Roadway and Traffic Signal Inventory

Existing Conditions

Evaluation of the transportation impacts associated with the Project requires a thorough understanding of the existing transportation conditions in the study area. Existing transportation conditions in the study area include roadway geometry and traffic controls. Each of these elements is described in detail below.

Roadways

Interstate 93

Interstate 93 is the only interstate highway near the study area, running from the Massachusetts/New Hampshire border near Methuen to Canton where it terminates at I-95. I-93 forms the southeastern boundary of the study area and serves as a major commuting route from the northern suburbs to downtown Boston. The only access to I-93 inbound near the study area is at the Route 28/38 intersection, adjacent to the Assembly Square Mall. Access from I-93 northbound is also possible at the Route 28/38 intersection and at a recently completed exit ramp to Cambridge Street/Washington Street near Sullivan Square on the Boston/Somerville city line. Access to and from I-93 north of the study area is available at the Mystic Avenue interchange on the Somerville/Medford city line. Supplemental connections between the study area and I-93 are also possible via Rutherford Avenue in Charlestown and via Leverett Circle in Boston. In the study area, I-93 carries nearly 150,000 vehicles per day with an average of 125 auto accidents per year.

Route 28/McGrath-O'Brien Highway

Route 28/McGrath-O'Brien Highway is a major multilane arterial that provides alternative connections from I-93 to Cambridge and downtown Boston. To the north of the study area, Route 28 is known as the Fellsway, which traverses Medford. To the south of the study area, Route 28 travels though Leverett Circle where connections are possible to the interstate system and Storrow Drive. Route 28 also provides important circulation functions within the study area linking Medford and the Assembly Square neighborhood to Winter Hill, East Somerville, and East Cambridge. Near Lechmere Station, Route 28 carries over 40,000 vehicles per day with 65,000 vehicles per day between Medford/Highland and Washington Streets. Approximately 170 auto accidents occur along this corridor annually. Observed truck volumes on Route 28 south of Medford Street are between 500 and 1000.

Route 38/Mystic Avenue

Route 38/Mystic Avenue parallels I-93 offering access to commercial areas in Somerville and Medford and providing links to I-93 entrance and exit ramps. Mystic Avenue begins near Medford Square and ends near Sullivan Square in Charlestown. Mystic Avenue is generally a four-lane arterial carrying approximately 35,000 vehicles per day. Approximately 205 auto accidents occur annually along this corridor.

Route 16/Mystic Valley Parkway

Route 16/Mystic Valley Parkway travels through the northern section of the study area in an east-west direction linking Wellington Station and Alewife Station. Route 16 is generally a four-lane arterial roadway carrying approximately 20,000 vehicles per day. The corridor averages 236 auto accidents annually.

Route 60/High Street

Route 60/High Street travels through the northern section of the study area in an east-west direction linking Medford Square and Winthrop Square to West Medford. Route 60 is two-lane arterial roadway carrying approximately 18,000 vehicles per day with approximately 90 auto accidents a year.

Broadway

Broadway crosses the study area in a northwest-southeast direction linking Powderhouse Square near Tufts University to East Somerville and Sullivan Square via the Winter Hill neighborhood. Between Powderhouse Square and Sullivan Square, Broadway is generally a four-lane arterial roadway carrying between 20,000 and 30,000 vehicles per day. The corridor averages approximately 195 auto accidents a year. Truck volumes on sections of Broadway can be up to 499 trucks per day.

Washington Street

Washington Street runs in an east-west direction across the southern portion of the study area, linking Union Square to Sullivan Square. In general, Washington Street is two-lane arterial roadway carrying approximately 11,000 vehicles per day and averaging 120 auto accidents a year. East of Route 28, there are 29,000 vehicles per day on this segment of Washington Street. Observed truck volumes on Washington Street range between 1000 and 2500 trucks per day.

Medford Street

Medford Street crosses the study area in a north-south direction beginning in Medford Square as Main Street and crosses Harvard Street where it becomes Medford Street. Medford Street then enters Somerville as it crosses Broadway at Magoun Square and continues behind the Somerville City Hall/High School

complex where it crosses the MBTA's Lowell Line at Gilman Square. Medford Street continues to the south and runs parallel with Route 28 to the east of Union Square. South of Somerville Avenue, Medford Avenue separates from Route 28, crossing the MBTA's Fitchburg Line and the Grand Junction Branch where it enters Cambridge and becomes Gore Street behind the Twin City Shopping Plaza. Gore Street terminates at Route 28 and the northwest corner of the existing Lechmere Station. In general, Medford Street is a two-lane arterial roadway carrying approximately 21,000 vehicles per day. On an annual average, 80 auto accidents occur along the Medford Street corridor through the City of Somerville. Observed truck volumes on sections of Medford Street can range from 0 to 499 trucks per day.

Highland Avenue

Highland Avenue crosses the study area in an east-west direction, beginning at Davis Square, passing by Somerville Hospital and the Somerville City Hall/ High School complex and ending at Medford Street near its intersection with Route 28. Highland Avenue serves a critical function in connecting the primary commercial district of Somerville (Davis Square) with its government and medical centers. In many ways, Highland Avenue is a symbolic "Main Street" for Somerville. Highland Avenue is a two-lane roadway carrying approximately 13,000 vehicles per day, with approximately 90 auto accidents a year. Observed truck volumes on sections of Highland Avenue can range from 1000 to 1499 trucks per day.

Somerville Avenue

Somerville Avenue runs in an east-west direction along the MBTA's Fitchburg Commuter Rail Line, beginning at Porter Square and continuing through Union Square. The land uses fronting Somerville Avenue are generally commercial or light industrial with residential neighborhoods located to the north of the roadway. Somerville Avenue ends at Route 28, approximately one mile west of Lechmere Station. Somerville Avenue is a two-lane roadway carrying approximately 8,000 vehicles per day, with approximately 18,000 vehicles per day at Bow Street and Somerville Avenue. Approximately 140 auto accidents occur annually on Somerville Avenue. Observed truck volumes on Somerville Avenue can range from 1000 to 2499 trucks per day in the vicinity of Union Square, and range from 1000 to 1999 trucks per day near Davis Square.

Elm Street

Elm Street begins at Davis Square and connects to Somerville Avenue just to the east of Porter Square. Elm Street provides an important connection between Davis Square and Union Square via Somerville Avenue. Elm Street generally forms the southwestern edge of the study area and is a two-lane arterial carrying approximately 11,000 vehicles per day, with approximately 40 auto accidents a year. In the vicinity of Porter Square, there are approximately 15,900 vehicles per day.

Observed truck volumes on Elm Street in the vicinity of Porter Square can range between 0 and 499 trucks per day.

College Avenue

College Avenue begins at Davis Square and traverses the study area in a southwest-northeast direction. Approximately one-half mile northeast of Davis Square, College Avenue enters Powderhouse Square and turns to the north, traveling through the Tufts University campus crossing Boston Street and ending at Summer Street in the Medford Hillside neighborhood in Medford. College Avenue is generally a two-lane arterial carrying 11,000 vehicles per day. The auto accident rate along this corridor in Somerville is approximately 40 accidents per year.

Boston Avenue

Boston Avenue enters the study area from West Medford and continues across Somerville and Medford in a northwest-southeast direction. Boston Avenue parallels the MBTA's Lowell Commuter Rail Line and passes near Tufts University at its intersection with College Avenue. Boston Avenue then continues to an intersection with Broadway at Ball Square, where its character changes to that of a neighborhood residential street. Boston Avenue is generally two lanes and carries between 11,000 and 18,000 vehicles per day. Approximately 20 auto accidents occur along the Boston Street corridor within the City of Somerville.

Curtis Street/Winthrop Street

Curtis Street/Winthrop Street begins with Curtis Street at Teele Square to the northwest of Davis Square in Somerville and continues in a north-south direction to the Somerville/Medford City Line on the west side of the Tufts University campus. In Medford the roadway is named Winthrop Street and continues across the Mystic River into West Medford. Curtis Street/Winthrop Street is a two-lane roadway that carries between 8,000 and 10,000 vehicles per day. Approximately 15 auto accidents occur along this corridor annually. Curtis and Winthrop Streets generally form the northwestern boundary of the study area.

Intersections

Mystic Valley Parkway/Alewife Brook Parkway

The intersection of Mystic Valley Parkway/Alewife Brook Parkway is an unsignalized roundabout. Mystic Valley travels into the roundabout from the west and the north while the Alewife Brook Parkway approach from the south. The Mystic Valley Parkway eastbound approach consists of one lane entering and exiting the roundabout. The Mystic Valley Parkway southbound approach consists of two striped lanes just prior to and two lanes exiting the roundabout. The Alewife Brook

Parkway northbound approach consists of two lanes entering and exiting the roundabout. The roundabout has delta islands to separate the approach lanes from the departure lanes on each leg while in the center of the roundabout has a raised circular island to enforce the flow direction. All of these approaches are under "YIELD" control. In addition, there is a side street, Capen Street, consisting of one general-purpose lane entering from the east into the roundabout. This approach does not have a delta island separating the approach from the departure and is under "STOP" control.

There are sidewalks present on all approaches, with the exception being that there is only sidewalk present on the north side of Capen Street. However, there are no crosswalks located at this intersection. Land use in the area consists of commercial uses in the vicinity of the intersection.

Mystic Valley Parkway/Auburn Street

The intersection of Mystic Valley Parkway and Auburn Street is an off-set signalized intersection. Mystic Valley Parkway runs in an east-west direction while Auburn Street intersects from the north-south. The Mystic Valley Parkway eastbound approach consists of a through lane and a shared through/right-turn lane. There is a delta island channelizing the right-turn movement, but it is close to the intersection and does get blocked by the through movement. The Mystic Valley Parkway westbound approach consists of two general-purpose lanes. The Auburn Street northbound and southbound approaches consist of one general-purpose lane. A raised median island separates the northbound approach lane from the departure lane while another raised island channelize the eastbound right turn.

There are sidewalks and crosswalks present on all approaches. The intersection operates as a four phase fully-actuated signal which includes an exclusive pedestrian phase and split phasing for Auburn Street. Land use in the area consists of Retail uses on the southeast corner of the intersection while residential uses are to the northwest of the intersection.

Mystic Valley Parkway/Winthrop Street

The intersection of Mystic Valley Parkway and Winthrop Street is a four-way signalized intersection. Mystic Valley Parkway runs in an east-west direction while Winthrop Street intersects from the north-south. The Mystic Valley Parkway eastbound approach consists of two general-purpose lanes. The Mystic Valley Parkway westbound approach consists of a through lane and an exclusive right-turn lane. The Winthrop Street northbound and southbound approaches consist of one general-purpose lane.

Sidewalks are present on all approaches, with the exception of on the south side of Mystic Valley Parkway. Crosswalk is located across each leg of the intersection. The intersection operates as a four phase fully-actuated signal which includes an

exclusive pedestrian phase and a southbound lead phase. Land use in the area consists of residential uses north of the intersection while parkway is present south of the intersection.

Boston Avenue/High Street/Sagamore Avenue

The intersection of Boston Avenue and High Street/Sagamore Avenue is a four-way unsignalized intersection. High Street runs in an east-west direction with Sagamore Avenue approaching from the north and Boston Avenue approaching from the south. The High Street eastbound and westbound approaches consist of a general purpose lane. Both the Sagamore Avenue southbound approach and the Boston Avenue northbound approach consist of a gerenal purpose lane.

Sidewalks and crosswalks are present on all approaches. The intersection is under flashing control, with High Street under flashing yellow control and Boston Avenue under flashing red (STOP) control. However, it was observed in the field that this flashing unit was not working presently. Land use in the area consists mainly of residential use in the immediate vicinity of the intersection.

Mystic Valley Parkway/Boston Avenue

The intersection of Mystic Valley Parkway and Boston Avenue forms a four-way signalized intersection. Mystic Valley Parkway runs in an east-west direction, and Boston Avenue approaches from the north and south. The Mystic Valley Parkway eastbound and westbound approaches consist of two general purpose lanes. The Boston Avenue northbound and southbound approaches consist of a general purpose lane.

Sidewalks and crosswalks are present on all approaches. The intersection operates as a three phase fully-actuated signal which includes an exclusive pedestrian phase. Land use in the area consists of residential and retail uses south of the intersection while parkway is present north of the intersection.

Boston Avenue/North Street

The intersection of Boston Avenue and North Street forms a four-way signalized intersection. Boston Avenue runs in a north-south direction, and North Street approaches from the east and west. The Boston Avenue northbound and southbound approaches consist of a general purpose lane. The North Street eastbound and westbound approaches consist of a general purpose lane.

Sidewalks and crosswalks are present on all approaches. The intersection operates as a three phase pre-timed signal which includes an exclusive pedestrian phase. Land use in the area consists of residential and retail uses in the immediate vicinity of the intersection.

Boston Avenue/Winthrop Street

The intersection of Boston Avenue and Winthrop Street forms a four-way signalized intersection. Boston Avenue runs in a north-south direction, and Winthrop Street approaches from the east and west. The Boston Avenue northbound and southbound approaches consist of a general purpose lane. The Winthrop Street eastbound and westbound approaches consist of a general purpose lane.

Sidewalks and crosswalks are present on all approaches. The intersection operates as a three phase pre-timed signal which includes an exclusive pedestrian phase. Land use in the area consists of residential and retail uses in the immediate vicinity of the intersection.

Boston Avenue/College Avenue

The intersection of Boston Avenue and College Avenue forms a four-way signalized intersection. Boston Avenue runs in a north-south direction, and College Avenue approaches from the east and west. The Boston Avenue northbound approach consists of a general purpose lane and the southbound approach consists of a shared left/through lane and an exclusive right-turn lane. The College Avenue eastbound approach consists of an exclusive left-turn lane and a shared through/right-turn lane and the westbound approach consists of a general purpose lane.

Sidewalks and crosswalks are present on all approaches. The intersection operates as a four phase fully-actuated signal which includes an exclusive pedestrian phase and split phasing for the side streets. Land use in the area consists mainly of Tufts University buildings in the immediate vicinity of the intersection.

Boston Avenue/Harvard Street/Warner Street

The intersection of Boston Avenue and Harvard Street/Warner Street forms a four-way signalized intersection. Boston Avenue runs in a north-south direction, Harvard Street approaches from the east and Warner Street approaches from the west. The Boston Avenue northbound and southbound approaches consist of a general purpose lane. The Harvard Street westbound approach consists of a shared left/through lane and an exclusive right-turn lane. The Warner Street eastbound approach consists of a general purpose lane.

Sidewalks and crosswalks are present on all approaches. The intersection operates as a five phase fully-actuated signal which includes an exclusive pedestrian phase and lead phasing for the Harvard Street westbound approach and the Boston Street southbound approach. Land use in the area consists of residential and retail uses in the immediate vicinity of the intersection.

Boston Avenue/Broadway

Broadway intersects Boston Avenue from the east and west, and Rodgers Street intersections Boston Avenue from the southwest to form this 5-legged, signalized intersection. Rodgers is one-way away from the intersection. Boston Avenue runs in a north-south direction. Rodgers approaches the intersection from the southwest and Broadway runs in an east-west direction. Boston Avenue northbound consists of a shared left-turn/through lane, and a right-turn lane. The Boston Avenue southbound approach consists of one lane allowing all movements and an exclusive right-turn lane. The Broadway eastbound approach consists of a shared left-turn/through lane, and the westbound approach consists of a single lane allowing all movements.

The intersection operates as a two phase signal which includes an exclusive pedestrian phase. Land use in the area consists of residential, retail and commercial uses.

Broadway/Winchester Street/Albion Street

Winchester Street intersects Broadway from the north, and Albion Street intersects Broadway from the northeast to form this four-legged, unsignalized intersection. Albion Street operates in a one-way direction towards the intersection. All approaches to this intersection consist of a single lane allowing all movements. Winchester Street and Albion Street operate under STOP control. Land use in the vicinity of this intersection consists of residential, retail and commercial uses.

Powder House Blvd/College Avenue/Broadway/Warner Street

The intersection of Powder House Boulevard and College Avenue/Broadway/Warner Street forms a six-legged partially signalized rotary. College Avenue runs in a north-south direction, Broadway approaches from the east and west, Powder House Boulevard approaches from the northwest and Warner Street approaches from the northeast. Each approach consists of a general purpose lane entering and exiting the rotary. Each leg has a raised delta island separating the approach traffic from the departing. At the center of the rotary is a raised circular island to enforce flow direction.

Sidewalks and crosswalks are present on all approaches. In addition, there are also three crossings to the center island of the rotary. The intersection operates under flashing operation unless a pedestrian actuated one of the four crossings under signal control. These crossing are the three to the central island and the crossing on the Broadway eastbound approach. When the pedestrian phase is actuated, the signal

goes from flashing operation to the exclusive pedestrian phase. Once the exclusive pedestrian phase is serviced, the signal reverts back to flashing operation again. Land use in the area consists of residential, retail and park land uses in the immediate vicinity of the intersection.

Main Street/High Street/Salem Street/Forest Avenue/Riverside Avenue

The intersection of Main Street and High Street/Salem Street/Forest Avenue/Riverside Avenue/Clipper Ship Road forms a six-leg signalized intersection. Main Street/Forest Street runs in a north-south direction, High Street approaches from the west, Riverside Avenue approaches from the east and Salem Street approaches from the northeast. Clipper Ship Road runs parallel with Riverside Avenue and intersects Main Street just south on the main intersection. The Main Street northbound approach consists of a through land and a channelized right-tune lane at Clipper Ship Road and as it continues northbound is becomes a right-turn only land onto Riverside Avenue. The Forest Street southbound approaches consist of a general purpose lane. Salem Street is a one-way street entering the intersection for the northeast and consists of two left-turn lanes and a shared through/right-turn lane. The High Street eastbound approach consists of a through lane and a channelized right-turn lane. Both Riverside Avenue and Clipper Ship Road are one-way street exiting the intersection.

Sidewalks and crosswalks are present on all approaches. The intersection operates as a interval based pre-timed signal with concurrent pedestrian movements. Land use in the area consists of retail/commercial uses in the immediate vicinity of the intersection.

Main Street/South Street/Mystic Valley Parkway EB Ramps

The intersection of Main Street and South Street/Mystic Valley EB Ramps forms a four-legged unsignalized intersection. Main Street runs in a north-south direction, both South Street and Mystic Valley Parkway EB Off-Ramp merge just west of the intersection and the Mystic Valley Parkway EB On-Ramp exiting the intersection to the east. The Main Street northbound consists of a shared through/right-turn lane and the southbound approach consists of a shared left/through lane. The South Street/Mystic Valley Parkway EB Off-Ramp eastbound approach consists of a general purpose lane.

Sidewalks are present along all approaches. Crosswalks are present on the Main Street northbound approach and the South Street/Mystic Valley Parkway EB Ramps eastbound and westbound approaches. The intersection operates under flashing operation, with Main Street getting a flashing yellow indication and South Street/Mystic Valley Parkway EB Off-Ramps getting a flashing red indication. Land use in the area consists of retail/commercial uses in the immediate vicinity of the intersection.

Main Street/Mystic Valley Parkway WB Ramps

The intersection of Main Street and Mystic Valley WB Ramps forms a four-legged unsignalized intersection. Main Street runs in a north-south direction and the Mystic Valley Parkway WB Ramp intersect form the east and west. The Main Street northbound consists of a shared left/through lane and the southbound approach consists of a shared through/right-turn lane. Mystic Valley Parkway WB Off-Ramp westbound approach consists of a general purpose lane.

Sidewalks are present along all approaches. Crosswalks are present on the Main Street southbound approach and the Mystic Valley Parkway WB Ramps eastbound and westbound approaches. The intersection operates under flashing operation, with Main Street getting a flashing yellow indication and Mystic Valley Parkway WB Off-Ramps getting a flashing red indication. Land use in the area consists of retail/commercial uses in the immediate vicinity of the intersection.

Main Street/Mystic Avenue

The intersection of Main Street and Mystic Avenue/Fire Station Driveway forms a four-legged unsignalized intersection. Main Street enters from the north and west of the intersection, Mystic Avenue enters from the south and the Fire Station Driveway enters from the east. The Main Street northbound consists of a shared left/through lane and a channelized right-turn lane. The Main Street eastbound approach consists of a general purpose lane. The Mystic Avenue northbound approach consists of a general purpose lane and the Fire Station westbound approach consists of a general purpose lane.

Sidewalks are present along all approaches. Crosswalks are present on the Main Street southbound approach and the Mystic Avenue northbound approach. The intersection operates under flashing operation, with Main Street southbound and Mystic Avenue northbound getting a flashing yellow indication and Main Street and the Fire Station Driveway getting a flashing red indication. Land use in the area consists of retail/commercial uses in the immediate vicinity of the intersection.

Main Street/George Street

The intersection of Main Street and George Street forms a three-legged unsignalized intersection. Main Street runs in a north-south direction and George Street approaches from the west. The Main Street northbound and southbound approaches consist of a general purpose lane. The George Street eastbound approach consist of a general purpose lane.

Sidewalks and crosswalks are present on all approaches. The intersection operates under flashing operation, with Main Street northbound and southbound getting a flashing yellow indication and George Street getting a flashing red indication. Land use in the area consists of residential uses in the immediate vicinity of the

intersection.

College Avenue/George Street

The intersection of College Avenue and George Street forms a four-way unsignalized intersection. College Avenue runs in a north-south direction and George Street approaches from the east and west. The College Avenue northbound and southbound approaches consist of a general purpose lane. The George Street eastbound and westbound approaches consist of a general purpose lane.

Sidewalks and crosswalks are present on all approaches. The intersection is under "STOP" control for all approaches. Land use in the area consists of residential uses in the immediate vicinity of the intersection.

Main Street/Harvard Street

The intersection of Main Street and Harvard Street forms a four-way signalized intersection. Main Street runs in a north-south direction and Harvard Street approaches from the east and west. The Main Street northbound and southbound approaches consist of a general purpose lane. The Main Street southbound approach also has angled parking ending just prior to the intersection. The Harvard Street eastbound and westbound approaches consist of a general purpose lane.

Sidewalks and crosswalks are present on all approaches. The intersection operates as a three phase fully-actuated signal which includes an exclusive pedestrian phase. Land use in the area consists of residential and retail uses in the immediate vicinity of the intersection.

Medford Street/Broadway

The intersection of Medford Street and Broadway/Dexter Street/CVS & Dunkin Donuts Driveway forms a six-legged signalized intersection. Medford Street runs in a north-south direction, Broadway runs east-west, Dexter Street approaches from the northeast and the CVS/Dunkin Donuts Driveway approaches from the southwest. The Medford Street northbound and southbound approaches consist of a general purpose lane. The Broadway eastbound approach consists of two un-striped general purpose lanes. The Broadway westbound approach consists of a shared left/through lane, a through lane and an exclusive right-turn lane. The Dexter Street southwest approach consists of a general purpose lane. The CVS/Dunkin Donuts Driveway northeast approach consists of a general purpose lane.

Sidewalks and crosswalks are present on all approaches. The intersection operates as a five phase fully-actuated signal which includes an exclusive pedestrian phase and split phasing for the Medford Street approaches. Land use in the area consists of retail/commercial uses in the immediate vicinity of the intersection.

Medford Street/Lowell Street

The intersection of Medford Street and Lowell Street forms an unsignalized T-intersection. Medford Street runs in a north-south direction and Lowell Street intersects from the west. The Medford Street northbound and southbound approaches consist of a general purpose lane. The Lowell Street eastbound approach consists of a general purpose lane.

Sidewalks are present on all approaches. Crosswalks are present on the Medford Street southbound approach and the Lowell Street approach. The intersection is unsignalized with the Lowell Street under "STOP" sign control. Land use in the area consists of residential and retail uses in the immediate vicinity of the intersection.

Medford Street/Central Street

The intersection of Medford Street and Central Street forms a four-way signalized intersection. Medford Street runs in a north-south direction while Central Street runs east-west. The Medford Street northbound and southbound approaches consist of a general purpose lane. The Central Street eastbound and westbound approaches consist of a general purpose lane.

Sidewalks and crosswalks are present on all approaches. The intersection operates as a three phase pre-timed signal which includes an exclusive pedestrian phase. Land use in the area consists of residential and retail uses in the immediate vicinity of the intersection.

Medford Street/School Street

The intersection of Medford Street and School Street forms a four-legged signalized intersection. Medford Street runs in a north-south direction while School Street runs east-west. The Medford Street northbound and southbound approaches consist of a general purpose lane. The School Street westbound approaches consist of a general purpose lane. The School Street west leg is a one-way street away from the intersection.

Sidewalks and crosswalks are present on all approaches. The intersection operates as a three phase pre-timed signal which includes an exclusive pedestrian phase. Land use in the area consists of residential and retail uses in the immediate vicinity of the intersection.

Medford Street/Pearl Street

Pearl Street intersects Medford Street from the east to form this three-legged, unsignalized intersection. Medford Street runs in a north-south direction, while Pearl Street runs northwest-southwest. The Medford Street northbound and southbound approaches consist of

a single shared lane allowing all movements, and the Pearl Street approach consist of a single lane allowing all movements. Pearl Street is under STOP control. Land use in the area consists of residential and commercial uses along with a park in the southeast corner of the intersection.

Medford Street/Walnut Street

The intersection of Medford Street and Walnut Street forms a four-legged signalized intersection. Medford Street runs in a north-south direction while Walnut Street runs east-west. The Medford Street northbound approach consists of a shared through/right-turn lane and the southbound approach consist of a shared left/through lane. The Walnut Street eastbound approach consists of a general purpose lane. The Walnut Street east leg is a one-way street away from the intersection.

Sidewalks and crosswalks are present on all approaches. The intersection operates as a three phase pre-timed signal which includes an exclusive pedestrian phase. Land use in the area consists of residential and retail uses in the immediate vicinity of the intersection.

Medford Street/Highland Avenue/Hamlet Street

The intersection of Medford Street and Highland Avenue forms a four-legged signalized intersection. Medford Street runs in a north-south direction while Highland Avenue enters from the northwest and Hamlet Street enters from the west. The Medford Street northbound approach consists of a shared left/through lane and a channelized right-turn lane. The Medford Street southbound approach consists of a general purpose lane. The Highland Avenue southeast approach consists of a general purpose lane. The Hamlet Street eastbound approach consists of a general purpose lane.

Sidewalks and crosswalks are present on all approaches. The intersection operates as a three phase pre-timed signal which includes an exclusive pedestrian phase. Land use in the area consists of residential and retail uses in the immediate vicinity of the intersection.

Medford Street/Somerville Avenue/McGrath Highway

The intersection of Medford Street and Somerville Avenue/McGrath Highway forms a four-legged signalized intersection. Medford Street runs in a north-south direction while Somerville Avenue enters from the west. McGrath Highway enters from the north and exits to the east. The Medford Street northbound approach consists of a shared left/through lane, a through lane and a channelized right-turn lane. The Medford Street/McGrath Highway southbound approach consists of a channelized left-turn lane, a through lane and a shared through/right-turn lane. The Somerville Avenue eastbound approach consists of two un-striped general purpose lane. The

McGrath Highway east leg is a one-way street away from the intersection.

Sidewalks are present on all approaches. Crosswalks are present on Medford Street northbound and southbound approaches and the Somerville Avenue eastbound approach. The intersection operates as a three phase pre-timed signal which includes split phasing for Medford Street and unsignalized concurrent pedestrian movements. Land use in the area consists of retail/commercial uses in the immediate vicinity of the intersection.

Highland Avenue/Lowell Street

The intersection of Highland Avenue and Lowell Street forms a four-legged signalized intersection. Highland Avenue runs in an east-west direction while Lowell Street runs north-south. The Highland Avenue eastbound and westbound approaches consist of a general purpose lane. The Lowell Street northbound and southbound approaches consist of a general purpose lane. Lowell Avenue northbound approach is a one-way street entering the intersection.

Sidewalks and crosswalks are present on all approaches. The intersection operates as a three phase fully-actuated signal which includes an exclusive pedestrian phase. Land use in the area consists of residential and retail uses in the immediate vicinity of the intersection.

Highland Avenue/Central Street

The intersection of Highland Avenue and Central Street forms a four-way signalized intersection. Highland Avenue runs in an east-west direction while Central Street runs north-south. The Highland Avenue eastbound and westbound approaches consist of a general purpose lane. The Central Street northbound and southbound approaches consist of a general purpose lane.

Sidewalks and crosswalks are present on all approaches. The intersection operates as a three phase fully-actuated signal which includes an exclusive pedestrian phase. Land use in the area consists of residential and retail uses in the immediate vicinity of the intersection.

Highland Avenue/School Street

The intersection of Highland Avenue and School Street forms a four-legged signalized intersection. Highland Avenue runs in an east-west direction while School Street runs north-south. The Highland Avenue eastbound and westbound approaches consist of a general purpose lane. The School Street southbound approach is a one-way street consists of a general purpose lane. The School Street west leg is a one-way street exiting the intersection.

Sidewalks and crosswalks are present on all approaches. The intersection operates as

a three phase fully-actuated signal which includes an exclusive pedestrian phase. Land use in the area consists of retail/commercial uses in the immediate vicinity of the intersection.

Washington Street/Innerbelt Road

The intersection of Washington Street and Innerbelt Road forms a three-way signalized T-intersection. Washington Street runs in an east-west direction while Innerbelt Road intersects from the south. The Washington Street eastbound consists of a through lane and an exclusive right-turn lane and the westbound approach consists of an exclusive left-turn lane and a through lane. The Innerbelt Road northbound approach consists of two un-striped lane.

Sidewalks are present on all approaches. Crosswalks are present on the Washington Street eastbound approach and the Innerbelt Road approach. The intersection operates as a three phase fully-actuated signal which includes an exclusive pedestrian phase. Land use in the area consists of residential and retail/commercial uses in the immediate vicinity of the intersection.

Washington Street/McGrath Highway

The intersection of Washington Street and McGrath Highway forms a four-legged signalized intersection. Washington Street runs in an east-west direction while McGrath Highway runs north-south. The Washington Street eastbound approach consists of two un-striped channelized left-turn lanes, a through lane and a shared through/right-turn lane. The Washington Street westbound approach consists of three general purpose lanes. The McGrath Highway southbound approach, is divided from the departure by approximately 150 feet of bridge abutments, consists of two un-striped general purpose lane and a channelized left-turn lane. The McGrath Highway northbound approach, is also divided from the departure by approximately 150 feet of bridge abutments, consists of two general purpose lanes.

Sidewalks and crosswalks are present on all approaches. The intersection operates as a five phase pre-timed signal with concurrent pedestrian movements. Land use in the area consists of retail/commercial uses in the immediate vicinity of the intersection.

Washington Street/Somerville Avenue/Webster Street

The intersection of Washington Street and Somerville Avenue/Webster Street forms a four-legged signalized intersection. Washington Street enters from the west, while Somerville Avenue enters from both the north and the east, and Webster Street exits to the south. The Washington Street eastbound approach consists of two general purpose lanes. The Somerville Avenue westbound approach consists of an exclusive left-turn lane, a through lane and an exclusive right-turn lane. The Somerville Avenue southbound approach consists of an exclusive left-turn lane, a shared left/through lane and a shared through/right-turn lane. Webster Street is a one-way

street away from the intersection.

Sidewalks and crosswalks are present on all approaches. The intersection operates as a four phase pre-timed signal, with time-of-day programming, which includes an exclusive pedestrian phase. Land use in the area consists of retail/commercial uses in the immediate vicinity of the intersection.

Washington Street/Beacon Street/Kirkland Street

The intersection of Washington Street and Beacon Street/Kirkland Street forms a four-way signalized intersection. Washington Street enters from the east, while Kirkland Street enters west, and Beacon Street runs north-south. The Washington Street westbound approach consists of a general purpose lane. The Kirkland Street eastbound approach consists of a general purpose lane. The Beacon Street northbound and southbound approach consists of a general purpose lane.

Sidewalks and crosswalks are present on all approaches. The intersection operates as a three phase pre-timed signal which includes an exclusive pedestrian phase. Land use in the area consists of retail/commercial uses in the immediate vicinity of the intersection.

Somerville Avenue/ Prospect Street /Washington Street

The intersection of Somerville Avenue and Prospect Street/Washington Street forms a four-legged signalized intersection. Somerville Avenue runs east-west, while Prospect Street enters from the south, and Washington Street enters from the north. The Somerville Avenue eastbound approach consists of a shared left/through land and a through lane. The Somerville Avenue westbound approach consists of a through lane and a shared through/right-turn lane. The Washington Street southbound approach consists of two exclusive left-turn lanes. Prospect Street is a one-way street consisting of an exclusive left-turn lane, a shared left/through lane and a share through/right-turn lane.

Sidewalks and crosswalks are present on all approaches. The intersection operates as a four phase pre-timed signal, with time-of-day programming, which includes an exclusive pedestrian phase. Land use in the area consists of retail/commercial uses in the immediate vicinity of the intersection.

Prospect Street /Webster Street/Concord Avenue

The intersection of Prospect Street and Webster Street/Concord Avenue forms a five-legged signalized intersection. Prospect Street runs southwest-northeast, while Webster Street runs north-south, and Concord Avenue enters from the west. The Prospect Street northeast approach consists of a general purpose lane. Prospect Street to the northeast is a one-way street away from the intersection. The Webster Street southbound approach is a one-way street consists of a channelize left-turn lane and a

shared through/right-turn lane. The Webster Street northbound approach consists of a general purpose lane. Concord Avenue is a one-way street away from the intersection.

Sidewalks and crosswalks are present on all approaches. The intersection operates as a three phase pre-timed signal which includes an exclusive pedestrian phase. Land use in the area consists of residential and retail/commercial uses in the immediate vicinity of the intersection.

Prospect Street /Cambridge Street

The intersection of Prospect Street and Cambridge Street forms a four-way signalized intersection. Prospect Street runs north-south, while Cambridge Street runs east-west. The Prospect Street northbound and southbound approaches consist of a general purpose lane. The Cambridge Street eastbound and westbound approach consists of a general purpose lane.

Sidewalks and crosswalks are present on all approaches. The intersection operates as an interval-based, pre-timed signal, with time-of-day programming, concurrent pedestrian movements and lead-pedestrian intervals. Land use in the area consists of residential and retail/commercial uses in the immediate vicinity of the intersection.

Prospect Street /Hampshire Street

The intersection of Prospect Street and Hampshire Street forms a four-way signalized intersection. Prospect Street runs north-south, while Hampshire Street runs east-west. The Prospect Street northbound approach consists of two general purpose lanes. The Prospect Street southbound approach consists of a general purpose lane. The Hampshire Street eastbound and westbound approaches consist of a general purpose lane.

Sidewalks and crosswalks are present on all approaches. The intersection operates as an interval-based, pre-timed signal, with time-of-day programming, concurrent pedestrian movements and lead-pedestrian intervals. Land use in the area consists of residential and retail/commercial uses in the immediate vicinity of the intersection.

O'Brien Highway/Third Street

The intersection of Monsignor O'Brien Highway and Third Street forms a three-legged signalized intersection. O'Brien Highway runs east-west, while Third Street intersects from the south. The O'Brien Highway eastbound and westbound approaches consist of three through lanes. Left and right turns are permitted to Third Street from O'Brien Highway. The Third Street northbound approach consists of a left-turn lane and a second undefined lane (operating often as a left-turn and shared left/right-turn lane during peak periods).

Sidewalks are present on all approaches. Crosswalks are provided for the O'Brien Highway east leg and for Third Street. The intersection operates as a pre-timed signal, with concurrent pedestrian movements. Land use in the area consists of retail and commercial uses in the immediate vicinity of the intersection.

O'Brien Highway/Land Boulevard/Charlestown Avenue

The intersection of Monsignor O'Brien Highway and Land Boulevard/Charlestown Avenue forms a four-way signalized intersection. O'Brien Highway runs east-west, while Land Boulevard intersects from the south and Charlestown Avenue (Gilmore Bridge) intersects from the north. The O'Brien Highway eastbound approach consists of an exclusive left-turn lane, three through lanes, and an exclusive right-turn lane. The O'Brien Highway westbound approach consists of an exclusive left-turn lane, two through lanes and an exclusive right-turn lane. The Land Boulevard northbound approach consists of an exclusive left-turn lane, two through lanes and an exclusive right-turn lane. The Charlestown Avenue (Gilmore Bridge) southbound approach consists of two general purpose lanes.

Sidewalks are present on all approaches. Crosswalks are provided for both legs of O'Brien Highway and for Land Boulevard. The intersection operates as a pre-timed signal, with protected left-turn movements for O'Brien Highway and split phasing for Land Boulevard and Charlestown Avenue. Land use in the area consists of retail and commercial uses in the immediate vicinity of the intersection.

O'Brien Highway/Museum Way

The intersection of Monsignor O'Brien Highway and Museum Way forms a three-legged signalized intersection. O'Brien Highway runs east-west, while Museum Way intersects from the north. The O'Brien Highway eastbound approach consists of a shared left/through lane and two through lanes. The O'Brien Highway westbound approach consists of two through lanes and a shared through/right-turn lane. The Museum Way southbound approach consists of an exclusive left-turn lane and an exclusive right-turn lane.

Sidewalks and crosswalks are present on all approaches. The intersection operates as a four phases actuated signal, with a protected left-turn phase for O'Brien Highway eastbound and an exclusive pedestrian phase. Land use in the area consists of retail and commercial uses in the immediate vicinity of the intersection.

Cambridge Street/First Street

The intersection of Cambridge Street and First Street forms a four-legged signalized intersection. Cambridge Street runs east-west, while First Street intersects from the south and busway exit from the station intersects from the north. The Cambridge Street eastbound and westbound approaches consist of two general purpose lanes, allowing for turning movements from Cambridge Street onto First Street. The First

Street northbound approach consists of an exclusive left-turn lane and an exclusive right-turn lane. The busway exit southbound approach consists of one general purpose lane allowing left-turns to Cambridge Street.

Sidewalks are present on all approaches. Crosswalks are provided for both legs of Cambridge Street and for First Street. The intersection operates as an interval-based, pre-timed signal. Land use in the area consists of retail and commercial uses in the immediate vicinity of the intersection.

O'Brien Highway at Third Street

Third Street intersects Monsignor O'Brien Highway from the south to form a three-legged, T-type, signalized intersection. The Third Street approach consists of a left turn lane and a second undefined lane (operating often as a left-turn and shared left/right-turn lane during peak periods). The Monsignor O'Brien Highway eastbound and westbound approaches each consist of three through lanes. Left and right turns are permitted to Third Street from Monsignor O'Brien Highway.

O'Brien Highway at Water Street

Water Street intersects Monsignor O'Brien Highway from the north to form a three-legged, T-type, unsignalized intersection. Given the center median along O'Brien Highway at this location, Water Street allows for right-turn in/right-turn out movements only. Monsignor O'Brien Highway consists of three lanes in each direction.

O'Brien Highway / North First Street

This intersection does not exist under current conditions

O'Brien Highway / Land Boulevard/Charlestown Avenue

Land Boulevard intersects Monsignor O'Brien Highway from the north and the south to form a four-legged, signalized intersection. The Land Boulevard northbound approach consists of one left-turn lane, two through lanes and one right-turn lane. The Charlestown Avenue (Gilmore Bridge) southbound approach consists of two shared lanes. The Monsignor O'Brien Highway eastbound approach consists of an exclusive left-turn lane, three through lanes, and an exclusive right-turn lane. The Monsignor O'Brien Highway westbound approach consists of an exclusive left-turn lane, two through lanes, and an exclusive right-turn lane. This intersection experiences poor level of service and lengthy queuing during both the morning and evening peak hours.

O'Brien Highway/ Museum Way

Museum Way intersects Monsignor O'Brien Highway from the north to form a three-legged, T-type, signalized intersection. The Museum Way approach consists of one left-turn lane and one right-turn lane. The Monsignor O'Brien Highway eastbound approach consists of a shared left-through lane and two through lanes. The Monsignor O'Brien Highway westbound approach consist of two through lanes and one shared through/right-turn lane.

Cambridge Street /First Street

First Street intersects Cambridge Street from the south to form a four-legged, signalized intersection. The First Street northbound approach consists of one left-turn lane and one right-turn lane. The busway exit from the station on the southbound approach is one-way and consists of a one lane allowing left-turns to Cambridge Street. The Cambridge Street eastbound and westbound approaches consist of two lanes allowing turns into the south leg of First Street and through movements.

O'Brien Highway / East Street

East Street intersects Monsignor O'Brien Highway from the north and Cambridge Street intersects Monsignor O'Brien Highway from the south to form a four-legged, signalized intersection. The East Street southbound approach consists of a single multi-purpose lane. The Cambridge Street northbound approach consists of a shared left-turn/through lane, and two right turn lanes. The Monsignor O'Brien Highway eastbound approach consists of one left-turn lane, three through lanes and an exclusive right-turn lane. The Monsignor O'Brien Highway westbound approach consists of two left-turn lanes, a through lane and one shared through/right-turn lane.

Total	196	207	97	12	48	40	10	104
Weekday Evening Peak Hour:								
Entering	151	160	75	10	37	30	8	80
Exiting	82	87	41	5	20	17	4	43
Total	233	247	116	15	57	47	12	123

[a]Mode splits based on 1990 U.S. Census Data and Statistics for Tract No. 3521 published by the CTPS for the Metropolitan Planning Organization in the 1997 Transportation Plan for the Boston region, approved April 29, 1997.
[b]Based on ITE LUC 220 – Apartment; 392 units.
[c]Multiply ITE vehicle trips by vehicle occupancy ratio of 1.06 persons/vehicle per census tract data.
[d]Assume 47 percent of total person trips.
[e]Assume 6 percent of total person trips.
[f]Assume 23 percent of total person trips.
[g]Assume 19 percent of total person trips.
[h]Assume 5 percent of total person trips.
[i]Drive-alone plus rideshare person trips divided by vehicle occupancy ratio of 1.06 persons per vehicle.

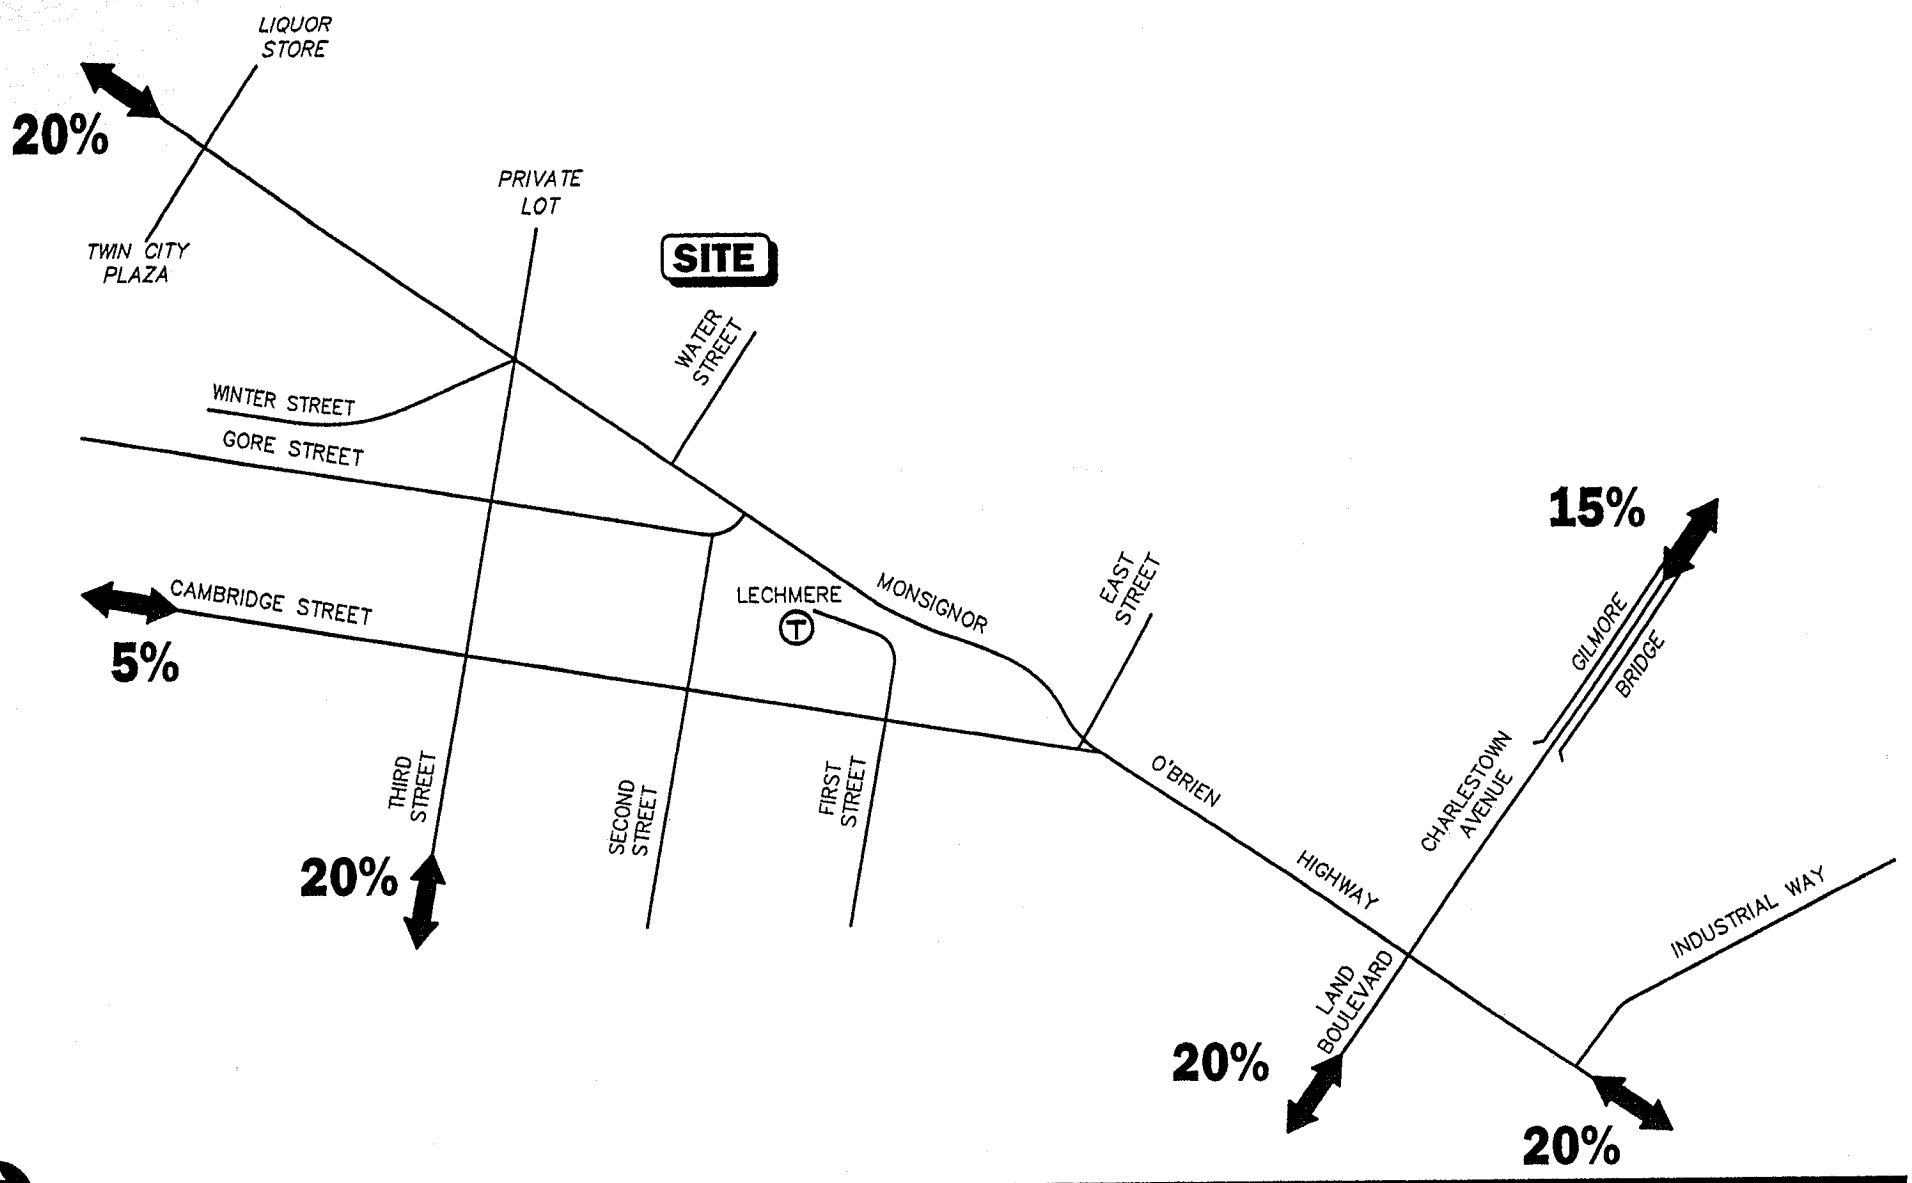
Bicycle trips are estimated to be 132 (66 in and 66 out) on a daily basis, 10 trips (2 in and 8 out), and 12 trips (8 in and 4 out) during the morning and evening peak hours, respectively.

The proposed development is expected to generate an average of 2 truck trips per day, based on anticipated trash and recycling schedules and other deliveries. The vehicle-trip estimates include truck trips, as these are implicitly contained in trip-generation formulae.

TRAFFIC DISTRIBUTION AND ASSIGNMENT

Directional distribution of generated trips to and from the proposed development is expected to follow existing traffic patterns which, in turn, are a function of population densities and available travel routes. In developing the travel route, the following was completed:

- Review of existing trip patterns of site
- Review of other available traffic studies
- Review of 1990 and 2000 Journey-To-Work (JTW) Census Data



Based upon this data, the overall trip-distribution pattern was developed in consultation with City officials and is summarized in Table 12. A graphical depiction appears on Figure 11.

Table 12
TRIP DISTRIBUTION SUMMARY

Roadway	Direction (To/From)	Percent To/From the Site
O'Brien Highway	East	20
O'Brien Highway	West	20
Third Street	South	20
Land Boulevard	North	15
Land Boulevard	South	20
Cambridge Street	West	5
TOTAL		100

The peak-hour site-generated traffic volumes were distributed on the roadway network according to the distribution shown in Table 12 and Figure 11. Figure 12 depicts the weekday morning and weekday evening site-generated traffic volume flow networks for 2006 conditions. These volumes were then added to the 2006 Baseline condition traffic flow networks to derive the 2006 Build condition networks, shown as Figure 13 for the weekday morning and weekday evening peak hours. Figure 14 represents the projected 2006 Build Peak Hour Pedestrian Volumes.

A summary of the peak-hour projected traffic-volume changes in the vicinity of the site drive is shown in Table 13. These volumes are based on the expected increases from the project traffic volumes.

P:\4743\4743rda.dwg 4/13/2006 4:09:58 PM EDT

Table 13
2006 PEAK-HOUR TRAFFIC-VOLUME INCREASES[a]

Location	2006 Baseline	2006 Build	Volume Difference	Percent Increase
O'Brien Highway, west of Third Street:				
Weekday Morning	3,027	3,048	21	0.7
Weekday Evening	2,816	2,841	25	0.9
O'Brien Highway, east of Land Boulevard:				
Weekday Morning	2,773	2,794	21	0.8
Weekday Evening	2,808	2,833	25	0.9
Third Street, south of O'Brien Highway:				
Weekday Morning	931	951	20	2.1
Weekday Evening	1,185	1,196	11	0.9
Cambridge Street, south of O'Brien Highway:				
Weekday Morning	936	941	5	0.5
Weekday Evening	1,129	1,149	20	1.8
Land Boulevard, south of O'Brien Highway:				
Weekday Morning	2,316	2,337	21	0.9
Weekday Evening	3,163	3,187	24	0.8
Land Boulevard, north of O'Brien Highway:				
Weekday Morning	2,212	2,228	16	0.7
Weekday Evening	2,797	2,815	18	0.6

[a]Two-way volume.

As shown in Table 13, project-related traffic-volume increases at most locations are estimated to range between 0.5 and 2.1 percent during the weekday morning peak hour and between 0.6 and 1.8 percent during the weekday evening peak hour.

Under Review:
56-61 Clyde St (MaxPak site): seeking 199 units.

Received Zoning approval:
515 Somerville: 39 residential units, plus commercial. Received special permits. Under stop work order for enviro/demolition infractions.
343-349 Summer St: 14 residential units. Received special permits. Litigated, cannot satisfy conditions of approval, future uncertain.

COs in last year:
131-135 Willow Ave: 11 units. Not built according to permits, some units without COs. (condo)
1188-1194 Broadway: 21 units plus commercial. (condo)
43-45 Pitman St: 10 units (presently rental)

Completed in last few years:
50 Bow St: 14 units. (condo)
24-28 Marshall St:
165 Beacon St: 17 units.
27 Osgood St: 14 units (condo).
35 Charlestown: 34 units (affordable rental)

40B Affordable Housing:
65 Temple: 15 units (constructed).
1-16 Capen Ct: 95 units (permitted).
405 Alewife Brook Pkwy: 95 units (permitted).
Also a VNA facility on Lowell Street (can't find the file right now).

CTPS Memos

DRAFT MEMORANDUM

To: Green Line Extension Project Files **August 18, 2008**

From: Scott Peterson, CTPS

Re: Kiss-n-ride Demand at New Green Line Stations

Introduction

The travel demand model that CTPS uses breaks access to a transit station into walk access and drive access through the use of a node that connects it to the station. The drive access node is used to attract two types of auto trips to a transit station namely: people driving to the park-and-ride (PNR) lots to park and those that get dropped off by another person. In the modeling work done for the Green Line Extension project, only the Mystic Valley Station (MVP) was allowed to have a drive access connection and this only occurred on selected alternatives. The reasons for this approach were to focus on understanding the parking demand at MVP the terminal station, and not worry about drop-offs at intermediate stations. Now that the majority of the modeling work is complete, we can approximate the drop-offs based on surveys of existing stations using an off-model approach. This memo presents the results of this off-model approach and itemizes the number and impact of adding drop-offs to the alternatives.

Drop-offs Transit Analysis

CTPS conducted a survey in the spring of 2007 to understand the use by station and mode of drop-offs at transit stations across eastern Massachusetts. This work showed that within the urban core, surface rail stops generally have between 3-7% of their daily boardings originating from drop-offs. An average of 5% was used in the Green Line Ext analysis, pivoting off of the unconstrained modeling results. Applying this percentage to the daily boardings for all new Green Line stations, allowed us to calculate an estimate of drop-offs that may occur at those stations. It was assumed that the people car-pooling would not have carpooled otherwise and are carpooling now due to solely to the project. Since it was unlikely that the person driving the person being dropped off would be driving past the station without a detour, it was assumed that only 70% of a 5-mile trip one-way would be saved in the estimate of VMT being saved. The estimate for drop-offs from this analysis ranged from a low of 200 new daily transit trips for Alt. 6, which consisted of only Union Square to a high of 820 for Alt. 7. Alt 3 and 4 had 750 new daily transit boardings, Alt 5a/5b had 650/670 new transit boardings, and Alt 1/2a/2b had 720 new transit boardings.

Drop-offs Highway and Air Quality Analysis

These drop-offs translated into a reduction of between 1,400 vehicle miles traveled (VMT) in Alt 6 to 5,740 in Alt 7. This results in air quality savings that is shown in Table 1.

TABLE 1: Emissions Saved by Off-Modeled Drop-offs

			Pollutant Reductions in grams			
Alt	**Drop-Offs**	**VMT Saved**	**Summer VOC**	**Summer NOx**	**Winter CO**	**Summer CO2**
6	200	1,400.0	277.2	211.4	11,543.0	797,160.0
5b	650	4,550.0	900.9	687.1	37,514.8	2,590,770.0
5a	670	4,690.0	928.6	708.2	38,669.1	2,670,486.0
1,2a,2b	720	5,040.0	997.9	761.0	41,554.8	2,869,776.0
3,4	750	5,250.0	1,039.5	792.8	43,286.3	2,989,350.0
7	820	5,740.0	1,136.5	866.7	47,326.3	3,268,356.0

The emissions factors used are for the year 2030 and assume the savings is predominantly on arterials at an average speed of 25 mph.

DRAFT MEMORANDUM

To: Green Line Extension Project Team **August 21, 2008**

From: Bruce Kaplan, CTPS

Re: MVP Competing Station Origin-Station Analysis

CTPS examined the origins of modeled future year users of park-and-ride lots at transit stations pertinent to the Green Line Extension project during the AM Peak Period, when most park-and-ride activity occurs. Investigated park-and-ride lots at existing stations include Alewife, Wellington, Lechmere, and West Medford. Additionally, special attention was paid to a potential new park-and-ride lot at Mystic Valley Parkway (MVP), the terminus of several Green Line Extension alternatives. Parking usage at these stations was analyzed under a number of conditions related to parking lot capacities – unconstrained demand, demand constrained to lot availability, and demand constrained to lot availability except at MVP.

Unconstrained Parking Demand

Most park-and-ride trip origins follow expected travel patterns. Park-and-riders typically travel to the nearest station, usually one accessible by highway or arterial. Alewife park-and-riders originate from points north and west along the Route 2 and Route 3 corridors, with the largest percentages coming from communities (Lexington and Arlington) located immediately west of the station. Significant numbers also come from nearby communities along the Route 16 corridor – Medford, Somerville, and Cambridge. These are unsurprising given Alewife's location at the intersection of Route 16 and Route 2. Similarly unsurprising is the composition of the Wellington station park-and-riders. These too seem to come from communities located along the roadways that intersect at the station (Route 16, Route 28, I-93). The largest percentages of users originate in Medford, Malden, Everett, and Somerville. A substantial portion comes from points north of the station along the I-93 corridor as well as from the North Shore. Lechmere park-and-riders come from communities lining the Route 28 corridor – Medford, Somerville, and Cambridge – as well as from Boston, which provides the single largest share. Most West Medford station park-and-riders originate in communities along Route 38 (Medford, Woburn, and Winchester) and nearby Arlington, as well as other points north along the I-93 corridor.

Not much change in terms of origins at these stations appears to occur with the addition of the MVP station. A slight siphoning off of West Medford trips does occur. The largest origin community is Medford, with substantial percentages from Somerville, Malden, Winchester, and Arlington. Additionally, more people originate along the I-93 corridor than from along the Route 2 corridor, due to the closer proximity of the station to I-93. Roughly the same number of people originating in Winchester uses the MVP station as do folks from the slightly closer

Arlington. It is interesting to note that Arlington park-and-riders continue to park at Alewife in the same numbers as without the MVP station, thus indicating that the Arlington drive market for the MVP station appears to be confined to the portion in eastern Arlington currently being served by the West Medford station.

Constrained Parking Demand

Constrained parking demand presents an interesting dilemma for park-and-riders in the study area. The small lot at West Medford is filled up quickly and the overflow park-and-riders from that station migrate to the nearby MVP station facility, which also reaches its 300-space capacity. The origin breakdown of trips at West Medford remains the same, while the origin makeup at MVP changes slightly due to the diversion of trips from West Medford. When compared with the unconstrained demand scenario, new park-and-ride trips at MVP are more apt to come from Somerville, Medford, and Malden, than from Arlington and Winchester. Therefore, it seems that the closest communities (with the exception of Arlington) appear to be the ones to fill up the MVP park-and-ride lot first.

Constrained Parking Demand except at MVP

When parking demand is unconstrained at MVP, but constrained at the rest of the system's park-and-ride facilities, the origin makeup at the non-MVP facilities surprisingly looks very similar to the constrained lot demand scenario. What does occur is that communities further away from MVP, from the North Shore and along I-93 as well as along the Route 2 and Route 3 corridors, begin to take advantage of the park-and-ride opportunity at MVP. In the process, the percentage of trips coming from Arlington rises while those from Medford, Somerville, and Malden decrease. This could possibly be due to the complete satisfaction of trip-making using the Green Line from those neighboring communities, which then allows trips from further communities (Arlington, Winchester, and points north and west) to be made via MVP and the Green Line.

Note:

Lechmere is not included because detailed info exists regarding access percentages for the North Point Development Project.

Access % don't vary much between alternatives for the Brickbottom, Gillman Sq, Lowell St, Ball Sq, and Union Sq Stations.

When the terminus is College Ave instead of MVP, the walk market area extends further north for College Ave and this changes the walk percentages for it.

Due to rounding, percentages may not all add up to 100%.

554	2	College Ave via Walnut	Side streets filter to Walnut; S on Walnut; E on Summer; S on College
			Side streets filter to Main
554	3	College Ave via Royall and Main	S on Main; W on Royall; S on College
554	4	College Ave via Royall	W on Columbia Rd; W on Royall; S on College
554	5	College Ave via George	W on George; S on College
			Side streets filter to Pearl via Main
554	6	College Ave via Pearl	W on Pearl; S on College
			Side streets filter to Stearns via Main
554	7	College Ave via Stearns	W on Stearns; S on College
554	8	College Ave via Frederick	W on Hancock Ct; S on Kenway; W on Hancock St; W on Frederick; S on College
553	1	College Ave	W on side streets (Stearns, Stanley, Frederick); S on College
			Side streets filter to Buzzells Ln
553	2	Buzzells Ln/Alumni Fields	W on Buzzells; cross playing fields and parking lot; up stairs; cross College
553	3	Buzzells Ln/Alumni Fields	N on Main; W on Buzzells; cross playing fields, etc
			Side streets filter to Dartmouth
553	4	Buzzells Ln/Alumni Fields	N on Dartmouth; W on Buzzels; cross playing fields, etc
553	5	Boston Ave via Harvard	Side streets filter S to Harvard; W on Harvard; N on Boston
		To Ball Square Sta: Winchester	This portion of the TAZ is considerably closer to the Ball Square Station, yet all of
553	6	To College Ave Sta: Boston via Harvard	the pedestrian traffic from this TAZ is allocated to College Ave
555	1	Boston Ave via Tufts campus	Walk E across Tufts campus to parking lot SE of University Ave; SE on Boston
555	2	Boston Ave	Side streets filter to Boston Ave; SE on Boston
555	3	Boston Ave via Tufts campus	Walk SE across Tufts campus; descend stairs to intersection of College and Boston
555	4	College Ave via Tufts campus	Walk SE across Tufts campus; descend main entrance stairs on College Ave; NE on College
555	5	Boston Ave	NW on Boston Ave
		To Ball Square: S on Boston Ave	This portion of the TAZ is considerably closer to the Ball Square Station, yet all of
555	6	To College Ave: N on Boston Ave	the pedestrian traffic from this TAZ is allocated to College Ave
			Side streets filter across Winthrop to Tufts campus; walk SE across campus;
623	1	College Ave via Tufts campus	descend main entrance stairs on College Ave; NE on College
623	2	College Ave via Professors Row	SE on Curtis; SE on Professors Row; NE on College
			Side streets (Conwell, Raymond, Sawyer, Whitfield, Teele) filter to Talbot via
623	3	College Ave via Talbot	Packard; SE on Talbot; N on College
623	4	College Ave via Talbot Ave	SE on Powder House; NE on Packard; SE on Talbot; N on College
556	1	College Ave	Side streets filter to College; S on College
			Side streets filter to Burget Ave; Burget dead ends at what appears to be a path
556	2	College Ave via Burget Ave (path)	through to College Ave and (future) station entrance
			Side streets filter W across Main to Stearns, Stanley, Frederick, or Windsor; then S
552	1	College Ave	on College
552	2	Buzzells Ln/Alumni Fields	Side streets filter to Main; N on Main; W on Buzzells; cross playing fields etc
		To Ball Square: Albion St	This portion of the TAZ appears closer to the Ball Square Station, yet all of the
552	3	To College Ave: Buzzells Ln	pedestrian traffic from this TAZ is allocated to College Ave

NOTE: For TAZs 552 and 553, if there is not free access to the Tufts Alumni Fields from Buzzells Ln, this pedestrian traffic will travel W on Windsor Rd to College Ave

NOTE: There are four critical questions for TAZ 554:

1) Will there be a crosswalk from the top of the Alumni Fields stairs to the station entrance?

2) Will the gate from Buzzells Ln to the Alumni Fields ever be locked?

3) Has Tufts Univ issued its opinion on pedestrians cutting across the Alumni Fields and parking lot?

4) How much, if any, pedestrian traffic is assumed to come from south of Harvard St? If any, why aren't these pedestrians allocated to Ball Square Station?

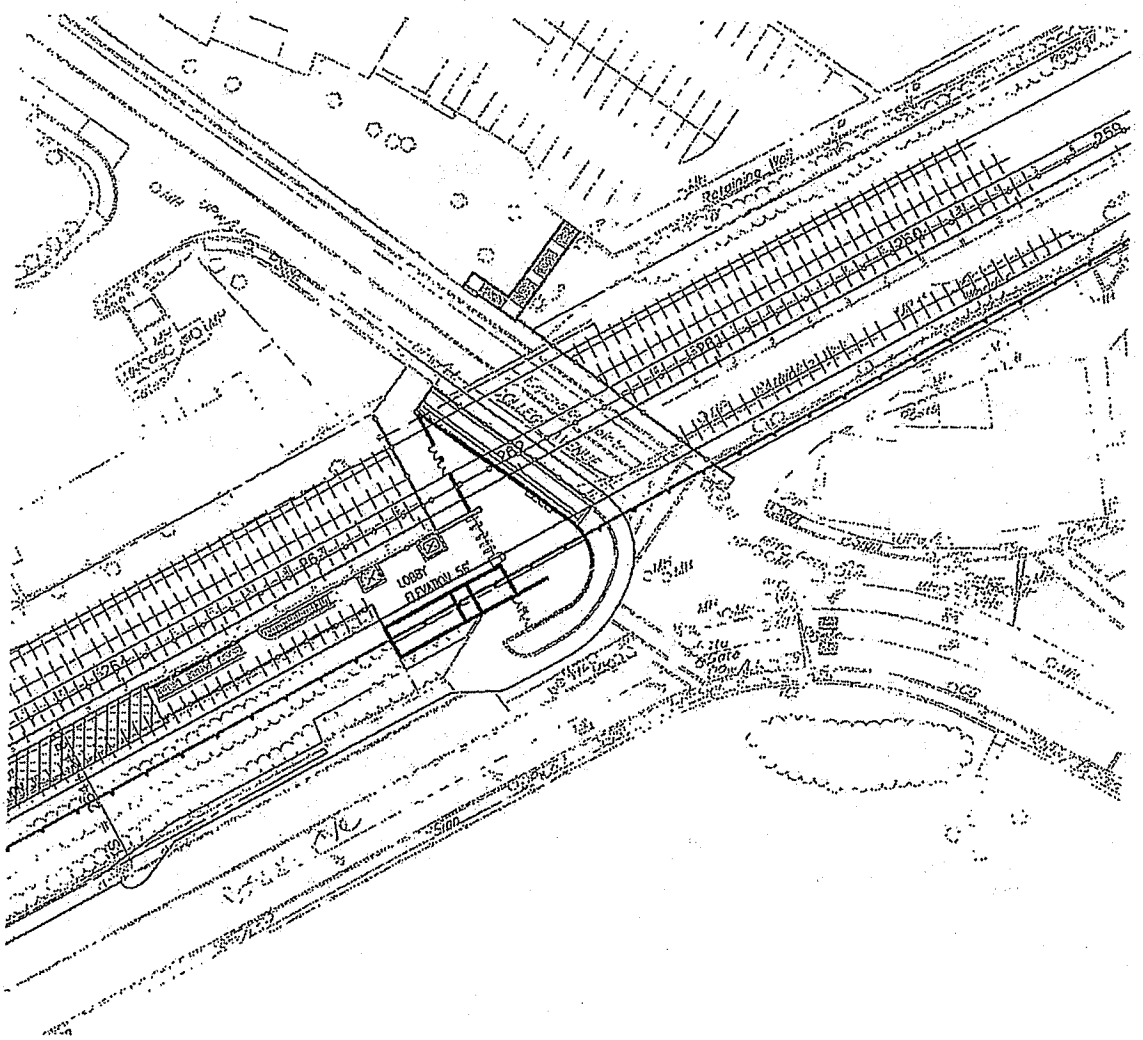
		To Ball Square: Albion St	This portion of the TAZ appears closer to the Ball Square Station, yet all of the
552	3	To College Ave: Buzzells Ln	pedestrian traffic from this TAZ is allocated to College Ave



NOTE: For TAZs 552 and 553, if there is not free access to the Tufts Alumni Fields from Buzzells Ln, this pedestrian traffic will travel W on Windsor Rd to College Ave

NOTE: There are four critical questions for TAZ 554:

1) Will there be a crosswalk from the top of the Alumni Fields stairs to the station entrance?
2) Will the gate from Buzzells Ln to the Alumni Fields ever be locked?
3) Has Tufts Univ issued its opinion on pedestrians cutting across the Alumni Fields and parking lot?
4) How much, if any, pedestrian traffic is assumed to come from south of Harvard St? If any, why aren't these pedestrians allocated to Ball Square Station?

Williams

2000 Residents of Cambridge

Workplace Location[1]	As % of Resident Workers	Single Occupancy Vehicle	Public Transit	Car/Van Pool	Bike	Walk	Other Means	Work at Home
In Cambridge and Abutting Towns	78.7%	25.3%	28.3%	4.9%	4.5%	29.2%	1.0%	6.7%
In Cambridge	46.5%	19.0%	13.3%	4.6%	5.4%	45.2%	1.1%	11.4%
In Abutting Towns[2]	32.1%	34.5%	50.0%	5.2%	3.2%	6.1%	1.0%	0.0%
Elsewhere	21.3%	72.2%	12.1%	6.5%	1.8%	6.1%	1.2%	0.0%
All Locations	100.0%	35.3	24.9	5.2	3.9	24.3	1.1%	5.3%

1. Steps taken by the Census Bureau to protect individual confidentiality by suppressing data affect the accuracy of the only “worker flow” table to separate bicyclers, walkers, and several other “minor” modes of commuting. Thus, the 2000 Census does not provide accurate or useful individual figures for the "Bike", "Walk" and "Other" modes. The figures used here come from an analysis that weights various factors to generate useful mode splits for resident flows to different locations. As such, they do not have the same level of rigor as figures for the total labor force irregardless of work location.

2. Abutting towns include Arlington, Belmont, Boston, Brookline, Somerville, and Watertown.

Traffic Signal Warrant Worksheets

2003 MUTCD

TRAFFIC SIGNAL WARRANT ANALYSIS (VOLUME BASED)

Intersection:

Major Street Direction: Eastbound-Westbound

Year: 2008 **Condition:** Alt 2A

Operating speed on major roadway: 30 mph

Number of approaches: 3

			Required approach volumes	
Warrant 1	**EIGHT-HOUR VEHICULAR VOLUME**		Minimum*	Adjusted Minimum**
Warrant 1A	MINIMUM VEHICULAR VOLUME (8 hours of day)			
	Major Street :	2 Lane(s) on each approach	600	600
	Minor Street :	1 Lane(s) on each approach	150	150
Warrant 1B	INTERRUPTION OF CONTINUOUS TRAFFIC (8 hours of day)			
	Major Street :	2 Lane(s) on each approach	900	900
	Minor Street :	1 Lane(s) on each approach	75	75
80 PERCENT SATISFACTION OF WARRANT 1A **AND** WARRANT 1B			Warrant 1A	Warrant 1B
	Major Street :	2 Lane(s) on each approach	480	720
	Minor Street :	1 Lane(s) on each approach	120	60

Warrant 2	**FOUR HOUR VEHICULAR VOLUME**		
	Major Street :	2 Lane(s) on each approach	If "verify" indicated, see Figure 4C-1 or 4C-2.
	Minor Street :	1 Lane(s) on each approach	25 = accuracy of regression equations

Warrant 3	**PEAK HOUR VOLUME**		
	Major Street :	2 Lane(s) on each approach	If "verify" indicated, see Figure 4C-3 or 4C-4.
	Minor Street :	1 Lane(s) on each approach	25 = accuracy of regression equations

Hour	Entering Vol. Minor Road+	Entering Vol. on Major Road Eastbound	Entering Vol. on Major Road Westbound	Tot. Ent. Vol. On Major Rd	Meets the following volume-based warrants? 1A	1B	80%(1A&1B)	2	3

Symbols which may appear in this table:

Following Degree of Saturation
x = 1.00 for Short Lane with resulting Excess Flow
* x = 1.00 due to minimum capacity

Following LOS
- Based on density for continuous movements

Following Queue
- Density for continuous movement

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Symbols which may appear in this table:

Following Degree of Saturation
x = 1.00 for Short Lane with resulting Excess Flow
* x = 1.00 due to minimum capacity

Following LOS
- Based on density for continuous movements

Following Queue
- Density for continuous movement

Intersection Summary

Area Type: Other
Cycle Length: 120
Actuated Cycle Length: 120
Offset: 67 (56%), Referenced to phase 2:EBWB, Start of Green
Natural Cycle: 120
Control Type: Actuated-Coordinated
~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 3: O'Brien Hwy & Charlestown Ave

Symbols which may appear in this table:

Following Degree of Saturation
x = 1.00 for Short Lane with resulting Excess Flow
* x = 1.00 due to minimum capacity

Following LOS
- Based on density for continuous movements

Following Queue
- Density for continuous movement

Intersection Summary	
Area Type:	Other
Cycle Length: 82	
Actuated Cycle Length: 71.6	
Natural Cycle: 145	
Control Type: Actuated-Uncoordinated	

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary
Area Type: Other
Cycle Length: 120
Actuated Cycle Length: 120
Offset: 28 (23%), Referenced to phase 2:WBT and 6:EBT, Start of Green
Natural Cycle: 115
Control Type: Actuated-Coordinated
~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 6: O'Brien Hwy & First Street Extension

Symbols which may appear in this table:

Following Degree of Saturation
x = 1.00 for Short Lane with resulting Excess Flow
* x = 1.00 due to minimum capacity

Following LOS
- Based on density for continuous movements

Following Queue
- Density for continuous movement
