families buying up property? This is another good point that reporters should be looking into during this process. No one has mentioned these problems as a change element for the worst possible effect on West Medford.

I-338-006

Nor have they mentioned that developing property above the tax rate today will only increase taxes in the future for all the cities with an effect of moving people and being a people mover, leaving generations of psychological stain on people and their families. Can this be proven? The West End Museum in downtown Boston documents this affect and books have been written on this effect. But in reality we must plan based upon abstract, outdated measures such as carbon monoxide, which the federal EPA is evaluating to determine if health base standards need to be modified. It should be required that every three years as new facts become available they become part of the system of study and that environmental studies be required to include these new facts, such as the numerous studies being done on diesel particulates health impacts upon communities.

For two generations West Enders have kept together as a group, with a newspaper that publishes many times a year. There is a class at MIT with Mr. Jim Campano as guest lecturer on the West End development. Mr. Campano, one of the leaders of the West End neighborhood lectures on the urban village concept and how not to develop a neighborhood that creates social inequality. West Enders hold meetings and social events all the time demonstrating the strong ties that held this diverse neighborhood together. West Enders makes up a large population in the city of Medford.

Is this the legacy of West Medford? Do the people feel government has/will destroy the oldest African American community in the United States with the end result of its history being lost? The West Medford environmental justice community is not a community of dense need for rehabilitation. It is an area that is well cared for by its community. The type of development the government is proposing upon this area equates with the Native American being pushed from their land, although on a smaller scale, with broken treaties by the United States government.

My research and discussion with these populations shows a pattern of trauma from different types of government interference upon the natural and sustainable growth for the people who lived there and to the people who may or may not be here in the future. The futuristic look, though popular with the urban planner and in the eyes of the urban planner a developer's dream, has not gone away. Neither has the university/corporate expansionist program gone away despite being halted for economic reasons. This futuristic look does not include the environmental justice and disability populations in those communities. All we have to do is go to the West End and Kendall Square and see how many of

4

I-338-006

Direct and indirect impacts to land use are described in DEIR/EA Section 5.2, Land Use, and FEIR Chapter 2, Maintenance Facility Alternatives Analysis. MassDOT cannot control land use by property owners along the alignment or in the vicinity of the stations, but recognizes that the presence of rail transit can impact nearby land use both adversely and beneficially. Station design in particular can motivate transit-oriented development, a Commonwealth goal for sustainable land use, which could further reduce automobile traffic congestion and improve air quality.

these populations are living there in comparison to those who lived there. Is it a scant and invisible figure when researched?

Rarely do planners plan for the environmental justice or disability populations who live within their community. In fact, we had to have the American with Disabilities Act to force, not volunteer, people to pay attention to the disability and elderly population. The Congress of the United States called this systemic discrimination. Massachusetts on the other hand calls its university development for the best interest of the community. But the question is what community? Do the number of people with disabilities at these universities mirror the general population for full participation in our society?

No one I have talked to in the beginning of the EOT Advisory Committee would admit that there was any group that did not want the proposed Greenline Extension. Now these concerns are coming out from Brick Bottom, West Medford, the Hillside and the area around Somerville at Route 16. This voicing of concerns includes businesses.

I-338-007

The public relations involving this project were tremendous. How did that public relations work? Simply over a 17-year period by not allowing the environmental justice and disability populations to authentically participate within the framework of the planning of this subject. Had the state included these groups within those planning years, every Green Line station (old and new) would have been argued about to become fully accessible to the population that I am discussing. To this day there are still stations not accessible.

If there had been true representation by these populations, there would have been groups of individuals from both the environmental justice and disability community more interested in transit. Now EOT continues to leave out these people at times by posting meetings at times they are not available.

EOT has stated through its process that every one has a computer and can get the data quickly and efficiently as the educated class in these communities. EOT balked at people coming to meetings. EOT presents meeting structures that do not fit all educational backgrounds or cultural differences. It is like saying that we all must become homogeneous. We all must look and smell like a university educated class member. This is against all human rights. Yet you will not find many human rights members willing to stand up and against their own cultural preference.

In fact, what does surprise, as I said earlier, was when EOT and advocates stated that 80%-90% agreed with the proposed Green Line Extension, which included Brick Bottom and West Medford Route 16. The state and federal government knows that is not true and never was. It was a public relations tool. There was no real help to get other groups involved out there until the Green

I-338-007

The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), and the MBTA. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement as the station designs are refined.

Line Advisory Group for Medford (GLAM) was formed and advocated for more, diverse citizen participation.

There have been many futuristic looks at societies that create homogeneous societies where everyone looks, works and acts the same. Without going into history there have been a few that tried it only to eradicate individuals. Though not claiming this is the full intent of this project, it surely has acted that way.

It takes a great deal of education to understand another social culture, or as a dear friend of mine states about the Native American Culture, to walk within another person's moccasins. This process has not been done in this project.

But we have the opportunity to prove me wrong. We have the opportunity to know that there are two phases of this project. This opportunity is unique in a project like this. One phase will be to go to College Ave and Boston Avenue. This first phase allows time to research if the first phase of the project actually has a negative impact on the environmental justice and disability community. We have the opportunity to research this social issue and apply for research grants that will prove this claim to be true or false. We have the opportunity to look at West Medford who has been denied comment and how this project will affect the community of West Medford and the lives of the people in Medford while we are building and running the Green Line.

Remember that I personally have never expressed that I did not support the Green Line to College and Boston Avenue. Yet the Medford sister group to the Somerville supporters has made this a major issue. As an educated person with a Ph.D. and a lifelong member of the disability class, I waited for studies before I made an open statement on the proposed Green Line. At this juncture with only 10% of the studies complete and based upon the effect to the community, this is not enough for me to support the DEIR as a final report. This project is a bad idea due to the social impact, the current financial stress situation and one that needs more studies on local air quality and requires a diesel particulate health impact study.

I-338-008

Somerville printed in their newspaper that I was against the environmental justice and disability community. Very untrue. Any time you dare to speak out for either the environmental justice or disability communities, what occurs in this area of development is that there is a Greek chorus stating you are trying to stop the Green Line Extension. This Greek chorus means you are trying to get a handle on the human rights issue and this may hurt their cause. And you are trying to put an identity on the development and how that development is going to affect the people who live in the community. Is this project going to substantially change the neighborhoods and the character of the neighborhoods in West Medford and at College Avenue?

6

I-338-008

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

As you can see I am not discussing Somerville. Yet Somerville has greatly stated that I am against the environmental justice and disability population, even though I am a lifelong member of the disability population and have worked in Somerville to make the disability and environmental justice population more welcomed within that area. I am a lifelong member of this area. Somerville with its multiple of choices for EOT advisory members never saw fit to appoint an self identified disability member or a self identified environmental justice population member.

I participated in the War on Poverty that the Lyndon Johnson administration enacted. Working as a consultant providing advice to the Dept of Education at that time, I reviewed proposals directed toward what we now call the environmental justice population. During a later time frame, as a young man, I gave advice to the environmental justice population in the Jimmy Carter administration. I worked on disability rights in the 1970s for special education in the state of Massachusetts. Despite my work in civil rights, I was still hammered by the Somerville contingency that I was against the environmental justice population since I would not accept a view of support for this project without the support of studies and participation of the environmental justice and disability populations.

It shows you how much of a community's history is lost and how much the population who supported the Green Line do not know about their community. I integrated African American colleges in the 1960's and was severely beaten by a large group of people for doing so. The Green Line advocacy community who is so well educated to the point that it knows nothing about its own community embarrasses me. My statements can all be backed up since there are African American activists in Cambridge and disability workers I have worked with over the years who know my background.

Once I outreached to the authentic environmental justice and disability population in West Medford I found out that no maintenance center was acceptable at Route 16 by those populations. A parking facility was not supported nor other imposed changes upon their community were acceptable to that population. The Hillside area was split over Route 16 as the terminus. As a veteran with a disability who is a long time member of American Legion Post 447 in Somerville, my commander asked me to look into Union Square and Brick Bottom. These two areas seemed to be left out of citizen participation by the Greek Chorus of Green Line supporters. I found that Brick Bottom new little about the maintenance center and my Legion Post little about the Union Square proposal for the proposed Green Line. The majority of Post members do not use computers to find information.

I helped found a group called GLAM with a disabled woman. This group includes participation by the environmental justice and the disability population and was organized without the help of the state while Somerville kept these populations

out in the cold. While other organizations were supported by the state to provide public relations to promote the benefits they claim come with this project, I contacted Dr. Marlene Warner to read the original environmental proposed review. She called friends in the environmental justice community, at the EPA and universities throughout the country and they all agreed that this environmental review wasn't up to par.

In the meantime, I went to work on trying to get the state to follow the Americans with Disabilities Act (ADA) and the governor's own Executive Order Number 478. The Governor, who I had met during his campaign, at a public meeting told me to keep fighting for the disability movement. We both knew the late Supreme Court Justice Thurgood Marshall's quotes on how the disability population is segregated out of events.

I-338-009

Yet EOT has gratefully stated they did all this disability work despite the fact that Jim Morse, a deaf man, Danny Colangelo, an impaired walker, and the Clinton family, who are disability members as well as elderly, were left out of the process for lack of accessibility. All these people and many more were left out in the cold by the state government's EOT process since the EOT started out their meetings without giving the disability community the right to participate in a fashion that would be best to their cultural and accommodating way. We never saw Spanish, Haitian or any other bi-lingual material at meetings nor Braille or any other type of disability accommodation in these meetings. I was appalled by the lack of communication that EOT staff and representatives had in these meetings with the environmental justice and disability community. Is this process being challenged? Yes, at the FTA level right now in a written complaint/report. Not only is the disability community challenging the EOT process, but so also is the environmental justice population challenging this process by one of their own experts. After our complaints about this process, EOT is now starting to make this type of material available. It was not available in the beginning of the process. This was a violation of the 1964 Civil Rights Act intent.

But let me state this, there were many good state employees who gave us the information that lead to this report. These are people who were concerned about the EOT's ineffective manner toward the environmental justice and disability populations. In doing this kind of research and presenting arguments about this development transit project, we find that now there is a large population in Somerville, as I stated, who did not want a maintenance facility. And many of them do not support the proposed Green Line extension to Route 16. Some of them are veterans and disabled veterans; some are ordinary citizens and Brickbottom residents.

I am not writing about these groups specifically, but about the general public relations that seems to only apply between EOT and the educated group of individuals who use the website set up for home computers. Not everyone uses the computer. Surely the government must understand that among non-degreed

8

I-338-009

Outreach efforts to environmental justice populations are described in DEIR/EA Section 5.4, Environmental Justice. Additionally, the Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes specific outreach efforts to the environmental justice community that will be made as the Project progresses through its next phases.

people there are adults who do not use a computer and that there are technology gaps within populations. Number one, they cannot afford it. Number two, they have not been trained. Number three, technology does not go to everyone in our society. Theses are generally accepted points that real educated persons understand.

Wasn't it a surprise to find out that when people in Somerville were offered a proposed Green Line Extension in Somerville that it was only the technologically inclined that knew about it? Was it a surprise that the first mayor to support the Governor for election was from Somerville and the State Senator who supports this transit growth was from Somerville? Is it a surprise? No. Will it be a surprise that the people in Medford will not be listened to by the state government? No. That is what Congress calls systemic discrimination. That is what has happened and what we are fighting here.

I-338-010

But what can we do to eradicate this situation? We can actually study the empirical side of the proposed Green Line Extension to Route 16. We can use empirical data from other development projects around Massachusetts and the Boston/Cambridge/Somerville to see if they do change and cause an effect that is more a social impact toward injustice to the environmental justice and disability community.

I-338-011

Phase I of this project can also allow time to see the affect of the newer standards that the federal EPA is studying to enhance the Co2 factor. We can study as to whether a particulate health study needs to be conducted beyond Route 16 to the West Medford community. We have the time and capacity to study these and other problems that have been brought out by GLAM. I am stating that the educated class and state should do better homework for the people of the environmental justice and disability populations of West Medford. This study should be conducted with the West Medford disability and environmental justice population.

I-338-012

We also have the capacity and time to look at in a fair manner the tunnel alternatives such as making the proposed Green Line extension project in a similar vein to the Reno, Nevada train project. This train project was enclosed to limit noise and to enhance environmental benefits including washing environmental particulates out of the air before they become particulates for cancer. These particulates are an impact concern for the environmental justice and disability populations from Ball Square to Route 16. What we have here is a moral obligation and an ethical consideration as well as the capacity to do it.

If we don't perform these studies, we, as a society, are losing out again to a Harvard like dominance of a community like Union Square Allston. A place that will not be developed for the best interest of the community that lives there, but to a hypothetical future that may never be seen.

9

I-338-010

Impacts to environmental justice populations are described in DEIR/EA Section 5.4, Environmental Justice. Additionally, the Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes specific outreach efforts to the environmental justice community that will be made as the Project progresses through its next phases.

I-338-011

The Proposed Project terminates at College Avenue Station. The Project does not extend to West Medford, there are no impacts in West Medford, and no additional studies are warranted.

I-338-012

Tunneling alternatives were evaluated but dismissed, as described in DEIR/EA Appendix B, Section 7.

We can study to see what can help the tax burden of the cities. We can study how to keep populations or even relocate populations if necessary in a fair manner, instead of as in the past. It is my conclusion that this project has been unfair to the populations that live here. That the technologically based population has clamored to control the vast media regarding this project and to control that media through computer sciences.

Tufts University has made it clear to the population here that it does not serve that it is has it fingers or tentacles in other groups. And that those tentacles will be revved up to destroy the credibility of any one who criticizes the proposed Green Line Extension project that they consider dangerous to their futuristic plans. If the government of the United States and President Obama coming from a university background, a president that I supported, funds this project, the government is then setting in motion a human tragedy unless we understand it now. We need to correct what we can and study that which we need so we can go further to preserve the populations that live here.

This DEIR does not mitigate the cost of this transit project. Mitigation cost has not been put into the DEIR report as I read it. Land taking has always been a Medford issue. If you go to Rte 16, you will take land and tax dollars. It leads this writer to surmise that you will eventually put a project in area that will do nothing but create destruction of the oldest black community in this country that has been free and standing for many historical years. Again, you will not listen to the environmental justice population and their needs and you will not listen to the disability community and their need for studies to make sure you are not creating a disability zone for cancer, which may include West Medford and the Hillside. The state is creating a possible human rights cancer-producing zone.

As my friends in the union tell me, they haven't been talking about the Green Line as a jobs program. Hence, I cannot see it as a jobs program. So the state will not be addressing that issue. But the only issue you will be addressing is development through transportation and a possible reduction to the Tuft's budget saving them transportation costs. This project will allow the university the privilege of parking its cars in its parking lot and taking the Green Line into Tufts Medical Center in Boston, as well as, Red Sox games, symphony hall events, and visiting other universities.

I-338-013

But will there really be jobs created for the disability and environmental justice populations on either side of the Green Line in Boston or in Somerville and Medford? There is no empirical data that supports that jobs will be created for either of these populations. In fact, it was brought to EOT's attention that jobs were moving to the 128 and 495 beltways. Copies of the business newspaper articles that claimed this fact were given to EOT in other public comments. Studies requested by a state legislature were given to EOT to state this job trend to the suburbs was a fact. The action of the state between Ball Square and Rte

I-338-013

Socioeconomic impacts, including projected effects on businesses, jobs, tax revenues, and community disruptions, are described in DEIR/EA Section 5.3, Socioeconomic Impacts. Effects on land use and transit access are discussed in DEIR/EA Section 5.2, Land Use, and Section 5.15, Indirect and Cumulative Effects. As required by the Secretary's Certificate on the DEIR/EA, additional analysis of the socioeconomic effects of the maintenance facility alternatives are described in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. A series of Project workshops will provide opportunities to discuss broader impacts of the Project on job creation, economic development, housing affordability, and other community impacts.

I-338-013 16 seems to take jobs away, takes parking away, takes buildings away that have been mentioned in the EOT report.

There is no replacement for these jobs and this is just the beginning. In every project there are enhancements and missed plan conceptions that have to be corrected. This project does not address these issues and would do even more in the taking away of environmental justice and disability jobs. One of my recommendations would be to develop a fund to find jobs for displaced workers in Somerville and Medford. I also recommend a fund to keep these workers on unemployment for a longer period of time than the law requires for the purpose of helping these people resettle their lives that you, the government, are disturbing. This is not out of context. This would be called a mitigation fund.

I-338-014

These funds could be set up through developers linkage projects that pay the federal and state government. Developers would be required to pay linkage funds to the state if they develop within the first ten years after the transit project is finished. There should be a fund by Tufts University to pay for its usage and its responsibility to the communities for the disruption of linkage to its college.

Is this something out of the ordinary? Not really. Similar arguments were presented in Reno and the business community stepped up to the plate and helped with the development of that project. What the Commonwealth is saying is that the taxpayers alone should pay for this project. What Reno said was that the taxpayer should pay some, but the people who will get the most out of it should pay some also.

I-338-015 In conclusion, I support the project to College Avenue on condition that the people at Brickbottom get a full hearing on their needs and wants unlike the people of West Medford have received. I would support the Green Line to College Avenue on condition that studies are done to mitigate the impact of the proposed Green Line in Medford if those studies, as I think, show a change in the community. In that case, Route 16 should be dropped from any plan. Studies

I-338-016 should be more empirical and less based in abstract theory and not necessarily based in current federal standards but on forthcoming changes. Empirical means, will the state actually change the community as happened in other projects in Massachusetts? Will the environmental justice population get the full worth of their homes, businesses and community? Or will empirical data show that these populations will be low-balled and the second group of ownership will make a large profit off the government interfering with natural development.

I-338-017 For financial reasons I could support stopping at Ball Square because groups such as STEP and MGNA, who supported this project before studies were presented, have stated they support walk to and bike to stations as a replacement for cars. Because Ball Square is so close to College and Boston Avenues, it would only be appropriate that we save money by stopping at Ball Square so peoples such as STEP and MGNA get what they worked for, walk to

I-338-014

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

I-338-015

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

I-338-016

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-338-017

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

I-338-018 and bike to stations. I also support true community paths, not just walk and bike paths. Community paths must be accessible by the disability community. I support full participation of the disability community in the design of the stations. It should be mandated that self-identified people with disabilities are protected from MGNA and STEP, the Greek chorus of supporters. These groups have a pattern of leaving out the environmental justice and disability communities in participation.

There also are ways to build this project in Sections for financial consideration that I would support (e.g. Union Square with Lechmere station first); then when the state has more funds move the project to the next area. In the next section build the maintenance facility (wherever it will be). While building these segments, the state should do further studies on the affect of the new build around each stopping point before moving forward. Although it may cost more, we will have a better sense of this project's affect on human populations and whether it needs to move foward.

Is the government going after small businesses while allowing universities alone to harvest the benefits of this project? The government should make sure the tax base of Medford is protected from the loss of land or businesses and that the residents are protected from speculators and carpet baggers as was the case historically in the South during Reconstruction. Yes, I am saying that universities and business will take advantage of the community in these situations.

Is Tufts getting a large benefit from mitigation costs while residents and St. Clement's Church gets little or no help? This is a public relations nightmare since most people so far believe that Tufts University gets the most benefit of this project to College and Boston Avenue and will get the bulk of mitigation money while lowering their cost of transportation.

I-338-019 The fair price of housing should be based on future figures and not on the basis of today. If you are stating that the future is going to change, than you should state that the profit to be made should be made by the people who live here now because the current community is taking the blunt of the disturbance of this project as well as the trauma.

As I earlier quoted Paulo Coelho, the Brazilian writer and philosopher, there are many paths and all might be right for one group or another. Hence closing anyone's path from the beginning of this process is nothing more than a rubber stamp without truly looking at the needs of progress. Closing paths at the beginning of this process is what was done in the communities impacted by this project. These are the personal comments of Dr. Wood.

Sincerely yours,

Dr. William Wood

12

I-338-018

DEIR/EA Section 3.7 describes bus, pedestrian, and bicycle access at each of the proposed stations. Sections 4.4 and 5.3 of the FEIR, Access and Circulation, describe pedestrian and traffic access for the proposed College Avenue Station and redesigned Lechmere Station, respectively. The preliminary station access and platform designs are based on requirements and guidance provided by the Americans with Disabilities Act, 1990, the Commonwealth of Massachusetts Architectural Access Board (MAAB), the MBTA, and the recent Boston Center for Independent Living (BCIL) agreement. In general, current station concepts include two elevators, escalators, and stairs, and meet the MBTA's requirements for access.

In accordance with the Secretary's Certificate on the DEIR/EA, bicycle, pedestrian, bus and automobile access at stations, as well as specific design details and station elements, will be refined during preliminary engineering. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-338-019

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

MEPA

Dear Secretary Bowles,

I have lived in Cambridge for 30 years and in East Cambridge for one year. I am an avid cyclist and user of public transportation. I would like to express my concerns about the planned move of the Lechmere T station to the north side of McGrath/O'Brien Highway.

I-339-001 I am very concerned about the crossing where pedestrians will walk between the station and East Cambridge. This is a very busy highway, and the crossing must be well-designed, and give pedestrian convenience and safety high priority.

I-339-002 Apparently the plan is for the Charlie Card machines to be uncovered and exposed to the elements. This seems like a major oversight. Lechmere Station is an important bus and subway interchange, and people should be able to buy tickets and wait without getting rained on. In addition, my understanding is that there will not be an entrance to the station facing East Cambridge. East Cambridge residents will already have to negotiate the highway on foot. Please don't force us to walk around the back of the building in addition.

One suggestion I heard recently was to have bus routes go on Cambridge Street all the way to First Street before turning north toward the station. This plan would have several advantages:

- Riders going to East Cambridge could get off the bus on Cambridge Street before it turns north;
- Riders from East Cambridge could board the bus on Cambridge Street, avoiding having to cross the highway;
- Busses would cross straight across the highway at a light rather than having to make a left turn to get into the station;
- Riders could be allowed to board the bus for free on Cambridge Street in order to get a ride across the highway and avoid having to cross the highway on foot.

I urge you to consider this plan.

I-339-004 I have seen a proposal for the redevelopment of the existing Lechmere station buildings as a public market. I am very excited about this prospect and I urge you to consider it. There is an enormous amount of development in East Cambridge, and providing a place for environmentally-friendly food sales proximate to public transportation would be a wonderful addition to the neighborhood.

Thank you,

Alec Wysoker
131 Spring Street #1
Cambridge, MA 02141

I-339-001

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. The chapter presents a traffic analysis, a detailed description of pedestrian crossings of O'Brien Highway, and proposed roadway, crosswalk, and sidewalk improvements that are consistent with the NorthPoint development plans. These station and street plans will be further refined in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-339-002

Revised conceptual plans for Lechmere Station, including modifications to the station headhouse and entrances, enclosed automatic fare collection, and other amenities are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-339-003

Revised conceptual plans for Lechmere Station, including bus facilities and bus waiting areas, are included in FEIR Chapter 5, Lechmere Station. Bus layover has been shifted further to the east and away from the Glass Factory Condominiums in the revised Lechmere Station design. Signs will be posted to limit idling of buses, in conformance with MBTA standards.

I-339-004

MassDOT has reviewed the suggestions submitted by the East Cambridge Planning Team. Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. These plans, including the pedestrian crossings of O'Brien Highway and associated

street, crosswalk, and sidewalk designs will be further refined in the preliminary engineering stage of the Project. As part of the Green Line Extension, MassDOT intends to demolish the existing Lechmere Station and prepare the site for potential future redevelopment. Based on the current requirements of the O'Brien Highway roadway improvements (as shown in FEIR Chapter 5, Lechmere Station), the existing bus shed must be removed.

Boston, MA 02114

Dear Secretary Bowles:

Despite the 2014 Green Line Extension deadline, the DEIR/EA has enough glaring inadequacies that I hope you will not hesitate ask MassDOT for more forward-thinking land use planning that that will be less detrimental to the Brickbottom community and to the city of Somerville.

I-340-001 I have explored the Inner Belt area on my own and toured the Riverside Maintenance facility with Kate Victor and have become comfortable with Option L as the best proposal so far. An ideal solution, though, would be to make more efficient use of the 40+ acres occupied by the Boston Engine Terminal and fit the new facility onto existing MBTA land.

I've lived and worked in a second floor north-facing Brickbottom studio since 1988, just a few yards away at eye-level and ear-level from what will soon become the main Green Line to Medford. I don't own a car and am looking forward to the convenience of the extended Green Line, although the trains will leave me with just a few hours of peace and quiet each night. If the maintenance facility is sited at Yard 8, I won't even have those few hours. Visitors to my studio are always shocked at how deafeningly loud the squealing and crashing of the freight trains outside my windows can be, but I've considered myself fortunate to live on the "quiet" side of the Bakery building, away from the more-frequent roar of the commuter trains. On those tracks we are also unfairly subjected to the grating racket of roof-top air conditioners and refrigerated freight cars. All this noise pollution is *intensely unpleasant* even to the most noise-tolerant among us. The constant, inescapable noise and vibration of trains en mass, 20 yards away walled in with sound-reflective surfaces is undoubtedly the kind of physiological and psychological stressor that could take a serious toll on anyone's health. This would be our fate with Yard 8.

In addition to noise, the commuter trains often spew enormous blue clouds of diesel exhaust. Brickbottom is constantly bathed in a rain of brake dust and exhaust particulates from the trains and from traffic on Route 28. Public transportation today should be as much about maximizing the environmental benefits as it is about moving people form point A to point B.

We are depending on you to:
I-340-002 1) not accept the Draft EIR as final,
I-340-003 2) disallow the use of Yard 8 for train storage or maintenance,
I-340-004 3) require the formation a Citizen Advisory Committee to help ensure the rights of abutters are respected,
I-340-005 4) require the MBTA to install effective mitigation features *before* construction begins,
I-340-006 5) establish a formal appeals process in the event that pre-agreed maximum levels for noise, etc. are not attained. A framework to air and redress grievances could prevent drastically more expensive litigation.

Thank you so very much for your assistance at this crucial juncture.

Sincerely,
Ellen Young
Ellen Young

I-340-001

As explained in FEIR Chapter 2, MassDOT has explored opportunities for the Green Line Extension storage and maintenance facility to share resources with the Boston Engine Terminal. The independent needs and constraints of these facilities limit opportunities for shared resources. MassDOT will coordinate with the MBTA during preliminary engineering to maximize efficient land utilization between these storage and maintenance facilities, if possible.

I-340-002

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.

I-340-003

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-340-004

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has developed a Public Involvement Plan (PIP) for the Green Line Extension Project. The PIP, Chapter 6 of the FEIR, describes MassDOT's plans for public outreach in the next phases of the Project.

I-340-005

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in

FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

I-340-006

As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds. FEIR Chapter 8 describes specific proposed mitigation measures, plans for monitoring after construction, and next steps pertaining to mitigation. The stakeholder coordination process for Project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

Johnson, Holly (EEA)

Subject: My support for the Green Line Extension to Rt.16

Dear Secretary Bowles:

As a Medford homeowner and resident (and a former Somerville resident) for the past 6 years, I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA #13886.

I-341-001

First of all, I strongly support the Green Line extension, and urge that it be built in the most practical, beneficial and cost-effective manner - that is, to construct the entire project in one phase, with a terminus station at Mystic Valley Parkway (Route 16), by December 31, 2014.

The DEIR is encouraging in that it concludes that the Route 16 station would provide the most benefits according to all project criteria, including air quality and environmental justice. However, MassDOT states that it is incapable of building (and funding) the entire "Preferred Alternative," so it only intends to build the extension to College Avenue in the Tufts University area of Medford, by its deadline of December 31, 2014.

In my opinion, the DEIR as currently written does not serve the best interests of the project. More importantly for your review, it was not done in a way that "adequately and properly" complies with the state environmental regulations, nor with the December 1, 2006 MEPA certificate that defined the requirements of the DEIR.

For the following reasons, I strongly urge you to not accept the DEIR as the Final EIR and require further environmental analysis of the project by MassDOT:

1. A two-phased approach is unacceptable. The Route 16/Mystic Valley Parkway Station should be built as part of a single-phase project to minimize costs and negative impacts and achieve the maximum benefits with regard to ridership, vehicle mile travel reduction, air quality improvements, and service to environmental justice communities.

The recommendation as outlined in the DEIR is for the Route 16/Mystic Valley Parkway station to be a separate stand-alone Phase II project with no funding source identified. This means, Route 16 may never be built.

There are many, many problems with the Phase II approach, including:
* Risk. Without an identified funding source there is a very high probability that Route 16 will never be built and the implications of this are critical.
* Terminus Impact. Without a Route 16 Station, the College Avenue stop (designed and intended to be an interim station) would become the de facto terminus for the Green Line extension. It is not designed for a terminus and due to the traffic flow and neighborhood density, as well as the lack of opportunity for transit-oriented development at College Ave., it is not a good location for a terminus.
* Cost. The two-phased approach is fiscally irresponsible and by MassDOT's own estimates will inflate the cost by $55 million over a single-phase approach. Severing a single stop (less than one mile of track) from the project as a whole will cost the state, and thus the taxpayers, significant additional money. There are obvious ways to easily reduce costs in the overall project and provide enough additional funds to include Route 16 as part of a single, complete project. This is the most prudent approach, and also would ensure that the project

1

I-341-001

Please see responses to Letter I-002.

produces the air quality improvements the Commonwealth must achieve to come into compliance with the Clean Air Act.
* Project Management. There are significant efficiencies gained from completing the project in one phase, rather than the starts and stops required to execute on separate, multi-stage efforts for such a small add-on project as a single station stop.
* Environmental Justice: The environmental justice population cited, in part, to justify the project as a whole will largely not be served if the project terminates at College Avenue. The negative aspects of this project will affect them most, while they will receive the least benefit without service to a Route 16 terminus.
* Legal Mandate: The state is legally obligated to provide public transit services to Medford Hillside by December 31, 2014, and stopping the extension at College Ave. fails to meet this legal obligation. At a minimum, this incurs significant mitigation costs required if the obligation is not met.

2. College Avenue should not be a terminus. The College Avenue station is not designed for the additional requirements of a terminus. The neighborhood cannot sustain the impact of a terminus station operations and traffic volume and the potential environmental damage is of serious concern.

3. The Route 16 station design is inadequate. The DEIR offers only a "worst case scenario" (MassDOT's description) for the Route 16 station design, while offering optimized station designs for all other Green Line extension stations. The Route 16 station design must be revisited. The Medford Green Line Neighborhood Alliance, a volunteer citizen group, has offered an alternative station design that prevents two major commercial property acquisitions and the resulting job displacement, preserves $182,000/year in property taxes for the City of Medford, optimizes traffic flow and better serves the integrity of the station's surroundings.
MassDOT apparently has been exploring similar improved designs, which should be presented to the public for comment. A $1 billion project deserves a higher caliber design than a "worst case scenario."

To summarize, there is much more work to be done on the Environmental Impact report, and I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis in order to make the Green Line extension the best project it can be, and MUST be.

Best Regards,

David Zawacki

Subject: My support for the Green Line Extension to Rt.16

Dear Secretary Bowles:

As a new Medford homeowner and resident (and a former Somerville resident, 2007-2009), I am writing to comment on the Draft Environmental Impact Report (DEIR) for the Green Line Extension project to Medford, EEA#13886.

I-342-001

First of all, **I strongly support the Green Line extension**, and urge that it be built in the most practical, beneficial and cost-effective manner -that is, to construct the entire project in one phase, **with a terminus station at Mystic Valley Parkway** (Route 16), **by December 31, 2014**.

The DEIR is encouraging in that it concludes that the Route 16 station would provide the most benefits according to all project criteria, including air quality and environmental justice. However, MassDOT states that it is incapable of building (and funding) the entire "Preferred Alternative," so it only intends to build the extension to College Avenue in the Tufts University area of Medford, by its deadline of December 31, 2014.

In my opinion, the DEIR as currently written does not serve the best interests of the project. More importantly for your review, it was not done in a way that "adequately and properly" complies with the state environmental regulations, nor with the December 1, 2005 MEPA certificate that defined the requirements of the DEIR.

For the following reasons, I strongly urge you to not accept the DEIR as the Final EIR and require further environmental analysis of the project by MassDOT:

1. A two-phased approach is unacceptable. The Route 16/Mystic Valley Parkway Station should be built as part of a single-phase project to minimize costs and negative impacts and achieve the maximum benefits with regard to ridership, vehicle mile travel reduction, air quality improvements, and service to environmental justice communities.

The recommendation as outlined in the DEIR is for the Route 16/Mystic Valley Parkway station to be a separate stand-alone Phase II project with no funding source identified. This means, Route 16 may never be built.

There are many, many problems with the Phase II approach, including:

- **Risk**. Without an identified funding source there is a very high probability that Route 16 will never be built and the implications of this are critical.
- **Terminus Impact**. Without a Route 16 Station, the College Avenue stop (designed and intended to be an interim station) would become the de facto terminus for the Green Line extension. It is not designed for a terminus and due to the traffic flow and neighborhood density, as well as the lack of opportunity for transit-oriented development at College Ave., it is not a good location for a terminus.
- **Cost**. The two-phased approach is fiscally irresponsible and by MassDOT's own estimates will inflate the cost by $55 million over a single-phase approach. Severing a single stop (less than one mile of track) from the project as a whole will cost the state, and thus the taxpayers, significant additional money. There are obvious ways to easily reduce costs in the overall project and provide enough additional funds to include Route 16 as part of a single, complete project. This is the most prudent approach, and also would ensure that the project produces the air quality improvements the Commonwealth must achieve to come into compliance with the Clean Air Act.
- **Project Management**. There are significant efficiencies gained from completing the project in one phase, rather than the starts and stops required to execute on separate, multi-stage efforts for such a small add-on project as a single station stop.
- **Environmental Justice**: The environmental justice population cited, in part, to justify the project as a whole will largely not be served if the project terminates at College Avenue. The negative aspects of this project will affect them most, while they will receive the least benefit without service to a Route 16 terminus.
- **Legal Mandate**: The state is legally obligated to provide public transit services to Medford Hillside by December 31, 2014, and stopping the extension at College Ave. fails to meet this legal obligation. At a minimum, this incurs significant mitigation costs required if the obligation is not met.

1

I-342-001

Please see responses to Letter I-002.

2. **College Avenue should not be a terminus.** The College Avenue station is not designed for the additional requirements of a terminus. The neighborhood cannot sustain the impact of a terminus station operations and traffic volume and the potential environmental damage is of serious concern.

3. **The Route 16 station design is inadequate**. The DEIR offers only a "worst case scenario" (MassDOT's description) for the Route 16 station design, while offering optimized station designs for all other Green Line extension stations. The Route 16 station design must be revisited. The Medford Green Line Neighborhood Alliance, a volunteer citizen group, has offered an alternative station design that prevents two major commercial property acquisitions and the resulting job displacement, preserves $182,000/year in property taxes for the City of Medford, optimizes traffic flow and better serves the integrity of the station's surroundings. MassDOT apparently has been exploring similar improved designs, which should be presented to the public for comment. A $1 billion project deserves a higher caliber design than a "worst case scenario."

To summarize, there is much more work to be done on the Environmental Impact report, and I strongly urge you to reject the DEIR in its current form and instruct MassDOT to perform the required further environmental analysis in order to make the Green Line extension the best project it can be, and MUST be.

Best Regards,

Stephanie Zawacki

Dear Secretary Bowles:

I have read the DEIR report regarding the extension of the green line to Somerville. I am very much in favor of this extension and thought the report was well presented and helpful. However I understand there is some question regarding whether the community path development will be coordinated with the green line extension.

I-343-001

Given that the community path will need to use some of the right of way, and that the community path is bound to provide a pedestrian feeder to the green line stations, it is clear to me that these projects need to be planned together. I remember this issue being brought up at an early green line extension meeting and the response had been that these are independent proposals.

There might have been a weak argument for the position in the early stages, but at this point it should be very clear that these projects both need to be completed and that they need to be intimately coordinated. Any other approach will result in inefficient use of tax payer dollars and, at worst, bad design decisions.

I-343-002

The DEIR should clearly state that the extension of the Community Path will be designed by MassDOT's contractor as agreed in the February 24, 2009 letter from the former EOT.

Thank you for all your efforts bringing this project forward. I look forward to seeing this project progress.

Best Regards,

Kate Zebrose

I-343-001

MassDOT has committed to complete the final design of the proposed Community Path between Lowell Street and the Inner Belt area. MassDOT is not able to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

I-343-002

Please see response to Comment I-343-001.

Subject: Comment on green line extension

I-344-001

Good morning. My family lives on Woodbine Street in Somerville. Our backyard overlooks the train tracks. We are aleady concerned about the effects of train-related air- and noise-pollution on ourselves and our young children. These tracks see heavy traffic from freight and passenger trains, and we want to make sure that the additional train traffic will not add to these problems. We hope that there will be noise and pollution studies to demonstrate the potential impact of the additional traffic and residents' health and wellness will be insured.

Thank you.

Jessica Zeigler

I-344-001

The Green Line Extension will have a positive impact on air quality within the study area. DEIR/EA Section 5.6, Air Quality, describes the expected improvements in local and regional air quality that would result from the Proposed Project. Further explanation of air quality modeling assumptions and potential impacts are described in the FEIR Chapter 3, Air Quality. Additionally, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors.

As discussed in DEIR/EA Chapter 6 and FEIR Chapter 8, MassDOT has complied with FTA-established guidelines to identify and then eliminate, minimize, or offset noise and vibration impacts to sensitive receptors above regulatory thresholds. The stakeholder coordination process for project mitigation is described in FEIR Section 6.3, Public Outreach Strategies.

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA #03886
100 Cambridge St., Suite 900
Boston, MA 02114

Dear Secretary Bowles:

I-345-001 I As a resident of the Glass Factory Condominiums, I am deeply concerned about the design and placement of the Green Line Extension and the new Lechmere Station.

TRACKS ARE TOO CLOSE TO OUR BUILDING.
The present design shows the tracks running very close to the rear of our building. We urge your designers and engineers to place the tracks as far to the rear of our building as possible to preserve views & light to the many units that will be severely impacted by the elevated tracks. The design and placement of the tracks and supports should do all it can to minimize the visual impact to those units and also minimize noise & vibration impacts to the whole building as well as the surrounding neighborhood.

LECHMERE STATION.
At present, your designs show the new Lechmere Station so close to the Glass Factory that it appears to be part of our condominium building. Please move the station closer to East Street, where it could be part of the entrance way to the eventual North Point development. The station design needs to be substantially improved so it is not an eyesore but rather an enhancement to this rapidly developing neighborhood. It should reflect the importance of this location as the gateway between Cambridge & Boston.

BUS TRAFFIC.
The many bus lines that converge on Lechmere Station are presently designed to enter at one end of our building, pick up passengers, and emerge at the other end of our condo building. Please do not route bus traffic, directly under our windows. Bus traffic noise, vibrations and fumes are a great concern. Sidewalks where passengers wait, should also be moved farther from our building to preserve our privacy and minimize impacts from noise, light and smoking. If too close, it will feel like we are living in the bus station.

PRESERVE OUR TREES & GREEN SPACE.
Presently there is a row of mature evergreen trees behind our building. I urge you to preserve all these trees and the entire small green space behind our building. The current fence could be replaced with more substantial screening lined with additional trees and then the tracks placed beyond this screen. Sidewalks should be on the far side of the large trees. These trees serve as a natural screen for the tracks and busway.

I-345-001

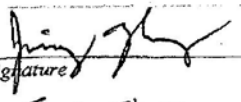
Please see Comment Letter I-013.

MAINTENANCE FACILITY.
I strongly oppose the Mirror H location. It is much too close to the Glass Factory and other residential buildings and will effectively destroy further development in North Point. Putting a maintenance facility on prime land in a desirable, developable location that would generate significant tax revenue to Cambridge simply does not make sense. Of the three options proposed, Option L seems to be the best choice however I would prefer there be no maintenance facility in this area but rather it be at the end of the line.

REDUCE SURFACE PARKING.
The present Lechmere Station is at the end of the Green Line. That will no longer be the case with the new Green Line Extension and the number of parking spaces should be substantially reduced. Please consider using the under-utilized parking garages that are already in this neighborhood. Surface parking is bad urban design and should be minimized in the new North Point neighborhood. One half of our building will overlook the new parking and we request it be carefully designed with this in mind. Ample green space should be included in the design and all lighting should be down lighting that minimizes light pollution to our building.

Thank you for hearing my concerns.

Sincerely,



Signature

Jimmy Zhang

RECEIVED
NOV 30 2009
MEPA

Dear Sir/Madam:

We would like to comment on the Green Line Extension Project's Draft Environmental Impact Report that was discussed at the public meeting on November 18, 2009 at Somerville High School.

I-346-001

Please keep the MEPA process open and continue the environmental review. There is no *final* Impact Report so it is difficult to determine the complete scope. Also, since it is only a 10% plan there is more work that needs to be done. The air quality study is not complete. The negative factors greatly outweigh the positive factors. A traffic study needs to be completed---much more thoroughly.

We do not approve of the Green Line Extension, especially to Medford (College Ave and Rte 16). Please continue the process as a MEPA certificate cannot be issued based on the report that we were told about on November 18, 2009.

Thank you.

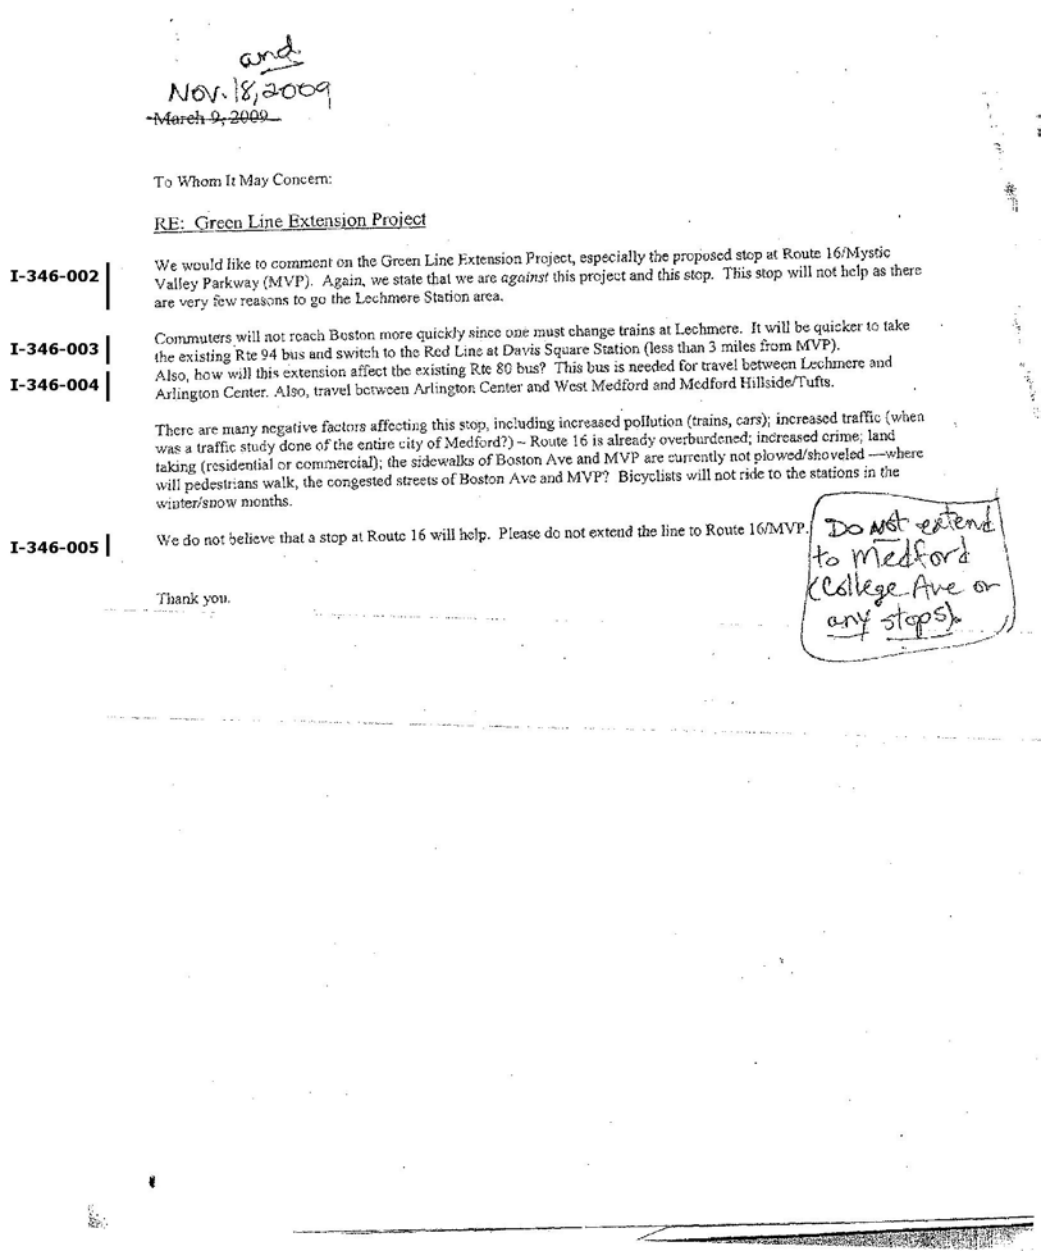
I-346-001

In accordance with the Secretary's Certificate on the DEIR/EA, MassDOT has prepared an FEIR for the Green Line Extension Project. This limited scope FEIR addresses those requirements specified in the Secretary's Certificate on the DEIR/EA.



and
Nov. 18, 2009
~~March 9, 2009~~

To Whom It May Concern:

RE: Green Line Extension Project

I-346-002 | We would like to comment on the Green Line Extension Project, especially the proposed stop at Route 16/Mystic Valley Parkway (MVP). Again, we state that we are *against* this project and this stop. This stop will not help as there are very few reasons to go the Lechmere Station area.

I-346-003 | Commuters will not reach Boston more quickly since one must change trains at Lechmere. It will be quicker to take the existing Rte 94 bus and switch to the Red Line at Davis Square Station (less than 3 miles from MVP).

I-346-004 | Also, how will this extension affect the existing Rte 80 bus? This bus is needed for travel between Lechmere and Arlington Center. Also, travel between Arlington Center and West Medford and Medford Hillside/Tufts.

There are many negative factors affecting this stop, including increased pollution (trains, cars); increased traffic (when was a traffic study done of the entire city of Medford?) – Route 16 is already overburdened; increased crime; land taking (residential or commercial); the sidewalks of Boston Ave and MVP are currently not plowed/shoveled —where will pedestrians walk, the congested streets of Boston Ave and MVP? Bicyclists will not ride to the stations in the winter/snow months.

I-346-005 | We do not believe that a stop at Route 16 will help. Please do not extend the line to Route 16/MVP.

Do not extend to Medford (College Ave or any stops)

Thank you.

I-346-002

Although the extension to Mystic Valley Parkway/Route 16 was considered the Preferred Alternative for a full-build of the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. A future extension to Mystic Valley Parkway/Route 16 will require a separate environmental clearance process. MassDOT is considering initiating a community planning process for a future extension to Mystic Valley Parkway/Route 16 to obtain stakeholder input on station design and layout, neighborhood impacts, economic development, and other area planning issues.

I-346-003

Both Green Line Extension branches (College Avenue and Union Square) would continue through Lechmere Station and downtown Boston without requiring transfers.

I-346-004

To the extent possible, Green Line Extension stations will be designed for accessible, convenient transferring between MBTA bus routes and Green Line light rail during preliminary engineering. MassDOT will work with the MBTA during preliminary engineering to evaluate opportunities to improve connections between existing bus routes and proposed stations. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, describes MassDOT's plans for public outreach as station designs are refined in the next phases of the Project.

I-346-005

MassDOT has noted and considered your comment. Thank you for your interest in the Green Line Extension Project.

To all of the people at the:
Mass. Dept.of Transportation and any others involved with the Green Line Extension Project:

I-347-001

I am writing you today as a Somerville resident of 23 years and a Brickbottom Artist Community live/work Resident of just over 12. I want to express my concern with the continuation of this project and more specifically the proposed placement of the Maintenance Facility. The continuation of the project with the current location at 'YARD 8' would yield major problems for this city and more particularly with our neighborhood here at Brickbottom.* The impact that this Maintenance Facility would have on this neighborhood, this building and it's residents (my neighbors) at it's current proposed location will throw a very large wrench into what has been recognized as a rather successful conscious effort to supply artists (the undeniably necessary elements of society) a place to be able to live and work comfortably within this city. For those who are not familiar with Brickbottom Artists Building, we are a group of artists that started our community over 22 years ago and to this day are recognized as one of the oldest and more successful artist communities in the country. We are important to Somerville and the fabric of Boston/Cambridge /Somerville. We are Community oriented, take great pride and concern in keeping our building and grounds up and clean and invite the public in annually to introduce ourselves and share our art with people from all over Massachusetts.

The impact that this proposed Maintenance Facility as you well know is going to have ramifications that will render this area useless and barely habitable. I am speaking of the noise pollution that will be inescapable as will be the vibrations that are inevitably created. Not to mention the havoc it will wreak on the already weakened property values and it will create an eyesore that no one is going to want to look at. It will render this neighborhood the armpit of Somerville, further obstructing any possible tax revenues as this will become the least desirable area of Somerville where at least without this proposed facility it could well be slated to be developed into an area where people would enjoy coming for shopping, restaurants and commercial shopping.

I-347-002

I am not opposed to the Green Line Project in any way at all. In fact am quite in favor of it. I just personally believe that a **LOT MORE** consideration needs to be given to the idea of what is going to happen to this neighborhood and this whole quarter of Somerville, if this is pushed through. It saddens me greatly that such a lack of consideration is given to the ramifications of people's lives and the contribution to society in the name of progress.

I-347-003

There are many things which need to be considered not the least of which is the mitigation necessary to lessen the impact of a project of this size. At the meetings I have attended I have heard time and again **"We get 1 chance, ONE CHANCE to do this, so, let's do it right and not in hindsight say that we didn't even think about the ramifications of these issues in this light"**.

I-347-004

We here at Brickbottom Artists Community as well as in other parts of Somerville and Cambridge are urging you to use all the insights and foresights we have supplied you with to reconsider using 'Mirror H' at the very least, and to truly deeply consider what you are doing to people, families, a neighborhood..... a city.

Thank-You for your Re[illegible]ion of this vital issue,

RECEIVED

I-347-001

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is included in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Yard 8 location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-347-002

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. The evaluation considers land use and connectivity impacts and opportunities associated with each maintenance facility site alternative.

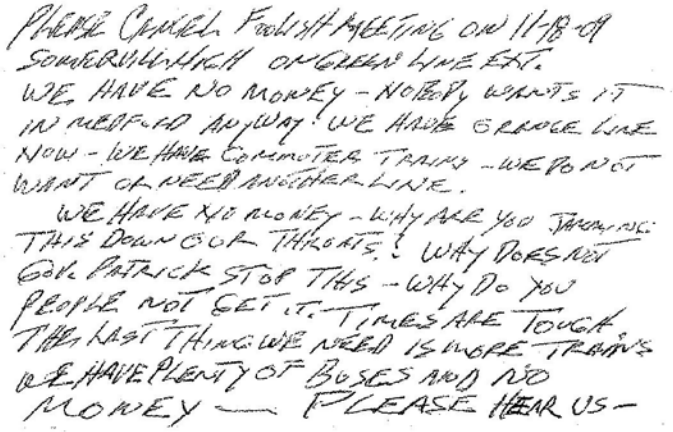
I-347-003

MassDOT has developed proposed mitigation measures / draft Section 61 findings for the Green Line Extension Project. These are provided in FEIR Chapter 8, Draft Section 61 Findings and Mitigation Measures. The mitigation measures, steps for implementation, and post-construction monitoring required by the Secretary's Certificate on the DEIR are also described in FEIR Chapter 8.

I-347-004

An expanded technical and environmental analysis of the light rail storage and maintenance facility alternatives is provided in FEIR Chapter 2, Maintenance Facility Alternatives Analysis. As a result of the evaluation, the Mirror H location is not recommended for further consideration and Option L is identified as the preferred maintenance facility site.

I-347-005



PLEASE CANCEL FOR LIGHT MEETING ON 11-18-09
SOMEWHERE HIGH ON GREEN LINE EXT.
WE HAVE NO MONEY - NOBODY WANTS IT
IN NEEDED ANYWAY. WE HAVE ORANGE LINE
NOW - WE HAVE COMMUTER TRAIN - WE DO NOT
WANT OR NEED ANOTHER LINE.

Boston, MA 02114

RECEIVED
NOV 18 2009
MEPA

Dear Secretary Bowles,

As a longtime resident of East Cambridge and a advocate of the East Cambridge Planning Team, I am writing to express my concerns and those I have heard over the years from neighbors about the planned move of the Lechmere T station across McGrath Highway..

Lechmere Square is a major gateway to East Cambridge and an integral hub of our neighborhood. According to reports from those studying area business potential, approximately one million people cross Cambridge Street from the present stop at Lechmere to shop at the Galleria Mall on First Street every year. That number alone, along with residents using public transportation is an inordinate amount of people to cross a major highway.

I-348-001 One of our principal concerns is safety. Crossing a major highway and a busy intersection can present problems for the development of the new station as well as for those using public transportation. We want to be sure that all crossings at Cambridge Street and Monsignor O'Brien Highway are well designed and offer the utmost protection.

I-348-002 Another concern is the design of the station. The preliminary design shown to residents at a recent meeting left much to be desired. Why are we being asked to purchase the Charlie Card while standing out in the elements? There appears to be no lobby in the present plans. Furthermore, the entrance is not convenient to anyone coming from the East Cambridge neighborhood or the Mall. There needs to be more than one entrance and easy access for the handicapped. We sincerely believe that the Green Line and bus station design need to be properly integrated with the future Northpoint street grid. This will further insure safety for those using the bus service and the T.

I-348-003 Last but not least, I would like to see the historic station buildings redeveloped around a new public market square. I firmly believe that this concept could be done with little or no expense to the T. A lively square/market area will make crossing two busy streets easier for those using public transportation and will add to the value of the area. Make Lechmere a destination not a transition point.

Thank you for your consideration.

I-348-001

Revised conceptual plans for Lechmere Station are included in FEIR Chapter 5, Lechmere Station. The chapter presents a traffic analysis, a detailed description of pedestrian crossings of O'Brien Highway, and proposed roadway, crosswalk, and sidewalk improvements that are consistent with the NorthPoint development plans. These station and street plans will be further refined in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-348-002

Revised conceptual plans for Lechmere Station, including modifications to the station headhouse and entrances, enclosed automatic fare collection, and other amenities are included in FEIR Chapter 5, Lechmere Station. These plans will be further developed in the preliminary engineering stage of the Project. The Public Involvement Plan (PIP), Chapter 6 of the FEIR, proposes a structure for community involvement during station design.

I-348-003

As part of the Green Line Extension, MassDOT intends to demolish the existing Lechmere Station and prepare the site for potential future redevelopment. Based on the current requirements of the O'Brien Highway roadway improvements (as shown in FEIR Chapter 5, Lechmere Station), the existing bus shed must be removed.

1 Introduction

1.1 Introduction

On October 15, 2009, the Massachusetts Department of Transportation (MassDOT) filed the Green Line Extension Project *Draft Environmental Impact Report/Environmental Assessment* (DEIR/EA) with the Massachusetts Environmental Policy Act (MEPA) Office. The submission of the DEIR/EA was a major milestone in the development of the Green Line Extension Project, a legal requirement of the Commonwealth of Massachusetts under the State Implementation Plan (SIP). The Commonwealth is committed to initiating passenger service on the Green Line Extension Project by December 31, 2014. In order to meet that commitment, a vehicle maintenance and storage facility must be constructed to support the operations of the Green Line Extension.

The DEIR/EA stated that the area referred to as "Yard 8 with Adjacent Parcel" (Yard 8) was selected as the preferred location for the construction of a Green Line vehicle storage and maintenance facility, given its combination of size, configuration, and adjacency to the Green Line Extension tracks. The selection of the Yard 8 site prompted local opposition from some municipal officials, elected representatives, and abutting residents. To try to address and resolve these concerns, MassDOT qualitatively analyzed two additional possible sites for the facility in December 2009.[1] Option L, a site conceived by MassDOT, is immediately adjacent to the Massachusetts Bay Transportation Authority's (MBTA) Commuter Rail maintenance facility, also referred to as the Boston Engine Terminal (BET). Mirror H, a site proposed by the City of Somerville, straddles the Inner Belt area of Somerville and the NorthPoint area of Cambridge. All three maintenance facility alternatives are shown on Figure 1-1.

1 Massachusetts Department of Transportation. *Green Line Extension Project, Additional Maintenance Facility Alternatives Analysis*. December 9, 2009.

The December 2009 *Additional Maintenance Facility Alternatives Analysis*[2] included an analysis of operations, property acquisition needs, and schedule implications, as well as a preliminary evaluation of potential environmental impacts and costs. It did not include an in-depth environmental analysis of the type presented in the DEIR/EA for the Yard 8 site. This qualitative analysis concluded that both Yard 8 and Option L remained viable locations for the Green Line Extension Project support facility, while the Mirror H site rated lower in a number of categories.

Following an extensive public review and comment period on the DEIR/EA, on January 15, 2010, the Secretary of the Executive Office of Energy and Environmental Affairs (EEA) issued a Certificate on the DEIR. The Secretary's Certificate required MassDOT to prepare a Final Environmental Impact Report (FEIR) for the Green Line Extension Project, including a more detailed, quantitative analysis of the environmental and operational impacts associated with Option L and Mirror H. In response, MassDOT has now prepared that analysis, documented in this technical memorandum. The full environmental analysis for Yard 8 was conducted for and included in the DEIR/EA, but has been repeated in this document for comparison purposes.

MassDOT will review and consider the DEIR/EA comments on the maintenance facility together with the outcome of this analysis to decide whether to substitute either Option L or Mirror H for Yard 8 as the preferred site for the storage and maintenance facility for the Green Line Extension Project.

1.2 Project Background

The Green Line Extension Project is an initiative of MassDOT and the MBTA to enhance transit service in order to improve mobility and regional access for residents in the municipalities of Cambridge, Somerville and Medford.

The Proposed Project documented in the DEIR/EA includes:

- Extending Green Line service to Medford within the existing MBTA Lowell Line Commuter Rail right-of-way (the Medford Branch), from a newly relocated Lechmere Station terminating at Medford Hillside in the vicinity of College Avenue with intermediate stations at Brickbottom, Lowell Street, Gilman Square, and Ball Square.
- Extending Green Line service to Union Square in Somerville (the Union Square Branch), within the existing MBTA Fitchburg Line Commuter Rail right-of-way with a station near Union Square.

2 Massachusetts Department of Transportation. *Green Line Extension Project, Additional Maintenance Facility Alternatives Analysis.* December 9, 2009.

Numerous studies over the last 40 years have explored extending public transit from Lechmere Station (the current terminus of the Green Line) along the existing MBTA Lowell or MBTA Fitchburg Line Commuter Rail rights-of-way. In 2005, the *Beyond Lechmere Northwest Corridor Study* conducted a *Major Investment Study/Alternatives Analysis* that evaluated a wide range of technologies and operating plans for a future extension. The *Beyond Lechmere Northwest Corridor Study* did not identify a preferred alternative for an extension, but rather investigated a range of cost-effective transit solutions that would increase transit accessibility, improve corridor mobility, increase transit services, and support opportunities for smart growth initiatives and sustainable development.

An Expanded Environmental Notification Form (EENF) was submitted to EEA on October 10, 2006. The Secretary of EEA issued a Certificate on the EENF on December 1, 2006, requiring the preparation of a DEIR for the Green Line Extension Project.

The DEIR/EA was submitted to EEA on October 15, 2009. Because MassDOT is seeking funding through the Federal Transit Administration (FTA), the Project also requires review under the National Environmental Policy Act (NEPA). Therefore, the document submitted to MEPA on October 15, 2009 served as a joint DEIR/EA. After an extensive public review and comment period, the Secretary of EEA issued a Certificate on the DEIR on January 15, 2010, requiring the preparation of a limited FEIR for the Proposed Project. MassDOT is currently preparing that document, which will include the more detailed environmental and further operational analysis of the maintenance facility alternatives. At the request of the FTA, MassDOT is also preparing a stand-alone Final EA.

1.3 Contents of this Technical Memorandum

Chapter 2 of this technical memorandum provides a description of the three alternatives being evaluated – Yard 8, Option L and Mirror H. The program, operational plan, real estate impacts and costs are provided for each maintenance facility alternative. Chapter 3 documents and compares any environmental resource impacts from the construction of each of the three maintenance facility alternatives. Chapter 4 describes any construction impacts and construction mitigation measures associated with each of the three maintenance facility alternatives. Chapter 5 provides a comparison summary of environmental impacts for the three maintenance facility alternatives.

This Page Intentionally Left Blank

2

Description of Alternatives

This chapter provides a description of the three locations evaluated as part of the environmental analysis of additional maintenance facility alternatives for the Green Line Extension Project – Yard 8, Option L and Mirror H. The program, operational plan, real estate impacts and cost for each maintenance facility alternative are provided. Figure 1-1 shows the location of the three alternatives under evaluation.

2.1 Yard 8

Yard 8 is an approximately six-acre railroad yard adjacent to the proposed Green Line alignment and accessed from Inner Belt Road in Somerville. The yard is partially owned by the MBTA and by Pan Am Railways. The Pan Am Railways' portion of the yard is currently used for freight operations while the MBTA portion of the yard is currently inactive. This site, combined with an adjacent undeveloped parcel at 200 Inner Belt Road, was previously determined to be the preferred maintenance facility site that could accommodate the necessary maintenance facility components for the Green Line Extension Project. A detailed environmental analysis of the Yard 8 site was provided in the DEIR/EA. Figure 2-1 shows the proposed layout of the Yard 8 maintenance facility alternative.

2.1.1 Program

Yard 8 accommodates the defined support facility program including, but not limited to: storage for 80 Green Line vehicles, two pit tracks, two lift tracks, one wheel truer track, support shops, Green Line vehicle wash, administrative office space, and an approximately 100-space employee parking lot.

Combining the MBTA and Pan Am Railways' portions of Yard 8 would result in sufficient area to accommodate the Green Line Extension tracks and a five-track storage facility that could store 70 vehicles. The shape of Yard 8 is well-suited to provide a double-ended storage yard, with lead tracks at each end feeding ladder tracks which fan out to the five storage tracks.

The layout of Yard 8 allows for a single storage yard north of the maintenance building. Total capacity of the storage yard is 70 cars. It is assumed that, at any one time, 10 additional cars would be in the maintenance shop building or temporarily stored on the tracks just outside the building. The building and the yard are proposed to be approximately at the existing grade of the site.

Both the building and the storage yard have double-ended access, which provides redundancy so that operations can be maintained even if a train should derail in the yard. With only single-ended access, a derailment at a critical location in the yard could block trains from entering or leaving the yard, resulting in serious impacts to Green Line service.

This alternative could accommodate potential future air rights development.

2.1.2 Operational Plan

This section describes the operational interface of Yard 8 with future Green Line Extension operations as it impacts existing railroad operations.

Yard Interface with Green Line Extension Operations

The facility layout includes a double-ended yard which provides the necessary redundant connections to the mainline of the Green Line Extension. Light rail vehicles can directly enter and exit the yard from both the north and south ends of the yard, eliminating the need for any reverse moves[3] or switchbacks for access to the mainline, providing optimal operational efficiencies.

The Yard 8 layout includes three leads that provide access into and out of the storage and maintenance facilities, providing access in both directions on the mainline of the Extension (Lechmere Station to Medford Hillside). Reverse moves from the yard would be needed in order for vehicles to access the Union Square Branch.

Medford Lead

At the north end of the yard, the Medford Lead track connects to the mainline just north of Brickbottom Station. This lead is an extension of the north ladder of the storage yard.

Trains leaving the yard for Medford Hillside would use this lead to reach the northbound mainline track and continue to Medford Hillside. Trains from Medford Hillside heading to the yard would use the southbound track until they cross over to the northbound track north of Washington Street and then enter the yard using the Medford Lead turnout. All storage tracks have direct movements (i.e., no reversing required) to and from the Medford Lead track.

3 A reverse move is when the operator would have to stop the train, leave the control cab at one end of the train and walk to the other end of the train and enter the control cab to operate the train.

Lechmere Station Lead

At the south end of the yard, the Lechmere Station Lead track connects to the mainline just south of the proposed Green Line bridge (formerly the Red Bridge) over the Fitchburg Mainline. This lead is an extension of the south ladder of the storage yard.

Trains leaving the yard for Lechmere Station or points west use this lead and enter the northbound mainline track through the turnout at the south end of the lead and cross over from the northbound to the southbound mainline track and continue on to Lechmere Station. Trains from Lechmere Station heading to the yard use the turnout at the south end of the lead track from the northbound mainline track to enter the yard.

Maintenance Lead

A third lead track into the maintenance facility portion of the yard branches off the outbound loop track headed towards Union Square. Northbound trains from Lechmere Station can enter the yard by first taking the turnout onto the Union Square Branch (north of Lechmere Station) and then take a second turnout onto the Maintenance Lead and into the yard at a point just south of the maintenance building.

Trains To/From Union Square

As this facility does not have a direct connection to Union Square, trains from the yard could reach Union Square in either of the following ways. Trains could proceed towards Lechmere Station and the Central Subway, and reverse direction either at Lechmere Station or at the Brattle Loop at Government Center Station. Changing direction at Lechmere Station would require a reverse movement on revenue track, potentially impacting revenue service operations. The second option would be for trains to leave the yard via the Maintenance Lead. They would enter the outbound track to Union Square and reverse direction on this revenue track before proceeding to Union Square.

On the Union Square Branch, there is only the terminal station on this line, so trains on this service would continue to deadhead (i.e., run without picking up passengers) to Union Square. Trains from Union Square to the yard would need to proceed inbound and reverse direction either at Lechmere Station or at the Brattle Loop at Government Center Station.

Daily Operations - Storage

In the morning, trains would leave the storage yards for Medford Hillside, Union Square and inbound towards Lechmere Station. Prior to the start of revenue operations at 5 AM, the initial trains would deadhead to their respective origin stations. After 5 AM, trains for Medford Hillside could either deadhead or enter revenue service at Brickbottom Station.

Trains would continue to leave the yard until all peak hour service trains are in operation. Toward the end of peak service (approximately 9 AM), some trains would come out of service and return to the yard. In the afternoon, prior to the evening peak, these cars would leave the yard and return to service. After the evening peak, a number of cars would again return to the yard while the remainder handle the night service schedule. At the end of the service day, the remaining trains would return to the yard, with the last ones arriving after the end of revenue service at 1 AM.

Impacts to Existing Railroad Operations

The construction of Yard 8 would remove all existing freight trackage within Yard 8 and the Wiley Track, a connecting track between the south end of Yard 8 and the Valley Tracks. Thus, this option would require some revisions to current freight operations by Pan Am Railways. However, based on on-going discussions with Pan Am Railways, none of this would preclude existing overall freight rail operations in the area.

Pan Am Railways' freight trains reach Boston via the MBTA Lowell Line. Typically, there are about three to four round-trips per week for the local switching operation, which serves Somerville as well as Chelsea, Salem, and Peabody via other MBTA routes. In addition, the "sand and gravel unit train" to Boston Sand and Gravel in Charlestown makes another three to four round-trips a week. Most freight trains operate in the evening or night, when MBTA Commuter Rail operations are less frequent.

The main impact to freight operations would be the reconstruction of Yard 8, converting it from a freight rail yard to a Green Line storage and maintenance yard. Currently, Pan Am Railways has two tracks in the yard: one through track and one storage track. Pan Am Railways' freight trains coming down the MBTA Lowell Line pass through Yard 8, occasionally temporarily storing freight cars in the yard.

If Yard 8 were dedicated to the Green Line, it would still be possible for Pan Am Railways to access the Boston area and to store freight cars in other nearby locations. Alternative routes exist within the MBTA system to support Pan Am Railways' operations. There is no impact to CSX freight rail operations with this option. CSX freight trains could continue to operate as they do today with a Green Line maintenance facility at Yard 8.

Yard 8 would not preclude the future North-South Rail Link project or the ability to expand the BET facility within existing MBTA property limits.

2.1.3 Real Estate Impacts

Yard 8 fits within existing rail yards owned by the MBTA and Pan Am Railways. The maintenance facility building would be on private land (the undeveloped portion of 200 Inner Belt Road) that is currently vacant and, therefore, no buildings, structures or businesses would need to be removed or relocated. Maintenance facility uses are consistent with the existing industrial zoning for the area. Table 2-1 provides a list of properties that would need to be acquired for Yard 8. This alternative requires the acquisition of approximately 5.8 acres of land, which is estimated at approximately $15 million.

Table 2-1 Potential Property Acquisitions for Yard 8

Address	Owner/Occupant	Acreage	Full or Partial Lot Acquisition
200 Inner Belt Road, Somerville	Fine Arts Storage Partners	3.9	Partial (undeveloped portion)
0 Inner Belt Road, Somerville	Pan Am Railways (rail yard)	1.9	Full
TOTAL		*5.8 acres*	

The undeveloped parcel at 200 Inner Belt Road (also referred to as 150 Inner Belt Road) that would be acquired for the maintenance facility has an existing land use permit for the construction of a proposed 190,000-square-foot building approximately 64 feet high. The proposed building and the proposed maintenance facility cannot share the site due to space constraints. Therefore, the maintenance facility would require voiding the existing land use permit. If the MBTA acquired the land within the footprint of the facility (tracks and buildings) in fee, this would represent a loss of current tax revenue to Somerville as the MBTA is exempt from local property taxes. This alternative could result in the loss of potential tax revenue which would be generated by future development at this location.

As part of the amendment to the original NorthPoint development agreement, the MBTA has an option to acquire the portion of Yard 8 that is currently owned by Pan Am Railways. Although the Commonwealth would still need to pay for the land, acquisition of this site could be easier than under typical circumstances because of the proposed agreement.

2.1.4 Order-of-Magnitude Capital Costs

An Order-of-Magnitude conceptual capital cost estimate for the proposed maintenance and storage facility at Yard 8 was developed and is estimated to be approximately $79 million in 2008 dollars. Since the publication of the DEIR, the design of Yard 8 was refined to make it more operationally consistent with the other two alternatives. Table 2-2 provides a breakdown of the conceptual capital cost estimate for Yard 8.

Table 2-2 Order-of-Magnitude Conceptual Capital Cost Estimate for Yard 8

	Cost ($2008)
Real Estate Acquisition	$ 15 M
Building	$ 38 M
Track	$ 22 M
Infrastructure	$ 2 M
Earthwork	$ 2 M
Total	Approx. $ 79 M

2.2 Option L

Option L is immediately adjacent to and northwest of the MBTA's Commuter Rail maintenance facility, also referred to as the Boston Engine Terminal (BET). Option L is along the southern and southeastern fringe of the existing Inner Belt industrial area of Somerville. The layout of yards and buildings is in an "L" shape and adjacent to the Valley Tracks just north of the MBTA's BET. Figure 2-2 shows the layout of the Option L alternative.

2.2.1 Program

Option L accommodates the same defined support facility program as Yard 8, including but not limited to: storage for 80 Green Line vehicles, two pit tracks, two lift tracks, one wheel truer track, support shops, Green Line vehicle wash, administrative office space, and an approximately 100-space employee parking lot. The maintenance building and associated track work are proposed on land adjacent to and northwest of the existing BET facility. That land is currently occupied by two businesses at 20 Third Avenue and 44-48 Third Avenue. The vehicle storage yard is proposed at the southern end of Inner Belt Road just north of the MBTA Fitchburg Line on vacant private property and land that is currently an unused parking lot for 70 Inner Belt Road.

The layout of Option L includes two storage yards and the maintenance building. The south yard is immediately south of the hook in Inner Belt Road. This yard includes eight storage tracks and a runaround track. The south yard would store up to 40 cars. The east yard is east of the maintenance building and just south of Third Avenue. This yard provides eight vehicle storage tracks and has a total capacity of 27 cars. Total capacity of the storage yards is 67 cars. For Option L, 13 cars would need to be stored in the building or tracks just outside the buildings at any given time in order to meet program storage requirements.

The maintenance building for Option L would be identical in size and layout to the building proposed for Yard 8 and Mirror H. The main difference is the location of the building. For Option L, it would be south of Third Avenue and east of the existing building at 70 Inner Belt Road.

To provide double-ended access to the maintenance building, a loop track is added which provides access to the north side of the building from a runaround track to the east of the building and the east storage yard.

This alternative could accommodate potential future air rights development.

2.2.2 Operational Plan

This section describes the operational interface of Option L to future Green Line Extension operations and impacts to existing railroad operations.

Yard Interface with Green Line Extension Operations

Option L is the only one of the three alternatives discussed in this report that provides a direct connection to the Union Square Branch. This advantage allows trains to be dispatched directly from the yard to both termini, at Medford Hillside and at Union Square, without the need to perform a reverse move (would not impact revenue operations). Option L has two lead tracks that provide access into and out of the storage yards and maintenance facility.

Medford Lead

The main yard lead is oriented for movements to and from Medford Hillside. The lead is an extension of the west ladder of the south yard and rises up adjacent to the mainline until it connects with the mainline south of Brickbottom Station.

Trains leaving the yard for Medford Hillside would use this lead to reach the northbound mainline track and continue on to Medford Hillside. Trains from Medford Hillside heading to the yard would use a crossover south of Brickbottom Station to reach the northbound main and then the yard lead track.

All storage tracks in the south and east yards have direct movements (i.e., no reversing required) to and from the Medford Lead track.

Trains to/from Lechmere Station and Central Subway

For trains leaving the yard for Lechmere Station or the Central Subway, there is a tail track provided at the north end of the Medford Lead track. This tail track can hold a three-car train. The trains for Lechmere Station would leave the storage track, ascend the grade on the Medford Lead track and enter the tail track and stop. The operator must switch ends of the train to reverse direction, but this would be done on the tail track not on a mainline track. Therefore, there would be no impacts to revenue service. There is a crossover from the tail track to the northbound mainline track. The train would enter the northbound mainline track and then quickly use

another crossover to reach the southbound mainline track and proceed to Lechmere Station.

For trains from Lechmere Station entering the yard, the train would cross over from the northbound mainline track to the tail track. After reversing direction on the tail track, the train would descend the Medford Lead track into the storage yard.

Union Square Lead

The location of Option L provides a unique opportunity to make a direct connection between the Union Square Branch and the storage yard. This direct connection is not possible with Yard 8 or Mirror H. The Union Square Lead track is a short track connecting to the Union Square Branch outbound track just east of where the mainline crosses overhead. The lead track connects into the south storage yard.

Trains leaving the yard for Union Square would take the Union Square Lead track and enter the Union Square Branch outbound track and continue on to Union Square. Trains from Union Square headed to the yard would run "against the current" on the outbound track from a crossover approximately 2,000 feet west of the Union Square Lead track. However, given the proposed headways on the Union Square Branch, there should be no conflicts that hamper revenue service. Therefore, unlike Yard 8 and Mirror H, Option L would not need to deadhead trains returning to the Yard from Union Square to reverse in revenue traffic at Lechmere Station or turn around at Government Center Station.

Daily Operations - Storage

In the morning, trains would leave the storage yards for Medford Hillside, Lechmere Station and Union Square. Prior to the start of revenue operations at 5 AM, the initial trains would deadhead to their respective terminal stations. After 5 AM, trains for Medford Hillside could either deadhead or enter revenue service at Brickbottom Station. On the Union Square Branch, there is only one terminal station so trains on this service would continue to deadhead to Union Square.

Trains would continue to leave the yard until all peak hour service trains are in operation. Toward the end of peak service (approximately 9 AM), some trains would come out of service and return to the yard. In the afternoon, prior to the evening peak, these cars would leave the yard and return to service. After the evening peak, a number of cars would again return to the yard while the remainder handled the night service schedule. At the end of the service day, the remaining trains would return to the yard, with the last ones arriving after the end of revenue service at 1 AM.

Impacts to Existing Railroad Operations

Option L would impact Pan Am Railways' freight operations to the same degree as Yard 8. Both options would require the removal of the Wiley Track which connects the south end of Yard 8 to the Valley Tracks. Without the Wiley Track, Yard 8 would

be a two track stub end (single-ended) yard which would have little utility to Pan Am Railways' operations. M.S. Walker, a current freight customer of Pan Am Railways, is a business that would have to be relocated to make room for the Green Line maintenance facility. Alternative routes exist within the MBTA system that could support Pan Am Railways' service to other customers.

Option L would not have any impacts on revenue passenger operations or on other operations associated with the MBTA (e.g., vehicle storage and maintenance, maintenance-of-way). Option L would have no impacts on existing CSX operations between the Grand Junction Branch and the Valley Tracks. Option L would not preclude the future North-South Rail Link project or the ability to expand the BET facility within existing MBTA property limits.

2.2.3 Real Estate Impacts

Option L would require the complete acquisition of two parcels and partial acquisition of two other parcels. The land required for the yard and maintenance facility includes the building and parking at 44-48 Third Avenue; the building and parking lot at 20 Third Avenue; the isolated parking lot for 70 Inner Belt Road; plus the southern corner of 200 Inner Belt Road. M.S. Walker Wholesale Distribution, a wholesale manufacturer/distributor of wine and spirits located at 20 Third Avenue, provides jobs for approximately 74 people (based on parking occupancy). The building located at 44-48 Third Avenue (formerly occupied by Digital Publishing Solutions, Inc.) is being leased temporarily as an indoor parking/storage facility for federally confiscated vehicles.

This alternative requires the acquisition of approximately 10.2 acres of land and buildings which has been estimated at approximately $51 million (including building demolition and site cleanup). This cost could be refined with additional research. If the MBTA acquired the land within the footprint of the facility (tracks and buildings) in fee, this would represent a loss of current tax revenue to Somerville as the MBTA is exempt from local property taxes. This alternative could result in the loss of current and potential tax revenue which would be generated by future development at this location. Table 2-3 provides a list of properties that would need to be acquired for the Option L location. Option L does not use any portion of the Pan Am Railways' owned land at Yard 8.

Table 2-3 Potential Property Acquisitions for Option L

Address	Owner/Occupant	Acreage	Full or Partial Lot Acquisition
20 Third Avenue, Somerville	M.S. Walker Wholesale Distribution	4.6	Full
44-48 Third Avenue, Somerville	APCA Third Avenue, LLC	2.8	Full
70 Inner Belt Road, Somerville	CRG West Parking Lot	1.2	Partial
200 Inner Belt Road, Somerville	Fine Arts Storage Partners	1.6	Partial (undeveloped portion)
TOTAL		*10.2 acres*	

2.2.4 Order-of-Magnitude Capital Costs

An Order-of-Magnitude conceptual capital cost estimate for the proposed maintenance and storage facility at Option L was developed and is estimated to be approximately $129 million in 2008 dollars. Table 2-4 provides a breakdown of the conceptual capital cost estimate for Option L.

Table 2-4 Order-of-Magnitude Conceptual Capital Cost Estimate for Option L

	Cost ($2008)
Real Estate Acquisition	$ 51 M
Building	$ 38 M
Track	$ 33 M
Infrastructure	$ 2 M
Earthwork	$ 5 M
Total	Approx. $ 129 M

2.3 Mirror H

Mirror H straddles portions of the NorthPoint site (which includes portions of Cambridge, Somerville and Boston) and a portion of MBTA land. This alternative locates the facility at the north side of the proposed NorthPoint development and partly on MBTA land south of the BET, and represents a plan that places new light rail facilities next to existing MBTA Commuter Rail facilities. Figure 2-3 shows the layout of Mirror H.

This report refers to Mirror H as the option previously proposed by the City of Somerville, and then enhanced by the Project team to optimize proposed operations. The enhancements represent layout modifications to provide operational equivalency to the original "Scheme H" as presented in the November 6, 2008 *Green Line Support Facility Alternatives Analysis* for the location of the support facility. The specific enhancements include:

- Extending the double-track lead and adding switches so that trains can operate on either lead track in either direction.
- Providing a 300-foot tail track so that trains to/from Lechmere Station can make the reverse move off the mainline tracks.
- A loop east of the maintenance shop plus a shop runaround track are included to provide access to the east side of the building.
- Various minor layout modifications to make this option as operationally equivalent as possible to Yard 8 and Option L.

2.3.1 Program

Mirror H accommodates the same defined support facility program as Yard 8 including, but not limited to: storage for 80 Green Line vehicles, two pit tracks, two lift tracks, one wheel truer track, support shops, Green Line vehicle wash, administrative office space, and an approximately 100-space employee parking lot.

The layout of Mirror H includes a single storage yard of six tracks west of the maintenance building. Total storage is 70 cars. It is assumed that, at any time, 10 additional cars would be in the maintenance shop building or temporarily stored on the tracks just outside the building. Most of the storage tracks are in Cambridge, while the maintenance building would be in Somerville. Some of the employee automobile parking, as well as the tail tracks and loop east of the maintenance building, are in Boston.

The maintenance building at Mirror H would be identical in size and layout to the building proposed for Yard 8. To provide double-ended access to the maintenance building, a loop track is added which provides access to the east side of the building from a runaround track to the north of the building.

This alternative could accommodate potential future air rights development.

2.3.2 Operational Plan

This section describes the operational interface of Mirror H with the future Green Line Extension operations and impacts to existing railroad operations.

Yard Interface with Green Line Extension Operations

Mirror H is the only one of the three alternatives with a single point of access from the yard to the revenue service tracks. Since a stalled or derailed train on a single yard lead track would prevent other trains from entering or leaving the yard, a second track lead was proposed.

Double-Track Lead

The double-track yard lead is oriented for movements to and from Medford Hillside. The lead is an extension of the west ladder and runaround tracks at the storage yard. Between the west end of the storage tracks and the mainline tracks to Medford, the double-track lead rises steeply (about a six-percent grade). This is required because the double-track lead must "thread the needle" by first passing under the outbound track to Union Square and then rising quickly to the mainline grade before crossing over the MBTA Fitchburg Line tracks.

The steepness of this grade is a concern when disabled cars are being brought into the yard. The existing vehicles can handle this grade going up or down. But if the

brakes were not working properly on a disabled car, it would be difficult to descend the grade into the yard safely.

Trains leaving the yard for Medford Hillside use this lead to reach the northbound mainline track and continue on to Medford Hillside. Trains from Medford Hillside heading to the yard use a crossover south of Brickbottom Station to reach the southbound main and then the yard lead track.

All storage tracks in the yard have direct movements (i.e., no reversing required) to and from the double-track lead when traveling to or from Medford Hillside.

Trains to/from Lechmere Station and Central Subway

For trains leaving the yard for Lechmere Station or the Central Subway, there is a tail track provided at the north end of the double-track lead. This tail track can hold a three-car train. The train for Lechmere Station would leave the storage track, ascend the grade on the lead track and enter the tail track and stop. The operator would need to switch ends of the train to reverse direction. There is a crossover from the tail track to the northbound mainline track. The train would travel briefly against the current on the northbound mainline track and then use the crossover to reach the southbound mainline track and proceed to Lechmere Station.

For trains from Lechmere Station entering the yard, the train would proceed onto the lead track and then the tail track. After reversing direction, the train would descend along the lead track into the storage yard.

Trains To/From Union Square

As this facility does not have a direct connection to Union Square, trains could reach Union Square as follows -- trains could take the double-track lead to the tail track, reverse direction and proceed towards Lechmere Station and the Central Subway as described above. Trains would then reverse direction either at Lechmere Station, requiring a reverse move on revenue track, or at the Brattle Loop at Government Center Station.

On the Union Square Branch, there is only one terminal station, so trains on this service would continue to deadhead to Union Square. Trains from Union Square to the yard would need to proceed inbound and reverse direction either at Lechmere Station, requiring a reverse move on revenue track (potentially impacting revenue service), or at the Brattle Loop at Government Center Station.

Daily Operations - Storage

In the morning, trains would leave the storage yards for Medford Hillside and inbound towards Lechmere Station. Prior to the start of revenue operations at 5 AM, the initial trains would deadhead to their respective terminal stations. After 5 AM, trains for Medford Hillside could either deadhead or enter revenue service at Brickbottom Station.

Trains would continue to leave the yard until all peak hour service trains are in operation. Toward the end of peak service (approximately 9 AM), some trains would come out of service and return to the yard. In the afternoon, prior to the evening peak, these cars would leave the yard and return to service. After the evening peak, a number of cars would again return to the yard while the remainder handled the night service schedule. At the end of the service day, the remaining trains would return to the yard, with the last ones arriving after the end of revenue service at 1 AM.

Impacts to Existing Railroad Operations

Mirror H would not impact existing freight railroad operations. Pan Am Railways' operations through Yard 8 would remain as would the Wiley Track connection from Yard 8 to the Valley Tracks. Pan Am Railways' operations would continue as they do today with this option.

There is no impact to CSX freight rail operations with this option. CSX freight trains could continue to operate as they do today with a Green Line maintenance facility at the Mirror H site.

However, Mirror H would preclude the future North-South Rail Link project and the ability to expand the BET facility within existing MBTA property limits.

2.3.3 Real Estate Impacts

Mirror H would be partly in Somerville and partly in Cambridge, with some portions in Boston. If the MBTA acquired the land within the footprint of the facility (tracks and buildings) in fee, this would represent a loss of current tax revenue to the municipalities as the MBTA is exempt from local property taxes. This alternative could also result in the loss of potential tax revenue which would be generated by future development at this location. This alternative requires the acquisition of approximately 4.3 acres of developable and Pan Am Railways' owned properties, which is estimated at a value of approximately $11 million. Table 2-5 provides a list of properties that would need to be acquired for Mirror H. At the time of this analysis, discrepancies in City property limits between Somerville and Cambridge were identified and are being reviewed. The amount and cost of property acquisition for Mirror H are subject to change based on the resolution of the city boundary issue.

Table 2-5 Potential Property Acquisitions for Mirror H

Address	Owner/Occupant	Acreage	Full or Partial Lot Acquisition
NorthPoint Development Lots A/B & C/D/E/F	Pan Am Railways	4.3	Partial

2.3.4 Order-of-Magnitude Capital Costs

An Order-of-Magnitude conceptual capital cost estimate for the proposed maintenance and storage facility at Mirror H was developed and is estimated to cost approximately $82 million in 2008 dollars. Since the publication of the February 18, 2009 *Green Line Support Facility – Review of Mirror Scheme H, Addendum to the Alternatives Analysis*, the design of Mirror H has been more fully developed and refined to make it operationally comparable to Yard 8 and Option L. Table 2-6 provides a breakdown of the conceptual capital cost estimate for Mirror H.

Table 2-6 Order-of-Magnitude Conceptual Capital Cost Estimate for Mirror H

	Cost ($2008)
Real Estate Acquisition	$ 11 M
Building	$ 38 M
Track	$ 25 M
Infrastructure	$ 2 M
Earthwork	$ 6 M
Total	Approx. $ 82 M

3

Environmental Resource Analyses

3.1 Introduction

This chapter documents and compares the environmental resource impacts of the three maintenance facility alternatives. The environmental categories considered in this analysis include:

- Air quality
- Noise
- Vibration
- Traffic
- Socioeconomic impacts
- Title VI/Environmental justice
- Visual resources
- Wetlands
- Stormwater management
- Hazardous materials
- Historic and archaeological resources
- Public parks, recreation areas, and conservation land
- Section 4(f) resources
- Consistency with Federal, State and Local Planning

3.2 Air Quality

This section compares direct impacts of the three maintenance facility alternatives on air quality. None of the three maintenance facility alternatives would have a measurable impact on air quality. Any maintenance facility alternative, in conjunction with the Project, would remain compliant with the SIP and Air Pollution Control Regulations (310 CMR 7.36).

The three maintenance facility alternatives are not anticipated to generate substantial emissions because the Green Line vehicles that would be stored there would be electric and would not generate air pollution in the study area. The proposed maintenance facility itself would be an open building with no heating-related emissions.

The mobile source emissions, generated by automobiles accessing the sites, for all three alternatives would be minimal. The proposed maintenance facility would provide approximately 100 parking spaces. The majority of these trips would occur during off-peak periods when there is little congestion in the study area.

3.3 Noise

This section compares the direct noise impacts of the three maintenance facility alternatives in combination with the Green Line Extension mainline operations. The noise impact analysis for the Green Line Extension Project is based on the methodology defined in the FTA guidance manual *Transit Noise and Vibration Impact Assessment*.[4] Noise impact has been assessed at sensitive receptors and includes contributions from mainline operations and maintenance facility operations including train movements in and out of the yard, increases in noise from special trackwork, potential wheel squeal, the traction power substation, and the employee parking lot. Figures 3-1 through 3-3 show the noise study measurement locations. Figures 3-4 through 3-6 show the buildings impacted by noise prior to mitigation. Background information on noise and vibration fundamentals, descriptors, impact criteria, land use categories, existing noise conditions and sensitive land use in areas other than near the proposed maintenance facilities are presented in DEIR Section 4.8, *Noise*. Further detail on the reference noise levels, principal modeling assumptions and impact analyses for Option L and Mirror H is available in the maintenance facility noise assessment technical memoranda.[5,6] The full noise analysis for Yard 8 was conducted for and included in the DEIR/EA.

The proposed maintenance facility would introduce new noise sources into the surrounding areas and would contribute to the future noise exposure conditions at sensitive receptors. Potential noise impact has been assessed at sensitive receptors near Yard 8, Option L and Mirror H including the Brickbottom Artists Building (northeast and southwest sides), the Hampton Inn Hotel, the Glass Factory Condominiums and NorthPoint Development properties. Based on the current NorthPoint development plan, eight sites have been assumed to be noise-sensitive including the existing Tango and Sierra residential properties and future planned properties shown in Figure 3-6 (Site 1, Site 2, Site 3, Site 4, Site 5 and a park).

Potential noise impact is assessed by comparing the existing noise conditions with future conditions. Existing noise conditions were measured at four locations near

4 Federal Transit Administration. *Transit Noise and Vibration Impact Assessment* (Report FTA-VA-90-1003-06). May 2006.

5 Harris Miller Miller & Hanson Inc., *Option L Maintenance Facility Noise and Vibration Assessment*, April 2010.

6 Harris Miller Miller & Hanson Inc., *Mirror H Maintenance Facility Noise and Vibration Assessment*, April 2010.

these sensitive properties. A summary of the measurement sites and results is shown in Table 3-1 and the measurement locations are shown in Figures 3-1 through 3-3. Short-term measurement site ST-1 was conducted on the northeast side of the Hampton Inn Hotel and is representative of the existing noise conditions on the northeast sides of the Glass Factory Condos, the Hampton Inn Hotel and the Brickbottom Artists Building. Short-term measurement site ST-2, on the southwest side of the Brickbottom Artists Building, is representative of the existing noise conditions for the southwest side of the Brickbottom Artists Building. The dominant noise source at ST-2 is commuter train activity on the MBTA Fitchburg Line. Short-term measurement site ST-8, at the end of Water Street, is representative of existing noise conditions at the five future NorthPoint properties and the park. Long-term measurement site LT-10, on the southwest side of the Glass Factory Condos, is representative of the existing noise conditions at the existing Tango and Sierra NorthPoint properties (adjusted for relative distances to O'Brien Highway).

Table 3-1 Existing Noise Measurement Results

Measurement Site	Location	Existing Day-Night Average Sound Level (Ldn)	Existing Peak-Transit Hour Sound Level (Leq)	Commuter Train Noise Level (Lmax)[d]	Distance to Near Track (feet)
ST-1	Water Street (Cambridge) – Hampton Inn Hotel (northeast side of building)	58[b]	60	n/a	n/a
ST-2	Fitchburg Street (Somerville) – Brickbottom Artists Building (southwest side of building facing Fitchburg Line)	64[a]	61	78	65[c]
ST-8	End of Water Street between O'Brien Highway and Boston Engine Terminal	62[b]	65	n/a	n/a
LT-10	Glass Factory Condominiums [c] (southwest side of building)	65	63	n/a	n/a

Source: HMMH, 2010 & 2008 and Lechmere Station Relocation Project (November, 2006).
a Ldn estimated by comparing SEL levels of train events to long-term sites whose noise environment is dominated by train noise.
b Ldn estimated according to FTA guidance for short-term measurements conducted between 7 AM and 7 PM.
c Measurement conducted March, 2006 and reported in Environmental Assessment for the Lechmere Station Relocation Project (November, 2006).

Future noise sources associated with the Project include mainline Green Line operations, MBTA commuter train operations (southwest side of Brickbottom Artist Building only) and maintenance facility noise sources. Maintenance facility noise sources include train movements in and out of the yards, increases in noise from special trackwork (crossovers or turnouts), potential wheel squeal on tight radius curves, stationary cars in the yards operating with auxiliary equipment on, the traction power substation, and the employee parking lot.

Train movements in and out of the yards are non-revenue operations between the proposed yards to and from the closest stations (Union Station, Lechmere Station and Brickbottom Station). These "pull in" and "pull out" movements are required to bring trains into service or to take trains out of service for maintenance or at the end of the service day. These movements are in addition to the standard revenue service train operations. Often these additional train movements represent the most significant noise source associated with the maintenance facilities.

Maintenance lead tracks and yard tracks often include special trackwork (crossovers or turnouts) or tight-radius curves which can increase noise levels associated with train movements into and out of the yards. Special trackwork introduces gaps into the rail running surface which will increase noise levels from the train as the wheels impact these gaps. Tight-radius curves, typically 400-foot radius or less, may cause wheel squeal which is a high-frequency tonal noise generated by the wheels. Another potentially significant noise source associated with the maintenance facilities are stationary cars in the storage yards operating with auxiliary equipment on. Cars are typically operated under this condition in the early morning to heat or cool the interior and prepare the trains for revenue service as well as at other times during the day when cars are in the yards but will be required to return to service. The contribution of noise from such operation of cars in the storage yards is generally not as significant as the train movements unless receptors are much closer to the storage yards than the mainline tracks.

Maintenance operations within the building such as wheel truing, using pneumatic tools and the car wash are not expected to be significant noise sources in the community as the building will shield these activities. The heating ventilation and air-conditioning (HVAC) system for the maintenance building is also not expected to be a significant noise source. Unlike maintenance buildings for diesel-electric locomotives which require more substantial HVAC systems to handle the train exhaust, this building would only require normal levels of airflow for storing electric Green Line vehicles.

Table 3-2 presents a summary of the potential noise impact at sensitive receptors near the proposed maintenance facilities prior to mitigation. This table shows the results for Yard 8, Option L and Mirror H. Potential noise impact locations for the three alternatives are also shown in Figures 3-4 through 3-6. This table includes the sensitive receptors, which side of the tracks it is on, the future distances between the receptor and the near track centerlines of the mainline Green Line and MBTA Fitchburg commuter line, the existing noise condition (Ldn), the moderate and severe impact criteria, the contribution of noise from mainline operations, the contribution from maintenance facility noise sources, the future noise level (which include maintenance facility, mainline operations and existing noise sources), the increase in noise between the existing and future conditions and whether the potential impact would be moderate or severe.

At the Brickbottom Artists Building, Hampton Inn Hotel, Glass Factory Condominiums and NorthPoint properties, noise barriers may not be a feasible or effective means of mitigation. Since these buildings have upper-floor residences that may not benefit from a potential noise barrier and most properties do not have outdoor land use, sound insulation mitigation and/or potential noise barriers will be considered during the preliminary engineering phase of the Project.

Table 3-2 Potential Project Noise Impact at Sensitive Receptors (Prior to Mitigation)

Source: HMMH, August 2010.
a Total future noise level includes future mainline noise, future yard noise sources and existing noise sources.
b Brickbottom Artists Building impact is counted under listing for Brickbottom Artists Building (northwest).
c Future noise level reported in DEIR for this receptor does not include yard noise sources.
d Receptor does not have significant contribution from yard noise sources.
e Noise includes contribution from crossover in front of building.
f Most significant yard noise source is stationary vehicles operating with auxiliary equipment running.

During the next phase of Project development, the existing outdoor-to-indoor noise reduction of the buildings will be measured and interior noise levels will be assessed against applicable interior noise criteria (the current analysis is based on outdoor noise levels and an outdoor criterion assessed at the closest sides of these buildings). The FTA specifies that maximum interior noise levels from transit sources (excluding horns) should be 65 dBA or lower. In addition to this maximum criterion, potential impact in interior spaces will be assessed against an interior criterion Ldn of 45 dBA from transit sources.

Substantial improvements in building sound insulation (on the order of five to 10 dBA) can often be achieved by adding an extra layer of glazing to windows, by sealing any holes in exterior surfaces that act as sound leaks, and by providing forced ventilation and air conditioning so that windows do not need to be opened. Sound insulation would be considered an effective mitigation measure if it is possible to improve the noise reduction of the existing building by five decibels or more. The FTA generally considers sound insulation mitigation a reasonable expenditure if it can be effective at a cost of $25,000 to $30,000 per residence.

3.3.1 Yard 8

A total of two buildings would be exposed to moderate impact and three buildings would be exposed to severe noise impact prior to mitigation for Yard 8. Future noise conditions are primarily a function of the mainline train operations and maintenance facility noise sources only increase future noise levels a relatively small amount. Future noise levels from all yard sources are five to 13 decibels lower than noise from mainline operations. As an example of the effect of maintenance facility noise sources, future noise from mainline operations at the northeast façade of the Brickbottom Artists Building would be Ldn 75.3 dBA and noise from the maintenance facility operations would be Ldn 69.9 dBA. The future noise level would be Ldn 75.3 dBA without any contribution from the maintenance facility and would be Ldn 76.4 dBA including the maintenance facility. Therefore, the Yard 8 maintenance facility would only increase future noise levels by 1.1 decibel compared to the mainline operations alone (which is not perceptible to humans). At the other receptors potentially impacted under Yard 8 (Hampton Inn, Glass Factory Condominiums and two existing NorthPoint properties Tango and Sierra), the contribution of noise from maintenance facility operations is even less than at Brickbottom Artists Building.

3.3.2 Option L

The noise impact assessment results for Option L are very similar to the results for Yard 8. A total of two buildings would be exposed to moderate impact and three buildings would be exposed to severe noise impact prior to mitigation for Option L. Future noise conditions are primarily a function of the mainline train operations and maintenance facility noise sources only increase future noise levels a relatively small amount. Future noise levels from all yard sources are five to 13 decibels lower than

noise from mainline operations. Noise from train movements in and out of the yard at Option L would be slightly higher at the southwest façade of the Brickbottom Artists Building than Yard 8 due to the presence of a tight radius curve on the Medford Lead track. Noise from train movements in and out of the yard at Option L would be slightly higher at the Hampton Inn Hotel and the Glass Factory Condos due to stationary cars in the south yard operating with auxiliary equipment on.

As an example of the effect of maintenance facility noise sources, future noise from mainline operations at the northeast façade of the Brickbottom Artists Building would be Ldn 75.3 dBA and noise from the maintenance facility operations would be Ldn 69.9 dBA. The future noise level would be Ldn 75.3 dBA without any contribution from the maintenance facility and would be Ldn 76.4 dBA including the maintenance facility. Therefore, the Option L maintenance facility would only increase future noise levels by 1.1 decibel compared to the mainline operations alone (which is not perceptible to humans). At the other receptors potentially impacted under Option L (Hampton Inn, Glass Factory Condominiums and two existing NorthPoint properties Tango and Sierra), the contribution of noise from maintenance facility operations is even less than at Brickbottom Artists Building.

3.3.3 Mirror H

For Mirror H, a total of three buildings would be exposed to moderate impact and seven buildings exposed to severe impact prior to mitigation. The relative contribution of noise from maintenance operations versus mainline operations is similar to Yard 8 and Option L at the Brickbottom Artists Building, Hampton Inn and Glass Factory Condominiums with this alternative. Noise from train movements in and out of the yard and mainline operations would be higher at the northeast façade of the Brickbottom Artists Building for Mirror H than Yard 8 or Option L due to the presence of a double crossover and a turnout between the northbound mainline and the maintenance lead track directly in front of the building. For the existing NorthPoint properties, Tango and Sierra, future noise conditions also depend primarily on the mainline operations. For the future planned NorthPoint properties (Sites 1 to 5), which are more set back from the mainline (300 to 700 feet) and are closer to the Mirror H storage yards, future noise conditions depend primarily on the stationary cars operating in the yards with auxiliary equipment running.

It is assumed that future properties at the NorthPoint development would have noise-sensitive receptors at upper-floor residences, which would not benefit from a noise barrier for potential mitigation. Since the proposed development is not currently under construction and is assumed to be completed by 2030, after the completion of the Green Line Extension Project, the buildings could be designed with consideration of the noise environment (i.e. windows with high transmission loss or sound transmission class [STC] ratings) to mitigate potential impact.

3.4 Vibration

This section documents direct vibration impacts from the three maintenance facility alternatives. The vibration impact analysis for the Green Line Extension Project is based on the methodology defined in the FTA guidance manual *Transit Noise and Vibration Impact Assessment*.[7] Vibration impacts are assessed for maximum levels, as vibration — unlike noise — is not a cumulative metric. To assess the potential effect of the three maintenance facility alternatives for vibration, the maximum vibration levels from both mainline operations and any movements to or from the maintenance facility are reported for all impacted receptors. The FTA criterion for vibration impacts for residential spaces such as the Brickbottom Artists Building is 72 VdB. The FTA impact criterion does not distinguish between "moderate" and "severe" vibration impacts. Figures 3-1 through 3-3 show the vibration study measurement locations. Figures 3-4 through 3-6 show buildings impacted by vibration prior to mitigation.

The proposed maintenance facilities would introduce new vibration sources into the surrounding areas and may cause potential vibration impact prior to mitigation. Potential vibration impact has been assessed at sensitive receptors near the proposed Yard 8, Option L and Mirror H including the Brickbottom Artists Building (northeast and southwest sides), the Hampton Inn Hotel, the Glass Factory Condominiums and NorthPoint Development properties. Based on the current NorthPoint development plan, seven sites have been assumed to be vibration-sensitive including the existing Tango and Sierra residential properties and future planned properties shown in Figure 3-6 (Site 1, Site 2, Site 3, Site 4 and Site 5).

Vibration generated by trains depends on several factors including the speed of the train, the presence of special trackwork (crossovers and turnouts) and whether the track alignment is at-grade or on an aerial structure. Special trackwork introduces gaps into the rail running surface which will increase vibration levels, similar to noise, from the train as the wheels impact these gaps. Although maintenance lead tracks and yard tracks often include special trackwork, these tracks are typically further away from sensitive receptors. An aerial structure reduces vibration significantly (10 VdB) compared to at-grade alignments because the vibration must propagate through the structure to the support columns and then into the ground and into surrounding buildings.

Table 3-3 shows the potential vibration impact prior to mitigation near the proposed maintenance facility alternatives. This table includes the vibration-sensitive receptor, the distance the mainline and yard track centerlines generating the highest levels of vibration, the maximum vibration velocity in any 1/3-octave band between four and 80 Hz for both mainline and maintenance facility movements and the number of buildings impacted. For all three alternatives, the Brickbottom Artists Building is the only receptor projected to be exposed to vibration impact prior to mitigation. For all maintenance facility alternatives, the maximum vibration generated by any yard

7 Federal Transit Administration. *Transit Noise and Vibration Impact Assessment* (Report FTA-VA-90-1003-06). May 2006.

movements is lower than the respective mainline operations. Mirror H is the only alternative projected to have potential vibration impact from yard movements.

As stated in the DEIR/EA, resilient rail fasteners, which are specially-designed fasteners between the rails and the ties, are one option for mitigating potential vibration impact at the Brickbottom Artists Building. Resilient rail fasteners can reduce vibration by five to 10 VdB at frequencies above 30 to 40 Hz. Approximately 500 feet of vibration mitigation along the length of the Brickbottom Artists Building would be effective in mitigating potential vibration impact. During the next phase of the project, vibration measurements will be conducted at additional sensitive locations to refine vibration mitigation recommendations.

Table 3-3 Potential Vibration Impacts at Sensitive Receptors (Prior to Mitigation)

Vibration Sensitive Receptor Location	Side of Tracks	Distance to Track Centerline (feet)		Maximum Vibration Velocity Level in any 1/3-Octave band from 4 to 80 Hz (VdB re: 1 -in.sec)		Total Number of Impacted Buildings

Source: HMMH, August 2010.

a Green Line is on elevated structure at this location.

b Increased vibration from special trackwork is included at these locations.

c The maximum vibration generated for this alternative and receptor is from the far mainline track due to the presence of a double crossover.

3.4.1 Yard 8

For Yard 8, the maximum vibration level (77 VdB) at the Brickbottom Artists Building is projected to be generated from trains on the elevated near mainline track approximately 18 feet away. The highest vibration generated by yard movements is 67 VdB. Therefore, no vibration impact is projected at any receptors directly from yard movements for Yard 8.

3.4.2 Option L

For Option L, the maximum vibration level (77 VdB) at the Brickbottom Artists Building is projected to be generated from trains on the elevated near mainline track approximately 18 feet away. The highest vibration generated by yard movements is 71 VdB. Therefore, no vibration impact is projected at any receptors directly from yard movements for Option L.

3.4.3 Mirror H

For Mirror H, the maximum vibration level (84 VdB) at the Brickbottom Artists Building is projected to be generated from trains on the elevated far mainline track approximately 33 feet away because this track includes a double crossover to the maintenance tail track. The maximum vibration generated by yard movements is 75 VdB due to the presence of a double crossover on the maintenance yard tail track approximately 50 feet away from the Brickbottom Artists Building.

3.5 Traffic

This section discusses existing conditions and impacts to automobile traffic and parking operations as a result of each of the three maintenance facility alternatives. Figures 3-1 through 3-3 show the traffic study intersections.

3.5.1 Yard 8

Yard 8 would have no measurable impact to automobile parking or traffic operations. Access to the facilities would be via Washington Street and Inner Belt Road.

Parking Impacts

There is no existing public or private parking supply at Yard 8. Parking for approximately 100 vehicles would be constructed in concert with the Yard 8 facility. These spaces would be available only to MBTA employees serving either the maintenance facility or the Green Line. There would be no impact to the public parking supply. MBTA Lechmere Station parking would also be unaffected.

Traffic Impacts

All MBTA personnel parking at the maintenance facility would arrive and depart outside of the peak commuting hours and would not impact the peak hour vehicular traffic patterns or traffic operations. There would also be no adverse impact to pedestrians or bicyclists in the vicinity of the facility.

3.5.2 Option L

Similar to Yard 8, locating the maintenance facility at Option L would have no measurable impact to parking or traffic operations. No changes to the conceptual design and circulation plan for Brickbottom Station are envisioned under Option L. Access to the Option L maintenance facility would be via Washington Street and Inner Belt Road.

Parking Impacts

There is an existing unused parking lot on 70 Inner Belt Road, which has 97 striped parking spaces available. This unused parking lot would serve as employee parking for Option L. Existing parking spaces along each building would be removed. Similar to the Yard 8 analysis, Option L would have no impact to the public parking supply.

Traffic Impacts

All MBTA personnel parking at Option L would arrive and depart outside of the peak commuting hours and would not impact the peak hour vehicular traffic patterns or traffic operations. There would also be no adverse impact to pedestrians or bicyclists in the vicinity of Option L.

The two existing building uses on the Option L site include a wholesale liquor distribution center and a building temporarily leased as an indoor parking/storage facility for federally confiscated vehicles (formerly occupied by Digital Publishing Company). It is assumed that these buildings and their associated parking would be removed entirely. Since the majority of vehicle trips associated with these buildings occur during the peak hours, there would be a slight reduction in traffic volumes on Washington Street and Inner Belt Road under Option L. Since the reduction is slight and would likely have no noticeable impact on traffic operations, no reduction in peak hour traffic volumes was assumed in the traffic analysis for the Washington Street/Inner Belt Road intersection.

3.5.3 Mirror H

Similar to Yard 8 and Option L, locating the maintenance facility at Mirror H would have no measurable impact on parking or traffic operations. There may be isolated impacts regarding access to/from the facility as discussed further.

Parking Impacts

There is no existing public or private parking supply at the Mirror H site. New parking for approximately 100 vehicles would be constructed in concert with the Mirror H facility. These spaces would be available only to MBTA employees serving either the maintenance facility or the Green Line Extension. Similar to Yard 8 and Option L, Mirror H would have no impact to the public parking supply. MBTA Lechmere Station parking would also be unaffected.

Traffic Impacts

All MBTA personnel parking at Mirror H would arrive and depart outside of the peak commuting hours and would not impact the peak hour vehicular traffic patterns or traffic operations. There would also be no adverse impact to pedestrians or bicyclists in the vicinity of Mirror H.

Access to the Mirror H Facility and Circulation at Lechmere Station

Regional access to Mirror H would be via Monsignor O'Brien Highway. Traffic to/from the north would use Water Street as a connection from O'Brien Highway to the Mirror H facility. Traffic entering the facility from the south would also be provided via O'Brien Highway and Water Street. This requires the existing median along O'Brien Highway to be cut and a traffic signal installed at Water Street. This improvement is currently proposed as part of the relocation of Lechmere Station. Timing of the construction of this improvement could be impacted if access to Mirror H is needed prior to completion of Lechmere Station construction.

To accommodate pedestrians crossing O'Brien Highway at Water Street, no left turns would be allowed out of Water Street. Therefore, traffic exiting the facility would use North First Street to O'Brien Highway southbound. The construction of North First Street is also proposed as part of the relocation of Lechmere Station. As with Water Street, timing of construction could be impacted if access to Mirror H is needed prior to completion of station construction.

In order to provide access to/from all directions, a roadway connection between Water Street and North First Street would be required. This connection could be provided as part of the Lechmere Station construction, or could be a separate private way behind the station until such time that the NorthPoint development is complete and the accompanying roadway infrastructure is constructed in its entirety.

3.6 Socioeconomic Impacts

This section compares the socioeconomic impacts in terms of projected tax effects and job loss for the three maintenance facility alternatives. Two buildings would be purchased and demolished under Option L. All other acquisitions would involve strips of land or vacant lots and would not require building demolition. Table 3-4 lists the current annual property taxes for the areas to be acquired.

Table 3-4 Property Tax Effects of Yard 8, Option L, and Mirror H

Property	Type	Annual Property Taxes on Acquired Area[a, b, c, d]	Estimated Jobs Displaced or Relocated[e]	Acquisition
Yard 8				
200 Inner Belt Road, Somerville	Commercial/industrial building	$80,532.95	0	Partial (undeveloped portion)
0 Inner Belt Road, Somerville	Pan Am Railways track	$35,530.85	0	Full
SUBTOTAL		*$116,063.80*	*0*	
Option L				
20 Third Avenue, Somerville	Commercial/industrial building	$120,420.22	74	Full
44-48 Third Avenue, Somerville	Commercial/industrial building	$138,004.75	0	Full
70 Inner Belt Road, Somerville	Commercial/industrial lot	$30,975.55	0	Partial (parking lot)
200 Inner Belt Road, Somerville	Commercial/industrial lot	$33,039.16	0	Partial (southern Corner)
SUBTOTAL		*$322,439.68*	*74*	
Mirror H				
NorthPoint Development Lot 17/A/2, Somerville	Pan Am Railways track	$56,222.22	0	Partial
NorthPoint Development Lot 1A-102, Cambridge	Pan Am Railways track	$78,411.23	0	Partial
NorthPoint Development Lot 0202190050, Boston	Pan Am Railways track	$2,993.19	0	Partial
SUBTOTAL		*$137,626.64*	*0*	

a Annual property taxes for partial acquisitions are prorated based on the square footage taken from each parcel.
b Somerville Assessor's Office: Fiscal Year 2010 tax rate = $20.44 per $1,000 assessed value (commercial).
c Cambridge Assessor's Office: Fiscal Year 2010 tax rate = $18.75 per $1,000 assessed value (commercial).
d Boston Assessor's Office: Fiscal Year 2010 tax rate = $29.38 per $1,000 assessed value (commercial).
e Jobs estimated based on data from InfoUSA and publicly-available data. Municipal buildings are assumed to relocate within the same city and cause no net change. Vacant buildings are assumed to have no jobs under existing conditions.

Table 3-5 summarizes the annual tax value decreases by city. Somerville would have a annual tax loss of $116,063.80 (0.12 percent of total city revenue) for Yard 8, $322,439.68 (0.33 percent of total city revenue) for Option L and $56,222.22 (0.05 percent of total annual city revenue) for Mirror H. Cambridge and Boston would only experience tax loss under Mirror H, an annual tax loss of $78,411.23 (0.03 percent of total city revenue) and $2,993.19 (0.0002 percent of total city revenue), respectively.

Table 3-6 summarizes the job displacements or relocations for each city. Option L would displace or relocate 74 jobs in Somerville. Many of the jobs displaced would likely be relocated or replaced within Somerville. Cambridge and Boston would lose zero jobs for either maintenance facility alternative selected.

Table 3-5 Property Tax Decreases by City for Yard 8, Option L, and Mirror H

	Somerville		Cambridge		Boston	
Alternative	Tax revenue decrease	% of City total	Tax revenue decrease	% of City total	Tax revenue decrease	% of City total
Yard 8	$116,063.80	0.12	$0	0.00	$0	0
Option L	$322,439.68	0.33	$0	0.00	$0	0
Mirror H	$56,222.22	0.05	$78,411.23	0.03	$2,993.19	0.0002

Table 3-6 Estimated Job Decreases or Relocations for Yard 8, Option L, and Mirror H

Alternative	Somerville	Cambridge	Boston	TOTAL
Yard 8	0	0	0	0
Option L	74	0	0	74
Mirror H	0	0	0	0
Work Force in City	*47,026*	*55,737*	*347,611*	

Source: U.S. Census Bureau, 2006-2008 American Community Survey
(Total work force included to demonstrate scale of impacts.)

3.6.1 Yard 8

The total estimated annual property tax value of the land and buildings acquired for Yard 8 is $116,063.80. These acquisitions would reduce annual property tax revenue by 0.12 percent in Somerville.

Yard 8 would not require the displacement or relocation of any jobs. Table 3-6 summarizes the job displacements or relocations for each city.

3.6.2 Option L

The total estimated annual property tax value of the land and buildings acquired for Option L is $322,439.68. These acquisitions would reduce annual property tax revenue by 0.33 percent in Somerville.

Table 3-6 summarizes the job displacements or relocations for each city. Option L would displace or relocate approximately 74 jobs in Somerville. Many of the jobs displaced would likely be relocated or replaced within Somerville.

This change would not represent a significant fraction of the jobs in Somerville. By comparison, the 2006-2008 U.S. Census estimated the workforce of Somerville at 47,026 workers. Although it is uncertain how many of the jobs displaced under Option L are held by local residents rather than commuters, the small scale of the job displacements relative to the workforce makes it clear that the jobs at stake represent at most a minor economic impact.

3.6.3 Mirror H

The total estimated annual property tax value of the land and buildings acquired for Mirror H is $137,626.64. These acquisitions would reduce annual property tax revenue by 0.05 percent ($56,222.22) in Somerville, 0.03 percent ($78,411.23) in Cambridge and 0.0002 percent ($2,993.19) in Boston. At the time of this analysis, discrepancies in City property limits between Somerville and Cambridge were found and are being reviewed. These annual tax revenue estimates are subject to change based on the resolution of city limits.

Mirror H would not require the displacement or relocation of any jobs.

3.7 Title VI and Environmental Justice

The EEA established an Environmental Justice Policy in 2002, in accordance with Title VI of the Civil Rights Act of 1964, to help address the disproportionate share of environmental burdens experienced by lower-income people and communities of color who, at the same time, often lack environmental assets in their neighborhoods. The policy is designed to help ensure their protection from environmental pollution as well as promote community involvement in planning and environmental decision-making to maintain and/or enhance the environmental quality of their neighborhoods. All major elements of the proposed Green Line Extension Project must meet the standards set forth by this Policy.

The Project must also comply with Executive Order 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, directing federal agencies to address environmental injustices in their operations and in communities across the country. The Executive Order requires that each Federal agency shall, to the greatest extent allowed by law, administer and implement its programs, policies, and activities that affect human health or the environment so as to identify and avoid "disproportionately high and adverse" effects on minority and low-income populations.

The U.S. Department of Transportation (DOT) also established its own policy to actively ensure nondiscrimination under Title VI of the 1964 Civil Rights Act in Federally funded activities, DOT Order on Environmental Justice to Address Environmental Justice in Minority Populations and Low-Income Populations (DOT Order 5610.2) , which the Project must comply with. DOT Order 5610.2 summarizes and expands on the requirements of Executive Order 12898 and describes the process for incorporating environmental justice principles into all DOT existing programs, policies, and activities. As shown on Figure 3-7, all three maintenance facility alternatives are within designated environmental justice areas, as is much of the overall Green Line Extension Project corridor.

3.7.1 Yard 8

Yard 8 would require acquiring two pieces of land on Inner Belt Road: the existing Yard 8 at 0 Inner Belt Road and an undeveloped area at 200 Inner Belt Road. Like all other maintenance facility sites considered, this site is within a designated environmental justice area. However, no buildings would be acquired or demolished and no residential land would be acquired, resulting in no direct effect on local environmental justice populations.

The proposed maintenance facility site is in an existing industrial area in between the MBTA Fitchburg and Lowell Lines. The noise from the maintenance facility is included in the overall noise analysis presented in DEIR/EA Section 5.7, *Noise*, and in Section 3.3, *Noise*, of this technical memorandum. Potential severe noise impact is projected at the Brickbottom Artists Building, the Hampton Inn Hotel, and the Glass Factory Condos, and potential moderate noise impact is projected at the existing NorthPoint Tango and Sierra properties, prior to mitigation. Noise from the mainline operations is the dominant factor in future noise levels at these receptors.

Sound insulation of residences to improve the outdoor-to-indoor noise reduction is a potential mitigation measure for these existing properties. The need and effectiveness of building sound insulation for interior spaces will be assessed in the next phase of project development. There would be no moderate or severe impacts from noise after mitigation is implemented. With no other residential populations nearby, there would be no disproportionate impact to environmental justice populations due to the Yard 8 maintenance facility.

The building for the maintenance facility would result in a moderate change to the local visual environment by introducing an additional industrial building to this largely commercial/industrial neighborhood. In the absence of the proposed maintenance facility, the site selected may be redeveloped for other uses that would have similar or greater impacts on the local neighborhood. The proposed maintenance facility building site is zoned for industrial use and other related uses.

Overall, the placement of the maintenance facility in an existing industrial district would not result in any substantial changes to the local environment. There would be no disproportionate impact to environmental justice populations due to Yard 8.

3.7.2 Option L

Two buildings would be acquired and demolished as part of Option L. However, no residential land would be acquired, resulting in no direct effect on local environmental justice populations.

Under Option L, 74 jobs would be displaced in an environmental justice area. While the analysis cannot assume that the employees of these businesses are local residents, the local racial makeup and economic status provides the best available indicator for the affected populations. As discussed in Section 3.6, *Socioeconomic Impacts*, of this

technical memorandum, the displacement of these jobs does not represent a substantial economic change for the local area.

The proposed maintenance facility site is in an existing industrial area in between the MBTA Fitchburg and Lowell Lines. The noise from the maintenance facility is included in Section 3.3, *Noise,* of this technical memorandum. Potential severe noise impact is projected at the Brickbottom Artists Building, the Hampton Inn Hotel, and the Glass Factory Condos, and potential moderate noise impact is projected at the existing NorthPoint Tango and Sierra properties, prior to mitigation. Noise from the mainline operations is the dominant factor in future noise levels at these receptors.

Sound insulation of residences to improve the outdoor-to-indoor noise reduction is a potential mitigation measure for these existing properties. The need and effectiveness of building sound insulation for interior spaces will be assessed in the next phase of project development. There would be no moderate or severe impacts from noise after mitigation is implemented. Therefore, there would be no disproportionate environmental justice impacts from the proposed maintenance facility.

The building for the maintenance facility would change the local visual environment slightly by introducing an additional industrial building to this largely commercial/industrial neighborhood.

Overall, the placement of the maintenance facility in an existing industrial district would not result in any substantial changes to the local environment. There would be no disproportionate impact to environmental justice populations due to Option L.

3.7.3 Mirror H

Mirror H would require acquiring partial pieces of land owned by Pan Am Railways and planned for the future NorthPoint development project. However, no buildings would be acquired or demolished, and no residential land would be acquired, resulting in no direct effect on local environmental justice populations.

The proposed maintenance facility site is in an existing industrial area south of the MBTA Fitchburg Line. The noise from the maintenance facility is included in Section 3.3, *Noise,* of this technical memorandum. Potential severe noise impact is projected at the Brickbottom Artists Building, the Hampton Inn Hotel, the Glass Factory Condos, and four future properties in the NorthPoint development (Sites 1, 2, 3 and 4), prior to mitigation, and potential moderate noise impact is projected at one future property in the NorthPoint development (Site 5) and two existing properties (Tango and Sierra). Noise from the mainline operations is the dominant factor in future noise levels at the Brickbottom Artists Building, Hampton Inn Hotel, Glass Factory Condos and existing NorthPoint properties Tango and Sierra. Sound insulation of residences to improve the outdoor-to-indoor noise reduction is a potential mitigation measure for these existing properties. The need and effectiveness of building sound insulation for interior spaces will be assessed in the next phase of project development. There would be no moderate or severe impacts

from noise after mitigation is implemented. Therefore, there would be no disproportionate environmental justice impacts from the proposed maintenance facility.

Noise from Mirror H is the dominant project-related noise source at the five future NorthPoint properties (Sites 1, 2, 3, 4 and 5). It is assumed that future properties at the NorthPoint development would have noise-sensitive receptors at upper-floor residences, which would not benefit from a noise barrier for potential mitigation. Since the proposed development is not currently under consideration and is assumed to be completed by 2030, after the completion of the Green Line Extension Project, the buildings could be designed with consideration of the noise environment (i.e. windows with high transmission loss or STC ratings) to mitigate potential impact.

The building for the maintenance facility would change the local visual environment slightly by introducing an additional industrial building to this largely commercial/industrial neighborhood. In the absence of the proposed maintenance facility, the site selected may be redeveloped for other uses that would have similar or greater impacts on the local neighborhood.

Overall, the placement of the maintenance facility in an existing industrial area would not result in any substantial changes to the local environment. There would be no disproportionate impact to environmental justice populations due to Mirror H.

3.8 Visual Resources

This section compares the direct visual impacts from the three maintenance facility alternatives. The support facility would be an enclosed building, resulting in minimal light exposure to the surrounding area. Any outdoor lighting would be directed downward and towards the building with fixture hoods to prevent any direct lighting impacts at night on neighboring buildings.

Moreover, the aesthetic features of the exterior of the maintenance facility structure would enhance the possibility of quality redevelopment nearby. Heavy visual screening by landscaping or walls would be considered, especially adjacent to the outdoor rail car storage area. Consideration would be given to the development of a deck for parking or other purposes over the storage yard, which would provide weather protection to the Green Line cars while screening the visual impacts.

3.8.1 Yard 8

Yard 8 has been in continuous use as a rail facility since 1835, and train cars would use the layover tracks mostly at night. The support facility building would be directly across the right-of-way from the Brickbottom Artists Building. The building would be easily visible from the east-facing windows of the Brickbottom Artists Building. Given the existing industrial and commercial buildings visible from this

area, the support facility would result in a moderate change to the local landscape by adding a new industrial building.

3.8.2 Option L

Option L is immediately adjacent to the MBTA's BET, on the northwest. Option L is along the southern and southeastern fringe of the existing Inner Belt industrial area. The vehicle storage yard is proposed at the southern end of the Inner Belt Road just north of the MBTA Fitchburg Line on vacant private property and land that is currently an unused parking lot for 70 Inner Belt Road. The maintenance building would be south of Third Avenue and east of the existing building at 70 Inner Belt Road.

A maintenance facility at Option L would require the demolition of two buildings and the construction of a new building. The building would be less visible from the Brickbottom Artists Building than would Yard 8. Given the existing industrial and commercial buildings visible from this area, the support facility would result in a minor change to the local landscape.

3.8.3 Mirror H

Mirror H straddles portions of the NorthPoint site and a portion of MBTA-owned land. This alternative locates the facility at the north side of the proposed NorthPoint development and partly on MBTA land south of the BET, and represents a plan that places new light rail facilities next to existing MBTA Commuter Rail facilities. A support facility in this location would result in some visual changes to the local area. A single storage yard would be in Cambridge to the west of the maintenance building in Somerville. Some of the auto parking, as well as the tail tracks and loop east of the maintenance building, would be in Boston.

The support facility building would be directly across the right-of-way from the proposed NorthPoint buildings. The building would be easily visible from the northern-facing windows of the proposed NorthPoint buildings. Given the existing industrial (MBTA's BET facility) and commercial buildings visible from this area, the support facility would result in a minor change to the local landscape by constructing a new building.

3.9 Wetlands

There are no state- or Federally-regulated wetlands within the Yard 8, Option L, or Mirror H sites. Therefore, there would be no wetland impacts created by developing any chosen maintenance alternative.

3.10 Stormwater Management

The proposed maintenance facility would be constructed in previously-developed areas and would be designed to meet the Massachusetts Stormwater Management Standards for redevelopment. Maintenance activities (such as light rail vehicle washing) would be conducted inside the maintenance building and are anticipated to contribute to stormwater. Stormwater from the site would discharge to an existing storm drain system and would not discharge directly to any wetlands.

The MBTA would need to apply for coverage under the EPA Multi-Sector General Permit for Stormwater Discharges Associated with Industrial Activity (MSGP) for the maintenance facility.[8] This general permit requires numerous control measures and operational plans to control spills, manage potential contaminant sources, and prevent the impairment of any water bodies receiving runoff from industrial facilities.

A new EPA National Pollutant Discharge Elimination System (NPDES) permit for an industrial use would be required. This permit would require a new Stormwater Pollution Prevention Plan (SWPPP) to address maintenance and monitoring and a Spill Prevention, Control, and Countermeasures (SPCC) plan to demonstrate vigilance and preparedness for hazardous spills. The storage tracks would have collection trays to catch any incidental drips, leaks, or spills of hazardous materials that may occur during storage or maintenance. The collection trays would be connected to an oil/water separator that would separate petroleum products from stormwater runoff prior to discharge. Any oil or other hazardous materials stored at the site would be secured with secondary containment structures to catch any spills. With the proposed containment measures in place, the storage and maintenance facility would not pose a significant risk to any surface or groundwater resources in the vicinity of either site.

3.10.1 Yard 8

Yard 8 would add 2.6 acres of impervious surfaces to the site. Approximately 54 percent of the new total impervious area (approximately 2.7 acres) would be roof area, which is expected to be clean. The stormwater management system would include many of the same features found in the station and railway drainage. Proposed management measures include:

- Deep sump catch basins to collect runoff from paved areas;
- Hydrodynamic particle separators to treat pavement runoff;

8 The Multi-Sector General Permit for Stormwater Discharges (MSGP) is part of the National Pollutant Discharge Elimination System (NPDES), which requires permits for various stormwater and industrial discharges in order to prevent the contamination and impairment of receiving waters. The EPA is responsible for issuing NPDES permits in Massachusetts, and the permits are also reviewed by MA DEP. The MSGP covers most types of industrial discharges and requires general control measures as well as specific measures tailored to specific industrial uses. Industrial facilities applying for coverage under the MSGP must demonstrate compliance with all requirements and submit copies of their SWPPPs and SPCCs for review.

- Roof drains from building connected to an underground pipe storm drainage system;
- Underground infiltration chambers to store and infiltrate runoff; and
- Overflow outlets from the infiltration chambers to direct excess flow into the municipal storm drainage system in Inner Belt Road.

The stormwater system would be designed to ensure no net increase in peak flow to the existing municipal drain line in Inner Belt Road.

3.10.2 Option L

Option L would reduce existing impervious surfaces by about 3.2 acres. Approximately 40 percent of the new total impervious area (approximately 3.4 acres) would be roof area, which is expected to be clean. The stormwater management system would include many of the same features found in the station and railway drainage. Proposed management measures include:

- Deep sump catch basins to collect runoff from paved areas;
- Hydrodynamic particle separators to treat pavement runoff;
- Roof drains from building connected to an underground pipe storm drainage system;
- Underground infiltration chambers to detain and infiltrate runoff; and
- Overflow outlets from the detention chambers to direct excess flow into the existing MBTA Fitchburg Line Main Drain, which crosses the eastern portion of this site.

The stormwater system would be designed to ensure no net increase in peak flow to the existing MBTA drain line.

3.10.3 Mirror H

Mirror H would reduce existing impervious surfaces (pavement) by about 0.4 acres. Approximately 47 percent of the new total impervious area (approximately 2.2 acres) would be roof area, which is expected to be clean. The stormwater management system would include many of the same features found in the station and railway drainage. Proposed management measures include:

- Deep sump catch basins to collect runoff from paved areas;
- Hydrodynamic particle separators to treat pavement runoff;
- Roof drains from building connected to an underground pipe storm drainage system;

- Underground storage chambers to detain runoff;
- Underground filtration basin to provide additional TSS removal (in lieu of infiltration; and
- Overflow outlets from the detention chambers to direct excess flow into the existing MBTA Fitchburg Line Main Drain, which crosses the eastern portion of this site.

Infiltration is not advised, as there is ongoing groundwater remediation in this area. The stormwater system would be designed to ensure no net increase in peak flow to the existing MBTA drain line.

3.11 Hazardous Materials

This section discusses the potential presence of oil and/or hazardous materials (OHM) on or adjacent to the proposed maintenance facility alternatives for the proposed Green Line Extension Project.

To assess the potential for encountering OHM, Phase I Environmental Site Assessments (ESAs) were performed as per the American Society for Testing Materials (ASTM) 1527-05 Standard and All Appropriate Inquiries (AAI) pursuant to 40 CFR Part 312. The purpose of the Phase I ESAs is to identify Recognized Environmental Conditions (RECs) in connection with the properties, to the extent feasible pursuant to the process described in the Standard. The Phase I ESAs were completed utilizing the Standard as guidance. The scope of services provided for the Phase I ESAs included the following:

- Performed a computer database search of Federal and state files. The Federal databases included the current Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS), National Priorities List (NPL), Resource Conservation and Recovery Act (RCRA) Transportation, Storage and Disposal (TSD), RCRA Generators, and Emergency Response Notification System (ERNS) list. The state databases included the state equivalent CERCLIS list, spills, Underground Storage Tanks (USTs), Solid Waste Landfills (SWL), and public water supply lists.
- Reviewed available Massachusetts Department of Environmental Protection (MassDEP) files to provide more information about reported releases of OHM identified through the database search on or adjacent to the sites. The MassDEP files provided additional information regarding past ownership; historic site usage; past usage, storage and disposal of OHM on and adjacent to the subject site; and other evidence of potential environmental impacts.
- Reviewed available municipal and historic files to help confirm ownership history and past usage. Resources included tax records, aerial photographs, Board of Health Department records, Building Department records, Fire

Department records, Conservation Commission records, and Sanborn fire insurance maps. The site history review also identified reports of historic spills, disposal areas, or other past releases of OHM on or adjacent to the properties.

- Reviewed previous site documents including an ESA, if applicable and/or available for review.
- Performed a partial site reconnaissance from public roadways to observe each site for overt evidence of a release or threat of release of oil and/or hazardous materials within exterior portions of the entire property. The uses of abutting properties were also documented. No interior inspections were conducted.
- Areas of property acquisition were assessed as discussed above. Properties already owned by the MBTA or the Commonwealth of Massachusetts were not assessed. Notable deviations from the standard include not inspecting interior portions of buildings, interviews with knowledgeable personnel were not conducted, and a user questionnaire was not completed.

The findings of the Phase I Environmental Site Assessments conducted for the three maintenance facility alternatives indicate that all of the proposed maintenance facilities encompass and abut sites of known and suspected OHM contamination. All three alternatives would likely be impacted by fill material present throughout the area, the historic use of the properties for railroad operations, present industrial use of the property, and several documented disposal sites detailed below. Asbestos containing materials (ACM) and/or lead-based paint may be present in site structures or fill piles in the location of the proposed maintenance facilities; therefore, a detailed survey is recommended prior to acquisition or demolition.

The purpose of this analysis was to identify and compare the number of RECs in connection with each maintenance facility site. RECs that are deemed to have a high potential impact consists of sites such as those confirmed with soil, groundwater, and/or indoor air impacts that were reported to the MassDEP and have undergone some type of cleanup or remain an active case. RECs that are deemed to have a medium potential impact consist of properties such as those with potential sources of OHM with limited or inconclusive information.

It is recommended that upon selection of the preferred maintenance facility site, that subsequent investigation be conducted to identify specific contaminants and associated clean-up costs. On-site contamination encountered would be assessed and, if necessary, remediated prior to and during construction activities. Any necessary response actions would be performed in accordance with the Massachusetts Contingency Plan (MCP).

3.11.1 Yard 8

Based upon the research review conducted for the Phase I ESA, seven RECs are believed to be associated with Yard 8 (off-site releases were consolidated into one REC), comprised of the properties identified in Table 3-7.

Table 3-7 RECs and Potential Impacts for Yard 8

Station/Facility	REC(s)	RTN(s)	Relative Impact
Maintenance Facility	Historic Use of Site at Rail Yard (all Yard 8 parcels)	Not applicable	Medium
	Releases of Petroleum at Nearby Properties (all Yard 8 parcels)	See below[a]	Medium
	Releases of Hazardous Materials (Metals, PCBs, and Unknown Chemicals) at Nearby Properties	See below [b]	Medium
	Release of Petroleum at 100 Inner Belt Road and Petroleum Storage at 70 Inner Belt Road (Currently a portion of the same parcel)	RTN 3-974	Medium
	Release of Arsenic and PCBs at 120 Inner Belt Road	RTN 3-19075	Medium

	Releases of Petroleum at and Current use of MBCR maintenance facility at 70R Third Avenue	See below[a]	Medium
	Releases at the former B&M Railroad Yard (now Pam Am Railways)(all Mirror H parcels)	RTN 3-12277 and RTN 3-11533	High

a N90-1956, N90-0236, N90-1810, N93-0627, N93-0705, RTNs 3-24428, 3-22276, 3-26988, 3-22964, 3-23114, 3-18363

3.12 Historic and Archaeological Resources

The Green Line Extension Project Area of Potential Effects (APE) for historic resources includes the area extending approximately 125 feet, or one assessor's lot, on either side of the Proposed Project's Medford and Union Square Branch routes, associated proposed station locations, and maintenance and/or interim train storage facilities.

The APE for historic resources, in accordance with 36 CFR 800.16(d) is defined as "the area or areas within which an undertaking may directly, indirectly, or cumulatively cause changes in the character or use of historic properties (defined as resources listed or eligible for listing in the National Register), if any such properties exist there."[9] Therefore, the APE includes other areas where the undertaking could cause changes in land use, traffic patterns, or other aspects that could affect historic properties. Factors with potential to cause changes are noise, vibration, visual (setting), traffic, atmospheric, construction, indirect, and cumulative impacts. Different project factors may produce more than one APE for a given undertaking.

The APE for archaeological resources is limited to the construction areas for the proposed maintenance facility alternatives.

There are no historic resources or recorded archaeological sites located within the APE for any alternative site. However, the presence of deeply buried archaeologically sensitive strata below the railroad and modern fill soils is

9 Advisory Council on Historic Preservation. United States 36 Code of Federal Regulations, Part 800 – *Protection of Historic Properties.* http://www.achp.gov/regs-rev04.pdf.

considered possible at all of the proposed maintenance facility alternatives. Further research including a review of soil borings is recommended prior to construction to determine if archaeologically sensitive strata may be impacted by the construction of the maintenance facility.

3.13 Public Parks, Recreation Areas, and Conservation Land

There are no public parks, recreation areas or conservation land areas within or adjacent to the proposed Yard 8, Option L, or Mirror H maintenance facility areas; therefore, there would be no impacts to parks or conservation land.

3.14 Section 4(f) Resources

A historic and archaeological resources reconnaissance survey for the Green Line Extension Project was undertaken as the first step in fulfilling compliance responsibilities regarding cultural resources under Section 4(f) provisions of the U.S. Department of Transportation (DOT) Act of 1966,[10] as well as Section 106 of the National Historic Preservation Act (NHPA) and the regulations of the Advisory Council on Historic Preservation at 36 CFR 800. The FTA is the lead Federal agency for the Green Line Extension Project. MassDOT serves as the lead state agency and is responsible for identifying and evaluating properties through archaeological and historic architectural surveys.

Section 4(f) of the DOT Act of 1966, as amended in 1983 and 2008, specifies that the Secretary of the DOT may approve a transportation program or project requiring the use of publicly-owned land (such as a park, recreation area, or wildlife or waterfowl refuge) or land of an historic site of national, state, or local significance (as determined by federal, state, or local officials having jurisdiction over the park, recreation area, refuge, or site) only if:

- There is no feasible and prudent alternative to the use of land from the property; and
- The action includes all possible planning to minimize harm to the property resulting from the use.

Use is defined as the permanent incorporation of land from a Section 4(f) site into a transportation facility, temporary occupancy of a Section 4(f) property, or constructive use of a Section 4(f) property. For example, the acquisition of land that is within a public park, recreation area, wildlife refuge, or property listed on or eligible for listing on the National Register, for a highway right-of-way is considered permanent incorporation of land. At this time, MassDOT does not anticipate that

10 Section 4(f) provisions of the U.S. Department of Transportation Act of1966, recodified at 49 U.S.C., Subtitle I, Section 303(c).

Section 4(f) uses that are "temporary occupancy of land" would occur during construction as a result of the need for temporary construction easements or activities. These would be identified during the final design process, and are not defined at this conceptual stage of project development. MassDOT anticipates that the final design for the maintenance facility would avoid temporary occupancy of any Section 4(f) site.

There are no Section 4(f) resources (park, recreation area, wildlife/waterfowl refuge, or land of an historic site of national, state, or local significance) within or adjacent to the proposed maintenance facility sites. Section 4(f) also applies to archaeological sites that are on or eligible for inclusion on the National Register and that warrant preservation in place. There is the potential for archaeologically-sensitive strata below railroad and upper fill deposits at all the proposed maintenance facility alternatives that would be impacted by construction of the chosen alternative. However, no archaeological sites within the proposed maintenance facility alternatives have been listed as eligible for, or on, the National Register.

3.15 Consistency with Federal, State, and Local Planning

This section compares the consistency and compatibility of each maintenance facility site to other planned federal, state and local planning initiatives. Figures 3-1 through 3-3 show the existing land uses in the vicinity of the maintenance facility alternatives, and Figure 3-8 shows a generalized zoning map for the communities of Cambridge and Somerville.

Yard 8 and Option L would be compatible locations for the maintenance facility because these alternatives are in the middle of an industrial area. Option L would likely have the least transit oriented development (TOD) potential since it is the farthest away from proposed stations. Option L, in terms of future land use impacts, would likely be the most consistent with local development plans. Mirror H would be less compatible with state and local planning initiatives.

3.15.1 Yard 8

Yard 8 is compatible with the potential future Urban Ring project, the Somerville Community Path, and the North-South Rail Link project. Yard 8 within the City of Somerville is zoned Industrial A (IA).

The proposed vehicle maintenance building and overnight rail car storage area are compatible with much of the existing industrial land uses along this segment of the railroad corridor. However, its development character and impacts may potentially affect future non-industrial development opportunities in adjacent areas.

The facility would be similar in appearance to other MBTA maintenance facilities serving the Green Line (e.g., Riverside and Reservoir). To encourage planned mixed use development near the Brickbottom Station and in the Inner Belt area, consistent

with City of Somerville planning policies for the area, mitigation measures may be necessary. The design of an aesthetic building facade, the enabling of potential air rights development (perhaps through zoning amendments), and dense screening landscaping may be necessary to create a more compatible facility with future non-industrial land uses.

3.15.2 Option L

Option L does not preclude the potential future Urban Ring project, the Somerville Community Path, or future North-South Rail Link project. Option L within the City of Somerville is zoned Industrial A (IA).

The vehicle maintenance building and overnight rail car storage area are compatible with much of the existing industrial land uses along this segment of the railroad corridor. However, its development character and impacts may potentially affect future non-industrial development opportunities in adjacent areas.

The facility would be similar in appearance to other MBTA maintenance facilities serving the Green Line (e.g., Riverside and Reservoir). To encourage planned mixed use development near the Brickbottom Station and in the Inner Belt area, consistent with City of Somerville planning policies for the area, mitigation measures may be necessary. The design of an aesthetic building facade, the enabling of potential air rights development (perhaps through zoning amendments), and dense screening landscaping may be necessary to create a more compatible facility with future non-industrial land uses.

3.15.3 Mirror H

Mirror H does not preclude the potential Urban Ring and Somerville Community Path projects. However, Mirror H could preclude the future North-South Rail Link project and the future expansion planned for the BET facility, both of which are programmed within the MBTA"s existing property limits. The portion of Mirror H within Somerville is zoned Industrial B (IB). The portion of Mirror H within Cambridge is designated as zoned NorthPoint Residence District PUD (NP PUD-6). Zoning in the NorthPoint District is primarily residential, with retail, office uses and community services. The land in Boston that is adjacent to the proposed NorthPoint Development is zoned as a Local Industrial Subdistrict (LI). Mirror H would be less compatible to local planning initiatives than Option L or Yard 8 as the industrial use of this facility would be adjacent to a lot of zoned residential developments.

Most of the underused land between the Mirror H site and the proposed relocated Lechmere Station site, however, is already programmed as part of the NorthPoint development project, which is projected to occupy 46.3 acres and 20 buildings when completed. Full build-out of these developments would be made more attractive by construction of the Green Line Extension, which would make the area more accessible to a larger region.

Farther east and adjacent to the NorthPoint project is the Charles E. Smith/Archstone residential development. Phase I, which includes 437 rental units, was completed in 2007. Phase II is permitted for 426 units. Construction had not yet begun on Phase II as of March 2010.

Directly adjacent to Mirror H is the 2.4 acre site for a 392 unit triple-tower residential/parking/open space project proposed by Catamount Holdings. The development would occupy the vacant site of the former headquarters of the Mac Gray Company at 22 Water Street, behind the Hampton Inn Hotel on O'Brien Highway. The project has been approved by the Cambridge Planning Department.

Additional land use impacts in the station area are uncertain, as there are few other vacant sites available for development. However, the improved Lechmere Station and the proposed future developments are likely to increase land values in the area, making existing underused parcels attractive sites for potential redevelopment.

The vehicle maintenance building and overnight rail car storage area are compatible with much of the existing industrial land uses along this segment of the railroad corridor. However, its development character and impacts would affect future non-industrial development opportunities in adjacent areas.

This Page Intentionally Left Blank

4

Construction Impacts

This chapter discusses construction impacts related to the construction of the three maintenance facility alternatives. Construction impacts at any of the alternative sites would be the same, unless noted otherwise. Table 4-1 provides a summary of anticipated construction impacts. Table 4-2 summarizes construction mitigation measures for the maintenance facility alternatives.

Table 4-1 Construction Impacts for Yard 8, Option L and Mirror H

Construction Impacts
Traffic ■ There would be no impacts to vehicular traffic directly related to construction of any of the maintenance facility alternatives. ■ Temporary lane closures and temporary traffic detours could be required along O'Brien Highway during construction of Mirror H. However, this construction would also be necessary to support the construction of the new Lechmere Station and would occur regardless of the alternative selected (schedule may be altered by Mirror H).
Air Quality ■ Dust and debris from construction of the maintenance facility. ■ Carbon dioxide emissions from diesel equipment used on-site during construction.
Noise ■ Noise emissions from construction equipment.
Vibration ■ Vibration from heavy construction equipment (e.g., pile drivers).
Water Quality/Stormwater ■ Temporary alterations to the existing stormwater drainage infrastructure during construction. ■ Potential oil/fuel leaks from construction equipment.
Hazardous Materials and Solid Waste ■ Hazardous, contaminated or special wastes could be generated during construction.
Historic and Archaeological ■ Archaeologically sensitive strata below the fill are possible at all the proposed maintenance facility alternatives. An intensive (locational) archaeological survey is recommended prior to construction to determine if archaeologically sensitive strata may be impacted by the construction of the maintenance facility.

Temporary, short-term impacts from construction activities would be mitigated to the extent practicable. Appropriate construction mitigation measures would be incorporated into the contract documents and specifications governing the activities of contractors and subcontractors constructing elements of the Green Line Extension Project, including the maintenance facility and storage yard. On-site resident engineers and inspectors will monitor all construction activities to ensure that mitigation measures are properly implemented. The construction mitigation measures are summarized in Table 4-2.

Table 4-2 Summary of Construction Mitigation Measures

Mitigation Measures
Traffic
■ Temporary detours would be established to minimize traffic disruption due to construction.
Air Quality
■ Apply water to dry soil to prevent dust production.
■ Use water for compaction in the fill areas and as a dust retardant in both the soil cut areas and haul roads.
■ Follow existing MBTA retrofit procedures for construction equipment to reduce emissions.
Noise
■ Use specially quieted equipment with enclosed engines and/or high-performance mufflers.
■ Avoid nighttime construction in residential neighborhoods.
■ Keep truck idling to a minimum.
■ Route construction equipment and vehicles through areas that would cause the least disturbance to nearby receptors where possible.
■ Fit any air-powered equipment with pneumatic exhaust silencers.
■ Locate stationary construction equipment as far as possible from noise-sensitive sites.
■ Construct noise barriers, such as temporary walls or piles of excavated material, between noisy activities and noise-sensitive receivers.
Vibration
■ Avoid nighttime construction in residential neighborhoods.
■ Use alternative construction methods to minimize the use of impact and vibratory equipment (e.g. pile drivers and compactors).
Water Quality/Stormwater
■ Develop and implement a SWPPP in accordance with NPDES and MA DEP standards.
■ Stabilize any highly erosive soils with erosion control blankets and other stabilization methods, as necessary.
■ Reinforce slopes using a hydroseed mix with a resin base, native vegetation, or other approved methods.
■ Use dewatering controls, if necessary.
■ Install a gravel entrance to prevent sediment from being tracked onto roadways and potentially discharged to surface waters.
■ Maintain construction equipment to prevent oil and fuel leaks.
Hazardous Materials and Solid Waste
■ Implement special management procedures for any hazardous, contaminated or special wastes generated during construction, including special handling, dust control, and management and disposal of contaminated soil. Procedures should protect both workers and nearby receptors.
■ Perform subsurface investigations for any planned excavation to test for possible contamination.
■ Prepare a site-specific Health and Safety Plan.
■ Conduct pre-demolition inspections to identify any hazardous materials such asbestos and lead-based paint.

5

Summary and Next Steps

Table 5-1 summarizes the findings of the environmental analysis of the three maintenance facility alternatives – Yard 8, Option L and Mirror H. As described in this document, the environmental analyses indicate that both Yard 8 and Option L are viable locations for support facilities for the Green Line Extension Project. Of the two, each has some environmental advantages and disadvantages. MassDOT believes that the disadvantages of Mirror H outweigh the potential benefits.

MassDOT will review and consider the results of the environmental analysis with the results of the operational analysis to determine whether to substitute an alternative option for Yard 8 as the preferred site for the storage and maintenance facility.

This Page Intentionally Left Blank

Table 5-1 Comparison of Yard 8, Option L, and Mirror H - Environmental Analysis

CRITERIA	YARD 8 Rationale	OPTION L Rationale	MIRROR H Rationale
Description	Adjacent to the proposed Green Line alignment and accessed from Inner Belt Road in Somerville	Adjacent to BET, outside the current BET fence line - along the southern and southeastern fringe of the existing Inner Belt industrial area	Partly on NorthPoint parcels C/D/E/F and storage on parcels A/B, and partly on MBTA land currently used for storage by BET
Capital Cost Estimate ($2008)	$79 million	$129 million	$82 million
Total acreage needed	11 acres	11 acres	11 acres
Property Acquisitions			
Number of Parcels	2 Parcels (200 Inner Belt Road, Somerville - partial; 0 Inner Belt Road, Somerville - full)	4 parcels (20 Third Avenue, Somerville [full]; 44-48 Third Avenue, Somerville [full]; 70 Inner Belt Road, Somerville [partial]); 200 Inner Belt Road, Somerville [partial]	NorthPoint Development lots A/B and C/D/E/F [partial], located partly in Cambridge and Somerville
Acreage to be Acquired	5.8 acres	10.2 acres	4.3 acres
Estimated Acquisition Cost	Approx. $15 M	Approx. $51 M	Approx. $11 M
Air Quality	No difference	No difference	No difference
Noise Impacts (cumulative = mainline operations and maintenance facility)			
Potential Moderate Impacts (prior to mitigation)	Two buildings (NorthPoint Properties - Tango and Sierra)	Two buildings (NorthPoint Properties - Tango and Sierra)	Two existing buildings (NorthPoint Properties - Tango and Sierra) and 1 future building (NorthPoint Properties - Site 5)
Potential Severe Impacts (prior to mitigation)	Three buildings (Brickbottom Artists Building, Hampton Inn Hotel, Glass Factory Condos)	Three buildings (Brickbottom Artists Building, Hampton Inn Hotel, Glass Factory Condos)	Three existing buildings (Brickbottom Artists Building, Hampton Inn Hotel, Glass Factory Condos) and four future buildings (NorthPoint Properties - Sites 1, 2, 3, and 4)
Vibration (from maintenance facility only)	No difference	No difference	Presence of double crossover between mainline and maintenance tail track would impact Brickbottom Artists Building (50 feet away)
Traffic and Access	No measurable impact to parking or traffic operations. Access via Washington Street and Inner Belt Road.	No measurable impact to parking or traffic operations. No changes to Brickbottom Station. Access via Washington Street and Inner Belt Road.	No measurable impact to parking or traffic operations. Possible isolated impacts from access improvements to/from facility (extension of Water Street from O'Brien Highway to Mirror H). Timing of construction could be impacted if access required prior to Lechmere Station construction.
Socioeconomics			
Estimated Annual Tax Loss	Approx. $116,063.80 (reduction of 0.12 percent in Somerville)	Approx. $322,439.68 (reduction of 0.33 percent in Somerville)	Approx. $137,626.64 (reduction of 0.05 percent [$56,222.22] in Somerville, 0.03 percent [$78,411.23] in Cambridge and 0.0002 percent [$2,993.19] in Boston)
Estimated Job Displacement	0 jobs	74 jobs (minor overall economic impact compared to total Somerville workforce)	0 jobs
Title VI and Environmental Justice	No difference	Option L would displace or relocate approximately 74 jobs within Somerville (a minor economic impact relative to total Somerville workforce).	No difference
Visual Resources	Moderate visual change to current landscape	Minor visual change to current landscape	Minor visual change to current landscape
Wetlands	No difference	No difference	No difference
Stormwater Management	Stormwater system would be designed to ensure no net increase in peak flow to the existing municipal drain line in Inner Belt Road	Stormwater system would be designed to ensure no net increase in peak flow to the existing MBTA drain line	Infiltration not advised, ongoing groundwater remediation in area. Stormwater system would be designed to ensure no net increase in peak flow to the existing MBTA drain line.
Impervious Area	Increase of approximately 2.6 acres	Reduction of approximately 3.2 acres	Reduction of approximately 0.4 acres
Hazardous Materials	7 Recognized Environmental Conditions	7 Recognized Environmental Conditions	6 Recognized Environmental Conditions
Historic and Archaeological Resources	No difference	No difference	No difference
Section 4(f) Evaluation	No difference	No difference	No difference
Public Parks, Recreation Areas, and Conservation Land	No difference	No difference	No difference
Consistency with Federal, State and Local Planning	Compatible location	Compatible location	Less compatible to state and local planning initiatives. Could preclude future North-South Rail Link project and the ability to expand the BET facility within existing MBTA property limits. Industrial architecture of building may be incompatible with intended residential/mixed-use developments already planned.

Medford Hillside Neighborhood Included in College Avenue Walk Market Area Memorandum

MEMORANDUM

TO: **Green Line Extension Project Files** **April 6, 2010**

FROM: **Bruce Kaplan and Scott Peterson**

RE: **Medford Hillside Neighborhood Included in the College Avenue Walk Market Area**

BACKGROUND

The specific configuration of the Green Line Extension has undergone many iterations during the course of its project history. Following extensive analysis, MassDOT has recently determined that the best and most feasible project to pursue in the near-term is one that includes (1) a branch from Lechmere Station in East Cambridge to College Avenue in Medford (along the Lowell Commuter Rail right-of-way) and (2) a branch from Lechmere Station to Union Square in Somerville (along the Fitchburg Commuter Rail right-of-way). This configuration is identified in the Green Line Extension Draft Environmental Impact Report/Environmental Assessment as the 'Proposed Project.'

Previous conceptual planning work for the Green Line Extension had also considered potential stations at:

- The intersection of the Lowell Commuter Rail Line right-of-way and Winthrop Street (Medford).
- The intersection of the Lowell Commuter Rail right-of-way and Mystic Valley Parkway/Route 16 (Medford/Somerville).

However, the current proposed project does not include Green Line stations at those locations. As a result, concerns have been raised that a proposed terminus at College Avenue would not adequately serve the Medford Hillside neighborhood, which was identified in the SIP regulation. This memorandum demonstrates that the walk market area for a College Avenue station does indeed cover and include the Medford Hillside neighborhood.

Medford Hillside is defined in this analysis as an area of the City of Medford bounded by the Mystic River to the north, Medford Square to the east, College Avenue to the south, and North Somerville to the west. This area was defined based on an examination of local maps and businesses that identified themselves with the Medford Hillside neighborhood. The Medford Hillside neighborhood is shown as a light red area on the maps in the Exhibits.

ASSUMPTIONS

Exhibit 1, on page 3, presents the northern section of the proposed project as defined in the recently Green Line Extension Draft Environmental Impact Report/ Environmental Assessment, with a branch extending from Lechmere Station towards Medford, and another branch extending towards Union Square (not shown). The terminus of the Medford branch is a station located at the intersection of the Lowell Commuter Rail right-of-way and College Avenue. Since none of the displayed stations have park-and-ride facilities, the ridership markets for these stations are almost wholly defined as persons capable of accessing stations by walking or bicycling, with limited anticipated automobile pick-ups and drop-offs.

For the purposes of the ridership projections developed to support the Draft Environmental Impact Report/Environmental Assessment and the New Starts application materials, MassDOT has followed the requirement of the Federal Transit Administration (FTA) that we use a one-mile walk-access catchment area for each of the proposed Green Line Extension stations. To refine this analysis further, however, MassDOT has also separately mapped (see Exhibit 2 on page 4) a smaller ¾-mile walk-access catchment area.

CONCLUSION

Exhibit 1 displays the one-mile radius walk catchment area, shown in orange on the map, extending from the proposed College Avenue Station outward via the walk and bike network. Every portion of the Medford Hillside neighborhood, represented by the transportation analysis zones (TAZs) that are used by the regional travel demand model, are covered by the one-mile walk-access catchment area. This means that all trips from TAZs 555-558 have the ability to access the College Avenue Station and use the proposed Green Line Extension. Thus, the Medford Hillside neighborhood is well served by the College Avenue Station in the regional travel demand model (the one-mile radius walk catchment area). The smaller ¾-mile walk-access catchment area (displayed in orange in Exhibit 2) continues to cover the majority of the Medford Hillside area. Exhibit 2 demonstrates that the bulk of the Medford Hillside neighborhood is served by the College Avenue station even when stricter ¾-mile non-FTA-sanctioned walk-access assumptions are made.

Source: VHB, Inc. using Synchro 7 (Build 773 Revision 8) software.
Note: Shaded cells denote LOS E/F conditions.
1 V/C – Volume-to-capacity ratio.
2 Delay – Control delay per vehicle, expressed in seconds.
3 LOS – Level-of-Service.
4 Q – 95th percentile queue length estimate, in feet.
NB=Northbound; SB=Southbound; EB=Eastbound; WB=Westbound; LT=left-turn; TH=through; RT=right-turn
m Volume for 95th percentile queue is metered by upstream signal
95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

Source: VHB, Inc. using Synchro 7 (Build 773 Revision 8) software.
Note: Shaded cells denote LOS E/F conditions.
1 V/C – Volume-to-capacity ratio.
2 Delay – Control delay per vehicle, expressed in seconds.
3 LOS – Level-of-Service.
4 Q – 95th percentile queue length estimate, in feet.
NB=Northbound; SB=Southbound; EB=Eastbound; WB=Westbound; LT=left-turn; TH=through; RT=right-turn
m Volume for 95th percentile queue is metered by upstream signal
95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

Source: VHB, Inc. using Synchro 7 (Build 773 Revision 8) software.
Note: Shaded cells denote LOS E/F conditions.
1 V/C – Volume-to-capacity ratio.
2 Delay – Control delay per vehicle, expressed in seconds.
3 LOS – Level-of-Service.
4 Q – 95th percentile queue length estimate, in feet.
NB=Northbound; SB=Southbound; EB=Eastbound; WB=Westbound; LT=left-turn; TH=through; RT=right-turn
m Volume for 95th percentile queue is metered by upstream signal
95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

Supplemental Traffic Analysis

O'Brien Highway Cross-Section Analysis

To support the development of the Final Environmental Impact Report (FEIR) for the Green Line Extension Project, comments received from the public and from local officials were reviewed and, to the extent possible, were incorporated into the revised Lechmere Station conceptual level design. Many comments received suggested the possibility of reducing the number of proposed travel lanes along O'Brien Highway in the vicinity of Lechmere Station. To support this request, an analysis of the feasibility and practicality of reducing the O'Brien Highway roadway cross-section was conducted.. This analysis was not required by the Secretary's Certificate on the Draft Environmental Impact Report (DEIR).

The currently proposed plan for O'Brien Highway consists of two travel lanes northbound (outbound from Boston) and three travel lanes southbound (inbound to Boston). Additional turning lanes are provided at signalized intersections, as needed. At the intersection of O'Brien Highway and new North First Street, the proposed cross-section includes two travel lanes in the northbound direction and three through lanes and a right-turn lane in the southbound direction. The request from commenters was to evaluate the possibility of reducing the overall width of O'Brien Highway (in order to retain the existing Lechmere Station structure) by providing only two (and possibly a third lane for right-turns only) travel lanes southbound. Two specific options were evaluated:

- **Option 1**: Two travel lanes along O'Brien Highway southbound from just north of Third through East Street, maintaining only two shared lanes at the intersection of O'Brien Highway and North First Street; and
- **Option 2**: Two travel lanes along O'Brien Highway southbound from just north of Third through East Street, providing two through lanes and an exclusive right-turn lane at the intersection of O'Brien Highway and North First Street.

The analysis considered both 2030 future traffic volumes (without traffic related to the NorthPoint development) and existing (2007) traffic volumes on the reconstructed O'Brien Highway roadway infrastructure. This second condition was considered to address comments related to the validity of the 2030 traffic projections. The analysis also considers the width of the proposed median island and the proposed inclusion of bicycle lanes on O'Brien Highway, as well as potential impacts to these features. The critical peak hour, with respect to traffic, pedestrian, and

bicycle operations, is the morning peak hour. Therefore, only the morning peak hour is discussed as part of this analysis. Evening peak hour operations were analyzed to confirm that the morning would be the critical condition. All data are provided as an attachment to this memorandum.

The findings of the analysis are that neither Option 1 nor Option 2 are acceptable solutions for traffic, pedestrian, and bicycle operations along O'Brien Highway. Three through lanes are needed in the southbound direction to accommodate vehicular demands and to appropriately store queued vehicles at the traffic signals. An exclusive right-turn lane onto First Street is also needed to manage vehicle queues. Further, a generous sized center median along O'Brien Highway is critical to pedestrian mobility and operations at the intersection of O'Brien Highway and North First Street, as well as its ability to act as a barrier to the southbound left-turn lane movement. The center median allows for additional pedestrian crossing opportunities that could not otherwise be completed and reduces the overall time a pedestrian must wait to cross O'Brien Highway.

■

Option 1

This Option would reduce the travel lanes along O'Brien Highway in the southbound direction from three lanes to two lanes. At North First Street, an exclusive through lane and shared through/right-turn lane would be provided in the southbound direction. Table 1 presents the level of service results of this option as compared to the currently proposed cross-section.

2 Delay – Control delay per vehicle, expressed in seconds

3 LOS – Level-of-Service

4 Q – 95th percentile queue expressed in feet

In the projected future condition, many of the traffic movements along O'Brien Highway at Third Street and North First Street operate near or above capacity. With only two lanes provided in the southbound direction (Option 1), there is a substantive decrease in overall level of service (LOS D to LOS F) at the intersection of O'Brien Highway and North First Street. Notably, the southbound through movement degrades significantly, from an average 28 seconds of delay to over 120 seconds of delay. More importantly, queues in the southbound direction are significantly higher and under Option 1 and would extend back beyond the closest upstream traffic signal. Once queues back through adjacent intersections, there is an increased likelihood that vehicles will block the intersection during a red traffic signal phase, causing "gridlock" and making it difficult for side street traffic to enter the intersection on a green signal indication. Additionally, the idling vehicles in the queue add to localized "hot spot" air quality emissions, which can contribute to unhealthy air quality, particularly during the summer months.

The analysis also considers existing traffic volumes, which are generally the volumes expected along O'Brien Highway immediately after construction is complete. This condition was analyzed because several members of the public expressed concern that there was too much uncertainty in the 2030 traffic projections and the use of existing volumes would show the benefit of a reduced cross-section. While level of service would be slightly improved, queuing in the southbound direction along O'Brien Highway would still be substantial at both Third Street and North First Street and level of service at North First Street would be poor. Therefore, all of the above stated operational concerns related to reducing the O'Brien Highway cross-section are not related solely to traffic projections and do not rely on development that some may consider speculative. Should only two southbound travel lanes be constructed, no additional growth (regional or local) could be accommodated on O'Brien Highway in the future.

Long vehicle queues present a challenge for pedestrians trying to cross O'Brien Highway. If queued vehicles are backed over crosswalks, pedestrians must then weave their way through vehicles. In this condition pedestrians are harder for a driver to see. This may also encourage pedestrians to cross against the traffic signal because they perceive traffic to be at a standstill.

The genesis of the public comments received is the desire of some members of the community to retain the existing Lechmere bus terminal structure. Under Option 1, even though only two approach lanes would be provided in the southbound direction at North First Street, there still would not be sufficient room to provide a sidewalk and bicycle lane adjacent to the bus terminal building. This option would also require a reduction in the median width to accommodate bicycles and pedestrians. The proposed center median is designed to accommodate half crossings (crossing only to the median), as well as full crossings (the entire roadway) of O'Brien Highway. This allows pedestrians to take advantage of every possible interval for crossing O'Brien Highway, while protecting pedestrians from higher volume and higher speed left-turn movements. However, this is dependent upon the provision of a center median island of sufficient width to accommodate those pedestrians who do not make it across in a single movement. Reduction in the median width would limit the number of opportunities a pedestrian has to cross O'Brien Highway, which degrades the pedestrian level of service at the intersection. Pedestrian level of service is a measure of how long a pedestrian must wait to cross the street, not how long it takes a pedestrian to walk across. Therefore reducing the median width, while shortening the crossing distance, does not improve pedestrian level of service. Even under a design that only provides for full crossings, a median for pedestrian refuge is recommended given the high vehicle volume and occasionally high travel speeds experienced along O'Brien Highway. Some portion of the population will choose to initiate a crossing of O'Brien Highway beyond the time at which a full crossing can be made and prefer to wait in the median refuge area than on the sidewalk.

■

Option 2

Option 2 provides two exclusive through lanes and an exclusive right-turn lane southbound on O'Brien Highway at North First Street. All other geometric features are identical to Option 1. Table 2 presents the level of service results of this option as compared to the currently proposed cross-section.

Note: Shaded cells denote Level-of-Service E/F conditions

NA Lane Group not provided under this condition

Volume exceeds capacity, queue may be longer

1 V/C – Volume-to-capacity ratio

2 Delay – Control delay per vehicle, expressed in seconds

3 LOS – Level-of-Service

4 Q – 95th percentile queue expressed in feet

The findings of the Option 2 analysis are very similar to Option 1. This is expected since the options themselves are not very different. The southbound O'Brien Highway approach at North First Street operates better under Option 2 and queuing is slightly reduced (by about 140 feet or 6 vehicles per lane) when compared to Option 1. However, queues are still significant in the southbound direction and would still extend through adjacent upstream intersections. As discussed above, long

vehicle queues present hazards to pedestrians and interfere with pedestrian, bicycle, and vehicular traffic operations.

Should Option 2 be progressed in order to retain the existing Lechmere bus terminal structure, almost the entire proposed median would have to be removed to accommodate the turn-lane, sidewalk, and bicycle lane. Shifting the alignment of the roadway to the east is not possible due to existing land uses on the opposite side of the roadway. Elimination of the median island would dramatically change levels of service and operations at the intersection of O'Brien Highway and North First Street for both vehicles and pedestrians. It also raises safety concerns for pedestrians who begin crossing too late to complete the crossing before the signal changes. The level of service analysis results presented in Table 2 do not consider the impacts of eliminating the median. Longer queues and worse levels of service would be realized on all approaches to the intersection.

Intersection Summary

Area Type: Other
Cycle Length: 120
Actuated Cycle Length: 120
Offset: 31 (26%), Referenced to phase 2:WBT and 6:EBT, Start of Green
Natural Cycle: 140
Control Type: Actuated-Coordinated
~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 6: O'Brien Hwy & First Street Extension

Source: VHB, Inc. using Synchro 7 (Build 773 Revision 8) software.
Note: Shaded cells denote LOS E/F conditions.
1 V/C – Volume-to-capacity ratio.
2 Delay – Control delay per vehicle, expressed in seconds.
3 LOS – Level-of-Service.
4 Q – 95th percentile queue length estimate, in feet.
NB=Northbound; SB=Southbound; EB=Eastbound; WB=Westbound; LT=left-turn; TH=through; RT=right-turn
m Volume for 95th percentile queue is metered by upstream signal
95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

Intersection Summary

Area Type: Other
Cycle Length: 120
Actuated Cycle Length: 120
Offset: 31 (26%), Referenced to phase 2:WBT and 6:EBT, Start of Green
Natural Cycle: 150
Control Type: Actuated-Coordinated

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 6: O'Brien Hwy & First Street Extension

	SB LT-TH-RT	0.16	46	D	43

Source: VHB, Inc. using Synchro 7 (Build 773 Revision 8) software.
Note: Shaded cells denote LOS E/F conditions.
1 V/C – Volume-to-capacity ratio.
2 Delay – Control delay per vehicle, expressed in seconds.
3 LOS – Level-of-Service.
4 Q – 95th percentile queue length estimate, in feet.
NB=Northbound; SB=Southbound; EB=Eastbound; WB=Westbound; LT=left-turn; TH=through; RT=right-turn
m Volume for 95th percentile queue is metered by upstream signal
95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

Intersection Summary

Area Type: Other
Cycle Length: 120
Actuated Cycle Length: 120
Offset: 31 (26%), Referenced to phase 2:WBT and 6:EBT, Start of Green
Natural Cycle: 120
Control Type: Actuated-Coordinated

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 6: O'Brien Hwy & First Street Extension

Source: VHB, Inc. using Synchro 7 (Build 773 Revision 8) software.
Note: Shaded cells denote LOS E/F conditions.
1 V/C – Volume-to-capacity ratio.
2 Delay – Control delay per vehicle, expressed in seconds.
3 LOS – Level-of-Service.
4 Q – 95th percentile queue length estimate, in feet.
NB=Northbound; SB=Southbound; EB=Eastbound; WB=Westbound; LT=left-turn; TH=through; RT=right-turn
m Volume for 95th percentile queue is metered by upstream signal
95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

Source: VHB, Inc. using Synchro 7 (Build 773 Revision 8) software.
Note: Shaded cells denote LOS E/F conditions.
1 V/C – Volume-to-capacity ratio.
2 Delay – Control delay per vehicle, expressed in seconds.
3 LOS – Level-of-Service.
4 Q – 95th percentile queue length estimate, in feet.
NB=Northbound; SB=Southbound; EB=Eastbound; WB=Westbound; LT=left-turn; TH=through; RT=right-turn
m Volume for 95th percentile queue is metered by upstream signal
95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

Source: VHB, Inc. using Synchro 7 (Build 773 Revision 8) software.
Note: Shaded cells denote LOS E/F conditions.
1 V/C – Volume-to-capacity ratio.
2 Delay – Control delay per vehicle, expressed in seconds.
3 LOS – Level-of-Service.
4 Q – 95th percentile queue length estimate, in feet.
NB=Northbound; SB=Southbound; EB=Eastbound; WB=Westbound; LT=left-turn; TH=through; RT=right-turn
m Volume for 95th percentile queue is metered by upstream signal
95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.
