FINAL ENVIRONMENTAL IMPACT REPORT (FEIR)

FOR THE

GREEN LINE EXTENSION PROJECT

CAMBRIDGE, SOMERVILLE, MEDFORD, MASSACHUSETTS

EEA FILE NO. 13886

Prepared Pursuant to the Massachusetts Environmental Policy Act M.G.L. CH 30 Sec. 61 through 62H

by the

COMMONWEALTH OF MASSACHUSETTS
DEPARTMENT OF TRANSPORTATION (MassDOT)
June 15, 2010

Dear Reviewer:

On June 15, 2010, the Commonwealth of Massachusetts Department of Transportation (MassDOT) submitted a Final Environmental Impact Report (FEIR) for the Green Line Extension Project to the Secretary of Energy and Environmental Affairs pursuant to the Massachusetts Environmental Policy Act. This document will be noticed in the June 23, 2010 Environmental Monitor, initiating a 30-day public review period. The Secretary of Energy and Environmental Affairs will issue a MEPA Certificate by July 30, 2010.

The Green Line Extension is a project of MassDOT and the MBTA to improve transit service, mobility, and regional access for residents of Cambridge, Somerville, and Medford. Bringing MBTA light rail service to these densely populated cities will address longstanding transportation inequities and meet strong demand for improved transit. The FEIR is the product of a four-year long planning and environmental review process that included thorough technical analyses and comprehensive public involvement, with participation by corridor municipalities, neighborhood groups, business and advocacy organizations, members of the general public, and other stakeholders. The FEIR responds to the specific issues identified in the Secretary’s Certificate on the DEIR, and includes:

- Additional analysis of maintenance facility locations, and the rationale for MassDOT’s selection of “Option L” as the preferred site.
- A revised conceptual station design for the relocated Lechmere Station, with additional analysis of impacts.
- Analysis of the operations and impacts associated with the proposed terminal station at College Avenue.
- Supplemental discussion of the air quality analysis methodology employed in support of the Project.
- A Public Involvement Plan that outlines opportunities for community involvement throughout the design and construction phases of the project.
- A summary of overall project impacts and mitigation measures.
- All of the comment letters submitted on the DEIR, with response to all substantive comments.

Enclosed is a copy of the FEIR for your review. Complete reference copies are also available at public libraries and city clerk’s offices in Cambridge, Somerville, and Medford. The FEIR may also be viewed on the Project website at [www.mass.gov/greenlineextension](http://www.mass.gov/greenlineextension).
MassDOT will hold a public meeting to discuss the FEIR and provide an opportunity for members of the public and other stakeholders to ask questions. The meeting will be held on:

June 30, 2010
6:00 pm
Somerville High School - Auditorium
81 Highland Avenue, Somerville, MA 02143

Comment letters on the FEIR must be received by the MEPA Office no later than July 23, 2010. Comments may be submitted by U.S. Mail to the address below, by fax to Holly Johnson at (617) 626-1181, or by email to holly.s.johnson@state.ma.us. Copies of comments may also be sent to Katherine Fichter, Massachusetts Department of Transportation, 10 Park Plaza, Room 4150, Boston, MA 02116. Comments on the document must be submitted in writing. All comment letters must include the EEA file number (13886). Written comments must be sent to:

Secretary Ian Bowles
Executive Office of Energy and Environmental Affairs
MEPA Office, Attn: Holly Johnson, MEPA Analyst
EEA number #13886
100 Cambridge Street, Suite 900
Boston, MA 02114

If you have any questions, please do not hesitate to contact Katherine Fichter at katherine.fichter@state.ma.us or (617) 973-7342.

Sincerely,

Jeffrey B. Mullan
Secretary and Chief Executive Officer

CERTIFICATE OF THE SECRETARY OF ENERGY AND ENVIRONMENTAL AFFAIRS
ON THE
DRAFT ENVIRONMENTAL IMPACT REPORT

PROJECT NAME : Green Line Extension
PROJECT MUNICIPALITY : Cambridge, Medford and Somerville
PROJECT WATERSHED : Boston Harbor
EOEA NUMBER : 13886
PROJECT PROONENT : Massachusetts Department of Transportation (MassDOT)
DATE NOTICED IN MONITOR : October 26, 2009

As Secretary of Energy and Environmental Affairs, I hereby determine that the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act (G. L. c. 30, ss. 61-621) and with its implementing regulations (301 CMR 11.00). However, I am declining to allow this DEIR to be considered the Final Environmental Impact Report (FEIR) (as permitted under 301 CMR 11.08(8)(b)(2)). The Proponent must prepare and submit for review a Final Environmental Impact Report (FEIR) in response to the Scope provided below.

At the outset, I would like to commend the proponent, the Massachusetts Department of Transportation (MassDOT), for its commitment to fund and build this critically important public transportation project. The project is the most significant remaining transit commitment arising out of the Central Artery/Tunnel Project (CA/T) in terms of reducing vehicle emissions and is emblematic of the type of public transportation investment needed to meet the Commonwealth’s greenhouse gas reduction mandates. The Green Line Extension Project will finally provide light rail transit beyond Lechmere Station, serving the densely populated communities of Cambridge, Somerville and Medford that today are substantially under-served by public transit. The project is also a reflection of the Commonwealth’s public transportation goals and commitment to the principles and practices of sustainable growth. The Commonwealth has committed to a significant
investment in urban mass transit in an effort to provide critical transportation, air quality and urban redevelopment benefits along the project corridor. The project is required by the State Implementation Plan (SIP) and fulfills a longstanding Commonwealth commitment to increase public transit in the greater Boston area. It will reduce regional emissions of nitrous oxides (NOx) volatile organic compounds (VOCs), the chief precursors of smog, and of carbon dioxide (CO2), the principal greenhouse gas responsible for global warming. The project also provides opportunity for new public and private investments to revitalize the social and environmental fabric of the corridor.

This project has received significant public input including hundreds of comment letters representing a range of views about numerous aspects of the project. I have received comment letters from elected officials and municipal representatives including U.S. Representative Capuano, Senator Jehlen, Representative Provost, Representative Sciortino, Representative Toomey, Medford Mayor McGlynn, Somerville Mayor Curtatone and the City of Cambridge. I have received comments from multiple city, State and regional agencies, from environmental, bicycle and pedestrian advocacy groups, from neighborhood groups, from groups that represent the disabled and environmental justice populations, and from businesses and residents.

The extension of any light rail service through an urban corridor such as Cambridge, Somerville and Medford is a challenging task and the range of views expressed in the comment letters reflect this challenge. I will note however, that despite the variety of comments received, comment letters generally expressed overall support in expanding light rail along the corridor. Expansion of light rail service is a unique opportunity for the region and I appreciate the time, effort, and thoughtfulness exhibited by residents of the Commonwealth through their ongoing attendance at public meetings and preparation of comment letters for consideration during the MEPA process. I anticipate that participation in these types of forums for the project will continue to be strong as the project proceeds to design and construction.

Comments on the DEIR reflect a unified desire to protect and enhance the character and vitality of this corridor and its neighborhoods and business centers. However, recommendations for how the project can achieve these goals most successfully vary widely among project constituents. The MEPA process has provided a valuable forum for the collection of all relevant points of view, but reconciling all of the identified (and sometimes competing) concerns is beyond the scope of the MEPA. The MEPA process occurs early in the design process to identify key environmental concerns and challenges associated with a project and therefore necessarily takes place in advance of final project design. It does not generally address issues commensurate with those often reviewed at the local site plan review or zoning board review levels within each municipality. Resolution of the final project planning details will therefore fall primarily to MassDOT, the affected communities, and to the various project stakeholders who I expect will continue to be actively engaged in this project going forward.

MEPA is also not a zoning process, and it does not proscribe to a Proponent what, where or how a project should be designed or built. MEPA review is limited by statute to those aspects of the project that may cause Damage to the Environment as defined in the MEPA regulations. I note that many of the environmental issues traditionally associated with expanded transit service are minimized in the current project by using an existing right-of-way (ROW); however, there are
many environmental impacts associated with the project that remain squarely within the scope of MEPA. For example, although the use of existing ROW dramatically decreases certain environmental impacts, this ROW will be altered both physically and operationally due to increased service and these impacts will need to be mitigated. Similarly, air quality and transportation impacts are at the heart of the proposed project, and are therefore a primary area of concern under MEPA. Thus, while many of the issues identified in comment letters are beyond the scope of review under MEPA, my decision today ensures that the environmental impacts of the proposed project have been thoroughly considered.

As set forth in greater detail herein, I acknowledge the continued concerns raised by many commenters regarding: the siting of the project’s maintenance and vehicle storage facility (Maintenance Facility); the details of MassDOT’s two-phased plan to provide service the Mystic Valley Parkway/Route 16 area; integration of stations into the neighborhood landscape; establishment of a robust public participation process during the final design and construction phase; and commitments to various environmental and construction period mitigation measures (notably noise and vibration mitigation). In order to address these concerns to the greatest extent possible and to ensure that the project adequately and properly complies with MEPA, I have provided a limited Scope for a FEIR below. The FEIR Scope requires MassDOT to further evaluate alternative locations for the Maintenance Facility in order to address the widespread opposition to the DEIR’s preferred location at Yard 8. Specifically, MassDOT will be required to provide additional quantitative assessment of the environmental and operational impacts associated with the alternative Maintenance Facility locations under consideration (known as “Option L” and “Mirror H”). The Scope also requires MassDOT to provide further clarification concerning its air quality modeling assumptions, to clarify and confirm impacts associated with the College Avenue Station operating as a terminus station, and to explore ways to improve integration of the Lechmere Station into the surrounding neighborhood.

In order for this project to reach its maximum potential, MassDOT must continue to, and in some ways enhance or expand, project design and coordination efforts in a collaborative manner with State and city agencies, citizens, local businesses, and other stakeholders during all aspects of the project – planning, design and construction. The FEIR will therefore also need to present a Public Involvement Plan to facilitate robust community participation beyond the conclusion of the MEPA process. Once a comprehensive plan has been developed, I am confident that MassDOT can and will address those issues that are beyond the scope of MEPA responsibly and thoroughly. I note that as project design advances, the Massachusetts Bay Transportation Authority (MBTA) will become the lead agency on the project and will ultimately be responsible for the construction and operation of the service. MassDOT and the MBTA must forge a collaborative relationship and make a strong commitment to continuing civic engagement opportunities during the design process as well as a transparent public information and outreach process once construction commences.
Project Description

As described in the DEIR, the project consists of the extension of Green Line light rail service from a relocated Lechmere Station through Cambridge, Somerville, and Medford. The "proposed project" (Alternative 1) in the DEIR includes:

- The Medford Branch - Extending Green Line service to Medford within the existing MBTA Lowell Line commuter railroad ROW, from a newly relocated Lechmere Station terminating at Medford Hillside in the vicinity of College Avenue with intermediate stations at Brickbottom, Lowell Street, Gilman Square, and Ball Square;
- The Union Square Branch – Extending Green Line Service to Union Square in Somerville, within the existing MBTA Fitchburg Line commuter rail ROW, with a station at Union Square.

Given the fiscal constraints that have been introduced since the commencement of MEPA review, MassDOT has proposed constructing the Green Line Extension project in two phases. The DEIR therefore also included an analysis of an extension of the Medford Branch to Mystic Valley Parkway/Route 16, with no parking at Mystic Valley Parkway/Route 16 Station, and extension of the Union Square Branch to Union Square (using commuter rail ROW) (Alternative 2). The DEIR states that while this alternative also meets all of the stated project goals and provides additional regional benefits with regard to air quality and increased ridership, fiscal constraints prevent MassDOT from committing to this alternative within the 2014 timeframe mandated by the SIP. The DEIR indicated that 'flex funding' allocated by the Boston Area Metropolitan Planning Organization may be available sometime between 2016 and 2020 to assist in funding the construction of the Green Line Medford Hillside to Mystic Valley Parkway/Route 16 segment. MassDOT proposes to construct Alternative 1 as the first phase of the project and Alternative 2 as the second.

The majority of anticipated environmental impacts along the corridor for both phases are largely similar, with the exception of additional impacts introduced in Alternative 2 with the extension of the project beyond Medford Hillside to Mystic Valley Parkway/Route 16. As it is not anticipated that construction of the Medford Hillside to Mystic Valley Parkway/Route 16 segment will commence within the applicable MEPA or NEPA timeframes, reassessment of Alternative 2 will be required in the form of a Notice of Project Change (NPC). I expect that this NPC would present additional (and updated) information on the potential environmental impacts of this segment for review by interested parties, as the DEIR presented a 'worst case scenario' of possible environmental impacts based on currently available conceptual designs. This NPC will be required to address how this portion of the project avoids, minimizes, and mitigates Damage to the Environment as directed by the MEPA regulations and present additional station design alternatives and existing and proposed conditions data on potential environmental impacts along this section of the corridor. I encourage MassDOT to consider the thoughtful comments and design suggestions submitted in response to the DEIR when preparing the NPC.

The project corridor passes through a wide cross-section of land uses: industrial, commercial, institutional, and residential. The project will provide access to a dense population of potential and existing transit riders currently serviced primarily by bus service along 15
established routes. Several of the station locations provide unique opportunities for transit-oriented redevelopment, potentially spurring economic development within the corridor. The corridor lends itself well to increasing the multi-modal transportation experience, with connections to the existing street and neighborhood network, as well as the conceptually designed Community Path (described in further detail below).

The proposed project includes the construction of new tracks and stations, relocation of existing commuter rail tracks, potential relocation, removal and/or elimination of freight tracks, reconstruction of bridges, construction of a new Maintenance Facility, construction of retaining walls, and the construction of traffic, pedestrian and bicycle improvements along the project corridor. The DEIR stated that the project is expected to increase the MBTA’s anticipated daily ridership at the project’s seven stations (boardings and alightings) by approximately 52,000 by 2030, with approximately 90% of these trips to take place in the project’s opening year of 2014. The DEIR estimates that Alternative 1 will generate new systemwide transit ridership of 7,900 boardings per day and a reduction of 25,018 vehicle miles traveled (VMT) per day (projected to the year 2030). The project cost for Alternative 1 is estimated at $804.8 million (in 2008 dollars) and includes the $76 million cost estimate for purchase of additional vehicles.

Procedural History

The Expanded Environmental Notification Form (EENF) was submitted for MEPA review and noticed in the Environmental Monitor on October 10, 2006. On December 1, 2006, Secretary Golledge issued a Certificate on the EENF outlining the scope for the DEIR.

As part of the EENF, MassDOT requested in accordance with 301 CMR 11.05(7) that it fulfill its EIR obligations under MEPA with a Single EIR, rather than the usual process of a Draft and Final EIR. The Secretary declined to grant this request for reasons discussed in the Certificate on the EENF. The DEIR received an extended comment period of 75 days, commencing on October 26, 2009 and concluding on January 8, 2010. On December 9, 2009, MassDOT issued supplemental information regarding the potential location of the Green Line vehicle storage and maintenance facility (Maintenance Facility), presenting a qualitative analysis of two additional Maintenance Facility sites (Mirror H and Option L) beyond the preferred alternative presented in the DEIR.

Within the DEIR, MassDOT requested that the DEIR be considered as the FEIR in accordance with 301 CMR 11.08(8)(b)(2). I have determined that while the DEIR is generally responsive to the requirements of 301 CMR 11.07 and the Scope, the ongoing evaluation of maintenance facility siting alternatives, the need for additional discussion of impacts at College Avenue and Lechmere Stations, and a requirement for clarification of the future mitigation and community participation commitments, preclude me from exercising my rights to declare that the DEIR will be considered an FEIR.
Project Permitting and Jurisdiction

The project is subject to review and mandatory preparation of an EIR pursuant to Sections 11.03 (1)(a)(1) and (6)(a)(5) of the MEPA regulations because it will require a State permit and will alter more than 50 acres of land and consists of a new rail or rapid transit line along a new, unused or abandoned right-of-way for transportation of passengers or freight. The project will require Access Permits from MassDOT. The project will require an 8(m) Permit from the Massachusetts Water Resources Authority (MWRA). It will require a Determination of Effect to Historic or Archaeological Resources (Section 106 of the National Historic Preservation Act) and a Section 4(f) Determination by the Federal Transit Administration (FTA). It will require review by the Massachusetts Historical Commission (MHC). Also, it will require a National Pollutant Discharge Elimination System (NPDES) industrial permit and a Multi-Sector General Permit for Stormwater Discharges Associated with an Industrial Activity (MSGP) from the United States Environmental Protection Agency (U.S. EPA).

Because the proponent is a State Agency and will use State funding, MEPA jurisdiction for this project is broad and extends to all aspects of the project that are likely, directly or indirectly, to cause Damage to the Environment as defined in the MEPA regulations.

It should be noted that the project will also review under the National Environmental Policy Act (NEPA) because MassDOT is seeking federal funding for the project. The DEIR also serves as the Environmental Assessment (EA) in accordance with NEPA. MassDOT has indicated in the DEIR that because the proposed project would be primarily located within the existing active commuter rail ROW and would be beneficial to communities, it anticipates that the FTA will issue a Finding of No Significant Impact (FONSI) at the conclusion of the NEPA process.

Review of the DEIR

General

The DEIR provided a response to the Secretary’s Certificate on the EENF and included additional information as necessary to respond to the Scope and respond to comments received on the EENF.

Project Description and Permitting

The DEIR provided a detailed description of the proposed project and each alternative, indentifying an anticipated project schedule, project costs and funding sources. The DEIR contained a substantial number of existing and proposed conditions plans and graphics to support the report narrative. Conceptual station and maintenance facility plans were included in the DEIR to illustrate project context and identify general circulation plans for motor vehicles, buses, pedestrians, and cyclists to each station location.

The DEIR discussed proposed track modifications, station locations, bridge replacements, and proposed operating plans and requirements for each project alternative. The DEIR identified
the need for new or modified electrical systems or support structures, including extended catenary lines and new signals, for each alternative. As noted later in this document, the DEIR and supplemental review materials described the proposed location, operations, and components of the Maintenance Facility at Yard 8, as well as a qualitative review of the potential Mirror H and Option L locations. The DEIR contained a list of required permits and approvals, the status of each permit and/or approval, and a discussion of project consistency with federal, State and local planning.

Smart Growth/Land Use

An overall policy goal of the Commonwealth is to direct public infrastructure investments to spur revitalization of previously developed urban sites over undeveloped greenfield sites. This project provides an opportunity to achieve this goal and must be actively pursued through ongoing collaboration between MassDOT and the affected communities. The success of this project continues to be dependent not only on MassDOT’s ability to plan effectively, but the ability of Cambridge, Medford and Somerville to respond with appropriate zoning changes and complementary regulations. MassDOT should work with these communities to coordinate land use planning activities and new transit operations.

If this project is designed with the proactive participation of communities and on a foundation of solid and innovative land-use planning, it has the opportunity to maximize economic development and long-term ridership potential. As discussed later in this Certificate, MassDOT must continue to engage interested parties in the form of a Citizens Advisory Group (CAG) which should include representatives of regional planning agencies, local government, business interests, community groups, representatives of environmental justice areas and the disabled community, abutters, and bicyclist and pedestrian groups.

The DEIR characterized existing land uses and provided population, housing density, and employment density data within a ½-mile radius of each proposed station site. The DEIR also described recent land use plans, studies, and design guidelines that may affect development near proposed station sites in each community. Proposed transportation projects that may have potential impacts on the Green Line Extension project were also discussed in the DEIR, noting their relationship to the expansion of light rail. The DEIR summarized direct land use impacts for each alternative, in the form of full or partial land takings.

The DEIR included data on current socioeconomic conditions in Cambridge, Somerville and Medford based upon available U.S. Census data, focusing on employment and income in each city. The DEIR characterized general socioeconomic conditions for each affected community along the project corridor. To evaluate direct socioeconomic impacts, the DEIR evaluated the local impacts of acquisition and demolition of existing homes and businesses for each alternative through loss of property taxes and estimated job displacement or relocations. I note that under Alternative 1, no homes and five businesses will be displaced and I commend the efforts put forth by MassDOT to propose a project that limits property takings to the maximum extent possible.

According to the DEIR, the project is expected to decrease low intensity commercial and light industrial uses in the project corridor and increase mixed-use, high-density transit-oriented
development, particularly in Union Square, and at Brickbottom and Lechmere Stations. The DEIR concluded that the project would provide socioeconomic benefits due to increased transit access, which increases both the potential for local commerce and the potential for area residents to commute to jobs elsewhere. The DEIR conceded that the precise economic benefit of increased transit access cannot be quantified based on existing data.

In accordance with federal and MEPA regulations, the DEIR included an assessment of short-term and long-term impacts and cumulative impacts of the project, any other projects, and other work or activity in the immediate surroundings and region (301 CMR 11.07). I acknowledge the difficulty in predicting future growth patterns and development pace, as future development will be greatly influenced by factors outside the control of MassDOT. This assessment described indirect effects as those effects resulting from possible redistribution of growth and changes in development densities. Federal guidance was used to evaluate the project’s cumulative effects, specifically, CEQ’s *Considering Cumulative Effects under the National Environmental Policy Act* (CEQ 1997). The assessment strived to analyze cumulative effects covering both known effects of the past, commencing in 1980, and predict those of the future, between present day and 2030.

The DEIR characterized and discussed corridor-wide indirect effects, noting that the various development alternatives will affect where growth occurs, the form of the growth, and the pace of development. The DEIR discussed potential for transit-oriented development (TOD) at proposed station sites, presented comparative data on impacts to property values, and characterized potential land use impacts within ½ mile radius of station sites. The cumulative impact analysis explored the potential influence of present and reasonably foreseeable actions (i.e., background population growth and development projects). Finally, the DEIR included a qualitative discussion of the indirect and cumulative effects of the project, comparing the various project alternatives to a no-build alternative, for several review areas including: land use; traffic and transportation; property values; economy; neighborhoods; environmental justice; and historic, archaeological and cultural resources.

I note that MassDOT has committed to perform land use workshops with affected communities to further identify community needs and issues regarding land use and redevelopment. The data and analysis presented in the DEIR should be used as the foundation for these workshops, driving the discussion on key issues surrounding how to best integrate anticipated changes from the project into the existing community fabric. Information gathered at these workshops could be helpful for community leaders and elected officials in determining how to best revise zoning regulations, affordable housing policies and parking management measures to reflect the anticipated transit-oriented landscape. I urge the communities of Cambridge, Medford and Somerville to take direct action to build on the State’s efforts and information in order to facilitate sustainable development and land use to the greatest extent possible.

*Consistency and Coordination with Planning and Projects*

The DEIR discussed preliminary project coordination, identified key project features and described the Green Line Extension’s relationship to proposed regional projects such as: the Urban Ring; reconstruction of Route 28/McGrath Highway; the North Point development and relocation
of Lechmere Station; the Community Path; and the Minuteman to Mystic Valley Parkway Path. I have received several comments requesting MassDOT to redesign and reconstruct the elevated portion of Route 28/McGrath Highway into a boulevard layout. Although this is beyond the scope of the proposed project, it is important that as project design advances, MassDOT accommodate identified future projects into project layout and design, or at a minimum, not preclude their construction. I encourage MassDOT to design the project to facilitate future transit projects such as light rail expansion or connections to existing infrastructure such as Porter Square and the Red Line, the Urban Ring, other commuter rail service expansion, or roadway, bicycle and pedestrian path networks as much as possible.

**The Community Path**

The intent of the Somerville Community Path (the Community Path) is to extend the Minuteman Bikeway/Linear Park multi-use path from its current terminus at Cedar Street in Somerville to the Charles River Path network in Cambridge and Boston, a distance of approximately 2.5 miles. The proposed route follows the edge of the MBTA Lowell Line ROW, generally located at street level while existing commuter rail trains and proposed light rail trains will run below grade, in a cut section. The DEIR presented ten-percent design plans for the Community Path to demonstrate the feasibility to construct the Community Path alongside the project. The DEIR identified where the Community Path could be accommodated within the ROW, identified potential pinch points and obstacles to including it within the ROW, and recommended solutions in instances where the Community Path could not be accommodated in the ROW (i.e. cantilevering the trail or narrowing the path). The DEIR also evaluated the viability of extending the Community Path to Route 16 to create a connection with the Mystic River Parkway based upon the feasibility of sufficient ROW widths or alternative on-street routes. The results of this study concluded that extending the path to Route 16 is not feasible at this time.

I have received many thoughtful comments received from bicycle and pedestrian advocates, and commenters in general, regarding the unique multi-modal transit opportunities afforded by effectively integrating the Community Path with proposed Green Line stations and overall neighborhood character. The Community Path could provide an additional avenue to access public transit, and thereby enhance and increase ridership potential. MassDOT has committed to the 100-percent design of the Community Path as part of the final design of the Green Line Extension. As station designs are refined, an emphasis should be placed on bicycle access to stations, as well as the provision of adequate bicycle parking. Based upon additional review of the location of the Maintenance Facility, the route of the Community Path through the Inner Belt and Brickbottom areas from Washington Street to Lechmere may become more feasible and should be re-evaluated for integration into project design. Lastly, I strongly encourage MassDOT and the City of Somerville to work together to seek State and federal funding opportunities to facilitate construction of the Community Path concurrently with the project.

**Environmental Justice**

Cambridge, Somerville, and Medford all have substantial State-defined environmental justice (EJ) areas, classified as areas with substantial foreign-born, minority, or low-income populations. As part of the Certificate on the EENF, I required MassDOT to identify EJ areas and
other sensitive populations, provide relevant socio-economic data, describe how the project is
designed to provide fair access to stations and economic development opportunities and avoid any
disproportionate share of impacts. The DEIR was generally responsive to this directive,
identifying EJ populations along the corridor, describing changes in transit access to EJ and
disability populations, tabulating the number of buildings to be acquired within EJ census blocks,
estimating project-related job losses, and identifying the number of sensitive receptors affected by
noise in EJ areas for each project alternative. The DEIR concluded that according to transit
modeling for the project, the Build Alternatives would substantially increase transit access for EJ
and disability populations and would thereby provide increased access to jobs, housing, and public
services.

In response to the requirement to take affirmative measures to ensure full public
participation in the MEPA process by all affected communities, particularly those with a high
percentage of minority, low-income, non-English-speakers and the disabled, the DEIR included a
summary of the ongoing public involvement and agency coordination process, with a specific
discussion of outreach efforts to EJ populations. MassDOT has established a public involvement
process that included a Project Advisory Group, open public meetings, and coordination with the
staff and elected officials of Cambridge, Somerville, and Medford, as well as other stakeholders
along the corridor. MassDOT identified key issues such as ridership modeling, maintenance
facility location and operations, station siting, tunnel alignment alternatives, and construction
impacts that were discussed during the course of the public involvement process. MassDOT
established a Project Advisory Group consisting of municipal officials, community
representatives, and other interested individuals to help guide the public process, build consensus,
and advise MassDOT on issues of concern. MassDOT also conducted tutorial sessions for
Advisory Group members, held general project public meetings, and station workshops.
MassDOT created a project website that acts as a portal to access project documents, studies, and
meeting minutes.

Alternatives Analysis

The DEIR included a discussion of a total of eight (8) project alternatives. The alternatives
analysis evaluated the following scenarios:

- No Build – existing transportation facilities and services and all future committed
  transportation improvements projects without the extension of the Green Line;
- Baseline – No-Build conditions plus enhanced MBTA Route 80 bus service between
  Lechmere Station and Mystic Valley Parkway/Route 16 and shuttle service between
  Lechmere Station and Union Square;
- Alternative 1 – Green Line Extension to Medford Hillside and Union Square (via
  commuter rail ROWs);
- Alternative 2 – Green Line Extension to Mystic Valley Parkway/Route 16 and Union
  Square (via commuter rail ROWs);
- Alternative 3 – Green Line Extension to Medford Hillside (via commuter rail ROW) and
  Union Square (in-street running);
- Alternative 4 – Green Line Extension to Mystic Valley Parkway/Route 16 (via commuter
  rail ROW) and Union Square (in-street running);
• Alternative 5 – Green Line Extension to Mystic Valley Parkway/Route 16 (via commuter rail ROW); and
• Alternative 6 – Green Line Extension to Union Square (via commuter rail ROW).

The alternatives presented in the DEIR were a result of years of study, creation of planning documents, work with State Agencies and advisory groups, and operational and design criteria requirements. The selection of Alternative 1, and Alternative 2 at a later date, were based on consideration of ridership, project costs, and community impacts. For each alternative, the DEIR described proposed operations, station locations, vehicle equipment requirements, anticipated new transit boardings and VMT reductions, estimated travel times, headways, fares, capital improvement requirements, and conceptual capital and operating and maintenance costs. The DEIR also provided data on noise, vibration, air quality, traffic, land acquisition, stormwater, historic and archaeological assets, hazardous materials and EJ population impacts for each project alternative for comparative purposes.

As directed in the Certificate on the EENF, the DEIR evaluated extending the project to Mystic Valley Parkway/Route 16. As I noted earlier, this project element, although part of MassDOT's “Preferred Alternative” (Alternative 2), is not being pursued at this time due to budgeting constraints and will be required to be reevaluated as part of an NPC review with the MEPA office.

Additionally, the DEIR evaluated design alternatives (Alternatives 3 and 4) that would bring light rail service closer to Union Square by diverting from the Fitchburg commuter rail ROW to an in-street running single-loop corridor. Alternatives 3 and 4 would result in increased construction costs due to roadway and bridge reconstruction and reconfiguration and would present challenges to extending service beyond Union Square in the future. Therefore the DEIR concluded that Alternative 1 provided a better balance of cost, ridership and environmental impacts than an option that included an in-street running of the Union Square branch.

Finally, the Certificate on the EENF requested that the DEIR explore alternatives that could provide a connection between light rail and commuter rail service including a new commuter rail stop at Tufts University or Gilman Square. Studies and conceptual design plans prepared in coordination with the DEIR concluded that to meet accessibility design requirements and maintain commuter rail, light rail and freight service along this portion of the ROW an additional track for freight service would be necessary, thereby increasing environmental impacts at either the College Avenue or Gilman Square Stations. MassDOT has therefore dismissed introduction of a commuter rail link along the Green Line Extension as a viable option at this time. The existing connection between the Green Line and the Lowell Commuter Rail Line will remain at North Station in Boston. Although not evaluated in the DEIR because it was not part of the Scope for that document, I note Congressman Capuano’s recent comments regarding the possibility of providing commuter rail service at Union Square and ask that MassDOT consider whether such a measure would be possible in the future. While there may be similar challenges to integrating the commuter rail, freight and light rail networks in this area, MassDOT should consider possibilities for expansion of commuter rail service in the area during its ongoing transit planning efforts.
Maintenance Facility

The DEIR indicated that the capacity of the MBTA’s Green Line system is constrained by the need for layover and maintenance facilities. Under existing conditions, there are no maintenance facilities located on the north side of the transit system in proximity to the proposed Green Line Extension. The preferred location for the Maintenance Facility presented in the DEIR is at a location known as Yard 8 with Adjacent Parcel (or simply, Yard 8), located in the Innerbelt/Brickbottom area of Somerville. The DEIR provided a general discussion of purpose and need for the facility, siting and program criteria, previous evaluations of potential facility locations, and a discussion of use of the MBTA Boston Engine Terminal (BET) Commuter Rail Maintenance Facility site in lieu of Yard 8.

During the public comment period on the DEIR, MassDOT issued a supplemental technical memorandum entitled, Green Line Extension Project – Additional Maintenance Facility Alternatives Analysis, dated December 9, 2009. This memorandum contained a preliminary analysis of two additional Maintenance Facility locations, the so-called “Mirror H” and “Option L” sites, and qualitatively compared them to Yard 8. The Mirror H site, proposed by the City of Somerville, straddles the InnerBelt area of Somerville and the North Point area of Cambridge. Option L, conceived by MassDOT, is located immediately adjacent to the MBTA’s Commuter Rail Maintenance Facility at BET. The technical memorandum outlined the Maintenance Facility program and requirements (developed in consultation with MBTA operations and vehicle maintenance staff), provided a brief discussion of system operational impacts associated with each location, and qualitatively evaluated each location with regard to a set of evaluation criteria. Evaluation criteria included: ability to meet MBTA program requirements; cost; property impacts; operation impacts to the Green Line Extension and railroads; compatibility with other transportation proposals in the project area; compatibility with existing land use planning; future economic development opportunities; ability to meet project schedule; natural, physical, and social/cultural impacts to neighborhoods; and future vision transportation access.

Both MassDOT and I acknowledge the broad-sweeping opposition from elected representatives, municipal officials, and abutting residences and businesses to locating the Maintenance Facility at Yard 8. Concerns range from noise, vibration and air quality impacts, to potential reduction of economic development potential in the area, and the equitable distribution of transit system impacts. Therefore, as part of the FEIR, MassDOT will be required to provide an expanded analysis of potential Maintenance Facility locations as further outlined later in this Certificate.

Impacts to Land/Stormwater

The DEIR indicated that impacts to land were minimized through the placement of the project primarily within the existing MBTA Lowell Line and Fitchburg Line ROWs, avoiding larger acquisitions of buildings or open space. The DEIR identified anticipated land acquisition parcels (and therefore areas of land alteration) along the corridor, the cause of impact to each parcel, the acquisition area, and whether the parcels would be acquired partially or in full. Alternative 1 is estimated to require the acquisition of 10.1 acres of land along the Medford Branch and 1.4 acres of land along the Union Square Branch. The DEIR also calculated the
anticipated increase in impervious surfaces along the project corridor for each alternative. Alternative 1 will result in a total of 6.8 acres of new impervious area associated with the Medford Branch, Union Square Branch and Maintenance Facility.

The existing ROW ranges from 55 to 110 feet in width. The project will not alter any wetlands although the ROW will be modified significantly and vegetated banks will be replaced with retaining walls in some locations. Proposed retaining walls will include a "green" design component, which means that efforts will be made to use recycled or recyclable materials and to incorporate vegetation as part of the wall system. Landscape treatments will also be proposed on the slopes above the walls and to the greatest extent practicable at each station. Estimated amounts of earthwork could not be determined at this time based upon the level of design. Temporary land takings to facilitate the construction process may also be required and should be determined as planning and design advance. The MassDOT has committed that as the project progresses through preliminary engineering and final design to refine project designs to further minimize temporary and permanent property acquisitions (via reductions in earthwork, land alteration, etc.) to have the least possible impact on local neighborhood and property owners.

The DEIR included an overall conceptual drainage plan, identifying the major connection points to the existing stormwater system and anticipated stormwater management measures. The DEIR indicated that a Stormwater Pollution Prevention Plan (SWPPP) will be prepared prior to construction. MassDOT has committed to preparing a detailed long-term operations and maintenance plan for the stormwater management system. MassDEP has made several recommendations regarding station area and maintenance facility stormwater drainage design, which I encourage MassDOT to consider as design plans advance. I remind MassDOT that the project will contribute flows to existing stormwater discharges to Category 5 impaired waterbodies (Mystic and Charles Rivers) and stormwater management systems should be designed to address any applicable Total Maximum Daily Load (TMDL) requirements. MassDOT has committed to designing the drainage system to meet the MassDEP Stormwater Standards to the extent practical. The project will be required to achieve requisite NPDES permit obligations, including MS4 requirements to implement construction site runoff controls, post-construction runoff controls, and pollution prevention/good housekeeping measures.

Station Design and Locations

The DEIR proposed specific station locations selected based upon siting criteria consisting of, but not limited to, station access (including to identified EJ populations), transit operations and ridership goals, land use compatibility, and costs. Station locations and general design were also based upon input from the public at station workshops, and from public officials and federal and State code requirements on accessibility, level of service (LOS), passenger circulation, and safety requirements. None of the new station locations in Alternative 1 have park-and-ride facilities and therefore the ridership market or these stations are almost wholly defined as persons capable of accessing the station by non-vehicular means. Walk-access transit catchment areas of a one-mile radius were evaluated based on FTA’s requirements.

The DEIR included a discussion of the feasibility and advisability of location stations a Winthrop Street in Medford, and a location between Winthrop Street and College Avenue.
MassDOT evaluated both the physical environmental impacts stations at these locations may impose, but also the ridership market potential given the project and the Preferred Alternative. MassDOT concluded that based on their understanding of the ridership market, the Winthrop Street area could best be served by the proposed College Avenue Station and the future Mystic Valley Parkway/Route 16 station, while minimizing the impacts on area residents.

I acknowledge the MBTA comment letter which indicates that efforts will be made to properly size stations to limit overall environmental impacts. The MBTA has indicated that all stations will meet Americans with Disabilities Act (ADA), Massachusetts Architectural Access Board (MAAB) standards and the MBTA’s settlement agreement with the Boston Center for Independent Living (BCIL); meet the applicable National Fire Protection Association (NFPA) standards; and be designed and built to be the most efficient and sustainable stations possible that function well and are integrated into the community.

The DEIR provided conceptual layout design plans and cross-section renderings of the stations that generally identified platform locations, access points, circulation patterns, bicycle storage areas, proximity to bus stops and crosswalks, and payment turnstiles. According to the DEIR, each station is envisioned to provide: a headhouse as a shelter for paid and unpaid lobbies with automated fare lines; vending machines; an information booth; and restrooms. Stations will also include: landscaping; bike racks; MBTA direction and spider maps; uniformly lit station platforms; tactile/Braille Station identification signs; and trash receptacles. Due to steep grade changes along the project route, many station platforms will be located at a different elevation than station access points. Entry to and exit from the platforms will be provided by elevators, escalators, and stairs. Finally, MassDOT has proposed a variety of “green” design elements to be incorporated into station design including high performance lighting, recycling stations, recycled content site and building materials as practicable, water efficiency measures, and where possible, maximization of building energy performance and implementation of an indoor air quality management plan.

As MassDOT refines project design plans, I encourage it to consider the many thoughtful comments I have received regarding station design, neighborhood integration, and station access. I note comments related to facilitating bus route/light rail station connections with bus pull-out areas, the potential advantages (or disadvantages) of kiss and ride drop offs, and bus route modifications to better integrate light rail stations with bus stops. As part of the Advisory Group process, station design issues germane to specific station locations, neighborhoods, and ridership needs should be collaboratively explored.

Air Quality

The DEIR included a mesoscale analysis to estimate area-wide emissions of VOCs, NOx, CO2, carbon monoxide (CO), and particulate matter (PM10). The mesoscale analysis evaluated the changes in emissions levels based upon changes in the average daily traffic volumes, roadway lengths, and vehicle emissions rates. An evaluation of air toxics was also conducted. The DEIR also included a microscale analysis of CO, PM10 and PM2.5 emissions. The microscale analysis estimated project related emission based on traffic and emissions data including, traffic volumes, VMT, signal cycle timing, physical roadway improvements, years of analysis and roadway speeds.
MassDOT consulted with MassDEP prior to conducting the analysis to develop appropriate modeling protocols. The air quality analysis compared the 2007 No-Build conditions with 2030 Build conditions, analyzing area-wide VMT reductions based upon new ridership projections for each alternative. The DEIR concluded that by 2030, ridership for Alternative 1 will generate 7,900 new transit trips per day, resulting in an area-wide reduction in daily VMT of 25,018.

In support of the air quality analysis, the DEIR included a discussion of the study methodology, National Ambient Air Quality Standards (NAAQS), and summary data for both the microscale and mesoscale studies for each alternative. The DEIR concluded that the 1-hour and 8-hour CO concentrations are below the CO NAAQS, the 24-hour PM$_{10}$ concentrations are below the PM$_{10}$ NAAQS, and the 24-hour PM$_{2.5}$ concentrations are below the PM$_{2.5}$ NAAQS. The DEIR also evaluated the potential PM$_{2.5}$ air quality impacts associated with the relocation of the existing commuter rail tracks. While PM$_{2.5}$ emissions will increase at both the nearest property line and residential building, the annual and 24-hour PM$_{2.5}$ concentrations will remain below the NAAQS standards. The DEIR mesoscale analysis results indicate that Alternative 1 will result in an area wide emissions decrease of 17,115 kilograms per day (kg/day) for CO$_2$, 7.6 kg/day for VOCs, 4.4 kg/day for NOx, and 0.8 kg/day for PM$_{10}$ when compared to the 2030 No Build condition.

The DEIR described the air quality benefits associated with this project and described its consistency with the State Implementation Plan (SIP) and MassDEP’s Transit Regulations. The construction of the Green Line Extension from Lechmere Station to Medford Hillside and the construction of the Union Square spur of the Green Line before December 31, 2014 are codified in MassDEP’s Transit System Improvement Regulations (310 CMR 7.36). These regulations do not include a specific geographic terminus of the Green Line within the Medford Hillside neighborhood. MassDOT has presented air quality data in the DEIR that, as confirmed by the comments submitted by MassDEP, are consistent with and meet the emission reduction requirements required under 310 CMR 7.36(8), Determination of Air Quality Emission Reductions.” These requirements are also part SIP, which was approved in 2008 by the U.S. EPA.

I note comments received from the Conservation Law Foundation (CLF) indicating its belief that MassDOT has not demonstrated consistency with the SIP due to perceived errors in the air quality modeling methodology. After consulting with MassDEP and MassDOT, I respectfully disagree with this assertion. Transportation modeling is inherently fluid and dynamic; data inputs and modeling refinements are constantly integrated into updated modeling runs with an end goal of providing the most accurate and up to date predictions of actual transportation impacts possible. In acknowledgement of the anticipated evolution of modeling techniques and data inputs, the SIP provides a provision (310 CMR 7.36(9)) whereby upon substantial completion of a project, MassDOT shall complete an analysis of the total air quality benefits of such projects and such analysis shall be performed in accordance with U.S. EPA requirements in effect at the time of the analysis. Thus, the predictive modeling provided at this stage of project development is backstopped by the use of actual data upon substantial completion of the project. This provides further support for the understanding that air quality data evolves over time through the use of updated modeling assumptions. However, I acknowledge that the air quality modeling methodology can be difficult for the average project reviewer to understand without the benefit of direct access to modeling experts. Therefore, as noted later in this Certificate, I have required MassDOT to
provide a narrative clarifying the relationships of air quality modeling data to MassDEP and EPA requirements for SIP consistency as part of the FEIR.

Transit Ridership

The DEIR estimated ridership methodologies, associated reductions in VMT (based on both new and diverted trips), operating parameters, vehicle requirements, headways, and travel times for each alternative. The model developed to calculate ridership provides projections for a forecast year of 2030 and assumes that a number of proposed transportation projects, including segments of the Urban Ring project Phase II and Silver Line Phase III projects and other area highway transportation projects consistent with the Regional Transportation Plan, will be implemented by this time. Operating plans were developed as an extension of the existing Green Line D and E Branch services, so as to minimize impact to the Central Subway system operations. Analyses conducted by the Central Transportation Planning Staff (CTPS) have concluded that all segments of the Green Line branches are capable of accommodating the peak transit loads in both the AM and PM peak hours and will not exceed the MBTA's maximum load service policy. The project does not propose to reduce bus service or bus operations within the service area. As requested by commenters, I encourage MassDOT to evaluate how existing bus service within the service area may be modified to provide improved or direct access to proposed light-rail stations in an effort to maximize ridership. This topic should be explored further in the context of the Advisory Group process. Construction activities should be structured to avoid or minimize any delays in service along the Lowell or Fitchburg commuter rail lines.

Traffic and Transportation

The DEIR analyzed existing and proposed conditions at a series of project area intersections selected subsequent to input from MassDOT, CTPS, MEPA, the City of Cambridge, the City of Somerville, and the City of Medford. The proposed 2030 traffic volume networks were developed by CTPS using its regional travel demand model and the model was run for each alternative at each selected project area intersection.

The DEIR analyzed traffic for existing, build and no-build conditions to evaluate the implications of the project for intersection LOS, pedestrian and bicycle circulation, intersection safety, and parking. The traffic analysis included the following areas:

- Mystic Valley Parkway/Route 16 and its intersections with Alewife Brook Parkway, Auburn Street and Winthrop Street;
- Boston Avenue and its intersections with High Street, Mystic Valley Parkway/Route 16, North Street, Winthrop Street, College Avenue, and Harvard Street;
- Broadway and its intersections with Boston Avenue and Winchester Street/Albion Street;
- College Avenue at its intersections with Powderhouse Boulevard/Broadway/ Warner Street and George Street;
- Main Street at its intersections with High Street/Salem Street/Forest Avenue/Riverside Avenue, South Street and Mystic Valley Parkway/Route 16
eastbound ramps, Mystic Valley Parkway/Route 16 westbound ramps, Mystic Avenue, Harvard Street, and George Street;

- Medford Street and its intersections with Broadway, Lowell Street, Central Street, School Street, Pearl Street, Walnut Street, Highland Avenue, and Somerville Avenue;
- Highland Avenue and its intersections with Lowell Street, Central Street, School Street, and McGrath Highway;
- Washington Street and its intersections with Innerbelt Road, McGrath Highway/Route 28, Somerville Avenue/Webster Street and Beacon Street;
- Prospect Street and its intersections with Somerville Avenue, Webster Avenue, Cambridge Street and Hampshire Street;
- O'Brien Highway and its intersections with Third Street, Water Street, North First Street, Mid-Block Pedestrian Crossing, Land Boulevard/Gilmore Bridge; and Museum Way; and
- Cambridge Street at First Street.

According to the DEIR, future build model runs for Alternatives 1 through 6 were prepared by including the extended Green Line as a mode choice and quantifying the number of vehicle trips expected to change mode from passenger car to transit service. Using additional model runs, peak hour turning movements, estimates of pick-up/drop-off and park-and-ride trips were generated, and peak hour volumes were determined and incorporated into LOS analyses. These LOS analyses and model data were then used to identify potential mitigation measures into the roadway network and evaluate their effectiveness. The DEIR proposed mitigation measures for intersections where LOS E/F conditions resulted because of the Build Alternative and where LOS E/F conditions under the No-Build Alternative were notably worsened (generally an increase in control delay of more than ten seconds). Pedestrian LOS is not expected to change and in many cases will be improved. Currently-designated and future bicycle facilities will not be negatively impacted under Alternative 1.

Proposed vehicular, bicycle and pedestrian mitigation includes: traffic signal timing and phasing modifications; new traffic signal equipment; geometric modifications at intersections; new pavement markings; addition of 270 bicycle parking spaces; and pedestrian signal improvements at 29 locations. Traffic mitigation is proposed at six intersections:

- Boston Avenue at Winthrop Street;
- Boston Avenue at College Avenue;
- Washington Avenue at McGrath Highway;
- Prospect Street at Somerville Avenue;
- Washington Street at Somerville Avenue/Webster Street; and
- Medford Street at Pearl Street.

Design of these intersection mitigation measures, as well as the establishment of construction management and detour plans, should be reviewed and designed collaboratively with MassDOT, the City of Cambridge, City of Somerville, City of Medford, and respective Police and Fire Departments to ensure conformance with applicable standards and regulations.
The DEIR also discussed the project’s relationship to O’Brien Highway reconstruction plans from Third Street to Museum Way associated with the Full-Build North Point development. While the traffic analysis assumes that all mitigation associated with North Point will be in place by 2030, delays in project development require that certain mitigation measures be implemented by MassDOT to mitigate impacts of the Green Line Extension. These intersection improvements have been incorporated into the list of traffic-related mitigation measures proposed by MassDOT in the DEIR.

As part of the project’s mitigation package, MassDOT has pledged to work with cities to develop station-area parking enforcement plans. While parking enforcement is ultimately the responsibility of each municipality, I encourage an open dialogue between MassDOT and each city to establish parking management and enforcement plans that effectively mitigate illegal parking within one-half mile of the stations. Additionally, as station designs are advanced, I encourage MassDOT to revisit opportunities to reduce vehicular traffic associated with the introduction of new stations through strong emphasis on bus route, pedestrian, and bicycle connections.

**Freight Service**

As indicated in the DEIR, the project will operate adjacent to operating rail lines, including the MBTA Lowell Line, the MBTA Fitchburg Line, and Pan Am Railway’s (PAR) Yard 8. Freight rail operations in the project area are provided by two railroads: CSX and PAR’s Springfield Terminal Railway. The DEIR described existing rail operations and routes along the project corridor. With the exception of impacts within Yard 8, the expansion of Green Line service along the Lowell Line ROW is not anticipated to negatively impact freight rail service along the corridor. Freight rail service will be maintained throughout the construction period.

According to the DEIR, the main impact to freight operations will be the use of Yard 8 for the Maintenance Facility. All PAR movements arriving or departing via the MBTA Lowell Line pass through Yard 8. As currently proposed, the project would include the reconstruction of the adjacent Yard 10 lead track, to allow PAR to continue through operations or temporarily store freight cars. I note comments received from PAR on the DEIR and concerns raised regarding the potential impact of MassDOT’s use of Yard 8 on PAR operations. These comments should be addressed as part of the Maintenance Facility portion of the FEIR scope outlined later in this Certificate.

**Noise/Vibration**

The DEIR presented an analysis of existing and proposed noise and vibration conditions along the project corridor, prepared based upon methodology defined in the FTA guidance manual *Transit Noise and Vibration Impact Assessment* (Report FTA-VA-90-1003-06, May 2006). The DEIR included a description of background information on the subject matter, a description of FTA sensitive land-use categories, identified sensitive locations along the corridor, and contained measurement results of the existing noise conditions for both noise and vibration impacts.
The DEIR states that the project corridor’s existing noise environment is generally dominated by trains on the MBTA commuter rail lines. Existing noise measurements included nine long-term (24-hour) and seven short-term (1-hour) locations and calculated: Existing Day-Night Average Sound Levels (Ldn); Existing Peak-Transit Hour Sound Level (Leq); Commuter Train Noise Level (Lmax); and Distance to Nearest Track. These measurements were taken to characterize the existing noise environment along various segments of the project route. The DEIR measured reference vibration levels of the commuter and Amtrak trains at Tufts University Alumni Field and performed measurements of the vibration propagation characteristics of the soil at three locations along the proposed corridor (200 Innerbelt Road, 20 Vernon Street, and Tufts University Alumni Field). Measurements were conducted of train passbys at several distances from the track centerline (50 to 250 feet).

Proposed noise and vibration impacts were analyzed for the various Build Alternatives and the type and location of mitigation measures required to mitigate potential significant noise and vibration impacts were presented in the DEIR. The DEIR acknowledges that the project will add a new noise and vibration source to the environment along the project corridor. While there is an existing noise and vibration source along the ROW, relocating the commuter rail lines and adding new light rail lines have the potential to increase future noise at some noise-sensitive and vibration-sensitive receptors. The DEIR summarized noise level projections for sensitive receptors without mitigation and identified their location, distance from the tracks, existing noise levels, moderate and severe noise impact criteria, future predicted noise levels, increases in noise levels over existing conditions, and the number of “moderate” and “severe” impacted buildings. Alternative 1, without mitigation, would result in moderate noise impact to 120 residential buildings and three institutional buildings, and severe noise impact to 41 residential buildings and one institutional building. The DEIR stated that vibration impact from the commuter trains generally occurs within 60 feet of the future commuter rail near track centerline and within 40 feet of the proposed Green Line near track centerline. The DEIR summarized vibration level projections for sensitive receptors without and mitigation and indentified their location, distance from the near track, maximum vibration velocities, the total number of impacted buildings, and which rail line was the cause of impact. For Alternative 1, without mitigation, vibration impact is projected at 90 residential buildings and three institutional buildings.

The DEIR stated that based upon the FTA guidance document, the project would mitigate both moderate and severe noise impacts wherever practical and wherever existing noise levels are above 65 dBA. The DEIR concluded that noise mitigation including noise barriers, sound insulation treatments, and rail lubrication would be feasible, reasonable, and effective in mitigating all potential noise impacts due to the project for all alternatives. The DEIR presented a goal for mitigating potential vibration impact below the impact criteria of 72 VdB for Green Line trains and 75 VdB for commuter trains. The DEIR concluded the vibration mitigation, including up to 19,700 track-feet of vibration mitigation such as ballast masts or resilient fasteners on the Green Line and relocated commuter rail tracks and the relocation or use of specially-engineered trackwork (flange-bearing or moveable-point frogs) for 12 crossovers and turnouts, would be effective in keeping future vibration levels at or below existing levels for commuter trains and below impact criterion for Green Line trains.
I received several comments questioning the validity of noise and vibration assessments at certain locations given that individual properties were not physically inspected. The level of noise and vibration assessment included with the DEIR is commensurate with the level of detail anticipated given the 10% design status of the project and effectively serves the MEPA process in identifying areas where mitigation will be necessary. The amount, type and specifics of noise and vibration mitigation appropriate for individual properties and structures will be refined during the ongoing design process in accordance with FTA guidance and standards. I have required MassDOT, as part of the scope for the FEIR, to provide a conceptual plan for evaluating, monitoring and compensating affected parties along the corridor with respect to noise and vibration.

Open Space and Historic Resources

As required, the DEIR included a discussion of the potential impact of the project on cultural resources including open spaces, historic properties and archaeological resources. This information was also prepared to fulfill the FTA’s obligations under Section 106 of the National Historic Preservation Act and the Section 4(f) provisions of the U.S. Department of Transportation Act of 1966.

The DEIR identified and described public parks, recreation areas and conservation lands within an area of potential effect (APE) that extends approximately 100 feet on either side of the proposed rail corridors, station locations and maintenance and/or interim train storage facilities. It noted that none of the five areas identified within the APE will be directly affected by the project. It indicated that there would be an indirect effect on one site (Trum Playground) associated with an increase in noise levels. The DEIR indicated that expansion of the existing 5-foot noise barrier within the right-of-way to 10 feet would effectively mitigate associated impacts.

The DEIR summarized the historic and archaeological reconnaissance survey conducted within the APE; defined as an area extending 125 feet or one assessor’s lot on either side of the proposed routes, station locations and maintenance and/or interim train storage facilities. It indicated that a total of 423 individual properties, two railroad corridor landscapes and 15 areas/districts were identified within the APE. Of these properties, four are individually listed in the National Register, 16 are recommended eligible for listing and 52 were previously recorded in the Inventory of Historic and Archaeological Resources of the Commonwealth. The DEIR noted direct impacts associated with removal of the existing Lechmere Station and re-construction of the station on the opposite side of O’Brien Highway. Indirect impacts associated with noise, vibration and changes to the visual setting may affect several properties identified in the DEIR.

The DEIR identified five areas where potentially significant archaeological resources may be located. It noted that previous activity within the corridor, including extensive earth moving and substantial filling, limit the possibility of finding intact archaeological deposits within the majority of the APE.

The DEIR indicated that mitigation will be provided for historic resources that are listed or eligible for listing in the National Register and that will be adversely affected by the Project. Mitigation for Lechmere Station will include archival documentation, consideration of salvage of
architectural elements of the Station and, potentially, interpretive signage. Other mitigation will include construction of noise walls and sound insulation. The DEIR indicates that design of the rail bed, ballast and track will incorporate measures to avoid impacts associated with vibration. To the extent that archaeologically sensitive areas are not avoided through project design, then the proponent will consult with MHC and FTA regarding the necessity of an intensive (locational) archaeological survey. MHC, in its role as the State Historic Preservation Officer (SHPO) will continue consultations with MassDOT and FTA regarding the development and refinement of project mitigation through the Section 106 process.

Hazardous Waste/Contaminated Soils

The Green Line Extension will traverse areas with a long-standing industrial and commercial history. As such, the project corridor contains numerous locations where impacted soil may be present and will require soil and/or groundwater remediation prior to or as part of project design or construction. Remediation will likely include removing contaminated soils and pumping contaminated groundwater in accordance with the provisions of the Massachusetts Contingency Plan (MCP), M.G.L. c.21E and c.21C, and the Resource Conservation and Recovery Act (RCRA).

The DEIR indicated that a Phase I Environmental Site Assessment (ESA) has been conducted for all the properties that are part of the land acquisitions for the project. As part of the Phase I ESA process, sites with Recognized Environmental Conditions (RECs) are evaluated. The DEIR included a description of each REC and its relative impact on proposed station sites and the Maintenance Facility site for each project alternative, along with respective Release Tracking Numbers (RTNs). The DEIR presented a general discussion of how the project will manage contaminated media and comply with applicable hazardous materials regulations for both soil and groundwater oil and hazardous materials (OHM).

The project will be required to comply with the MCP. The DEIR has indicated that at the completion of response actions for which an RTN has been obtained, but a closure report consisting of a Response Action Outcome (RAO) has not yet been submitted, a condition of No Significant Risk must exist as defined by the MCP. The MassDOT has indicated that a preferred outcome is a Class 1-A RAO in which contamination is reduced to background levels. In situations where a Class 1-A RAO cannot be supported, MassDOT should evaluate alternatives to a Class 1-A RAO designation. Proposed mitigation measures during construction may include special handling, dust control, and management and disposal of contaminated soil and groundwater.

MassDEP has indicated that if there is no pre-characterization of soils along the ROW, sampling of every 200 cubic yards of soils is recommended, including both the excavation piles and in-situ sampling. MassDEP notes that issues related to soil sampling, as further discussed in its comment letter, should be addressed prior to the 50-percent design stage of the project. MassDOT should consult with the MassDEP as project design proceeds and construction commences to ensure that planning and implementation of demolition and management of contaminated soils is performed consistent with applicable regulations and the recommendations made in the MassDEP comment letter.
Construction Period Impacts

MassDOT has acknowledged the challenges associated with the construction period impacts of such a complex project including: narrow roadways; traffic volumes; continuous access requirements to a variety of land uses; limited staging areas; and maintaining existing rail operations along the project corridor. Construction period mitigation measures must seek to minimize impacts to vehicular traffic, pedestrian and bicycle traffic, on-street parking, public access, and emergency access to local businesses and residences.

The DEIR included a conceptual construction sequencing and staging plan. Existing commuter rail and freight rail service will be maintained throughout the construction period. Alternative 1 will require the replacement of seven highway bridges and four railroad bridges, as well as the reconstruction of the Lechmere viaduct and the construction of two new viaducts at Red Bridge Junction to serve the Union Square Branch. The DEIR states that bridge reconstruction will be staged whenever possible to maintain traffic over respective bridges during construction; however, two bridges, Medford Street and Broadway Street in Somerville, will need to be closed during construction and detours established.

The project will also include numerous intersection upgrades to accommodate new transit stations, new traffic patterns and volumes, pedestrians, and bicycles. The DEIR outlined general criteria to be required for traffic management and construction staging along roadways and rail corridors. Blasting is not anticipated for construction of the project. Construction procedures will comply with MassDEP’s Solid Waste and Air Quality Control regulations, rodent control policies will be implemented, and construction policies will require that all diesel construction equipment used on-site will be fitted with after-engine emission controls such as diesel oxidation catalysts (DOCs) or diesel particulate filters (DPFs). The project will comply with MassDEP’s idling regulations (310 CMR 7.11) and MassDOT has committed to posting idling restriction signs on project construction sites. MassDOT should work with contractors to establish protocols to alleviate dust, noise, odor and nuisance conditions which may occur during construction.

Final identification of effective construction period mitigation measures requires advancement of project design. MassDOT must prepare a detailed plan to address myriad construction period impacts through coordination with the City of Cambridge, City of Somerville and City of Medford, and their respective Police and Fire Departments. I encourage MassDOT to also engage the broader community in the development of these plans as part of the mandated community outreach as project design is refined and prior to construction. As noted above, such a plan should seek to avoid, minimize and mitigate potential impacts to vehicular traffic, pedestrian and bicycle traffic, on-street parking, public access, emergency access to local businesses and residences, dust, noise, odor, rodents and construction-related nuisance conditions.
SCOPE

As discussed above, I am providing the following Scope for the preparation of a FEIR, limited to the topics outlined below. Although I recognize that this Scope will not address every issue raised by project commenters, I am confident that resolution of these remaining details will allow MassDOT to demonstrate that the project has fully complied with the requirements of MEPA. Additional topics will be addressed through the state and local permitting process and through MassDOT’s ongoing community involvement processes.

The FEIR should follow Section 11.07 of the MEPA regulations for outline and content, as modified by this Certificate. The FEIR should identify, describe and assess environmental impacts of any changes in the project that have occurred between the preparation of the DEIR and FEIR.

Maintenance Facility

Comment letters on the DEIR express a widespread lack of support for location of the Maintenance Facility at Yard 8 in Somerville. As part of the FEIR, MassDOT must expand upon the December 9, 2009 technical memorandum and provide a quantitative environmental analysis of both the Mirror H and Option L locations and include for comparative purposes the existing analysis of Yard 8. I note that comments submitted on the DEIR express preferences for both Mirror H and Option L, but based on the information and comments submitted to date, it appears that Option L may be the most feasible alternative location and the one with the fewest potential conflicts and impacts.

The analysis should expand upon the evaluation criteria presented in the technical memorandum (summarized on Page 4-1 of the report). The FEIR should provide a comprehensive analysis of Maintenance Facility siting and operations for not only these previously explored criteria but also on: land uses (including EJ populations), impervious area, parking, stormwater, hazardous materials, traffic, land acquisition, noise, vibration, air quality, open space, historic and archaeological resources, the Community Path, and construction period impacts.

The FEIR should provide a detailed assessment of Maintenance Facility sizing, and in exploring alternatives seek to minimize the project footprint and potentially reduce land acquisitions through innovative design (e.g., consolidating employee parking areas, shifting MBTA offices out of the Cobble Hill area property as suggested by Congressman Capuano, splitting storage and maintenance operations, etc.). The FEIR should evaluate impacts to freight operations for each design alternative, noting operational or deed restrictions that may hinder flexibility in Maintenance Facility siting or operations.
Air Quality

The FEIR should include a narrative discussion clarifying the air quality modeling assumptions, challenges associated with the inherent evolution of modeling programs and input data, and how the air quality modeling results were conducted in a manner that sufficiently demonstrated consistency with the SIP.

College Avenue Station

The DEIR presented a two phased approach to the Green Line Extension, with the initial phase terminating at College Avenue in Medford. In prior MEPA reviews and public meetings, the environmental impacts associated with College Avenue were reviewed within the context of functioning as an intermediate station along the project route. I have received numerous comments concerned about how the College Avenue Station will function for an undefined period as a terminus and the associated environmental impacts.

While MassDOT evaluated the College Avenue Station in the DEIR, it is unclear how modeling assumptions (pick-ups/drop offs, pedestrian trips, etc.) considered the unique attributes of a station acting as the terminus of a light rail line. The FEIR should revisit the DEIR models, revise as necessary to accurately assess the predicted function of the station, and describe differences in operations and mitigation measures between the DEIR and the FEIR, if any. The FEIR should clarify how College Avenue Station, functioning as a terminus, will impact traffic, parking, pedestrian, and bicycle operations within the study area and outline sufficient mitigation measures to offset identified negative impacts. The FEIR should describe Green Line operations at the proposed terminus (i.e. train reversals, temporary train storage, movement of personnel, etc.) and how the facility has been designed to accommodate terminal station ridership demand. The FEIR should clarify how train operations in Alternative 1 at this location may impact sensitive noise and vibration receptors, and present appropriate mitigation measures.

Lechmere Station

The project requires the relocation of the existing Lechmere Station in Cambridge. Lechmere Station presently functions as a northern terminus for Green Line operations, but will be transformed into an intermediate station for both the Medford and Union Square branches of the Green Line Extension. Lechmere Station is a hub for both Green Line light rail and MBTA bus routes and is currently integrated into the urban fabric, located between Cambridge Street and O’Brien Highway. The project will require the relocation of the station to the north side of O’Brien Highway, adjacent to a new street grid proposed as part of the North Point development project.

The FEIR should explore ways to reduce the proposed parking program (in light of the station no longer functioning as a terminus) and consider other design refinements to reduce impacts of the relocated Lechmere Station on abutting land uses (notably the Glass Factory Condominiums). I acknowledge the concerns regarding noise and vibration impacts and the potential for MBTA operational conflicts with residences closest to the station. Furthermore, I note concerns regarding pedestrian and bicycle safety in and around the new station location and
bus circulation routes. The FEIR should clarify modeling assumptions, and proposed station layout and mitigation measures that will be implemented to effectively and safely convey bus passengers, pedestrians and cyclists from the neighborhood to the relocated Lechmere Station. I do not expect MassDOT to present final station design and architectural drawings in the FEIR, as this is a level of detail that goes beyond the current design phase. Final station design should be explored further, as I have requested with other stations, during the public involvement process. However, the level of information presented in the FEIR should be of sufficient conceptual design to reflect anticipated station layout and operations, relationships to the broader transportation network, existing and permitted buildings, and where mitigation measures would be implemented.

Public Involvement Plan

As noted previously, a key to the overall success of the Green Line Extension project is the effective integration of light rail service into the existing urban landscape. To facilitate collaborative land use planning, review of advanced project design elements (notably station design), and implementation of mitigation measures, I am directing MassDOT to develop a Public Involvement Plan (PIP) for the project. The FEIR should present a PIP that clearly outlines how a broad range of participants (i.e., representatives of regional planning agencies, local government, business interests, community groups, representatives of EJ areas and the disabled community, abutters, and bicyclist and pedestrian groups) will continue to provide meaningful community involvement throughout the duration of the entire project, including detailed design, engineering, construction phases. This PIP should build on the lessons learned from the previous Advisory Groups convened in association with the project, consider ideas presented as part of the Community Corridor Planning Project, reflect comments received on the DEIR, and represent a serious commitment by both MassDOT and the MBTA to actively engage the public upon completion of MEPA review. I also expect that the PIP presented in the FEIR will provide not only a plan for procedural engagement of the various participants, but that it will also outline the primary substantive topics that are anticipated to be addressed through the PIP process.

Mitigation/Section 61 Findings

The FEIR should include a separate chapter on mitigation measures. This chapter on mitigation should include distinct draft Section 61 findings for each State Agency action. The draft Section 61 Findings should contain a clear commitment to mitigation, a schedule for implementation, an estimate of the individual costs of the proposed mitigation and the identification of the parties responsible for implementing the mitigation.

In response to the extensive comments received regarding future mitigation commitments on behalf of MassDOT and the MBTA, the FEIR should include a conceptual plan for evaluating, monitoring, and compensating affected parties along the corridor with a specific emphasis on, but not limited to, noise, vibration, and land acquisition impacts. This conceptual plan should address not only mitigation associated with the future ongoing operations of the Green Line Extension, but impacts uniquely limited to the construction period. I encourage MassDOT to integrate the components of this plan into the broader framework of the PIP to provide a forum for information sharing between future MassDOT studies and data and interested and affected parties.
Comments/Circulation

The FEIR should contain a copy of this Certificate and a copy of each comment letter received. The FEIR should respond fully to each substantive comment received to the extent that it is within MEPA jurisdiction. This directive is not intended to and shall not be construed to enlarge the Scope of the FEIR beyond what has been expressly identified in this Certificate.

In accordance with Section 11.16 of the MEPA Regulations and as modified by this Certificate, the MassDOT should circulate a hard copy of the FEIR to each State and city agency from which MassDOT will seek permits or approvals and to each of the City agencies that submitted comments. The MassDOT should also circulate a copy of the FEIR to those submitting individual written comments. To save paper and other resources, MassDOT may circulate the FEIR in CD-ROM format, although MassDOT should make available a reasonable number of hard copies, to accommodate those without convenient access to a computer to be distributed upon request on a first come, first served basis. MassDOT should send a notice of availability of the FEIR (including relevant comment deadlines and appropriate addresses) to those who signed the petition and for which addresses are available. In addition, a copy of the FEIR should be made available for public review at the Cambridge, Medford and Somerville public libraries.

Introduction

1.1 Introduction

The Green Line Extension Project is an initiative of the Massachusetts Department of Transportation (MassDOT) and the Massachusetts Bay Transportation Authority (MBTA) to enhance transit services in order to improve mobility and regional access for residents in the communities of Cambridge, Somerville and Medford. The Project is required by the State Implementation Plan (SIP) and fulfills a longstanding commitment of the Central Artery/Tunnel project to increase public transit. The Massachusetts Air Pollution Control Regulations (310 CMR 7.36) require that MassDOT complete this Project by December 31, 2014.

MassDOT expects Project funding will come both from the Federal Transit Administration (FTA) and from Commonwealth bonding. Because MassDOT is seeking funding through the FTA, the Project also requires review under the National Environmental Policy Act (NEPA). At the request of the FTA, MassDOT is preparing a separate Final EA.

The Green Line Extension Project is proposed to be built in two phases with an initial operating segment (the “Proposed Project”) being constructed to College Avenue in Medford and a spur to Union Square in Somerville, as described and evaluated in the DEIR/EA as Alternative 1. The second phase of this Project, the
“Future Full-Build Alternative” will include extending the Project from College Avenue Station to Mystic Valley Parkway/Route 16 Station in the future, as described and evaluated in the DEIR/EA as Alternative 2. Although the extension to Mystic Valley Parkway/Route 16 was considered for the Green Line Extension Project, limitations on available funding prohibit the Commonwealth from extending the Green Line beyond College Avenue at this time. This second, future phase is not currently part of the Proposed Project and is not the subject of this FEIR.

As required by the Secretary’s Certificate on the DEIR (hereafter referred to as the Secretary’s Certificate), this FEIR provides additional analyses of the Proposed Project, including:

- Quantitative environmental analysis of both the Option L and Mirror H Maintenance Facility locations including, for comparative purposes, the prior analysis of Yard 8 (see Chapter 2);
- Narrative discussion clarifying air quality modeling (see Chapter 3);
- Impacts associated with College Avenue Station as a terminal station (see Chapter 4);
- Refined conceptual design of Lechmere Station (see Chapter 5);
- A Public Involvement Plan (PIP) for community participation beyond the environmental process (see Chapter 6);
- Summary of Proposed Project impacts (see Chapter 7); and
- Mitigation measures and Section 61 Findings for Project impacts (see Chapter 8).

The DEIR/EA, available on the Project website, www.mass.gov/greenlineextension, provides the full description of existing conditions and environmental resources affected by the Green Line Extension, as well as a full impacts analysis, methodology assumptions and definitions of applicable terminology for each resource.

### 1.2 Project Background

Numerous studies over the last 40 years have explored extending transit from Lechmere Station (the current terminus of the Green Line) along the existing MBTA Lowell or MBTA Fitchburg Line commuter rail rights-of-way (Figure 1-1). More recently, the 2005 Beyond Lechmere Northwest Corridor Study generated a Major Investment Study/Alternatives Analysis that evaluated a wide range of technologies and operating plans for a future extension. The Beyond Lechmere Northwest Corridor Study did not identify a preferred alternative, but rather
investigated a range of cost-effective transit solutions that would increase transit accessibility, improve corridor mobility, increase transit services, and support opportunities for smart growth initiatives and sustainable development.

An Expanded Environmental Notification Form (EENF) was submitted to the EEA on October 10, 2006. The Secretary of EEA issued a Certificate on the EENF on December 1, 2006, requiring a DEIR for the Proposed Project.

After the submission of the EENF, the Project Area was expanded to include the relocation of Lechmere Station. Relocating Lechmere Station was previously reviewed under MEPA as part of the NorthPoint development project (EEA # 12651), but was not previously reviewed under NEPA. The October 2009 DEIR/EA included an evaluation of relocating Lechmere Station to the location previously reviewed under MEPA. The DEIR/EA evaluation included the need to relocate the station, documented the alternatives evaluated, and evaluated the environmental consequences of moving the station.

On Lechmere Station, the January 15, 2010 Secretary’s Certificate required the FEIR to:

- “Explore ways to reduce the proposed parking program (in light of the station no longer functioning as a terminus) and consider other design refinements to reduce impacts of the relocated Lechmere Station on abutting land uses (notable the Glass Factory Condominiums).”
- “The FEIR should clarify modeling assumptions, and proposed station layout and mitigation measures that will be implemented to effectively and safely convey bus passengers, pedestrians, and cyclists from the neighborhood to the relocated Lechmere Station.”

This information is provided in FEIR Chapter 5, Lechmere Station.

Another topic that has been extensively studied has been the vehicle maintenance and storage facility that must be constructed to support the operations of the Green Line Extension. The DEIR/EA stated that the area referred to as “Yard 8 with Adjacent Parcel” (Yard 8) was selected as the preferred location for the construction of a Green Line vehicle maintenance and storage facility, based on the combination of size, configuration, and adjacency to the Green Line Extension tracks. The selection of the Yard 8 site prompted local opposition from some municipal officials, elected representatives, and abutting residents. To try to address and resolve these concerns, MassDOT then qualitatively analyzed two additional possible sites for the facility, Option L and Mirror H, in December 2009.
The January 15, 2010 Secretary’s Certificate required MassDOT to “provide a quantitative environmental analysis of both the Mirror H and Option L locations and include for comparative purposes the existing analysis of Yard 8.” In response, MassDOT completed the required analysis in April 2010, as provided in the Environmental Analysis of Additional Maintenance Facilities technical memorandum, summarized in FEIR Chapter 2 and provided in full in Appendix B. The full environmental analysis for Yard 8 was conducted for and included in the DEIR/EA, and was repeated in the April 2010 technical memorandum for comparison purposes.

1.3 The Proposed Project

The Proposed Project is envisioned to provide service to College Avenue in Medford and Union Square using a two-branch operation, both in existing commuter rail rights-of-way. The 3.4-mile Medford Branch would operate from a relocated Lechmere Station to College Avenue in Medford along the MBTA Lowell Line commuter rail right-of-way. This branch would begin at relocated Lechmere Station and head northwest, meeting the MBTA Lowell Line just south of Washington Street in Somerville. From Washington Street, the alignment would run parallel to the MBTA Lowell Line to Medford, terminating its route at College Avenue in Medford. The 0.9-mile Union Square Branch would operate along the MBTA Fitchburg Line commuter rail right-of-way from relocated Lechmere Station into a terminus at Union Square in Somerville.

Seven stations would be constructed for the Proposed Project:

- Relocated Lechmere Station, Cambridge (relocated to east side of O’Brien Highway/Route 28);
- Brickbottom Station, Somerville;
- Gilman Square Station, Somerville;
- Lowell Street Station, Somerville;
- Ball Square Station, Medford;
- College Avenue Station, Medford; and
- Union Square Station, Somerville.

The primary infrastructure improvements of the Proposed Project would include relocating existing commuter rail lines, constructing approximately four miles of new light rail track and systems, four multi-span viaducts, a vehicle maintenance and storage facility, and reconstructing 11 bridge structures to support the extended service.

---

1 Massachusetts Department of Transportation, Green Line Extension Project, Environmental Analysis of Additional Maintenance Facilities, April 21, 2010.
The Proposed Project is expected to generate the MBTA’s anticipated daily ridership at the Project’s seven stations (boardings and alightings) by approximately 52,000 by the year 2030, with approximately 90 percent of these trips to take place in the Project’s opening year of 2014. The Green Line would also see an increase of 30,700 boardings and the entire MBTA system would see an increase of 7,900 new daily linked transit trips as a result of the extension of the Green Line service. Of these new transit trips, approximately 70 percent of these riders are projected to switch from using their automobiles to using transit. The Proposed Project would reduce vehicle miles travelled (VMTs) by 25,018 per day (projected to the year 2030).

Estimated travel time between College Avenue Station and Lechmere Station for the proposed Green Line Medford Branch is 9.5 minutes. Green Line service beyond Lechmere Station for the Medford Branch would operate on headways equal to that of the existing Green Line D branch service: five minutes in the morning and evening peak periods and ten minutes during off-peak periods.

Estimated travel time between Union Square and Lechmere Station for the proposed Green Line Union Square Branch is 4.5 minutes. Green Line service beyond Lechmere Station for the Union Square Branch would operate on headways equal to that of the existing Green Line E branch service: six minutes in the morning peak period, five minutes in the evening peak period, and between nine and ten minutes during off-peak periods.

Fares for the Green Line Medford Branch and Union Square Branch would be $1.70 for one-way adult trips, based on current MBTA subway fares.

1.3.1 Stations

Seven stations would be constructed as part of the Proposed Project, as described in more detail in DEIR/EA Section 3.7.3, Stations, and DEIR/EA Appendix B. Station locations for the Green Line Extension were identified through an evaluation process and in working with the public and local officials. Important considerations in station siting and configuration included operations and access, as well as impacts to area properties. Stations are intended to function as neighborhood stations with no provisions for parking.

Stations were designed to meet the Project’s goals of improved transit access and accessibility, and to minimize impacts to the community associated with land acquisition, traffic, and loss of local parking. The design for each station is envisioned to provide a headhouse with automated fare lines, vending machines, an information booth, and restrooms. Entry to and exit from the platforms would be by elevators, escalators, and stairs. Station access and platform design were based on requirements and guidance provided by the Americans with
Disabilities Act (1990) (ADA) and the Commonwealth of Massachusetts Architectural Access Board (AAB), as well as requirements of the MBTA. In addition to station amenities and access requirements, station criteria also considered “green” or sustainable design.

1.3.2 Vehicle Requirements

The Green Line Extension Project vehicle fleet will include a mix of three vehicle types: the two current vehicles (Type 7 high-floor cars and Type 8 low-floor cars) and a new “Type 9” low-floor car, which is currently under development. All three vehicle types would be able to operate within the existing system and along the Green Line Extension.

In general, the current Green Line trainsets (or “consists”) include two or three cars. For the purpose of calculating the number of required cars, two-car Green Line trains were conservatively assumed. Based on the 2006 MBTA’s Service Delivery Policy, the seating capacity of each Green Line car is 44 to 46 seats, depending on the car type, and the maximum peak load standard is 225 percent of the seated capacity for the peak periods. This translates into a peak period train capacity of 198 to 207 passengers per trainset. Utilizing the projected ridership and proposed operating plan for the Proposed Project, as well as working with the MBTA, it was determined that 24 additional Green Line cars would be needed to accommodate the proposed headways and projected ridership for the Green Line Extension Project.

1.3.3 Capital Improvements

Capital improvements for the Medford Branch include construction of light rail tracks and overhead catenary system (OCS) along the existing railroad right-of-way between the relocated Lechmere Station and College Avenue in Medford. Improvements also include use of the MBTA’s portion of the “Yard 8” right-of-way between relocated Lechmere Station and Washington Street and along the MBTA Lowell Line between Washington Street and College Avenue. The service would end immediately north of the College Street overpass. A support facility for storage and servicing of the Green Line fleet would be constructed to accommodate the existing north-side Green Line service fleet and the additional fleet of 24 vehicles. In addition to the track construction, some of the existing bridges along the right-of-way would need to be reconstructed to accommodate the additional tracks. The structures that would need to be reconstructed include the former Red Bridge, Washington Street, Walnut Street, Medford Street, School Street, Lowell Street, Cedar Street, Broadway, Harvard Street, and College Avenue. Existing track and signal equipment would also need to be relocated in order to accommodate the planned light rail tracks. Since
College Avenue would be the terminus for the line, additional track lengths would be required north of the station for short-term storage and operational flexibility.

The Union Square Branch would also require light rail tracks and OCS to be constructed along the MBTA Fitchburg Line between the former Red Bridge and the proposed Union Square Station near Prospect Street. The alignment to Union Square would require reconfiguration of the existing signal equipment as well as the commuter rail and freight rail tracks between the MBTA’s Boston Engine Terminal (BET) and Webster Avenue. In addition, the existing rail bridge over Medford Street along the right-of-way would need to be reconstructed to accommodate the additional tracks.

New signal, communications, and electrical systems will be required for the Green Line Extension Project. The Proposed Project would require Automatic Wayside Block Signals to govern Green Line train operations for both the Medford Branch and the Union Square Branch.

As described in the DEIR/EA, multiple communication systems are proposed for MBTA operations, MBTA staff communications, mechanical system monitoring, passenger communications, and emergency reporting.

Traction power for the Green Line is provided by 600 volts direct current (VDC) through an OCS. The Proposed Project will require traction power substations to supply direct current (DC) power to both the Medford Branch and the Union Square Branch. New substations would be required at the proposed maintenance facility site and at Ball Square Station. The traction power feeders and returns will be installed in underground electrical conduits. The OCS will consist of an overhead auto-tension catenary system registered and supported on cantilever-type assemblies, span wire assemblies, and portal bents.

1.3.4 Construction

The Proposed Project has been designed to minimize impacts to the corridor municipalities by reducing the footprint of the Project and maximizing the use of existing transportation corridors.

Construction staging and sequencing strategies are critical to achieving an efficient construction project while minimizing the impacts to vehicular traffic, pedestrian traffic, on-street parking, public access, emergency access to local businesses and residences, and general quality of life. This corridor presents several construction challenges including narrow roadways, urban traffic volumes, and a variety of commercial, industrial, and residential land uses that require continuous access, limited space for construction zones and lay down
areas within or near the rail corridor, and existing rail service that must be maintained throughout construction.

The current level of construction staging and sequencing developed for the Project addresses the constraints of the corridor, impacts to abutters, and other construction issues. More detailed evaluation and staging recommendations will be developed as design progresses and through coordination with the City of Cambridge, City of Somerville, and City of Medford, and their respective Fire and Police Departments. This effort would include public input. A comprehensive construction staging and sequencing plan will be developed and included in the final construction contract documents and communicated to the public.

1.3.5 Estimated Cost

During the development of the DEIR/EA, 10-percent concept plans for the Proposed Project were designed and detailed capital cost estimates were developed. The capital improvements include, but are not limited to, construction of track, stations, structures, systems, drainage, utilities, and the maintenance facility. Additional costs include property acquisitions and relocations as well as the cost for vehicle acquisition. The cost of the Proposed Project includes the cost to reconstruct Lechmere Station. The overall cost of the Proposed Project is currently estimated to be approximately $844.5 million in 2009 dollars, including $79.3 million for the 24 Green Line vehicles. Annual operating and maintenance costs would be approximately $22.1 million in 2009 dollars. The total costs for the Proposed Project were increased to include inflation for the time period in which the Project is to be implemented. Therefore, the “Year-of-Expenditure” (YOE) capital costs for the Proposed Project were calculated to be approximately $953.7 million in YOE dollars.

1.4 Public Involvement

The Green Line Extension Project has received significant public input throughout the planning process, as documented in DEIR/EA Section 1.5, Public Involvement and Agency Coordination. The public hearing for the DEIR, attended by over 400 people, was held in November 2009. As noted in the Secretary’s Certificate, the approximately 400 comment letters (with more than 2,400 individual comments) on the DEIR/EA reflect a substantial interest in the future of the corridor from elected officials and municipal representatives; city, state, and regional agencies; environmental, bicycle, and pedestrian advocacy groups; neighborhood groups; groups that represent the disabled; businesses; residents; and the general public. Table 1-1 provides a summary of substantive comments received, by topic.
During the review of the DEIR/EA comments, a number of key concerns and issues were raised including, but not limited to:

> **Station Design** – Members of the public were concerned with station design issues. The greatest number of station design comments focused on the relocated Lechmere Station (approximately 200 comments). Comments included the location of the track near the Glass Factory Condominiums; parking at the station; bus circulation and bus stop locations; the pedestrian crossing at O’Brien Highway; and general station layout, access, and
architectural character. Several comments expressed support for adaptive reuse of parts of the existing Lechmere Station, particularly the bus shed. Several comments requested reconsideration of the Mystic Valley Parkway/Route 16 station layout and its inclusion in the Proposed Project.

- **Access** – Stakeholder comments expressed general support for prioritizing pedestrian, bicycle, and bus access to the Project stations. Members of the public were concerned with locations of drop-off and pick-up areas and their impacts on traffic; platform locations; bicycle/pedestrian access; and ADA accessibility at station approaches, within the stations, and between the platforms and vehicles.

- **Maintenance and Storage Facility** – Members of the public were concerned with the location of the maintenance and storage facility. Of all comments received, the majority (including over 225 petition signatures) opposed the siting of the light rail maintenance and storage facility at Yard 8. Most maintenance facility commenters were in favor of the Option L site. Lechmere Station-area stakeholders expressed general opposition to the Mirror H location, while Somerville stakeholders generally preferred Mirror H but also welcomed Option L.

- **Continued Coordination with Agencies and Interested Parties** – Members of the public requested that MassDOT and the MBTA continue public involvement during design and construction. Several requested a construction field office where stakeholders could speak in person with Project representatives regarding construction impacts and mitigation.

- **Alternatives** – Members of the public were predominantly in favor of the Proposed Project. A large number of comments requested that the Project continue to Mystic Valley Parkway/Route 16 in one phase. Few expressed support for a College Avenue terminus of the Medford Branch. Approximately 70 comments expressed concern about traffic and neighborhood parking impacts at College Avenue. Several other comments expressed concern that the College Avenue terminus would not adequately serve Medford Hillside residents. Approximately 50 comments requested that the Project not preclude future extensions or additions of the Green Line. Most of these comments supported a future extension of the Union Square Branch to Porter Square; several comments supported a possible future station on one or both branches near the Brickbottom Artists Building and/or Boynton Yards.

- **Mitigation/Section 61 Findings** – Members of the public were concerned and/or interested with proposed mitigation measures for potential impacts from noise, vibration, traffic, and the maintenance facility. A large number of comments pertained to noise, vibration, and visual impacts at the Glass Factory Condominiums near the proposed Lechmere Station. Most of the comments from Brickbottom Artists Building stakeholders expressed
concern about noise and visual impacts of a maintenance and storage facility at Yard 8; others expressed concern about impacts from railroads and proposed light rail along the south side of the Brickbottom Artists building.

- **Community Path** – Members of the public requested that the design and construction of the Somerville Community Path be included in the Green Line Extension Project (over 125 comments and 175 petition signatures). Many of these comments requested that the Path extend to Lechmere Station as part of the Project.

- **Construction Impacts** – Members of the public expressed concerns with regards to impacts during construction, including noise and vibration, vehicular traffic, detours during bridge reconstruction, pedestrian traffic, on-street parking, public access, and emergency access to local businesses and residences.

### 1.4.1 Public Involvement since the DEIR/EA

This section discusses public involvement activities that have occurred since the release of the DEIR/EA, including a public meeting in December 2009 to release the results of the operational analysis on the maintenance facility alternatives; municipal meetings with Cambridge, Somerville and Medford; Land Use Workshops, and the creation of a design working group for later phases of the Proposed Project.

#### Meetings

MassDOT held one public meeting in Cambridge in December 2009 to present the Option L and Mirror H alternatives for siting, design, and construction of a Green Line vehicle maintenance and storage facility. Yard 8, as fully analyzed in the DEIR/EA, was also presented for comparison purposes. The meeting included a presentation by MassDOT and a questions and answer session. The presentation provided an overview of the operational analysis, property acquisition needs, and schedule implications, as well as a preliminary evaluation of potential environmental impacts and costs of the three sites under consideration. Attendance was over 125 people.

Beginning in March 2010, MassDOT and the Project Team have been meeting biweekly with municipal leaders of the corridor communities. These meetings have focused on a wide range of project-related issues, including developing the public involvement approach for the Preliminary Engineering phase of work and planning the municipal Land Use workshops for May and June 2010.
MassDOT, working with the local municipalities, has hosted a series of Land Use Planning Workshops associated with the Green Line Extension Project. After an overview presentation about the Green Line Extension project, participants were given a chance to share knowledge about their neighborhoods and to express their priorities and concerns about future land uses around the station areas. These workshops focused on areas around the planned stations, with the intention that future workshops would focus on the stations themselves. Workshops were held in Medford on May 19, 2010, in Cambridge on May 26, 2010, and in Somerville on June 12, 2010.

MassDOT and the Project Team are committed to reaching out to environmental justice populations. The team sent notifications to these communities to ensure their participation throughout the FEIR process to achieve compliance with state and Federal guidelines.

**Fact Sheets**

The Project Team prepared a Project Fact Sheet in advance of the DEIR/EA release in the Fall of 2009. This fact sheet outlined the contents of the DEIR/EA, provided a summary of Project impacts, Project cost and funding, an overview of Project components (stations and maintenance and storage facility) and information on providing comments on the DEIR/EA.

The Project Team prepared a Fact Sheet in advance of the FEIR release in Spring 2010. The fact sheet outlined the anticipated content of the FEIR, discussed ongoing survey work and data collection that will be used to advance the design of the Green Line, and discussed upcoming public workshops on station area land use planning and station design.

**Website/Emails**

MassDOT continually updates the interactive Project website, [www.mass.gov/greenlineextension](http://www.mass.gov/greenlineextension) with new information as it becomes available. Interested individuals have signed up to be part of the Green Line Extension mailing list (more than 4,500 names) and have also sent inquiries about the Project to MassDOT and the Project Team.

Since the release of the DEIR/EA, MassDOT has sent weekly notifications to the Project email distribution list concerning on-going data collection efforts, which include survey and geotechnical investigations.
Design Working Group

As part of the planning for the Preliminary Engineering phase, MassDOT is convening a Green Line Extension (GLX) Design Working Group. This group will assist MassDOT by reaching out to local residents, businesses, and institutions to gather input on the design of six new stations proposed for the neighborhoods of Brickbottom, Gilman Square, Lowell Street, Ball Square, College Avenue, and Union Square, as well as the relocation of Lechmere Station. In addition, MassDOT will seek public input on design issues related to the proposed Somerville Community Path and the Green Line Extension vehicle maintenance and storage facility.

On April 1, 2010, MassDOT distributed an application for membership on the GLX Design Working Group to the project database and announced its availability in local newspapers and libraries. Applications were accepted until April 30, 2010. MassDOT announced the members of the Working Group prior to the filing of this FEIR. The list of members is also available on the project website.

1.5 Requirements of Secretary’s Certificate

The Secretary’s Certificate on the DEIR (January 15, 2010) stated that the DEIR adequately and properly complied with MEPA and with its implementing regulations. The Secretary required MassDOT to prepare and submit for review a limited FEIR in response to those items identified in the scope, summarized in Table 1-2. The limited FEIR focuses on these six main topics:

- Maintenance facility location (Chapter 2);
- Air quality modeling (Chapter 3);
- Impacts associated with College Avenue Station as a terminal station (Chapter 4);
- Redesign of the conceptual layout for Lechmere Station (Chapter 5);
- Development of a plan for community involvement as the Project advances (Chapter 6);
- Summary of Proposed Project impacts (Chapter 7); and
- Mitigation measures and Section 61 Findings for Project impacts (Chapter 8).
The requirements of the Secretary’s Certificate, and the sections of this FEIR that address these requirements, are provided in Table 1-2. Detailed, point-by-point responses to the Secretary’s Certificate are provided with the other responses to comments in Volumes 2 and 3 (provided on CD) of this document.

Maintenance Facility Alternatives Analysis

2.1 Introduction

A vehicle maintenance and storage facility must be constructed to support the operations of the Green Line Extension. The DEIR/EA stated that the area referred to as “Yard 8 with Adjacent Parcel” (Yard 8) was selected as the preferred location for the construction of a Green Line vehicle maintenance and storage facility, based on combination of size, configuration, and adjacency to the Green Line Extension tracks. The selection of the Yard 8 site prompted local opposition from some municipal officials, elected representatives, and abutting residents. To try to address and resolve these concerns, MassDOT qualitatively analyzed two additional possible sites for the facility in December 2009. Option L, a site identified by MassDOT, is immediately adjacent to the MBTA commuter rail maintenance facility, also referred to as the BET. Mirror H, a site proposed by the City of Somerville, straddles the Inner Belt area of Somerville and the NorthPoint area of Cambridge. All three maintenance facility alternatives are shown on Figure 2-1.

The December 2009 Additional Maintenance Facility Alternatives Analysis included an analysis of operations, property acquisition needs, and schedule implications, as well as a preliminary evaluation of potential environmental impacts and costs. It did not include an in-depth environmental analysis of the type presented in the DEIR/EA for the Yard 8 site. This qualitative analysis concluded that both Yard 8 and Option L remained viable locations for the Green Line Extension Project support facility, while the Mirror H site rated lower in a number of categories.

Following an extensive public review and comment period on the DEIR/EA, the January 15, 2010 Secretary’s Certificate required MassDOT to prepare a FEIR for the Green Line Extension Project, including a more detailed, quantitative analysis of the environmental and operational impacts associated with Option L and Mirror H.

2 Ibid.
In response, MassDOT conducted that analysis as documented in the April 2010 *Environmental Analysis of Additional Maintenance Facilities*. The full environmental analysis for Yard 8 was conducted for and included in the DEIR/EA, but was repeated in that document for comparison purposes.

MassDOT reviewed and considered the DEIR/EA comments on the maintenance facility together with the outcome of the April 2010 analysis to decide whether to substitute either Option L or Mirror H for Yard 8 as the preferred site for the maintenance and storage facility for the Green Line Extension Project. After balancing all operational and environmental benefits and impacts of the three maintenance facility alternatives, combined with discussions with the local communities, MassDOT has selected Option L as the preferred maintenance facility site for the Green Line Extension Project.

### 2.2 Requirements of the Secretary's Certificate

The Secretary’s Certificate required the FEIR to provide additional information on the Green Line maintenance and storage facility to address comments received during the public comment period. Specific requirements include:

- Expand upon the December 9, 2009 technical memorandum and provide quantitative environmental analysis of Mirror H and Option L and include for comparative purposes the existing analysis of Yard 8.

- Provide a comprehensive analysis of Maintenance Facility siting and operations for: land uses (including environmental justice), impervious area, parking, stormwater, hazardous materials, traffic, land acquisition, noise, vibration, air quality, open space, historic and archaeological resources, the Community Path, and construction period impacts.

- Provide a detailed assessment of Maintenance Facility sizing, and explore alternatives to minimize the project footprint and potentially reduce land acquisitions through innovative design.

- Evaluate impacts to freight operations for each design alternative, noting operational or deed restrictions that may hinder flexibility in Maintenance Facility siting or operations.

- Comments received from Pan Am Railways (PAR) on the DEIR and concerns raised regarding potential impact of MassDOT’s use of Yard 8 on PAR operations should be addressed in Maintenance Facility portion of the FEIR.
The following sections provide a summary of the supplemental analysis of the three maintenance facility alternatives and respond to the requirements of the Secretary’s Certificate.

2.3 Description of Alternatives

This section provides a description of the three locations evaluated as part of the analysis of additional maintenance facility alternatives for the Green Line Extension Project – Yard 8, Option L and Mirror H (Figure 2-1). A summary of the program, operational plan, real estate impacts and cost for each maintenance facility alternative is provided. The complete description of the alternatives is provided in full in Appendix B.

2.3.1 Yard 8

Yard 8 is an approximately six-acre railroad yard adjacent to the proposed Green Line alignment and accessed from Inner Belt Road in Somerville (Figure 2-2). The yard is partially owned by the MBTA and by Pan Am Railways. The Pan Am Railways’ portion of the yard is currently used for freight operations while the MBTA portion of the yard is currently inactive. This site, combined with an adjacent undeveloped parcel at 200 Inner Belt Road, was previously determined to be the preferred maintenance facility site that could accommodate the necessary maintenance facility components for the Green Line Extension Project. A detailed environmental analysis of the Yard 8 site was provided in the DEIR/EA.

Program

Yard 8 accommodates the defined support facility program including, but not limited to: storage for 80 Green Line vehicles, two pit tracks, two lift tracks, one wheel truer track, support shops, Green Line vehicle wash, administrative office space, and an approximately 100-space employee parking lot.

Combining the MBTA and Pan Am Railways’ portions of Yard 8 would provide sufficient area to accommodate the Green Line Extension tracks and a five-track storage facility that could store 70 vehicles. The shape of Yard 8 is well-suited to provide a double-ended storage yard, with lead tracks at each end feeding ladder tracks which fan out to the five storage tracks.4

The layout of Yard 8 allows for a single storage yard north of the maintenance building. Total capacity of the storage yard is 70 cars. It is assumed that, at any one

4 A lead track is a primary track that provides access from a main line track to a yard, and from which a series of yard tracks can be connected via a turnout or switch within the yard. Multiple storage tracks that are connected to the lead track in a “ladder” configuration are referred to as ladder tracks.
time, 10 additional cars would be in the maintenance shop building or temporarily stored on the tracks just outside the building. The building and the yard are proposed to be approximately at the existing grade of the site.

Both the building and the storage yard have double-ended access, which provides redundancy so that operations can be maintained even if a train should derail in the yard. With only single-ended access, a derailment at a critical location in the yard could block trains from entering or leaving the yard, resulting in serious impacts to Green Line service.

This alternative could accommodate potential future air rights development.

Operational Plan

The following includes a brief description of the operational interface of the Yard 8 alternative with future Green Line Extension operations and of the potential impact to existing railroad operations. A more detailed description of the operating plan for the Yard 8 facility is included in FEIR Appendix B.

Yard Interface with Green Line Extension Operations

The Yard 8 facility layout consists of a double-ended yard, which provides the necessary redundant connections to the mainline of the Green Line Extension. Light rail vehicles can directly enter and exit the yard from both the north and south ends of the yard, eliminating the need for any reverse moves\(^5\) or switchbacks for access to the mainline, providing optimal operational efficiencies.

The Yard 8 facility layout includes three lead tracks (Medford Lead, Lechmere Station Lead, and Maintenance Lead) that provide access into and out of the maintenance and storage facility, providing access in both directions on the Medford Branch mainline between Lechmere Station and College Avenue. Reverse moves from the yard would be needed in order for vehicles to access the Union Square Branch.

On the Union Square Branch, there is only the terminal station on this line, so trains on this service would continue to deadhead (i.e., run without picking up passengers) to Union Square. Trains from Union Square to the yard would need to proceed inbound and reverse direction either at Lechmere Station or at the Brattle Loop at Government Center Station.

In the morning, trains would leave the storage yards for Medford Hillside, Union Square and inbound towards Lechmere Station. Prior to the start of revenue

---

\(^5\) A reverse move is when the operator would have to stop the train, leave the control cab at one end of the train and walk to the other end of the train and enter the control cab to operate the train.
operations at 5 AM, the initial trains would deadhead to their respective origin stations. After 5 AM, trains for Medford Hillside could either deadhead or enter revenue service at Brickbottom Station.

Trains would continue to leave the yard until all peak hour service trains are in operation. Toward the end of peak service (approximately 9 AM), some trains would come out of service and return to the yard. In the afternoon, prior to the evening peak, these cars would leave the yard and return to service. After the evening peak, a number of cars would again return to the yard while the remainder would handle the night service schedule. At the end of the service day, the remaining trains would return to the yard, with the last ones arriving after the end of revenue service at 1 AM.

Impacts to Existing Railroad Operations

The construction of a Yard 8 facility would remove all existing freight tracks within Yard 8 and would remove the Wiley Track, a connecting track between the south end of Yard 8 and the Valley Tracks. Thus, this option would require some revisions to current freight operations by Pan Am Railways. There is no impact to CSX freight rail operations with this option. With a Green Line maintenance facility at Yard 8, CSX freight trains could continue to operate as they do today.

The main impact to freight operations would be the reconstruction of Yard 8, converting it from a freight rail yard to the Green Line maintenance and storage yard. Currently, Pan Am Railways has two tracks in the yard: one through track and one storage track. Pan Am Railways’ freight trains that operate via the MBTA Lowell Line and through Yard 8, occasionally store freight cars in the yard.

Pan Am Railways’ freight trains reach Boston via the MBTA Lowell Line. Typically, there are about three to four round-trips per week for the local switching operation, which serves Somerville as well as Chelsea, Salem, and Peabody via other MBTA routes. In addition, the “sand and gravel unit train” to Boston Sand and Gravel in Charlestown makes another three to four round-trips a week. Most freight trains operate in the evening or night, when MBTA commuter rail operations are less frequent. If Yard 8 were dedicated to the Green Line, it would still be possible for Pan Am Railways to access the Boston area and store freight cars in other nearby locations. Alternative routes exist within the MBTA system to support Pan Am Railways’ operations. Based on on-going discussions with Pan Am Railways, existing overall freight rail operations into the Boston area would not be precluded.

Additionally, the Yard 8 facility site would not preclude the future North-South Rail Link project or the ability to expand the BET facility within existing MBTA property limits.
Real Estate Impacts

The maintenance yard for Yard 8 fits within existing rail yards owned by the MBTA and Pan Am Railways. The maintenance facility building would be on private land (the undeveloped portion of 200 Inner Belt Road) that is currently vacant and, therefore, no buildings, structures or businesses would need to be removed or relocated. Maintenance facility uses are consistent with the existing industrial zoning for the area. Table 2-1 provides a list of properties that would need to be acquired for Yard 8. This alternative requires the acquisition of approximately 5.8 acres of land, which is estimated at approximately $15 million.

The undeveloped parcel at 200 Inner Belt Road (also referred to as 150 Inner Belt Road) that would be acquired for the maintenance facility has an existing land use permit for the construction of a proposed 190,000-square-foot building approximately 64 feet high. The proposed building and the proposed maintenance facility cannot share the site due to space constraints. Therefore, the maintenance facility would require voiding the existing land use permit. If the MBTA acquired the land within the footprint of the facility (tracks and buildings) in fee, this would represent a loss of current tax revenue to Somerville as the MBTA is exempt from local property taxes. This alternative could result in the loss of potential tax revenue which would be generated by future development at this location.

As part of the amendment to the original NorthPoint development agreement, the MBTA has an option to acquire the portion of Yard 8 that is currently owned by Pan Am Railways. Although the Commonwealth would still need to pay for the land, acquisition of this site could be easier than under typical circumstances because of the proposed agreement.

Order-of-Magnitude Capital Costs

An Order-of-Magnitude conceptual capital cost estimate for the proposed maintenance and storage facility at Yard 8 was developed and is estimated to be approximately $79 million in 2008 dollars. Since the publication of the DEIR, the design of Yard 8 was refined to make it more operationally consistent with the other
two alternatives. Table 2-2 provides a breakdown of the conceptual capital cost estimate for Yard 8.

2.3.2 Option L

The proposed Option L facility, so called because of its “L” shape configuration, is located immediately adjacent to and northwest of the MBTA’s commuter rail maintenance facility, also referred to as the BET (Figure 2-3). Option L is situated along the southern and southeastern fringe of the existing Inner Belt industrial area of Somerville and adjacent to the Valley Tracks just north of the MBTA’s BET.

Program

Option L accommodates the same defined support facility program as Yard 8, including but not limited to: storage for 80 Green Line vehicles, two pit tracks, two lift tracks, one wheel truer track, support shops, Green Line vehicle wash, administrative office space, and an approximately 100-space employee parking lot. The maintenance building and associated trackwork are proposed on land adjacent to and northwest of the existing BET facility. That land is currently occupied by two businesses at 20 Third Avenue and 44-48 Third Avenue. The vehicle storage yard is proposed at the southern end of Inner Belt Road just north of the MBTA Fitchburg Line on vacant private property and land that is currently an unused parking lot for 70 Inner Belt Road.

The layout of Option L includes two storage yards and the maintenance building. The south yard is immediately south of the hook in Inner Belt Road. This yard includes eight storage tracks and a runaround track. The south yard would store up to 40 cars. The east yard is east of the maintenance building and just south of Third Avenue. This yard provides eight vehicle storage tracks and has a total capacity of 27 cars. Total capacity of the storage yards is 67 cars. For Option L, 13 cars would need to be stored in the building or tracks just outside the buildings at any given time in order to meet program storage requirements.
The maintenance building for Option L would be identical in size and layout to the building proposed for Yard 8 and Mirror H. The main difference is the location of the building. For Option L, it would be south of Third Avenue and east of the existing building at 70 Inner Belt Road.

To provide double-ended access to the maintenance building, a loop track is added, which provides access to the north side of the building from a runaround track to the east of the building and the east storage yard. This alternative could also accommodate potential future air rights development.

---

**Operational Plan**

The following includes a brief description of the operational interface of the Option L alternative with future Green Line Extension operations and of the potential impact to existing railroad operations. A more detailed description of the operating plan for the Option L facility is included in Appendix B.

**Yard Interface with Green Line Extension Operations**

Option L is the only one of the three alternatives that provides a direct connection to the Union Square Branch and the storage yard. This advantage allows trains to be dispatched directly from the yard to both termini, at Medford Hillside and at Union Square, without the need to perform a reverse move (a move that would impact revenue operations). Option L has two lead tracks (Medford Lead and Union Square Lead) that provide direct access into and out of the storage yards and maintenance facility. This direct connection is not possible with Yard 8 or Mirror H.

Similar to the Yard 8 discussion, in the morning trains would leave the storage yards destined for Medford Hillside, Lechmere Station and Union Square. Prior to the start of revenue operations at 5 AM, the initial trains would deadhead to their respective terminal stations. After 5 AM, trains for Medford Hillside could either deadhead or enter revenue service at Brickbottom Station. On the Union Square Branch, there is only one terminal station so trains on this service would continue to deadhead to Union Square.

Trains would continue to leave the yard until all peak hour service trains are in operation. Toward the end of peak service (approximately 9 AM), some trains would come out of service and return to the yard. In the afternoon, prior to the evening peak, these cars would leave the yard and return to service. After the evening peak, a number of cars would again return to the yard while the remainder handled the night service schedule. At the end of the service day, the remaining trains would return to the yard, with the last ones arriving after the end of revenue service at 1 AM.
Impacts to Existing Railroad Operations

The construction of an Option L facility would impact Pan Am Railways’ freight operations to the same degree as the Yard 8 alternative. Similar to Yard 8, the Option L alternative would require the removal of the Wiley Track that connects the south end of Yard 8 to the Valley Tracks. Without the Wiley Track, Yard 8 would be a two-track single-ended yard that would have little utility to Pan Am Railways’ operations. There is no impact to CSX freight rail operations with this option. With a Green Line maintenance facility at Yard 8, CSX freight trains could continue to operate as they do today.

If Option L were utilized for the Green Line facility, it would still be possible for Pan Am Railways to access the Boston area and to store freight cars in other nearby locations. Alternative routes exist within the MBTA system to support Pan Am Railways’ operations. Based on on-going discussions with Pan Am Railways, existing overall freight rail operations into the Boston area would not be precluded. However, M.S. Walker, a current freight customer of Pan Am Railways and located within the proposed Option L footprint, is a business that would potentially have to be relocated to a location with freight provisions.

Option L would not have any impacts on revenue passenger operations or on other operations associated with the MBTA (e.g., vehicle maintenance and storage, maintenance-of-way). Additionally, Option L would not preclude the future North-South Rail Link project or the ability to expand the BET facility within existing MBTA property limits.

Real Estate Impacts

Option L would require the complete acquisition of two parcels and partial acquisition of two other parcels. The land required for the yard and maintenance facility includes the building and parking at 44-48 Third Avenue; the building and parking lot at 20 Third Avenue; the isolated parking lot for 70 Inner Belt Road; plus the southern corner of 200 Inner Belt Road. M.S. Walker Wholesale Distribution, a wholesale manufacturer/distributor of wine and spirits located at 20 Third Avenue, provides jobs for approximately 74 people (based on parking occupancy). The building located at 44-48 Third Avenue (formerly occupied by Digital Publishing Solutions, Inc.) is being leased temporarily by a Federal agency as an indoor parking/storage facility for confiscated vehicles.

This alternative requires the acquisition of approximately 10.2 acres of land and buildings which has been estimated at approximately $51 million (including building demolition and site cleanup). This cost could be refined with additional research. If the MBTA acquired the land within the footprint of the facility (tracks and buildings) in fee, this would represent a loss of current tax revenue to Somerville as the MBTA is exempt from local property taxes. This alternative could result in the loss of
current and potential tax revenue which would be generated by future development at this location. Table 2-3 provides a list of properties that would need to be acquired for the Option L location. Option L does not use any portion of the Pan Am Railways’ owned land at Yard 8.

Suggestions for Refinements to Option L

Suggestions for refinements to the Option L site were received during the DEIR/EA public comment period. The Project Team reviewed and considered conceptual plans/materials that were received from members of the public for a revised version of Option L deemed “Mirror L,” as described in DEIR/EA comment letters from Mr. Stephen Kaiser, dated January 7, 2010 and January 8, 2010. This option was determined infeasible based on discussion with the MBTA operations:
The Mirror L plan proposes to eliminate one of the Valley Tracks. The Valley Tracks are the main hub of regional freight movements to and from the north, south, east and west. Eliminating either of these tracks would compromise MBTA’s ability to store and dispatch work trains daily and impact track rights that have been granted to Pan Am Railways and CSX. The current Option L concept provides two Valley Tracks. The two Valley Tracks between the BET and M.S. Walker are used daily for overnight storage and staging of maintenance-of-way equipment, ballast cars, etc.

The Mirror L plan would eliminate the only roadway connection to BET and there are no other available connections. Shifting the BET access road grade crossing north would impact Pan Am Railways and BET vehicle storage. Relocating this access would require reconfiguration of existing materials storage areas, relocation of an existing above ground storage tank, and relocation of existing storage structures. In addition, the new access would require construction of approximately five hundred feet of new roadway and at least three new grade crossings. Similarly, the route would require four sharp turns that could eliminate the ability of tractor-trailers to enter BET.

The Mirror L plan would locate the maintenance facility on an existing BET parking facility. Mitigating for the loss of this existing parking would require construction of a multi-level parking facility. Construction and staging the construction of this facility would impact costs and schedule for the Green Line Extension. At least one of the buildings that are proposed to be taken for Option L would need to be raised for BET temporary parking facilities while the parking deck is being constructed.

The new Callaghan Track (not shown on the Option L conceptual plan) would be impacted by the proposed parking deck shown in the Mirror L plan (provided in subsequent materials received from Mr. Stephen Kaiser). The new Callaghan Track is north of the shop entry tracks on the south end of the Mirror L proposed parking deck.

The Mirror L plan would eliminate the northern connection of the BET runaround track to Valley Tracks on the northwest side of the BET maintenance facility. This track and its spur are currently used for movements and storage.

Although the Mirror L plan would allow the Wiley Track to remain, negotiations regarding Option L are on-going with Pan Am Railways and MassDOT for alternative routes that exist within the MBTA system that could support Pan Am Railways’ service to other customers.

2.3.3 Mirror H

Mirror H straddles portions of the NorthPoint site (which includes portions of Cambridge, Somerville and Boston) and a portion of MBTA land (Figure 2-4). This alternative locates the facility at the north side of the proposed NorthPoint.
development and partly on MBTA land south of the BET, and represents a plan that places new light rail facilities next to existing MBTA commuter rail facilities.

The technical report refers to Mirror H as the option previously proposed by the City of Somerville, and then enhanced by the Project Team to optimize proposed operations. The enhancements represent layout modifications to provide operational equivalency to the original “Scheme H” as presented in the November 6, 2008 Green Line Support Facility Alternatives Analysis for the location of the support facility. The specific enhancements include:

- Extending the double-track lead and adding switches so that trains can operate on either lead track in either direction;
- Providing a 300-foot tail track so that trains to/from Lechmere Station can make the reverse move off the mainline tracks;
- A loop east of the maintenance shop plus a shop runaround track are included to provide access to the east side of the building; and
- Various minor layout modifications to make this option as operationally equivalent as possible to Yard 8 and Option L.

Program

Mirror H accommodates the same defined support facility program as Yard 8 including, but not limited to: storage for 80 Green Line vehicles, two pit tracks, two lift tracks, one wheel truer track, support shops, Green Line vehicle wash, administrative office space, and an approximately 100-space employee parking lot.

The layout of Mirror H includes a single storage yard of six tracks west of the maintenance building. Total storage is 70 cars. It is assumed that, at any time, 10 additional cars would be in the maintenance shop building or temporarily stored on the tracks just outside the building. The maintenance building and most of the storage tracks are in Somerville. Some of the employee automobile parking, as well as the tail tracks and loop east of the maintenance building, are in Boston.

The maintenance building at Mirror H would be identical in size and layout to the building proposed for Yard 8. To provide double-ended access to the maintenance building, a loop track is added that provides access to the east side of the building from a runaround track to the north of the building. This alternative could also accommodate potential future air rights development.
Operational Plan

The following includes a brief description of the operational interface of the Mirror H alternative with future Green Line Extension operations and of the potential impact to existing railroad operations. A more detailed description of the operating plan for the Mirror H facility is included in Appendix B.

Yard Interface with Green Line Extension Operations

Mirror H is the only one of the three alternatives with a single point of access from the yard to the revenue service tracks. Since a stalled or derailed train on a single yard lead track would prevent other trains from entering or leaving the yard, a second lead track was proposed for movements to and from Medford Hillside. All storage tracks in the yard would have direct movements (i.e., no reversing required) to and from the double-track lead when traveling to or from Medford Hillside. However, for trains traveling to/from Lechmere Station or the Central Subway, direct connections would not be available and would require some reverse moves within the yard and/or operations along the mainline tracks to access the yard.

The Mirror H facility does not have a direct connection to Union Square. Trains destined to or from Union Square would need to make a variety of complex moves, some of which would require reversing direction on revenue tracks. A detailed description the Mirror H operations can be found in Appendix B.

Similar to the other alternatives, in the morning trains would leave the storage yards for Medford Hillside and inbound towards Lechmere Station. Prior to the start of revenue operations at 5 AM, the initial trains would deadhead to their respective terminal stations. After 5 AM, trains for Medford Hillside could either deadhead or enter revenue service at Brickbottom Station.

Trains would continue to leave the yard until all peak hour service trains are in operation. Toward the end of peak service (approximately 9 AM), some trains would come out of service and return to the yard. In the afternoon, prior to the evening peak, these cars would leave the yard and return to service. After the evening peak, a number of cars would again return to the yard while the remainder handled the night service schedule. At the end of the service day, the remaining trains would return to the yard, with the last ones arriving after the end of revenue service at 1 AM.

Impacts to Existing Railroad Operations

The proposed Mirror H facility would have no impact on existing freight railroad operations. Pan Am Railways’ operations through Yard 8 would remain as would the Wiley Track connection from Yard 8 to the Valley Tracks. Pan Am Railways’
operations would continue as they do today with this option. This option would also not impact CSX freight rail operations. CSX freight trains could continue to operate as they do today with a Green Line maintenance facility at the Mirror H site.

However, construction of the Mirror H facility would preclude the future North-South Rail Link project and the ability to expand the BET facility within existing MBTA property limits.

### Real Estate Impacts

Mirror H would be partly in Somerville and partly in Cambridge, with some portions in Boston. If the MBTA acquired the land within the footprint of the facility (tracks and buildings) in fee, this would represent a loss of current tax revenue to the municipalities as the MBTA is exempt from local property taxes. This alternative could also result in the loss of potential tax revenue which would be generated by future development at this location. This alternative requires the acquisition of approximately 4.3 developable acres of Pan Am Railways’ owned properties, which is estimated at a value of approximately $11 million. Table 2-5 provides a list of properties that would need to be acquired for Mirror H. At the time of this analysis, discrepancies in City property limits between Somerville and Cambridge were identified and are being reviewed. The amount and cost of property acquisition for Mirror H are subject to change based on the resolution of the city boundary issue.

### Order-of-Magnitude Capital Costs

An Order-of-Magnitude conceptual capital cost estimate for the proposed maintenance and storage facility at Mirror H was developed and is estimated to cost approximately $82 million in 2008 dollars. Since the publication of the February 18, 2009 Green Line Support Facility – Review of Mirror Scheme H, Addendum to the Alternatives Analysis, the design of Mirror H has been more fully developed and refined to make it operationally comparable to Yard 8 and Option L. Table 2-6 provides a breakdown of the conceptual capital cost estimate for Mirror H, based on the current design.

### 2.3.4 Summary of Operation Analysis

In comparing the Yard 8, Option L and Mirror H alternatives for the Green Line Extension maintenance and storage facility, each of the alternatives meets the MBTA’s desired program and would have similar functionality in terms of hours of operations and start-up service.

However, some alternatives offer a better operating plan for vehicles entering and leaving the MBTA’s system to access the yard. While the Yard 8 facility layout has a fully functional layout, Option L offers some improvements beyond Yard 8 in its direct connection to Union Square and without the need to reverse direction to access either the main line or the branch line. Mirror H has the least desirable operating plans of the alternatives in that it requires a number of complex movements in and around the yard to access the mainline and branch line tracks.

Mirror H is the only alternative that does not impact freight operations. However, while both Yard 8 and Option L impact Pan Am Railways’ current tracks in Yard 8 and at the Wiley Track, it is understood that their operations would not be substantially affected and that their Boston customers could continue to be served.

Neither Yard 8 nor Option L would preclude future construction of the North-South Rail Link project or the future expansion of the MBTA’s BET within existing property limits. Mirror H would preclude both of these projects from occurring.

### 2.4 Responses to DEIR Comments on the Maintenance and Storage Facility

This section addresses the main questions and concerns received during the public comment period, as required in the Secretary’s Certificate. A detailed discussion of the program and requirements for the Maintenance Facility is presented in FEIR Section 2.3, Description of Alternatives, and in the technical memorandum titled Environmental Analysis of Additional Maintenance Facilities dated April 21, 2010.
The recent flooding and washout of the tracks on the Green Line D Riverside Branch illustrates the importance of well-dispersed maintenance facilities to ensure service reliability. This one breach of the D Branch severed the Riverside Shops, the principal maintenance facility, from the majority of the Green Line that remained in service. Adding a new maintenance facility for the Green Line extension would provide dispersed redundancy, particularly in the event of a service interruption that prevents access to one of the other major shops.

2.4.1 Minimizing Maintenance Facility Footprint

All three alternatives, Yard 8, Option L, and Mirror H, were designed within a compact layout, facilitated by the inherent flexibility of light rail vehicles to negotiate tighter curves. A comparison to other recently constructed light rail facilities around the nation revealed that each of these layouts are highly efficient on the basis of vehicles maintained per acre of land.

While the layouts of the three options are relatively efficient when compared to similar facilities, still, in consideration of the higher demand for land in the urban areas which encompass these three alternative sites, a number of strategies were employed to minimize the site footprint.

- MassDOT worked with the MBTA to identify only those items that were necessary to support the Green Line Extension Project. This was done to keep this facility on the scale of a “local shop” and not become a major shop like the Riverside maintenance facility.

- In all three locations, a significant portion of the site would be on land currently owned by the MBTA.

- Transportation functions (e.g., train operators and their supervisors) would be housed in the same building as vehicle maintenance.

- Offices and employee welfare facilities (restrooms, locker rooms, breakroom, etc.) would be included on a second floor between the two cathedral ceiling sections of the maintenance building, where inspection and repair work is performed.

- Employee parking would be located in scattered locations on the site, locations that are not occupied by tracks or buildings.

- For Option L and Mirror H, a loop track would be used on the “dead end” side of the maintenance building, as the loop would be a more compact layout than if a dead end tail track was used. Thus, using the loop track in these options would require less land for the facility. (This would not be required for the Yard 8 layout which would be completely doubled ended and has no “dead end.”)
Building program requirements were streamlined based on discussions with the MBTA in order to minimize impacts while still providing the operational integrity needed for Green Line operations when the extension is in service.

2.4.2 Minimizing Land Acquisitions

The Secretary’s Certificate suggested other possible approaches to minimize land acquisitions necessary for a maintenance facility including:

- Consolidating employee parking areas (the Green Line maintenance facility with the MBTA’s BET commuter rail maintenance facility);
- Shifting the MBTA office out of the Cobble Hill area property; and
- Splitting maintenance and storage operations.

Consolidating Employee Parking Areas

Public comments received since the DEIR/EA requested that the proposed employee parking area for the Green Line maintenance facility be combined with the existing BET commuter rail maintenance facility parking area. When designing a rail transit maintenance and storage facility, the layout of the tracks and buildings determines the overall size of the site required. Employee parking is a secondary consideration and spaces are located in scattered “infill” locations around the site that are not required for track or buildings. Thus, the addition of parking within these three site layouts does not add significantly to the size of the site required.

A concern with consolidating parking is that the existing BET commuter rail facility parking lot is sized for the peak demand of that facility. The MBTA states that all existing parking is needed at the BET and that there is no extra capacity to include Green Line parking or any other Green Line functions at the BET facility. Similarly, 100 spaces for MBTA Green Line parking at the maintenance facility is considered the absolute minimum required – MBTA currently has parking problems at Riverside, Reservoir and Lake Street Green Line facilities. To add employee parking at the BET for the Green Line facility would require the construction of a parking deck over the existing lot. This would add significant cost and time to the construction of the Green Line Extension Project since a temporary parking facility would need to be provided while the parking deck is being constructed, whereas the parking requirement may be better met by in-filling in and among the buildings and yard tracks.

For example, if the employee parking were completely removed from any of the three sites, there would be about one acre less land required. But the unneeded land would be in small, unconnected, and irregularly shaped areas, which would not represent buildable lots or useful additions to existing adjacent lots. From a practical
standpoint, if the majority of the parcel is required, MassDOT would take the entire parcel, as the leftover portions would have little to no real estate value.

Nevertheless, during Preliminary Engineering, the exact size of the lot required for rail operational needs would be re-evaluated. If there are leftover sliver parcels not required for the facility, they would be examined to determine if there represent any value as an “add-on” to an adjacent parcel. In such cases, a more beneficial use of the excess slivers of land may be as a landscape or screening buffer between the facility and adjacent private parcels.

Shifting the MBTA Office out of the Cobble Hill Area

Currently, the MBTA occupies a building in the Cobble Hill area in Somerville for its commuter rail system operations. This is occupied by staff from the MBTA and Massachusetts Bay Commuter Railroad (MBCR), the contractor that operates the commuter rail system. The Secretary’s Certificate requested MassDOT respond to requests to consolidate the MBCR Cobble Hill commuter railroad operations facility into the new MBTA Green Line maintenance facility.

To shift the MBTA offices out of Cobble Hill, an equivalent amount of floor area would need to be added to the Green Line maintenance building and additional parking demand would be added. As the objective is to minimize the footprint of Green Line facility building and site, the only way to add floor area would be to build it taller. Comparing the footprints of the existing Cobble Hill MBTA/MBCR building and the proposed Green Line maintenance building, it is estimated that it would add two to three stories or (assuming a 12 to 13-foot floor height) about 24 to 36 feet of additional height.

For Yard 8, such added height would be a significant visual impact to the nearby Brickbottom residents. For Option L, the adjacent land uses are all low-rise industrial. A taller Green Line maintenance building would be more visible to the surrounding neighborhood. For Mirror H, such added height would visually block views of the commuter rail maintenance facility from residential structures such as the Glass Factory Condominiums. However, it would add a tall mixed industrial and office structure closer to those residents.

The existing Cobble Hill functions are vital to the commuter rail operations. All dispatching of north side operations is performed at this location. A significant effort and cost would be required to relocate operations out of the existing facility and into a new one.
Splitting Maintenance and Storage Operations

Consideration of scenarios for splitting maintenance and storage operations onto separate sites were included in the initial alternatives analysis (dated November 8, 2008) for the siting of the maintenance facility. Option D2 was the best example of a split operations layout. However, this layout required about 25 percent more land than a single compact site, such as Yard 8, Option L or Mirror H. A split layout requires additional tracks. A consolidated layout allows for the use of common ladder tracks for maintenance and storage building access. A split facility adds to the number and length of such ladder tracks.

Also, a split facility would require a second building. In a consolidated layout, the transportation staff (e.g., train operators and their supervisors) could be located in the maintenance building. In a split layout, a separate building would need to be added to the storage yard site for the transportation staff (welfare facilities for operators and offices for supervisors). This could also increase the overall site footprint.

In summary, the split operations sites would require more land than the current compact consolidated layout with the maintenance and storage on the same site.

2.5 Environmental Resource Analysis

This section discusses the human and environmental resource impacts of the three maintenance facility alternatives (also provided in Appendix B). The human and environmental resource categories considered in this analysis included:

- Air quality
- Noise
- Vibration
- Traffic
- Socioeconomic impacts
- Title VI/Environmental justice
- Visual resources
- Wetlands
- Stormwater management
- Hazardous materials
- Historic and archaeological resources
- Public parks, recreation areas, and conservation land
2.5.1 Air Quality

This section compares direct impacts of the three maintenance facility alternatives on air quality. None of the three maintenance facility alternatives would have a measurable impact on air quality. Any maintenance facility alternative, in conjunction with the Project, would remain compliant with the SIP and Air Pollution Control Regulations (310 CMR 7.36).

The three maintenance facility alternatives are not anticipated to generate substantial emissions because the Green Line vehicles that would be stored there would be electric and would not generate air pollution in the Study Area. The proposed maintenance facility itself would be an open building with no heating-related emissions.

The mobile source emissions, generated by automobiles accessing the sites, for all three alternatives would be minimal. The proposed maintenance facility would provide approximately 100 parking spaces. The majority of these trips would occur during off-peak periods when there is little congestion in the Study Area.

2.5.2 Noise

This section compares the direct noise impacts of the three maintenance facility alternatives in combination with the Green Line Extension mainline operations. The noise impact analysis for the Green Line Extension Project is based on the methodology defined in the FTA guidance manual *Transit Noise and Vibration Impact Assessment.* Noise impact has been assessed at sensitive receptors and includes contributions from mainline operations and maintenance facility operations including train movements in and out of the yard, increases in noise from special trackwork, potential wheel squeal, the traction power substation, and the employee parking lot. Figures 2-5 through 2-7 show the noise study measurement locations. Figures 2-8 through 2-10 show the buildings impacted by noise prior to mitigation. Background information on noise and vibration fundamentals, descriptors, impact criteria, land use categories, existing noise conditions and sensitive land use in areas other than near the proposed maintenance facilities are presented in DEIR/EA Section 4.8, Noise. Further detail on the reference noise levels, principal modeling assumptions and impact analyses for Option L and Mirror H is available in the

---

The proposed maintenance facility would introduce new noise sources into the surrounding areas and would contribute to the future noise exposure conditions at sensitive receptors. Potential noise impact has been assessed at sensitive receptors near Yard 8, Option L and Mirror H including the Brickbottom Artists Building (northeast and southwest sides), the Hampton Inn Hotel, the Glass Factory Condominiums, proposed NorthPoint development properties, a residential development planned at 22 Water Street, and two planned Archstone residential developments (Phase II – Sites 1 and 2). Based on the current NorthPoint development plan, eight sites have been assumed to be noise-sensitive including the existing Tango and Sierra residential properties and future planned properties shown in Figure 2-10 (Site 1, Site 2, Site 3, Site 4, Site 5 and a park). Based on the current Archstone Development Phase II plan, two sites have been assumed to be noise-sensitive including a future building east of East Street (Site 1) and a building west of Leighton Street (Site 2).

Potential noise impact is assessed by comparing the existing noise conditions with future conditions. Existing noise conditions were measured at five locations near these sensitive properties. A summary of the measurement sites and results is shown in Table 2-7 and the measurement locations are shown in Figures 2-5 through 2-7. Short-term measurement site ST-1 was conducted on the northeast side of the Hampton Inn Hotel and is representative of the existing noise conditions on the northeast sides of the Glass Factory Condominiums, the Hampton Inn Hotel, the northeast side of the Brickbottom Artists Building, and the proposed residential property at 22 Water Street. Short-term measurement site ST-2, on the southwest side of the Brickbottom Artists Building, is representative of the existing noise conditions for the southwest side of the Brickbottom Artists Building. The dominant noise source at ST-2 is commuter train activity on the MBTA Fitchburg Line. Short-term measurement site ST-8, at the end of Water Street, is representative of existing noise conditions at the five future NorthPoint properties and the park. Long-term measurement site LT-10, on the southwest side of the Glass Factory Condominiums, is representative of the existing noise conditions at the existing Tango and Sierra NorthPoint properties (adjusted for relative distances to O’Brien Highway). Short-term measurement site ST-9 was conducted at the planned Archstone properties (Phase II) and is representative of the existing noise for those two sites.

Future noise sources associated with the Project include mainline Green Line operations, MBTA commuter train operations (southwest side of Brickbottom Artist Building only), the relocated bus transit center at Lechmere Station and maintenance facility noise sources. Maintenance facility noise sources include train movements in and out of the yards, increases in noise from special trackwork (crossovers or turnouts), potential wheel squeal on tight radius curves, stationary cars in the yards.
operating with auxiliary equipment on, the traction power substation, and the employee parking lot. Noise from the bus transit center is based on current activity from the MBTA Bus Routes 69, 80, 87 and 88 which total 79 buses departing the station during nighttime hours (10 PM to 7 AM) and 324 buses departing during daytime hours (7 AM to 10 PM).

a Ldn estimated by comparing SEL levels of train events to long-term sites whose noise environment is dominated by train noise.
b Ldn estimated according to FTA guidance for short-term measurements conducted between 7 AM and 7 PM.
c Measurement conducted March, 2006 and reported in Environmental Assessment for the Lechmere Station Relocation Project (November, 2006).
d Commuter train noise level is average of all events at site

Train movements in and out of the yards are non-revenue operations between the proposed yards to and from the closest stations (Union Station, Lechmere Station and Brickbottom Station). These “pull in” and “pull out” movements are required to bring trains into service or to take trains out of service for maintenance or at the end of the service day. These movements are in addition to the standard revenue service train operations. Often these additional train movements represent the most significant noise source associated with the maintenance facilities.

Maintenance lead tracks and yard tracks often include special trackwork (crossovers or turnouts) or tight-radius curves which can increase noise levels associated with train movements into and out of the yards. Special trackwork introduces gaps into the rail running surface which would increase noise levels from the train as the wheels impact these gaps. Tight-radius curves, typically 400-foot radius or less, may cause wheel squeal which is a high-frequency tonal noise generated by the wheels.

Another potentially significant noise source associated with the maintenance facilities are stationary cars in the storage yards operating with auxiliary equipment on. Cars are typically operated under this condition in the early morning to heat or cool the interior and prepare the trains for revenue service as well as at other times during the day when cars are in the yards but would be required to return to service. The contribution of noise from such operation of cars in the storage yards is generally...
not as significant as the train movements unless receptors are much closer to the storage yards than the mainline tracks. Maintenance operations within the building such as wheel truing, using pneumatic tools and the car wash are not expected to be significant noise sources in the community as the building would shield these activities. The heating, ventilation and air-conditioning (HVAC) system for the maintenance building is also not expected to be a significant noise source. Unlike maintenance buildings for diesel-electric locomotives which require more substantial HVAC systems to handle the train exhaust, this building would only require normal levels of airflow for storing electric Green Line vehicles.

Table 2-8 presents a summary of the potential noise impact at sensitive receptors near the proposed maintenance facilities prior to mitigation. This table shows the results for Yard 8, Option L and Mirror H. Potential noise impact locations for the three alternatives are also shown in Figures 2-8 through 2-10. This table includes the sensitive receptors, which side of the tracks it is on, the future distances between the receptor and the near track centerlines of the mainline Green Line and MBTA Fitchburg commuter line, the existing noise condition (Ldn), the moderate and severe impact criteria, the contribution of noise from mainline operations (which include noise from the bus transit center), the contribution from maintenance facility noise sources, the future noise level (which include maintenance facility, mainline operations and existing noise sources), the increase in noise between the existing and future conditions and whether the potential impact would be moderate or severe.

Source: HMMH, April 2010.

- **a** Total future noise level includes future mainline noise, future yard noise sources and existing noise sources.
- **b** Brickbottom Artists Building impact is counted under listing for Brickbottom Artists Building (northwest).
- **c** Future noise level reported in DEIR for this receptor does not include yard noise sources.
- **d** n/a = Not Applicable. Receptor does not have significant contribution from maintenance facility noise sources (such as stationary cars operating with auxiliary equipment running). Receptor is not exposed to noise from non-revenue maintenance facility operations (pull ins and pull outs) because it is east of Lechmere Station and all train pass bys would be for revenue service.
- **e** Noise includes contribution from crossover in front of building.
- **f** Most significant yard noise source is stationary vehicles operating with auxiliary equipment running.
- **g** Distance to alignment estimated for future proposed property.
- **h** Future noise level from mainline includes contribution from bus transit center at Lechmere Station.
Yard 8

A total of two buildings would be exposed to moderate impact and five buildings would be exposed to severe noise impact prior to mitigation for Yard 8. Future noise conditions are primarily a function of the mainline train operations and maintenance facility noise sources only increase future noise levels a relatively small amount. Future noise levels from all yard sources are five to 19 decibels lower than noise from mainline operations. As an example of the effect of maintenance facility noise sources, future noise from mainline operations at the northeast façade of the Brickbottom Artists Building would be Ldn 75.3 dBA and noise from the maintenance facility operations would be Ldn 69.9 dBA. The future noise level would be Ldn 75.3 dBA without any contribution from the maintenance facility and would be Ldn 76.4 dBA including the maintenance facility. Therefore, the Yard 8 maintenance facility would only increase future noise levels by 1.1 decibel compared to the mainline operations alone. At the other receptors potentially impacted under Yard 8 (Hampton Inn, Glass Factory Condominiums, two existing NorthPoint properties Tango and Sierra and the proposed developments at 22 Water Street and Archstone Phase II Site 1), the contribution of noise from maintenance facility operations is even less than at Brickbottom Artists Building.

Although there are locations that require mitigation for the Proposed Project, the contribution of noise from the Yard 8 maintenance facility would only increase future noise levels one decibel or less. Therefore, no additional noise mitigation is required specifically due to the proposed Yard 8 maintenance facility option.

Option L

The noise impact assessment results for Option L are very similar to the results for Yard 8. A total of two buildings would be exposed to moderate impact and five buildings would be exposed to severe noise impact prior to mitigation for Option L. Future noise conditions are primarily a function of the mainline train operations and maintenance facility noise sources only increase future noise levels a relatively small amount. Future noise levels from all yard sources are five to 15 decibels lower than noise from mainline operations. Noise from train movements in and out of the yard at Option L would be slightly higher at the southwest façade of the Brickbottom Artists Building than Yard 8 due to the presence of a tight radius curve on the Medford Lead track. Noise from train movements in and out of the yard at Option L would be slightly higher at the Hampton Inn Hotel and the Glass Factory Condominiums due to stationary cars in the south yard operating with auxiliary equipment on.

As an example of the effect of maintenance facility noise sources, future noise from mainline operations at the northeast façade of the Brickbottom Artists Building would be Ldn 75.3 dBA and noise from the maintenance facility operations would be Ldn 69.9 dBA. The future noise level would be Ldn 75.3 dBA without any
contribution from the maintenance facility and would be Ldn 76.4 dBA including the maintenance facility. Therefore, the Option L maintenance facility would only increase future noise levels by 1.1 decibel compared to the mainline operations alone. At the other receptors potentially impacted under Option L (Hampton Inn, Glass Factory Condominiums, two existing NorthPoint properties Tango and Sierra and the proposed developments at 22 Water Street and Archstone Phase II - Site 1), the contribution of noise from maintenance facility operations is even less than at Brickbottom Artists Building.

Although there are locations that require mitigation for the Proposed Project, the contribution of noise from the Option L maintenance facility would only increase future noise levels one decibel or less. Therefore, no additional noise mitigation is required specifically due to the proposed Option L maintenance facility option. Noise mitigation for the Proposed Project including Option L at receptors near Lechmere Station is presented in Section 5.5.1, Noise.

**Mirror H**

For Mirror H, a total of three buildings would be exposed to moderate impact and nine buildings exposed to severe impact prior to mitigation. The relative contribution of noise from maintenance operations versus mainline operations is similar to Yard 8 and Option L at the Brickbottom Artists Building, Hampton Inn, Glass Factory Condominiums and the proposed developments at Archstone Phase II Site 1 with this alternative. At the proposed development at 22 Water Street, there is a greater contribution of noise for the Mirror H option compared to Yard 8 and Option L due to the contribution of noise from stationary cars operating with auxiliary equipment running in the storage yards; however, the total future noise at this proposed property is still primarily a function of mainline operations. Noise from train movements in and out of the yard and mainline operations would be higher at the northeast façade of the Brickbottom Artists Building for Mirror H than Yard 8 or Option L due to the presence of a double crossover and a turnout between the northbound mainline and the maintenance lead track directly in front of the building. For the existing NorthPoint properties Tango and Sierra, future noise conditions also depend primarily on the mainline operations. For the future planned NorthPoint properties (Sites 1 to 5), which are more set back from the mainline (300 to 700 feet) and are closer to the Mirror H storage yards, future noise conditions depend primarily on the stationary cars operating in the yards with auxiliary equipment running. For the proposed development at Archstone Phase II Site 1, there is no considerable contribution of noise from the Mirror H maintenance facility.

At the Brickbottom Artists Building, Hampton Inn Hotel, Glass Factory Condominiums, existing NorthPoint properties Tango and Sierra and proposed developments at 22 Water Street and Archstone Phase II - Site 1, the contribution of noise from the Mirror H maintenance facility would only increase future noise levels less than one decibel. Therefore, no additional noise mitigation is required.
specifically due to the Mirror H maintenance facility option for these properties. At the proposed development at NorthPoint (Sites 1, 2, 3 and 4) potential noise impact prior to mitigation is primarily due to the Mirror H maintenance facility and potential mitigation would be associated with this maintenance facility option. It is assumed that future properties at the NorthPoint development would have noise-sensitive receptors at upper-floor residences, which would not benefit from a noise barrier for potential mitigation of noise from stationary cars in the storage yard. Since the proposed development is not currently under construction and is assumed to be completed by 2030, after the completion of the Green Line Extension Project, the buildings could be designed with consideration of the noise environment (i.e. windows with high transmission loss or sound transmission class [STC] ratings) to mitigate potential impact.

### 2.5.3 Vibration

This section documents direct vibration impacts from the three maintenance facility alternatives. The vibration impact analysis for the Green Line Extension Project is based on the methodology defined in the FTA guidance manual *Transit Noise and Vibration Impact Assessment*. Vibration impacts are assessed for maximum levels, as vibration — unlike noise — is not a cumulative metric. To assess the potential effect of the three maintenance facility alternatives for vibration, the maximum vibration levels from both mainline operations and any movements to or from the maintenance facility are reported for all impacted receptors. The FTA criterion for vibration impacts for residential spaces such as the Brickbottom Artists Building is 72 VdB (vibration velocity level in decibels). The FTA impact criterion does not distinguish between “moderate” and “severe” vibration impacts. Figures 2-5 through 2-7 show the vibration study measurement locations. Figures 2-8 through 2-10 show buildings impacted by vibration prior to mitigation.

The proposed maintenance facilities would introduce new vibration sources into the surrounding areas and may cause potential vibration impact prior to mitigation. Potential vibration impact has been assessed at sensitive receptors near the proposed Yard 8, Option L and Mirror H including the Brickbottom Artists Building (northeast and southwest sides), a residential development planned at 22 Water Street, the Hampton Inn Hotel, the Glass Factory Condominiums, NorthPoint development properties and two planned Archstone (Phase II) residential developments. Based on the current NorthPoint development plan, seven sites have been assumed to be vibration-sensitive including the existing Tango and Sierra residential properties and future planned properties shown in Figure 2-10 (Site 1, Site 2, Site 3, Site 4 and Site 5). Based on the current Archstone development plan, two sites have been assumed to be vibration-sensitive including a future building east of East Street (Site 1) and a building west of Leighton Street (Site 2).

---

Vibration generated by trains depends on several factors including the speed of the train, the presence of special trackwork (crossovers and turnouts) and whether the track alignment is at-grade or on an aerial structure. Special trackwork introduces gaps into the rail running surface which would increase vibration levels, similar to noise, from the train as the wheels impact these gaps. Although maintenance lead tracks and yard tracks often include special trackwork, these tracks are typically further away from sensitive receptors. An aerial structure reduces vibration significantly (10 VdB) compared to at-grade alignments because the vibration must propagate through the structure to the support columns and then into the ground and into surrounding buildings.

Table 2-9 shows the potential vibration impact prior to mitigation near the proposed maintenance facility alternatives. This table includes the vibration-sensitive receptor, the distance the mainline and yard track centerlines generating the highest levels of vibration, the maximum vibration velocity in any 1/3-octave band between four and 80 Hz for both mainline and maintenance facility movements and the number of buildings impacted. For all three alternatives, the Brickbottom Artists Building is the only receptor projected to be exposed to vibration impact prior to mitigation. For all maintenance facility alternatives, the maximum vibration generated by any yard movements is lower than the respective mainline operations. Mirror H is the only alternative projected to have potential vibration impact from yard movements. While the future proposed Archstone Site 1 building will be approximately 15 feet from the relocated Green Line alignment, train speeds are expected to be relatively slow (20 mph) and vibration impact is not expected.

Source: HMMH, April 2010.

a Green Line is on elevated structure at this location.
b Increased vibration from special trackwork is included at these locations.
c The maximum vibration generated for this alternative and receptor is from the far mainline track due to the presence of a double crossover.
As stated in the DEIR/EA, resilient rail fasteners, which are specially-designed fasteners between the rails and the ties, are one option for mitigating potential vibration impact at the Brickbottom Artists Building. Resilient rail fasteners can reduce vibration by five to 10 VdB at frequencies above 30 to 40 Hz. Approximately 500 feet of vibration mitigation along the length of the Brickbottom Artists Building would be effective in mitigating potential vibration impact. During the next phase of the project, vibration measurements would be conducted at additional sensitive locations to refine vibration mitigation recommendations.

Yard 8

For Yard 8, the maximum vibration level (77 VdB) at the Brickbottom Artists Building is projected to be generated from trains on the elevated near mainline track approximately 18 feet away. The highest vibration generated by yard movements is 67 VdB. Therefore, no vibration impact is projected at any receptors directly from yard movements for Yard 8.

Option L

For Option L, the maximum vibration level (77 VdB) at the Brickbottom Artists Building is projected to be generated from trains on the elevated near mainline track approximately 18 feet away. The highest vibration generated by yard movements is 71 VdB. Therefore, no vibration impact is projected at any receptors directly from yard movements for Option L.

Mirror H

For Mirror H, the maximum vibration level (84 VdB) at the Brickbottom Artists Building is projected to be generated from trains on the elevated far mainline track approximately 33 feet away because this track includes a double crossover to the maintenance tail track. The maximum vibration generated by yard movements is 75 VdB due to the presence of a double crossover on the maintenance yard tail track approximately 50 feet away from the Brickbottom Artists Building.

2.5.4 Traffic

This section discusses existing conditions and impacts to automobile traffic and parking operations as a result of each of the three maintenance facility alternatives. Figures 2-5 through 2-7 show the traffic study intersections.
Yard 8

Yard 8 would have no measurable impact to automobile parking or traffic operations. Access to the facilities would be via Washington Street and Inner Belt Road.

Parking Impacts

There is no existing public or private parking supply at Yard 8. Parking for approximately 100 vehicles would be constructed in concert with the Yard 8 facility. These spaces would be available only to MBTA employees serving either the maintenance facility or the Green Line. There would be no impact to the public parking supply. MBTA Lechmere Station parking would also be unaffected.

Traffic Impacts

All MBTA personnel parking at the maintenance facility would arrive and depart outside of the peak commuting hours and would not impact the peak hour vehicular traffic patterns or traffic operations. There would also be no adverse impact to pedestrians or bicyclists in the vicinity of the facility.

Option L

Similar to Yard 8, locating the maintenance facility at Option L would have no measurable impact to parking or traffic operations. No changes to the conceptual design and circulation plan for Brickbottom Station are envisioned under Option L. Access to the Option L maintenance facility would be via Washington Street and Inner Belt Road.

Parking Impacts

There is an existing unused parking lot on 70 Inner Belt Road, which has 97 striped parking spaces available. This unused parking lot would serve as employee parking for Option L. Existing parking spaces along each building would be removed. Similar to the Yard 8 analysis, Option L would have no impact to the public parking supply.

Traffic Impacts

All MBTA personnel parking at Option L would arrive and depart outside of the peak commuting hours and would not impact the peak hour vehicular traffic patterns or traffic operations. There would also be no adverse impact to pedestrians or bicyclists in the vicinity of Option L.
The two existing building uses on the Option L site include a wholesale liquor distribution center and a building temporarily leased as an indoor parking/storage facility for federally confiscated vehicles (formerly occupied by Digital Publishing Company). It is assumed that these buildings and their associated parking would be removed entirely. Since the majority of vehicle trips associated with these buildings occur during the peak hours, there would be a slight reduction in traffic volumes on Washington Street and Inner Belt Road under Option L. Since the reduction is slight and would likely have no noticeable impact on traffic operations, no reduction in peak hour traffic volumes was assumed in the traffic analysis for the Washington Street/Inner Belt Road intersection.

**Mirror H**

Similar to Yard 8 and Option L, locating the maintenance facility at Mirror H would have no measurable impact on parking or traffic operations. There may be isolated impacts regarding access to/from the facility as discussed further.

**Parking Impacts**

There is no existing public or private parking supply at the Mirror H site. New parking for approximately 100 vehicles would be constructed in concert with the Mirror H facility. These spaces would be available only to MBTA employees serving either the maintenance facility or the Green Line Extension. Similar to Yard 8 and Option L, Mirror H would have no impact to the public parking supply. MBTA Lechmere Station parking would also be unaffected.

**Traffic Impacts**

All MBTA personnel parking at Mirror H would arrive and depart outside of the peak commuting hours and would not impact the peak hour vehicular traffic patterns or traffic operations. There would also be no adverse impact to pedestrians or bicyclists in the vicinity of Mirror H.

**Access to the Mirror H Facility and Circulation at Lechmere Station**

Regional access to Mirror H would be via Monsignor O’Brien Highway. Traffic to/from the north would use Water Street as a connection from O’Brien Highway to the Mirror H facility. Traffic entering the facility from the south would also be provided via O’Brien Highway and Water Street. This requires the existing median along O’Brien Highway to be cut and a traffic signal installed at Water Street. This improvement is currently proposed as part of the relocation of Lechmere Station. Timing of the construction of this improvement could be impacted if access to Mirror H is needed prior to completion of Lechmere Station construction.
To accommodate pedestrians crossing O’Brien Highway at Water Street, no left turns would be allowed out of Water Street. Therefore, traffic exiting the facility would use North First Street to O’Brien Highway southbound. The construction of North First Street is also proposed as part of the relocation of Lechmere Station. As with Water Street, timing of construction could be impacted if access to Mirror H is needed prior to completion of station construction.

In order to provide access to/from all directions, a roadway connection between Water Street and North First Street would be required. This connection could be provided as part of the Lechmere Station construction, or could be a separate private way behind the station until such time that the NorthPoint development is complete and the accompanying roadway infrastructure is constructed in its entirety.

### 2.5.5 Socioeconomic Impacts

This section compares the socioeconomic impacts in terms of projected tax effects and job loss for the three maintenance facility alternatives. Two buildings would be purchased and demolished under Option L. All other acquisitions would involve strips of land or vacant lots and would not require building demolition. Table 2-10 lists the current annual property taxes for the areas to be acquired.

Table 2-11 summarizes the annual tax value decreases by city. Somerville would have a annual tax loss of $116,064 (0.12 percent of total city revenue) for Yard 8, $322,440 (0.33 percent of total city revenue) for Option L and $56,222 (0.05 percent of total annual city revenue) for Mirror H. Cambridge and Boston would only experience tax loss under Mirror H, an annual tax loss of $78,411 (0.03 percent of total city revenue) and $2,993 (0.0002 percent of total city revenue), respectively.

Maintenance Facility Alternatives Analysis 2-33
Table 2-12 summarizes the job displacements or relocations for each city. Option L would displace or relocate 74 jobs in Somerville. Many of the jobs displaced would likely be relocated or replaced within Somerville. Cambridge and Boston would lose zero jobs for either maintenance facility alternative selected.

Source: U.S. Census Bureau, 2006-2008 American Community Survey
(Total work force included to demonstrate scale of impacts.)

#### Yard 8

The total estimated annual property tax value of the land and buildings acquired for Yard 8 is $116,064. These acquisitions would reduce annual property tax revenue by 0.12 percent in Somerville.

Yard 8 would not require the displacement or relocation of any jobs. Table 2-12 summarizes the job displacements or relocations for each city.

#### Option L

The total estimated annual property tax value of the land and buildings acquired for Option L is $322,440. These acquisitions would reduce annual property tax revenue by 0.33 percent in Somerville.

Table 2-12 summarizes the job displacements or relocations for each city. Option L would displace or relocate approximately 74 jobs in Somerville. Many of the jobs displaced would likely be relocated or replaced within Somerville.

This change would not represent a significant fraction of the jobs in Somerville. By comparison, the 2006-2008 U.S. Census estimated the workforce of Somerville at 47,026 workers. Although it is uncertain how many of the jobs displaced under Option L are held by local residents rather than commuters, the small scale of the job displacements relative to the workforce makes it clear that the jobs at stake represent at most a minor economic impact.
Mirror H

The total estimated annual property tax value of the land and buildings acquired for Mirror H is $137,627. These acquisitions would reduce annual property tax revenue by 0.05 percent ($56,222) in Somerville, 0.03 percent ($78,411) in Cambridge and 0.0002 percent ($2,993) in Boston. At the time of this analysis, discrepancies in City property limits between Somerville and Cambridge were found and are being reviewed. These annual tax revenue estimates are subject to change based on the resolution of city limits.

Mirror H would not require the displacement or relocation of any jobs.

2.5.6 Title VI and Environmental Justice

The EEA established an Environmental Justice Policy in 2002, in accordance with Title VI of the Civil Rights Act of 1964, to help address the disproportionate share of environmental burdens experienced by lower-income people and communities of color who, at the same time, often lack environmental assets in their neighborhoods. The policy is designed to help ensure their protection from environmental pollution as well as promote community involvement in planning and environmental decision-making to maintain and/or enhance the environmental quality of their neighborhoods. All major elements of the proposed Green Line Extension Project must meet the standards set forth by this Policy.

The Project must also comply with Executive Order 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, directing Federal agencies to address environmental injustices in their operations and in communities across the country. The Executive Order requires that each Federal agency shall, to the greatest extent allowed by law, administer and implement its programs, policies, and activities that affect human health or the environment so as to identify and avoid "disproportionately high and adverse" effects on minority and low-income populations.

The U.S. Department of Transportation (DOT) also established its own policy to actively ensure nondiscrimination under Title VI of the 1964 Civil Rights Act in Federally funded activities, DOT Order on Environmental Justice to Address Environmental Justice in Minority Populations and Low-Income Populations (DOT Order 5610.2), which the Project must comply with. DOT Order 5610.2 summarizes and expands on the requirements of Executive Order 12898 and describes the process for incorporating environmental justice principles into all DOT existing programs, policies, and activities. As shown on Figure 2-11, all three maintenance facility alternatives are within designated environmental justice areas, as is much of the overall Green Line Extension Project corridor.
Yard 8

Yard 8 would require acquiring two pieces of land on Inner Belt Road: the existing Yard 8 at 0 Inner Belt Road and an undeveloped area at 200 Inner Belt Road. Like all other maintenance facility sites considered, this site is within a designated environmental justice area. However, no buildings would be acquired or demolished and no residential land would be acquired, resulting in no direct effect on local environmental justice populations.

The Yard 8 maintenance facility site is in an existing industrial area in between the MBTA Fitchburg and Lowell Lines. The noise from the maintenance facility is included in the overall noise analysis presented in DEIR/EA Section 5.7, Noise, and in Section 3.3, Noise, of this FEIR Appendix B. Potential severe noise impact is projected at the Brickbottom Artists Building, the Hampton Inn Hotel, the Glass Factory Condominiums, the future 22 Water Street residential development and the future Archstone Phase II – Site 1. Potential moderate noise impact is projected at the existing NorthPoint Tango and Sierra properties, prior to mitigation. Noise from the mainline operations is the dominant factor in future noise levels at these receptors.

Sound insulation of residences to improve the outdoor-to-indoor noise reduction or noise barriers are potential mitigation measures for these existing properties. The need and effectiveness of building sound insulation for interior spaces would be assessed in the next phase of project development. There would be no moderate or severe impacts from noise after mitigation is implemented. With no other residential populations nearby, there would be no disproportionate impact to environmental justice populations due to the Yard 8 maintenance facility.

The building for the maintenance facility would result in a moderate change to the local visual environment by introducing an additional industrial building to this largely commercial/industrial neighborhood. In the absence of the proposed maintenance facility, the site selected may be redeveloped for other uses that would have similar or greater impacts on the local neighborhood. The proposed maintenance facility building site is zoned for industrial use and other related uses.

Overall, the placement of the maintenance facility in an existing industrial district would not result in any substantial changes to the local environment. There would be no disproportionate impact to environmental justice populations due to Yard 8.

Option L

Two buildings would be acquired and demolished as part of Option L. However, no residential land would be acquired, resulting in no direct effect on local environmental justice populations.
Under Option L, 74 jobs would be displaced in an environmental justice area. While the analysis cannot assume that the employees of these businesses are local residents, the local racial makeup and economic status provides the best available indicator for the affected populations. As discussed in Section 3.6, Socioeconomic Impacts, of this FEIR Appendix B, the displacement of these jobs does not represent a substantial economic change for the local area.

The proposed maintenance facility site is in an existing industrial area in between the MBTA Fitchburg and Lowell Lines. The noise from the maintenance facility is included in Section 3.3, Noise, of this FEIR Appendix B. Potential severe noise impact is projected at the Brickbottom Artists Building, the Hampton Inn Hotel, the Glass Factory Condominiums, the future 22 Water Street residential development and the future Archstone Phase II – Site 1. Potential moderate noise impact is projected at the existing NorthPoint Tango and Sierra properties, prior to mitigation. Noise from the mainline operations is the dominant factor in future noise levels at these receptors.

Sound insulation of residences to improve the outdoor-to-indoor noise reduction or noise barriers are potential mitigation measures for these existing properties. The need and effectiveness of building sound insulation for interior spaces would be assessed in the next phase of project development. There would be no moderate or severe impacts from noise after mitigation is implemented. Therefore, there would be no disproportionate environmental justice impacts from the proposed maintenance facility.

The building for the maintenance facility would change the local visual environment slightly by introducing an additional industrial building to this largely commercial/industrial neighborhood.

Overall, the placement of the maintenance facility in an existing industrial district would not result in any substantial changes to the local environment. There would be no disproportionate impact to environmental justice populations due to Option L.

Mirror H

Mirror H would require acquiring partial pieces of land owned by Pan Am Railways and planned for the future NorthPoint development project. However, no buildings would be acquired or demolished, and no residential land would be acquired, resulting in no direct effect on local environmental justice populations.

The proposed maintenance facility site is in an existing industrial area south of the MBTA Fitchburg Line. The noise from the maintenance facility is included in Section 3.3, Noise, of this FEIR Appendix B. Potential severe noise impact is projected at the Brickbottom Artists Building, the Hampton Inn Hotel, the Glass Factory Condominiums, four future properties in the NorthPoint development (Sites 1, 2, 3 and 4), the future 22 Water Street residential development and the future Archstone
Phase II – Site 1, prior to mitigation. Potential moderate noise impact is projected at one future property in the NorthPoint development (Site 5) and two existing properties (Tango and Sierra). Noise from the mainline operations is the dominant factor in future noise levels at the Brickbottom Artists Building, Hampton Inn Hotel, Glass Factory Condominiums, the existing NorthPoint properties Tango and Sierra and future residential development at 22 Water Street and Archstone Phase II – Site 1. Sound insulation of residences to improve the outdoor-to-indoor noise reduction or noise barriers are potential mitigation measures for these existing properties. The need and effectiveness of building sound insulation for interior spaces would be assessed in the next phase of project development. There would be no moderate or severe impacts from noise after mitigation is implemented. Therefore, there would be no disproportionate environmental justice impacts from the proposed maintenance facility.

Noise from Mirror H is the dominant project-related noise source at the five future NorthPoint properties (Sites 1, 2, 3, 4 and 5). It is assumed that future properties at the NorthPoint development would have noise-sensitive receptors at upper-floor residences, which would not benefit from a noise barrier for potential mitigation of noise impact from stationary cars in the storage yard. Since the proposed development is not currently under construction and is assumed to be completed by 2030, after the completion of the Green Line Extension Project, the buildings could be designed with consideration of the noise environment (i.e. windows with high transmission loss or STC ratings) to mitigate potential impact.

The building for the maintenance facility would change the local visual environment slightly by introducing an additional industrial building to this largely commercial/industrial neighborhood. In the absence of the proposed maintenance facility, the site selected may be redeveloped for other uses that would have similar or greater impacts on the local neighborhood.

Overall, the placement of the maintenance facility in an existing industrial area would not result in any substantial changes to the local environment. There would be no disproportionate impact to environmental justice populations due to Mirror H.

2.5.7 Visual Resources

This section compares the direct visual impacts from the three maintenance facility alternatives. The support facility would be an enclosed building, resulting in minimal light exposure to the surrounding area. Any outdoor lighting would be directed downward and towards the building with fixture hoods to prevent any direct lighting impacts at night on neighboring buildings.

Moreover, the aesthetic features of the exterior of the maintenance facility structure would enhance the possibility of quality redevelopment nearby. Heavy visual screening by landscaping or walls would be considered, especially adjacent to the
outdoor rail car storage area. Consideration would be given to the development of a deck for parking or other purposes over the storage yard, which would provide weather protection to the Green Line cars while screening the visual impacts.

**Yard 8**

Yard 8 has been in continuous use as a rail facility since 1835, and train cars would use the layover tracks mostly at night. The support facility building would be directly across the right-of-way from the Brickbottom Artists Building. The building would be easily visible from the east-facing windows of the Brickbottom Artists Building. Given the existing industrial and commercial buildings visible from this area, the support facility would result in a moderate change to the local landscape by adding a new industrial building.

**Option L**

Option L is immediately adjacent to the MBTA’s BET, on the northwest. Option L is along the southern and southeastern fringe of the existing Inner Belt industrial area. The vehicle storage yard is proposed at the southern end of the Inner Belt Road just north of the MBTA Fitchburg Line on vacant private property and land that is currently an unused parking lot for 70 Inner Belt Road. The maintenance building would be south of Third Avenue and east of the existing building at 70 Inner Belt Road.

A maintenance facility at Option L would require the demolition of two buildings and the construction of a new building. The building would be less visible from the Brickbottom Artists Building than would Yard 8. Given the existing industrial and commercial buildings visible from this area, the support facility would result in a minor change to the local landscape.

**Mirror H**

Mirror H straddles portions of the NorthPoint site and a portion of MBTA-owned land. This alternative locates the facility at the north side of the proposed NorthPoint development and partly on MBTA land south of the BET, and represents a plan that places new light rail facilities next to existing MBTA Commuter Rail facilities. A support facility in this location would result in some visual changes to the local area. A single storage yard would be in Cambridge to the west of the maintenance building in Somerville. Some of the auto parking, as well as the tail tracks and loop east of the maintenance building, would be in Boston.

The support facility building would be directly across the right-of-way from the proposed NorthPoint buildings. The building would be easily visible from the
northern-facing windows of the proposed NorthPoint buildings. Given the existing industrial (MBTA’s BET facility) and commercial buildings visible from this area, the support facility would result in a minor change to the local landscape by constructing a new building.

### 2.5.8 Wetlands

There are no state- or Federally-regulated wetlands within the Yard 8, Option L, or Mirror H sites. Therefore, there would be no wetland impacts created by developing any chosen maintenance alternative.

### 2.5.9 Stormwater Management

The proposed maintenance facility would be constructed in previously-developed areas and would be designed to meet the Massachusetts Stormwater Management Standards for redevelopment. Maintenance activities (such as light rail vehicle washing) would be conducted inside the maintenance building and are anticipated to contribute to stormwater. Stormwater from the site would discharge to an existing storm drain system and would not discharge directly to any wetlands.

The MBTA would need to apply for coverage under the EPA Multi-Sector General Permit for Stormwater Discharges Associated with Industrial Activity (MSGP) for the maintenance facility. This general permit requires numerous control measures and operational plans to control spills, manage potential contaminant sources, and prevent the impairment of any water bodies receiving runoff from industrial facilities.

A new EPA National Pollutant Discharge Elimination System (NPDES) permit for an industrial use would be required. This permit would require a new Stormwater Pollution Prevention Plan (SWPPP) to address maintenance and monitoring and a Spill Prevention, Control, and Countermeasures (SPCC) plan to demonstrate vigilance and preparedness for hazardous spills. The storage tracks would have collection trays to catch any incidental drips, leaks, or spills of hazardous materials that may occur during maintenance or storage. The collection trays would be connected to an oil/water separator that would separate petroleum products from stormwater runoff prior to discharge. Any oil or other hazardous materials stored at the site would be secured with secondary containment structures to catch any spills. With the proposed containment measures in place, the maintenance and storage

---

10 The Multi-Sector General Permit for Stormwater Discharges (MSGP) is part of the National Pollutant Discharge Elimination System (NPDES), which requires permits for various stormwater and industrial discharges in order to prevent the contamination and impairment of receiving waters. The EPA is responsible for issuing NPDES permits in Massachusetts, and the permits are also reviewed by MA DEP. The MSGP covers most types of industrial discharges and requires general control measures as well as specific measures tailored to specific industrial uses. Industrial facilities applying for coverage under the MSGP must demonstrate compliance with all requirements and submit copies of their SWPPPs and SPCCs for review.
Yard 8

Yard 8 would add 2.6 acres of impervious surfaces to the site. Approximately 54 percent of the new total impervious area (approximately 2.7 acres) would be roof area, which is expected to be clean. The stormwater management system would include many of the same features found in the station and railway drainage. Proposed management measures include:

- Deep sump catch basins to collect runoff from paved areas;
- Hydrodynamic particle separators to treat pavement runoff;
- Roof drains from building connected to an underground pipe storm drainage system;
- Underground infiltration chambers to store and infiltrate runoff; and
- Overflow outlets from the infiltration chambers to direct excess flow into the municipal storm drainage system in Inner Belt Road.

The stormwater system would be designed to ensure no net increase in peak flow to the existing municipal drain line in Inner Belt Road.

Option L

Option L would reduce existing impervious surfaces by about 3.2 acres. Approximately 40 percent of the new total impervious area (approximately 3.4 acres) would be roof area, which is expected to be clean. The stormwater management system would include many of the same features found in the station and railway drainage. Proposed management measures include:

- Deep sump catch basins to collect runoff from paved areas;
- Hydrodynamic particle separators to treat pavement runoff;
- Roof drains from building connected to an underground pipe storm drainage system;
- Underground infiltration chambers to detain and infiltrate runoff; and
- Overflow outlets from the detention chambers to direct excess flow into the existing MBTA Fitchburg Line Main Drain, which crosses the eastern portion of this site.

The stormwater system would be designed to ensure no net increase in peak flow to the existing MBTA drain line.
Mirror H

Mirror H would reduce existing impervious surfaces (pavement) by about 0.4 acres. Approximately 47 percent of the new total impervious area (approximately 2.2 acres) would be roof area, which is expected to be clean. The stormwater management system would include many of the same features found in the station and railway drainage. Proposed management measures include:

- Deep sump catch basins to collect runoff from paved areas;
- Hydrodynamic particle separators to treat pavement runoff;
- Roof drains from building connected to an underground pipe storm drainage system;
- Underground storage chambers to detain runoff;
- Underground filtration basin to provide additional TSS removal (in lieu of infiltration); and
- Overflow outlets from the detention chambers to direct excess flow into the existing MBTA Fitchburg Line Main Drain, which crosses the eastern portion of this site.

Infiltration is not advised, as there is ongoing groundwater remediation in this area. The stormwater system would be designed to ensure no net increase in peak flow to the existing MBTA drain line.

2.5.10 Hazardous Materials

This section discusses the potential presence of oil and/or hazardous materials (OHM) on or adjacent to the proposed maintenance facility alternatives for the proposed Green Line Extension Project.

To assess the potential for encountering OHM, Phase I Environmental Site Assessments (ESAs) were performed as per the American Society for Testing Materials (ASTM) 1527-05 Standard and All Appropriate Inquiries (AAI) pursuant to 40 CFR Part 312. The purpose of the Phase I ESAs is to identify Recognized Environmental Conditions (RECs) in connection with the properties, to the extent feasible pursuant to the process described in the Standard. The Phase I ESAs were completed utilizing the Standard as guidance.

The scope of services provided for the Phase I ESAs included the following:

- Performed a computer database search of Federal and state files. The Federal databases included the current Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS), National Priorities List (NPL), Resource Conservation and Recovery Act (RCRA) Transportation,
Storage and Disposal (TSD), RCRA Generators, and Emergency Response Notification System (ERNS) list. The state databases included the state equivalent CERCLIS list, spills, Underground Storage Tanks (USTs), Solid Waste Landfills (SWL), and public water supply lists.

- Reviewed available Massachusetts Department of Environmental Protection (MassDEP) files to provide more information about reported releases of OHM identified through the database search on or adjacent to the sites. The MassDEP files provided additional information regarding past ownership; historic site usage; past usage, storage and disposal of OHM on and adjacent to the subject site; and other evidence of potential environmental impacts.

- Reviewed available municipal and historic files to help confirm ownership history and past usage. Resources included tax records, aerial photographs, Board of Health Department records, Building Department records, Fire Department records, Conservation Commission records, and Sanborn fire insurance maps. The site history review also identified reports of historic spills, disposal areas, or other past releases of OHM on or adjacent to the properties.

- Reviewed previous site documents including an ESA, if applicable and/or available for review.

- Performed a partial site reconnaissance from public roadways to observe each site for overt evidence of a release or threat of release of oil and/or hazardous materials within exterior portions of the entire property. The uses of abutting properties were also documented. No interior inspections were conducted.

- Areas of property acquisition were assessed as discussed above. Properties already owned by the MBTA or the Commonwealth of Massachusetts were not assessed. Notable deviations from the standard include not inspecting interior portions of buildings, interviews with knowledgeable personnel were not conducted, and a user questionnaire was not completed.

The findings of the Phase I Environmental Site Assessments conducted for the three maintenance facility alternatives indicate that all of the proposed maintenance facilities encompass and abut sites of known and suspected OHM contamination. All three alternatives would likely be impacted by fill material present throughout the area, the historic use of the properties for railroad operations, present industrial use of the property, and several documented disposal sites detailed below. Asbestos containing materials (ACM) and/or lead-based paint may be present in site structures or fill piles in the location of the proposed maintenance facilities; therefore, a detailed survey is recommended prior to acquisition or demolition.

The purpose of this analysis was to identify and compare the number of RECs in connection with each maintenance facility site. RECs that are deemed to have a high potential impact consists of sites such as those confirmed with soil, groundwater, and/or indoor air impacts that were reported to the MassDEP and have undergone some type of cleanup or remain an active case. RECs that are deemed to have a
medium potential impact consist of properties such as those with potential sources of OHM with limited or inconclusive information.

It is recommended that upon selection of the preferred maintenance facility site, that subsequent investigation be conducted to identify specific contaminants and associated clean-up costs. On-site contamination encountered would be assessed and, if necessary, remediated prior to and during construction activities. Any necessary response actions would be performed in accordance with the Massachusetts Contingency Plan (MCP).

Yard 8

Based upon the research review conducted for the Phase I ESA, seven RECs are believed to be associated with Yard 8 (off-site releases were consolidated into one REC), comprised of the properties identified in Table 2-13.

### 2.5.11 Historic and Archaeological Resources

The Green Line Extension Project Area of Potential Effects (APE) for historic resources includes the area extending approximately 125 feet, or one assessor’s lot, on either side of the Proposed Project’s Medford and Union Square Branch routes, associated proposed station locations, and maintenance and/or interim train storage facilities.

The APE for historic resources, in accordance with 36 CFR 800.16(d) is defined as “the area or areas within which an undertaking may directly, indirectly, or cumulatively cause changes in the character or use of historic properties (defined as
resources listed or eligible for listing in the National Register), if any such properties exist there." Therefore, the APE includes other areas where the undertaking could cause changes in land use, traffic patterns, or other aspects that could affect historic properties. Factors with potential to cause changes are noise, vibration, visual (setting), traffic, atmospheric, construction, indirect, and cumulative impacts. Different project factors may produce more than one APE for a given undertaking.

The APE for archaeological resources is limited to the construction areas for the proposed maintenance facility alternatives.

There are no historic resources or recorded archaeological sites located within the APE for any alternative site. However, the presence of deeply buried archaeologically sensitive strata below the railroad and modern fill soils is considered possible at all of the proposed maintenance facility alternatives. Further research including a review of soil borings is recommended prior to construction to determine if archaeologically sensitive strata may be impacted by the construction of the maintenance facility.

2.5.12 Public Parks, Recreation Areas, and Conservation Land

There are no public parks, recreation areas or conservation land areas within or adjacent to the proposed Yard 8, Option L, or Mirror H maintenance facility areas; therefore, there would be no impacts to parks or conservation land.

2.5.13 Consistency with Federal, State, and Local Planning

This section compares the consistency and compatibility of each maintenance facility site to other planned Federal, state and local planning initiatives. Figures 2-5 through 2-7 show the existing land uses in the vicinity of the maintenance facility alternatives, and Figure 2-12 shows a generalized zoning map for the communities of Cambridge and Somerville.

Yard 8 and Option L would be compatible locations for the maintenance facility because these alternatives are in the middle of an industrial area. Option L would likely have the least transit oriented development (TOD) potential since it is the farthest away from proposed stations. Option L, in terms of future land use impacts, would likely be the most consistent with local development plans. Mirror H would be less compatible with state and local planning initiatives.

Yard 8

Yard 8 is compatible with the potential future Urban Ring project, the Somerville Community Path, and the North-South Rail Link project. Yard 8 within the City of Somerville is zoned Industrial A (IA).

The proposed vehicle maintenance building and overnight rail car storage area are compatible with much of the existing industrial land uses along this segment of the railroad corridor. However, its development character and impacts may potentially affect future non-industrial development opportunities in adjacent areas.

The facility would be similar in appearance to other MBTA maintenance facilities serving the Green Line (e.g., Riverside and Reservoir). To encourage planned mixed use development near the Brickbottom Station and in the Inner Belt area, consistent with City of Somerville planning policies for the area, mitigation measures may be necessary. The design of an aesthetic building facade, the enabling of potential air rights development (perhaps through zoning amendments), and dense screening landscaping may be necessary to create a more compatible facility with future non-industrial land uses.

Option L

Option L does not preclude the potential future Urban Ring project, the Somerville Community Path, or future North-South Rail Link project. Option L within the City of Somerville is zoned Industrial A (IA).

The vehicle maintenance building and overnight rail car storage area are compatible with much of the existing industrial land uses along this segment of the railroad corridor. However, its development character and impacts may potentially affect future non-industrial development opportunities in adjacent areas.

The facility would be similar in appearance to other MBTA maintenance facilities serving the Green Line (e.g., Riverside and Reservoir). To encourage planned mixed use development near the Brickbottom Station and in the Inner Belt area, consistent with City of Somerville planning policies for the area, mitigation measures may be necessary. The design of an aesthetic building facade, the enabling of potential air rights development (perhaps through zoning amendments), and dense screening landscaping may be necessary to create a more compatible facility with future non-industrial land uses.

Mirror H

Mirror H does not preclude the potential Urban Ring and Somerville Community Path projects. However, Mirror H could preclude the future North-South Rail Link
project and the future expansion planned for the BET facility, both of which are programmed within the MBTA’s existing property limits. The portion of Mirror H within Somerville is zoned Industrial B (IB). The portion of Mirror H within Cambridge is designated as zoned NorthPoint Residence District PUD (NP PUD-6). Zoning in the NorthPoint District is primarily residential, with retail, office uses and community services. The land in Boston that is adjacent to the proposed NorthPoint development is zoned as a Local Industrial Subdistrict (LI). Mirror H would be less compatible to local planning initiatives than Option L or Yard 8 as the industrial use of this facility would be adjacent to a lot of zoned residential developments.

Most of the underused land between the Mirror H site and the proposed relocated Lechmere Station site, however, is already programmed as part of the NorthPoint development project, which is projected to occupy 46.3 acres and 20 buildings when completed. Full build-out of these developments would be made more attractive by construction of the Green Line Extension, which would make the area more accessible to a larger region.

Farther east and adjacent to the NorthPoint project is the Charles E. Smith/Archstone residential development. Phase I, which includes 437 rental units, was completed in 2007. Phase II is permitted for 426 units. Construction had not yet begun on Phase II as of March 2010.

Directly adjacent to Mirror H is the 2.4 acre site for a 392 unit triple-tower residential/parking/open space project proposed by Catamount Holdings. The development would occupy the vacant site of the former headquarters of the Mac Gray Company at 22 Water Street, behind the Hampton Inn Hotel on O’Brien Highway. The project has been approved by the Cambridge Planning Department.

Additional land use impacts in the station area are uncertain, as there are few other vacant sites available for development. However, the improved Lechmere Station and the proposed future developments are likely to increase land values in the area, making existing underused parcels attractive sites for potential redevelopment.

The vehicle maintenance building and overnight rail car storage area are compatible with much of the existing industrial land uses along this segment of the railroad corridor. However, its development character and impacts would affect future non-industrial development opportunities in adjacent areas.

2.5.14 Community Path

The choice of maintenance facility site would have no impact on the feasibility of the Somerville Community Path extension between Lowell Street and Inner Belt Road, as described in Appendix E of the DEIR/EA.
MassDOT is committed to completing all planning, design, and engineering work - including the identification of necessary property acquisitions - for the proposed extension of the Somerville Community Path between Lowell Street and Inner Belt Road. The limits of the path were predicated on the connections to Lechmere being made through the Inner Belt area via Inner Belt Road and the proposed Urban Ring Bridge into the Lechmere area. However, the cessation of planning for the Urban Ring project has changed this anticipated connection. MassDOT is unable to assume responsibility for designing the Urban Ring Bridge as part of the Green Line Extension Project. That being said, MassDOT is committed to working with the City of Somerville, residents and businesses in the Brickbottom and Inner Belt neighborhoods, and Community Path advocates to design the Path in such a way so as to create improved connectivity within the Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension.

### 2.5.15 Summary of Environmental Findings

Table 2-16 summarizes the findings of the environmental findings of the three maintenance facility alternatives - Yard 8, Option L and Mirror H. None of the maintenance facility alternatives are expected to impact air quality, parking or traffic operations, wetlands, historic and archaeological resources, public parks, recreation areas, or conservation land.

Two existing NorthPoint buildings (Tango and Sierra) would be moderately impacted by noise, prior to mitigation, under each alternative. In addition, Mirror H would moderately impact noise levels at one future NorthPoint property (Site 5). Three existing buildings (Brickbottom Artists Building, Hampton Inn Hotel, and Glass Factory Condominiums) and two future buildings (the proposed 22 Water Street and the proposed Archstone Development - Phase II, Site 1) would be severely impacted by noise, prior to mitigation, under each alternative. In addition, Mirror H would severely impact noise levels at four future NorthPoint properties (Sites 1, 2, 3 and 4).

The Brickbottom Artists Building would be impacted by vibration due to the presence of a double crossover at Mirror H, approximately 50 feet away, between the mainline and maintenance tail track. There are no vibration impacts projected at any receptors directly from yard movements at Yard 8 or Option L.

Table 2-10 provides the property tax effects of Yard 8, Option L, and Mirror H. The total estimated annual property tax value of the land and buildings acquired for Yard 8 is $116,064. These acquisitions would reduce annual property tax revenue by 0.12 percent in Somerville. Yard 8 would not require the displacement or relocation of any jobs.

The total estimated annual property tax value of the land and buildings acquired for Option L is $322,440. These acquisitions would reduce annual property tax revenue
by 0.33 percent in Somerville. Option L would displace or relocate approximately 74 jobs in Somerville. Many of the jobs displaced would likely be relocated or replaced within Somerville.

The total estimated annual property tax value of the land and buildings acquired for Mirror H is $137,627. These acquisitions would reduce annual property tax revenue by 0.05 percent ($56,222) in Somerville, 0.03 percent ($78,411) in Cambridge and 0.0002 percent ($2,993) in Boston. Mirror H would not require the displacement or relocation of any jobs.

Given the existing industrial and commercial buildings visible from this area, the Yard 8 support facility would result in a moderate change to the local landscape. Option L and Mirror H would result in a minor change to the local landscape.

The stormwater system at Yard 8 would be designed to ensure no net increase in peak flow to the existing municipal drain line. The Option L and Mirror H stormwater systems would be designed to ensure no net increase in peak flow to the existing MBTA drain line. Yard 8 would increase the amount of impervious area by approximately 2.6 acres, while Option L and Mirror H would reduce impervious area by approximately 3.2 acres and 0.4 acres, respectively.

All three maintenance facility sites encompass and abut sites of known and suspected OHM contamination. All three alternatives would likely be impacted by fill materials present throughout the area, the historic use of the properties for railroad operations, present industrial use of the property, and several documented disposal sites. Seven RECs are believed to be associated with Yard 8 and Option L, while six RECs are believed to be associated with Mirror H.

Because ACM and/or lead-based paint may be present in site structures or fill piles in the location of the proposed maintenance facilities, a detailed survey is recommended prior to acquisition or demolition. It is recommended that upon selection of the preferred maintenance facility site, that subsequent investigation be conducted to identify specific contaminants and associated clean-up costs. On-site contamination encountered would be assessed, and, if necessary, would be remediated prior to and during construction activities. Any necessary response actions would be performed in accordance with the MCP.

Yard 8 and Option L would be compatible locations for the maintenance facility because these alternatives are in the middle of an industrial area. The land required for the Option L site would likely have the least TOD potential since it is the farthest away from proposed stations. Option L, in terms of future land use impacts, would likely be the most consistent with local development plans. Mirror H would be less compatible site to state and local planning initiatives. The choice of maintenance facility site would have no impact on the feasibility of any alternative alignment for the Community Path.

</tr>
<tr>
<td>Historic and Archaeological</td>
<td>- Archaeologically sensitive strata below the fill are possible at all the proposed maintenance facility alternatives. An intensive (locational) archaeological survey is recommended prior to construction to determine if archaeologically sensitive strata may be impacted by the construction of the maintenance facility.</td>
</tr>
</tbody>
</table>

Temporary, short-term impacts from construction activities would be mitigated to the extent practicable. Appropriate construction mitigation measures would be incorporated into the contract documents and specifications governing the activities of contractors and subcontractors constructing elements of the Green Line Extension Project, including the maintenance facility and storage yard. On-site resident engineers and inspectors would monitor all construction activities to ensure that mitigation measures are properly implemented. The construction mitigation measures are summarized in Table 2-18.

</tbody>
</table>
2.7 Summary

As described in the technical memorandum, the operational and environmental analyses indicated that both the Yard 8 and Option L sites were viable locations for a support facility for the Green Line Extension Project. Of the two, each has operational and environmental advantages and disadvantages.

The Secretary’s Certificate noted that comments submitted on the DEIR expressed a widespread lack of support for the Yard 8 maintenance facility location. Comments on the DEIR expressed preferences for further evaluation of both Mirror H and Option L, as required by the Secretary’s Certificate. Based on the information and comments submitted, MEPA believed “that the Option L may be the most feasible alternative and the one with fewest potential conflicts and impacts.”

MassDOT reviewed and considered the comments received on the DEIR/EA along with the results of the environmental analysis and operational analysis to determine whether to substitute an alternative option for Yard 8 as the preferred site for the maintenance and storage facility. Option L was selected by MassDOT as the preferred site for the maintenance and storage facility for the following reasons:

- Option L received the greatest support from the public and local municipal representatives.
- Option L met the MBTA’s program requirements for the Green Line maintenance and storage facility.
- Option L provides the most operational flexibility for the MBTA as it provides a direct connection to the Union Square Branch. Neither Yard 8 nor Mirror H would provide this operation.
- Option L is located adjacent to similar railroad land uses (the BET commuter rail maintenance facility).
- Option L would have more separation from existing and proposed residential areas than would Yard 8 or Mirror H.
- Option L would not preclude future development of the Inner Belt area and future roadway connections from the Brickbottom area to the Inner Belt area.
3.1 Introduction

The Secretary’s Certificate stated that the FEIR should include a narrative discussion clarifying the air quality modeling assumptions documented in the DEIR/EA, challenges associated with the inherent evolution of modeling programs and input data, and confirming that the air quality modeling results were conducted in a manner that sufficiently demonstrated consistency with the SIP.

The SIP is a comprehensive document, approved by the U.S. Environmental Protection Agency (EPA) that demonstrates that Massachusetts can comply with the National Ambient Air Quality Standards (NAAQS) for air pollutants regulated by the Federal Clean Air Act. Specific requirements of the SIP regarding transit improvements are incorporated into the Massachusetts Air Quality Regulations at 310 CMR 7.36(2) and were approved by the EPA on July 31, 2008.¹ This chapter addresses these requirements identified in the Secretary’s Certificate.

3.2 Background

As discussed and further defined in the DEIR/EA, the Federal Clean Air Act contains provisions to ensure that major transportation projects improve air quality. These Transportation Conformity provisions of the Federal Clean Air Act are intended to integrate transportation and air quality planning. Guidance from both the EPA and MassDEP define the air quality modeling and review criteria for analyses prepared pursuant to the Federal Clean Air Act, Transportation Conformity, and the SIP.

The Federal Clean Air Act and the SIP require that a Proposed Project not:

- Cause any new violation of the NAAQS;
- Increase the frequency or severity of any existing violations; or
- Delay attainment of any NAAQS.

With respect to the Green Line Extension, the Project is included in the SIP and therefore conforms to the Federal Clean Air Act requirements. The Project also complies with the requirements of the Massachusetts Air Quality Regulations. The air quality analysis included in the DEIR/EA demonstrates that the Proposed Project meets the Transportation Conformity planning and project level requirements. The DEIR/EA also calculated the emissions reductions that would result from the proposed Green Line Extension to College Avenue and Union Square. This analysis showed that the emission reductions for the 2009 SIP package, which includes the Proposed Project and other transit projects, exceed the emission reductions established by the EPA for Massachusetts transit projects (the 2008 Federal Register SIP Approved Projects Plus Ten Percent Package). The emission reductions were calculated following the same modeling protocol and procedures required for all Transportation Conformity and SIP air quality analyses.

### 3.3 DEIR Modeling Assumptions

Transportation Conformity and SIP air quality analyses utilize traffic data from the statewide traffic model and the EPA’s emission factor model MOBILE6.2. The statewide traffic model is maintained by the Central Transportation Planning Staff (CTPS), the technical staff of the Boston Region Metropolitan Planning Organization (MPO), which is responsible for SIP air quality submissions.

The statewide traffic model is the basis for determining existing and future traffic data for Federal Clean Air Act and NEPA submissions. The EPA requires that statewide traffic models used for SIP submissions be based upon the most recent approved planning-level data. As a result, statewide traffic models are periodically updated to include newly identified background projects, land use changes, and model enhancements. Statewide traffic models typically include the roadway network that exists at the time it is run and regionally significant projects (background projects) that are reasonably expected to be constructed by the design year (i.e., twenty years into the future). Similarly, the MPOs establish and periodically update the land use for existing and future years.
The statewide traffic model that CTPS uses for forecasting travel demand is based on procedures and data that have evolved over many years. It uses the most up-to-date information, transportation networks, and input data available to CTPS at the time of analysis. The statewide traffic model simulates existing travel modes for transit, automobiles, and walking/bicycling, and forecasts future year travel on the entire transportation system, spanning, in this instance, the majority of eastern Massachusetts. It uses population, employment, number of households, automobile ownership, highway and transit levels of service, as well as downtown parking costs, automobile operating costs and transit fares as important inputs in applying the model to the real world condition. As required by EPA, these inputs are constantly updated so that the model set simulates current travel patterns with as much accuracy as possible.

The greatest challenge to the air quality modeling is ensuring consistent results when the statewide traffic and the mobile source emission factor models are updated. For example, the statewide traffic model of 2006 was used to establish the 2008 Federal Register Replacement/Substitution Project package emissions criteria. This air quality modeling used the most informative transportation network and input data available at that time. The air quality modeling presented in the DEIR/EA uses an improved statewide traffic model with an updated roadway network, more current land use data, and a newer version of EPA’s mobile source emissions factor model (MOBILE6.2). All of these measures result in improved accuracy of the present day and future air quality estimates. These modeling assumptions and this real-time approach to air quality modeling results in emission values that are considered appropriate for the SIP process. In fact, this air quality modeling approach is required by EPA for evaluating Transportation Plans, Transportation Improvement Programs, and projects for SIPs and NEPA documents.

3.4 Consistency with the SIP

The Green Line Extension Project is a requirement of the SIP and fulfills a longstanding commitment of the Central Artery/Tunnel Project to increase use of public transit. The Massachusetts Air Pollution Control Regulations (310 CMR 7.36), which implement the SIP, require that the MassDOT complete the Project by December 31, 2014.

The Massachusetts Transit System Improvements (MTSI) regulations (310 CMR 7.36) became effective in December of 1991 and were incorporated into

---

3 The SIP includes a list of transportation projects funded by the FHWA or FTA, which are consistent with the Statewide Long Range Transportation Plan and the Massachusetts Transportation Improvement Program that are needed to meet the NAAQS.
the Massachusetts SIP in October of 1994. This regulation specified transit system improvement projects deemed necessary to mitigate the air quality impacts of the Central Artery/Tunnel Project. While a number of the projects included in the MTSI regulations have been completed, several others (i.e., Green Line Arborway Restoration; Blue Line Connection from Bowdoin Station to the Red Line at Charles Station; and Green Line Extension to Ball Square/Tufts University) have been delayed. With this in mind, MassDOT and the MassDEP have continued to address project implementation delays within the 2000 Administrative Consent Order and subsequent amendments in 2002 and 2005.

The MTSI anticipated and allows for the substitution of projects included in the original regulation and the approved SIP. In 2005, MassDOT initiated the process for the substitution of the original SIP projects with a new package of projects, including an extension of the Green Line to Medford Hillside with a spur to Union Square, improvements to the Fairmount Line, and the construction of 1,000 Park and Ride parking spaces.

Following a public process on the proposed substitute projects, MassDOT submitted a request to MassDEP to revise the MTSI and the SIP. Air quality modeling was performed for these projects and reported in the 2008 Federal Register notice demonstrating that the current package of transit improvements (Green Line Extension to College Avenue with Union Square Spur; Fairmount; and additional Parking) achieves the emission reductions established by the EPA of the prior SIP Approved Projects Package Plus Ten Percent.

5  The Massachusetts Department of Environmental Protection adopted revisions to 310 CMR 7.36 on December 1, 2006 and submitted SIP revisions to EPA.
6  Central Transportation Planning Staff (at the request of MassDOT), 2009, State Implementation Plan Evaluation.
In 2009, at the request of MassDOT, CTPS conducted an updated air quality analysis of the currently-proposed Green Line Extension to College Avenue with Union Square Spur in combination with the proposed Fairmount Line improvements and additional MBTA parking, as required by 310 CMR 7.36(2). The results of this air quality analysis demonstrated that the emission reductions of carbon monoxide (CO), oxides of nitrogen (NOx) and volatile organic compounds (VOCs) are greater than the SIP Approved Projects Plus Ten Percent Package presented in the 2008 Federal Register notice.7 These results are presented in Table 3-1. The MassDEP reviewed this air quality analysis and stated in their January 8, 2010 DEIR/EA comment letter that the Green Line Extension Project meets the emission reductions for 310 CMR 7.36 (8) Determination of Air Quality Emission Reductions, which are the requirements of the SIP.

7 2008 Federal Register (59 FR 50495-50498). SIP Approved Projects Plus Ten Percent Package, October 4, 1994, Table 1 - EOT Air Quality Analysis Comparison of Project Packages Benefits in the Year 2025.
4.1 Introduction

College Avenue Station would be the terminal station for the first phase of the Green Line Extension Project (the Proposed Project) and would be an intermediate station during the second phase of the project (the Future Full-Build Alternative). The College Avenue Station is proposed to be located at the corner of College Avenue and Boston Avenue in Somerville, which primarily serves the residential neighborhoods adjacent to the station and the Tufts University community. Figure 4-1 shows the station and the surrounding neighborhood.

The January 15, 2010 Secretary’s Certificate required the MassDOT in the FEIR to clarify and confirm impacts associated with the College Avenue Station operating as a terminal station. Specific analyses and information requested by the Secretary included:

- Description of Green Line operations at the proposed terminus (i.e. train reversals, temporary train storage, movement of personnel, etc.) and how the facility has been designed to accommodate terminal station ridership demand;
- Clarification of how the College Avenue Station, functioning as a terminus, would impact traffic, parking, pedestrian, and bicycle operations within the Study Area;
- Clarification of how train operations from the Proposed Project at the College Avenue Station may impact sensitive noise and vibration receptors; and,
- Revisions to DEIR models as necessary to accurately assess the predicted function of the station, presentation of appropriate mitigation measures to offset identified negative impacts, and description of differences in mitigation measures from those proposed in the DEIR, if any.
This Chapter includes a description of the College Avenue Station as a terminal station, describes the Green Line operations in the context of the Station, explains proposed access and circulation at the Station area (traffic, pedestrian and bicycle access), and potential environmental impacts and proposed mitigation measures. This Chapter includes the information required by the Secretary’s Certificate.

4.2 Station Description

The College Avenue Station is described in DEIR/EA Section 3.7, Project Description – Preferred Alternative, for the Proposed Project (Alternative 1). For the Proposed Project, Green Line service would terminate at College Avenue Station. Figure 4-2 shows the station and Figure 4-3 shows access to the station. Daily ridership at this station is anticipated to be 2,420 boardings (projected to the year 2030) for the Proposed Project. In order to meet accessibility requirements and taking into consideration the eight percent grade along the College Avenue bridge, the station provides two points of access. One access point would be provided from the east side of the College Avenue bridge; the second access point would be provided from the west side along Boston Avenue. A sidewalk would be maintained along the College Avenue bridge for regular pedestrian access.

Vehicular drop-off/pick-up is currently planned along the northbound side of Boston Avenue, in the area where parking does not currently exist. Bicycle parking would also be provided at the station. Local MBTA Bus Routes 80, 94, and 96 would continue to provide service within close proximity of the station with existing bus stops located on College and Boston Avenues, as indicated on the figures.

With College Avenue Station as the terminus, an extension of tracks, known as tail tracks, would be constructed approximately 600 feet beyond the end of the proposed platform. A crossover (a special device allowing a train to move from one track to another) would be located approximately 300 feet beyond the end of the proposed platform. These tracks and the crossover would be required north of the station for short-term storage of vehicles for morning start-up of service (approximately one hour) and for operational flexibility (i.e., reverse direction and provide temporary storage for disabled trains). This track area would be open-air, therefore no additional structures are proposed.

The tail tracks and double crossover north of the proposed College Avenue Station platform would allow revenue trains to drop off passengers on the outbound side of the platform and then continue north out of the station. The crossover would enable the train to switch to the inbound track, reverse direction and then pull into the station on the inbound track and allow inbound passengers to board and then continue to Ball Square Station. Before revenue
service in the morning, up to four train sets may be dispatched to College Avenue and allowed to dwell north of the platform until each train is allowed to start service. MBTA train crews would start each day taking the trains from the Green Line maintenance and storage facility to College Avenue Station before the start of revenue service (approximately 5 AM). Similarly, at the end of each day trains would come out of service at the terminus and return to a storage facility after revenue service has ended (approximately 1 AM). Trains would not be stored overnight at the station and MBTA crews would not start or end their shift at this station.

4.3 Access and Circulation

This section discusses access and circulation in the vicinity of College Avenue Station. This analysis, documented in DEIR Section 5.5, Traffic, is provided to summarize College Avenue Station as a terminal station. No changes to the traffic model or analysis have occurred since the DEIR/EA was published.

Based on projected ridership, approximately 800 boardings are anticipated at College Avenue Station during peak hour operations under the Proposed Project. Approximately 40 riders are expected to access the College Avenue Station by vehicular drop-off/pick-up and approximately 40 riders are expected to access the station by bicycle. At a minimum, 40 bicycle parking spaces would be provided, based on the bicycle demand estimates. The remaining riders are assumed to access the station by walking or bus transfers. Traffic volume and pedestrian networks in the Medford Study Area intersections are presented in FEIR Figures 4-4a-b and 4-5a-b.

The information presented in the DEIR/EA for the Proposed Project, as well as the information presented in this chapter, assumes that the Green Line service would terminate at College Avenue Station. The ridership model was run separately for various alternatives both with and without Mystic Valley Parkway/Route 16 Station. When College Avenue is the terminal station, there will be approximately 320 additional boardings per day at this station. This translates into approximately 100 additional boardings at College Avenue per peak hour. The majority of additional trips (about 90 percent) are expected to be pedestrian trips. The balance is expected to arrive via bus, bicycle and drop-off/pick-up. The proposed College Avenue Station layout, as presented in the DEIR/EA, was designed to adequately accommodate the additional daily boardings.

As discussed in the DEIR/EA, the CTPS used its regional travel demand model to provide the traffic forecasts for this study. Future Build model runs for each DEIR/EA alternative were prepared separately by including the extended Green Line as a mode choice and quantifying the number of vehicle trips expected to
change mode from passenger car to transit service. Using the Build alternative model runs, peak hour turning movement volumes were developed for each alternative for a 2030 design year.

Vehicular drop-off/pick-up trips are assigned to each station based on the expected total boardings of that station. A survey completed by CTPS in 2007 indicates that approximately three to seven percent of daily boardings within the urban core originate from drop-offs. An average of five percent, or 120 total trips, was used for the purposes of this analysis. It is assumed that all of the drop-off/pick-up trips would occur during the morning and evening peak periods, with about 67 percent occurring during the morning and evening peak hour (40 trips per peak hour).

The Proposed Project has a measurable effect on both regional and local traffic volumes along Study Area roadways. Local traffic along Boston Avenue decreases under the Proposed Project due to a shift in travel mode from private automobile to transit, creating additional capacity at Study Area intersections. However, since many of the Study Area roadways also provide regional connections, the model results show that the capacity created on the roadway would be largely backfilled by regional traffic volume. It is important to note that the additional vehicles are shifting from local roadways through these communities where they do not belong (i.e. cut-through traffic) to the regional system. Therefore, while a large improvement in traffic operations is not seen on Study Area roadways, there are many other roadways outside the Study Area where this benefit would be realized.

Since the release of the DEIR/EA, a few stakeholders raised concerns that the proposed College Avenue Station, serving as a terminal station for the Proposed Project, would not adequately serve the Medford Hillside neighborhood, which was identified as part of the SIP description. To address and resolve these concerns, CTPS prepared a memorandum that demonstrates that the College Avenue Station location does adequately serve the walk market area for the Medford Hillside neighborhood. This memorandum is provided in Appendix C of this FEIR.

4.3.1 Traffic Operations

Intersections that degrade in level of service as a direct result of the Green Line Extension Project and more specifically as related to activity at the College Avenue Station are shown in Table 4-1. Changes in vehicular levels of service are attributable to both pedestrian signal timing changes and vehicular traffic related to drop-off/pick-up activity. Since the traffic modeling efforts in the DEIR/EA specifically evaluated the College Avenue Station as a terminal station, no new
mitigation is proposed beyond what was presented in the DEIR/EA. Mitigation to offset the adverse impacts is presented in Section 4.6, Mitigation Measures.

Table 4-1 College Avenue Station 2030 Build Signalized LOS Summary Comparison

| Signalized Intersection          | No-Build Morning Peak Hour |  | No-Build Evening Peak Hour |  | Proposed Project Morning Peak Hour |  | Proposed Project Evening Peak Hour |
|---------------------------------|-----------------------------|  |-----------------------------|  |-----------------------------------|  |----------------------------------|
|                                 | V/C            | Delay | LOS | V/C            | Delay | LOS | V/C            | Delay | LOS | V/C            | Delay | LOS |
| Boston Avenue at Winthrop Street| 1.10           | 65    | E   | 1.09           | 75    | E   | 1.09           | 69    | E   | **1.19**       | **91** | F   |
| Boston Avenue at College Avenue | 0.98           | 71    | E   | 0.94           | 60    | E   | **1.04**       | **81** | F   | 0.94           | 62    | E   |

Note: Intersections degrading by at least one level of service are denoted in bold.

1 Volume to capacity ratio
2 Delay in seconds per vehicle
3 Level of Service

4.3.2 Pedestrians and Bicycles

The Proposed Project would increase pedestrian activity in the vicinity of the College Avenue Station. Traffic signal timing and phasing changes at Study Area intersections would improve the pedestrian operations by reducing the amount of time pedestrians would be required to wait for the walk signal. However, pedestrian levels of service are not expected to change. All traffic signals in the Study Area would be improved to meet current standards set by ADA and related state regulations, and to be in compliance with the most recent version of the Manual of Uniform Traffic Control Devices (MUTCD).

There are six intersections in the immediate vicinity of College Avenue Station that require mitigation to address adverse impacts of the Proposed Project on pedestrians. These intersections include Boston Avenue at North Street, Winthrop Street, and Harvard Street; College Avenue at George Street; and two existing midblock crossings, Boston Avenue between Winthrop Street and College Avenue and College Avenue between Boston Street and Frederick Avenue. Mitigation includes adjustments to traffic signal timings, installing warning signage to accommodate the expected increase in pedestrian volumes, and the potential of a new signalized crossing, as discussed in FEIR Section 4.6, Mitigation Measures.

The Proposed Project would attract bicyclists to the College Avenue Station. As discussed above, MassDOT is committed to providing as much bicycle parking as possible at College Avenue Station.

---

4.3.3 Automobile Parking

No new parking is proposed for College Avenue Station, even as a terminal station. Many of the parking areas near the proposed College Avenue Station already see parking violations throughout the day and the available parking supply is limited. Increased enforcement would be necessary to ensure that parking areas would be used appropriately. MassDOT will work with the City of Medford in the next phase of project development to determine the most appropriate parking enforcement program (i.e. permits, meters, etc.) related to the new station.

Also as discussed in Section 4.6, Mitigation Measures, a proposed improvement to the intersection of Boston Avenue at Winthrop Street would require the elimination of a portion of the parking spaces along northbound Boston Avenue.

4.3.4 Bus Transportation

No impacts to bus transportation are anticipated from the Proposed Project. The MBTA may in the future consider the relocation of bus stops to encourage the use of the bus to access the station. The benefit of this action would be further evaluated during Preliminary Engineering.

4.4 Construction Impacts

Temporary access impacts associated with the construction of the College Avenue Station include temporary displacement of parking spaces required to ensure safety and equipment access/delivery during construction. These impacts are expected to be temporary and to terminate once construction is complete. Detours associated with the reconstruction of the College Avenue bridge are also anticipated. The College Avenue bridge is expected to remain open during construction; however, temporary bridge closures are possible and would be limited in time frame and duration. Care would be taken to ensure that adjacent bridges are not closed simultaneously.

Temporary noise impacts could result from construction activities associated with utility relocation, grading, excavation, track work and installation of systems components. Such impacts may occur in residential areas and at other noise-sensitive land use located within several hundred feet of the track alignment. The potential for noise impact would be greatest at locations near pile driving operations for the College Avenue Station structure.
Construction impacts are also expected to include air emissions, dust and vibration, as discussed in the DEIR/EA, and there have been no changes to these impacts since the DEIR/EA.

4.5 Environmental Impacts

This section describes the potential noise and vibration impacts associated with the proposed College Avenue Station, as a terminal station, as required by the MEPA Certificate.

4.5.1 Noise

Extending the Green Line would add a new noise source to the environment along the proposed corridor. While there is existing noise exposure from sources such as commuter trains and automobiles, introducing an additional noise source and relocating the commuter rail lines have the potential to increase future noise at some noise-sensitive receptors. The DEIR/EA, in the analysis of Alternative 1, evaluated noise levels along the entire route of the Green Line Extension, including noise levels associated with College Avenue Station as a terminal station.

Noise impacts are the result of several elements of the Proposed Project:

- Commuter Rail operations on the track shifted to the east, closer to residences;
- Green Line operations on the new western tracks;
- Green Line trains idling on the tail tracks north of the College Avenue Station; and
- Green Line trains operating on the crossover (turnout) switch at the tail tracks.

These noise sources are minor, do not cause potential impacts and are less significant than the noise generated by the commuter trains. As an example, the three residences on Burget Avenue which are closest to the proposed tail tracks, would be exposed to noise (62.1 dBA) from stationary trains on the tail tracks, 72.3 dBA from Green Line operations, and 74.7 dBA from commuter train operations. The total future noise (cumulative noise exposure) would be 76.8 dBA. This constitutes a moderate noise impact and is due primarily to commuter train operations. Other receptors on Burget Avenue would be exposed to even lower noise levels from sources associated with College Avenue as a terminal station.
4.5.2 Vibration

Potential vibration impact from the College Avenue Station was assessed using the methods described in the DEIR/EA (Section 5.8, Vibration). This analysis evaluated each vibration-sensitive receptor location taking into account the distances to the future commuter line and Green Line tracks and the presence of any special trackwork (crossovers or turnouts). A crossover on the Green Line tail tracks north of College Avenue Station is the only vibration source that is associated with College Avenue being a terminal station. There would be no vibration impact from Green Line trains near College Avenue Station.

A crossover south of College Avenue Station is required regardless of whether College Avenue Station is a terminal station or an intermediate station. No changes to noise and vibration impacts or proposed mitigation have occurred at this crossover location since the DEIR/EA.

Potential vibration impact prior to mitigation has been identified for residential receptors at Brookings Street due to the shifting of the commuter tracks beyond the College Avenue terminus station. Future vibration levels from the commuter trains would be 75 VdB (an increase from the existing 69 VdB). Since the commuter tracks would be shifted a similar distance closer to these receptors, whether or not College Avenue is a terminal, future vibration levels would be the same.

4.6 Mitigation Measures

This section presents a summary of the proposed mitigation options identified in the DEIR/EA to address adverse environmental impacts associated with construction and operation of the proposed College Avenue Station as the terminus of the Proposed Project. Potential permanent impacts resulting from constructing the station would be mitigated to the extent feasible, as summarized in Table 4-2.

4.6.1 Traffic Mitigation

Specific to College Avenue Station, two intersections require physical improvements to mitigate adverse impacts caused by project-related traffic: Boston Avenue at Winthrop Street and Boston Avenue at College Avenue. Impacts at Boston Avenue and Winthrop Street would be mitigated by restriping the Boston Avenue northbound approach (currently a single lane approach) to provide an exclusive left-turn lane and a shared through/right-turn lane. Signal timing and phasing changes would also be implemented. Approximately 12 parking spaces along Boston Avenue would be removed for this
improvement. It is anticipated that the level of service would improve at this intersection from LOS F to LOS D during the evening peak hour as a result of this mitigation.

Impacts to Boston Avenue at College Avenue would be mitigated by widening College Avenue westbound to provide an exclusive right-turn lane and a shared left-turn/through lane. Signal timing and phasing changes at this location would also be incorporated. To accommodate this improvement, the College Avenue bridge over the railroad tracks would be widened. Since the bridge is already slated for reconstruction as part of the Project, changes can be made without additional construction impacts. It is anticipated that level of service would improve at this intersection from LOS F to LOS D during the critical evening peak hour with this mitigation.

As shown in Table 4-2, pedestrian mitigation is proposed at six intersections surrounding College Avenue Station. This mitigation ranges from restriping crosswalk markings and increasing pedestrian crossing times to installing pedestrian crossing signals and ADA compliant wheelchair ramps.

4.6.2 Noise Mitigation

Noise mitigation is considered based on the need, feasibility, reasonableness and effectiveness of potential options. The FTA states that in considering potential noise impact, severe impacts should be mitigated if at all feasible. At the moderate impact level, more discretion should be used, and other project-specific factors should be included in considering mitigation. These factors include the predicted increase over existing noise levels, the types and number of noise-sensitive land uses affected, existing outdoor-to-indoor sound reduction, and the effectiveness of mitigation options and the cost-effectiveness of mitigating the noise. However, the FTA also states that there is a stronger need for mitigation if a project is proposed in an area currently experiencing high noise levels (Ldn above 65 dBA) from surface transportation sources. This is clearly the case at sensitive receptors adjacent to the College Avenue Station where existing Ldn levels range between 70 to 79 dBA. In view of this guidance by the FTA, the Project would mitigate both moderate and severe noise impacts wherever feasible and wherever existing noise levels are above 65 dBA. Noise impacts will also be mitigated for receptors with no significant outdoor land use if interior day-night sound levels (Ldn) are above 45 dBA from project sources or single-event maximum noise levels (Lmax) above 65 dBA.

To mitigate noise impact from train operations, noise control can be considered at the source, along the sound path, or at the receiver. Source noise control options, for example, may include special insulating hardware at turnout
locations, relocating special trackwork away from sensitive areas and using continuous welded rail. Noise barrier construction is the most common sound path noise control treatment, which is being considered for the track alignment, as described in the DEIR/EA. It can be very effective at reducing noise levels in the community.

A noise barrier 1,000 feet long, approximately six feet in height on a retaining wall along the right-of-way would be effective in mitigating potential noise impact at receptors on Burget Avenue and Brookings Street. This noise barrier is required whether or not College Avenue is a terminal station. Future noise levels from both commuter and Green Line trains are expected to be reduced nine to 11 decibels with this barrier and future noise levels are expected to be lower than existing levels. Figure 4-6 shows the location of the proposed noise barrier.

4.6.3 Vibration Mitigation

The purpose of vibration mitigation is to minimize adverse effects from a project at sensitive locations. While the consideration of noise mitigation is well-defined, there is more variability in the approach to vibration mitigation and the specific measures that may be considered. The goal for mitigating potential vibration impact from the proposed Green Line Extension Project is to reduce future vibration below the impact criteria, which is 72 VdB for Green Line trains and 75 VdB for commuter trains. At some locations, close to the existing commuter trains, future vibration levels may not be able to be reduced below the impact criterion with reasonable mitigation measures. As stated in the DEIR/EA, these locations were identified as locations with potential residual impacts, however, additional measurements will be conducted in the next phase of Project development and mitigation measures could be refined. At these locations, mitigation measures that will reduce vibration levels 5 decibels or more will be considered reasonable and effective with the intention of keeping future vibration levels at or below existing vibration levels.

The effectiveness of specific vibration mitigation measures is dependent on several factors such as the component design, installation techniques, axle loads of the trains and frequencies of concern. Resilient rail fasteners, which are specially-designed fasteners between the rails and the ties, may reduce vibration by 5 to 10 VdB. Ballast mats may be effective in reducing vibration levels 10 to 15 VdB.

Generally, well-designed and properly-installed ballast mats or resilient rail fasteners would be effective in reducing vibration levels up to 15 VdB for the Green Line trains and up to 10 VdB for commuter trains, keeping future vibration levels generated from commuter trains at or below existing levels and

---

2 A turnout is a mechanical device that enables a train to switch from one track to another.
reducing vibration levels generated from Green Line trains below the impact criterion. Vibration mitigation generally performs better for light rail vehicles because they do not weigh as much as commuter trains.

Figure 4-7 shows the vibration mitigation location near College Avenue Station. A total of 250 feet (500 track-feet) of vibration mitigation (location #17) is proposed to mitigate potential impacts at receptors on Brookings Street. This mitigation is required whether or not College Avenue is a terminal station.

4.6.4 Visual Impact Mitigation

The Project would incorporate vegetation in and above fences, trees, and steep slopes on each side of the right-of-way at the College Avenue Station site to minimize the rail corridor’s visibility. These would reduce the net loss of vegetation and reduce the visual impact of any tree removal on the neighborhood. The retaining wall design, including any vegetated features, would be developed in the final design for the Proposed Project.

The major materials used in the College Avenue Station structure would be masonry, steel and glass. Landscaping would be designed to provide protection from the elements without obscuring visibility. Landscaping would be inviting both to the users of the stations and to the passers-by, using small trees and low shrubs, which are easily maintained. The new College Avenue Station would be visible from their street access points and from nearby bridges.

The Proposed Project would require some degree of noise mitigation, as described above, such as noise barriers to protect sensitive receptors such as residences from increases in train noise. Noise barriers would reduce the visibility of the green space surrounding the right-of-way and it would also prevent any further visual impacts by obscuring the trains and rails that would otherwise be visible from residential back yards.

There have been no changes to the visual impact mitigation since the DEIR/EA.

4.6.5 Summary of Mitigation Commitments

This section summarizes the proposed mitigation options identified in the DEIR/EA to address adverse environmental impacts associated with construction and operation of the proposed College Avenue Station as the terminus of the Proposed Project.

Potential permanent impacts resulting from constructing the station would be mitigated to the extent feasible, as summarized in Table 4-2. MassDOT would be
responsible for ensuring that all mitigation commitments are implemented. There have been no changes to the impacts analysis or mitigation commitments since the DEIR/EA, but are summarized in Table 4-2.

Temporary, short-term impacts from construction activities would be mitigated to the extent feasible. Appropriate construction mitigation measures would be incorporated into the contract documents and specifications governing the activities of contractors and subcontractors constructing elements of the Proposed Project. On-site resident engineers and inspectors would monitor all construction activities to ensure that mitigation measures are properly implemented. Construction mitigation measures for the Proposed Project are summarized in DEIR/EA Table 6-2.

Lechmere Station

5.1 Introduction

Since the filing of the EENF for the Green Line Extension, the Project Area was expanded to include the relocation of Lechmere Station. The relocation of Lechmere Station to the eastern side of Monsignor O’Brien Highway/Route 28 and associated roadway and busway improvements had previously been intended to be constructed as part of the NorthPoint development project. However, due to the uncertainty surrounding the NorthPoint project and because it is necessary to relocate the station in order to extend the Green Line, the Commonwealth added the relocation of Lechmere Station and area roadway improvements into the Green Line Extension Project during the development of the DEIR.

Relocating Lechmere Station was previously reviewed under MEPA as part of the NorthPoint development project (EEA # 12651), but was not reviewed under NEPA. The DEIR/EA included an evaluation of relocating Lechmere Station to the location and in the same alignment and configuration that was previously reviewed under MEPA. The DEIR/EA evaluation included the need to relocate the station, alternatives evaluated, and the environmental consequences of moving the station.

This chapter addresses the requirements of the January 15, 2010 Secretary’s Certificate on the DEIR, which include:

- Reduce the proposed parking program (in light of the station no longer functioning as a terminus);
- Consider other design refinements to reduce impacts of the relocated Lechmere Station on abutting land uses (notably the Glass Factory Condominiums);
- Clarify modeling assumptions and proposed station layout and mitigation measures that would be implemented to effectively and safely convey bus
passengers, pedestrians and cyclists from the neighborhood to the relocated Lechmere Station; and

- Explore ways to improve integration of the Lechmere Station into the surrounding neighborhood.

To respond to these issues, and respond to comments on the DEIR/EA, this chapter presents the following information:

- A revised layout of the Lechmere Station, including an analysis of design alternatives that were evaluated in an attempt to minimize impacts to nearby properties, and design modifications considered to improve integration with the existing and proposed residential developments;
- A revised analysis of access and circulation, including bus, pedestrian, and bicycle access; and
- An updated analysis of the environmental impacts and mitigation measures based on the revised station concepts.

## 5.2 Revised Station Layout

Lechmere Station, located in East Cambridge, is currently the existing terminus of the Green Line on the northern end of the MBTA’s system. The Green Line Extension Project would extend transit service from relocated Lechmere Station to Medford Hillside along the MBTA Lowell Line, with a branch line from relocated Lechmere Station to Union Square via the MBTA Fitchburg Line. The new elevated Lechmere Station would be relocated to the east side of O’Brien Highway with a new and realigned viaduct. Daily ridership at this station is anticipated to be approximately 10,900 boardings (projected to the year 2030).

The Lechmere Station layout shown in the DEIR was based upon the original NorthPoint development project concept for relocated Lechmere Station. Based on comments received on the DEIR and on the requirements of the Secretary’s Certificate, the station design was revisited to evaluate opportunities to address concerns related to parking, access from the neighborhoods, pedestrian and bicycle safety, MBTA operations (both bus and Green Line), and impact on abutters.

Working closely with the MBTA, the City of Cambridge, and reviewing feedback from local interest groups and residents, a redesigned Lechmere Station has been developed that achieves many of the desired goals including reducing parking at the station, separating bus operations from vehicular and pedestrian movements, providing an improved station layout with access from two sides, accommodating requests for a wider crosswalk across O’Brien Highway, and providing dedicated bicycle lanes within the station area. Figure 5-1 shows the
revised station layout and the surrounding neighborhood. Figure 5-2 shows the revised station plan itself in detail, and Figure 5-3 shows routes of access for the station.

### 5.2.1 Refinements to Concept Design since the DEIR/EA

Modifications made to the Lechmere Station layout since the DEIR include:

- The proposed parking program has been reduced from approximately 234 parking spaces (as shown in the DEIR/EA) to approximately 180 parking spaces. These parking spaces would be provided in two separate parking lots and would replace some of the 347 parking spaces that exist today at Lechmere Station. It is anticipated that the remainder of the parking spaces that exist today will be replaced in the future within the NorthPoint project, as previously envisioned.

- The roadway improvements along O’Brien Highway proposed by the NorthPoint project and shown in the DEIR are still anticipated in the revised station layout. However, slight modifications to the roadways in this station layout include:
  - An exclusive busway with one-way circulation to accommodate local bus service, including MBTA Bus Routes 69, 80, 87, and 88, with access and egress from O’Brien Highway via Water Street.
  - Bus layover would be located further away from the Glass Factory Condominiums.
  - An access road would be provided to connect Water Street, North First Street, and East Street allowing vehicular access through the station limits.
  - Vehicular access to the north parking lot would be provided via Water Street and the one-way southbound segment of the station access road.
  - Vehicular access would be provided to the south parking lot via East Street with connections from Water Street and North First Street.
  - Curbside drop-offs for taxis, corporate shuttles, and station patrons would be provided at the station along the access road and also along new North First Street.
  - Bicycle lanes have been included along the access road so that bicycles can directly access the station and in order to make a continuous connection between the proposed 22 Water Street multiuse path on the north and the recently constructed NorthPoint path on the south.
Pedestrian access would be provided by a wider (15 feet wide) crosswalk across O’Brien Highway/Route 28.

The station layout has been redesigned to address many of the comments received by the public. While final station design will be explored further in the next phase of project development and in conjunction with the public involvement program, the following design elements at the station have been modified:

- Access into the station headhouse from both the north and south sides of the building structure has been added. This would allow direct access to the station from the bus drop-off/pick-up area on the north and from the intersection of O’Brien Highway and North First Street on the south.

- The automatic fare collection and other station amenities will be fully enclosed within the station headhouse and protected from the elements.

- The revised station design proposes a canopy system starting along the perimeter of the headhouse, underneath the elevated structure, and extending to the northeast corner of the O’Brien Highway/North First Street intersection. The canopy system would establish an architectural presence on O’Brien Highway and which would increase station visibility. This architectural feature is proposed originating at the station and running along North First Street to better define the station entry and direct users from O’Brien Highway to the station area.

- Because the station will no longer function as a terminal station, the proposed center island platform length was reduced from 450 feet long to 225 feet long, which can adequately accommodate a typical three-car Green Line trainset (rather than two trainsets, as required in the terminal station layout). The platforms will continue to be accessed using elevators, escalators, and stairs.

- Bicycle racks would continue to be provided to encourage use of this mode.

- Once the relocation is complete, the existing Lechmere Station would be demolished and the existing station site would be made available for potential future redevelopment, including the potential inclusion of a public or community use.

In the next stages of the project, the visual identity of the station will be further explored and final design will be advanced. The station identity will be shaped by the design of platform and station elements (i.e. canopy, elevators, side walls, etc.). Visual qualities will be investigated that integrate station elements and Green Line infrastructure. Design elements will have to be balanced with
potential neighborhood impacts (such as those associated with extensive glass surfaces, including noise and light impacts). Additional aspects of the station that influence its appearance and will be evaluated in more detail are providing security, visibility, and noise mitigation.

5.2.2 Other Alternatives Considered

A number of station layouts were considered in an effort to attempt to shift the station and tracks further away from the Glass Factory Condominiums and/or improve the functionality of the station. Scenarios included shifting the tracks, relocating the headhouse to the south side of the station site, and providing two separate headhouses. A summary of this analysis follows.

- The track alignment through the station site is constrained on the south side by the Archstone development parcel at East Street and on the north side by the MBTA right-of-way between the Hampton Inn Hotel and the 22 Water Street development site. The MBTA’s property around the station site is also constrained by its non-linear configuration, resulting in design challenges when trying to accommodate all of the station uses. Modifications intended to push the elevated track structure further to the east away from the Glass Factory Condominiums would require the use of curves that could impact train operations and could create additional noise impacts. Additionally, shifting the tracks from the current alignment would have a significant impact on the permitted NorthPoint development plans for this area. Based on potential noise impacts and feedback received from the MBTA and the City of Cambridge, it was determined that the track alignment would remain as proposed in the DEIR/EA.

- Two additional headhouse options were evaluated as part of the FEIR analysis. Headhouse alternatives were explored in response to stakeholder comments requesting MassDOT to consider the potential of a second station entrance for those MBTA customers accessing the station from other locations. The first option included a single headhouse location on the southern side of North First Street. The second option included two headhouses on the north and south side, respectively, of North First Street. Each option demonstrated some advantages and disadvantages compared to the DEIR/EA Lechmere Station conceptual design.

  - **Single headhouse, South of North First Street** - Under the single headhouse option, the main station entrance would be relocated to the southern portion of the MBTA parcel. This would move the building structure further away from the Glass Factory Condominiums, reducing potential impacts to abutting land uses. The single headhouse would also provide increased visibility from O’Brien Highway. However, a single headhouse at this location
would have a significant impact on the bus operations through the site. Since buses would still need to access the site via Water Street, buses could then operate as proposed, creating a significant distance between the bus berths and the station entrance and creating additional pedestrian/vehicle conflicts with bus transfers crossing North First Street to access the station. Another option that was evaluated was to provide a bus berthing/layover area on the south side of the site, between North First Street and East Street. This location presented many challenges for buses in terms of limited space, traffic operations and bus functionality. Additionally, the use of this parcel for the station and bus operations is not consistent with the permitted NorthPoint development plan.

- Two Headhouses, South and North of North First Street: The two headhouse option, with one on the north and one on the south side of North First Street, incorporates advantages found in the single headhouse option. The two entrances would provide equal opportunity for station access to all people, whether they walk from current and future land uses around the station, or use bus, car or bike to come to the Green Line. However, a second entrance would further reduce the MBTA’s parking, for which there is significant demonstrated demand; require additional circulation and fare collection areas; and increase capital and operating costs with little additional benefit for the project. Additionally, the use of this parcel for the station’s second headhouse is not consistent with the permitted NorthPoint development plan.

The evaluation of various station layout alternatives concluded in support of the DEIR/EA’s single headhouse north of North First Street, as this location is compatible with the MBTA’s bus operation needs, provides functionality and reasonable access to the surrounding areas for passengers arriving from a variety of modes, provides a fully accessible station in a cost-effective manner, and is consistent with the permitted NorthPoint development plan.

### 5.3 Access and Circulation

This section discusses refined access and circulation in the vicinity of relocated Lechmere Station based on the revised station layout present in this FEIR. Approximately 3,200 boardings are anticipated during the peak hour at the station by 2030. Because approximately 90 percent of the passengers using this station are expected to walk or bike to reach the station, pedestrian/bicycle circulation is critical to the success of the station. This section reevaluates the assumptions presented previously in the DEIR and updates the analysis for traffic operations, pedestrian and bicycle access and parking needs based on the
modified station layout plan developed for the DEIR. Traffic volume and pedestrian networks in the Cambridge Study Area intersections are presented in FEIR Figures 5-5a-b and 5-6a-b.

### 5.3.1 General Station Access

Station surface-level connectivity to other modes of transportation is provided in the following ways:

- Four berths allow passengers to alight or board MBTA buses;
- Twelve to fifteen curbside drop-off/pick-up spaces for passengers carpooling to the station (kiss-and-ride), taxis and corporate shuttles;
- Two separate parking lots, one to the north and another to the south, accommodating 65 and 115 parking spaces, respectively, for a total of 180 spaces;
- Two major pedestrian connections with East Cambridge through the Water Street and First Street crossings of O’Brien Highway; and
- Several dedicated bicycle lanes integrated into the broader vehicular network and connected to a bike storage area adjacent to the headhouse.

As directed in the Secretary’s Certificate, buses will be prohibited from idling in the bus layover and boarding area.

The proposed single headhouse on the north side of North First Street includes two entrances. One entrance services the bus passengers, a kiss-and-ride area and those pedestrians who are coming from the north. The other entrance services pedestrians coming from the west and south, another kiss-and-ride area along North First Street, and those who have parked in the two parking lots. The headhouse includes passenger circulation elements that are commonly found in MBTA Green Line stations, including:

- Enclosed unpaid areas for waiting and for purchasing of tickets;
- Automatic Fare Collection;
- A lobby area in the paid zone;
- An escalator and a stair connecting the lobby to the platform; and
- Two elevators.

Passengers would arrive from the surface street level at the northern end of a center island platform. The platform would be constructed 24 feet above street level and wide enough to safely accommodate inbound and outbound passengers. For passengers awaiting the train, a canopy as wide and as long as the platform would provide weather protection. At the south end of the center
platform, a second egress structure would allow passengers to exit the platform and reach the surface level in the case of an emergency.

The relocated Lechmere Station concept is consistent with design standards for roadways and for the station as defined by the local agencies including, but not limited to, MassDOT and the City of Cambridge. The station has been designed to be fully accessible, consistent with the ADA. The redesign of Lechmere Station with an exclusive busway will minimize conflicts with buses and vehicles in the station area and will provide a direct connection from the bus berthing area to the station, minimizing potential conflicts with bus riders and vehicles.

Careful attention has also been paid to minimizing conflicts with pedestrians and vehicles within the station area. The use of crosswalks and channelization techniques such as fencing will direct pedestrians to primary paths of travel. Specifically, the use of fencing along the western edge of the north parking lot will discourage pedestrians from walking directly into the access road, while fencing along the edge of the Glass Factory Condominiums property will discourage trespassing on private property. The use of pedestrian signals at primary station access points will also provide better pedestrian access at the roadways. A 15-foot wide crosswalk is now being provided on the north side of the intersection of O’Brien Highway and North First Street as a direct result of preferences articulated by the public. Finally, exclusive bicycle lanes are being provided in and around the station site for ease of access for bicycle commuters. Additional safety and design features can be considered as the station design moves into Preliminary Engineering.

### 5.3.2 Traffic Operations

This section discusses the consistency of the proposed station refinements for the relocated Lechmere Station with the area traffic operations. This section also discusses how traffic in the vicinity of the relocated Lechmere Station would operate in year 2030 under two different scenarios:

- The “Interim Condition,” a scenario in which the Green Line Extension Project and other area development projects (i.e. 22 Water Street) are completed, but does not include the construction of the full NorthPoint development project and its associated internal roadway/busway improvements.

- The “Future Build Condition,” which includes the final construction and implementation of the full NorthPoint development program.
The purpose of the evaluation of these two scenarios is to detail the impacts that the internal roadway system and busway will have on the O’Brien Highway corridor, during both the short (no additional NorthPoint construction) and long term (NorthPoint fully built).

Consistency with NorthPoint

The NorthPoint project includes proposals to construct a number of mixed-use buildings and internal circulation roadways to be built on private property not currently owned by the MBTA or MassDOT. Because NorthPoint does not have a definitive schedule for construction, MassDOT has proposed a station layout that would include all of the Lechmere Station elements – including circulation roadways, station, parking and bus berthing/layover – all within the property limits owned by the MBTA.

To the extent feasible, the station layout includes the proposed roadway improvements along O’Brien Highway and within the station area. However, once NorthPoint is constructed, the station’s internal circulation roadways would be modified, where appropriate, to match the roadway layout delineated as part of the City of Cambridge’s special permit for the NorthPoint project. Modification to the portions of the busway, the north-south internal circulation road, and parking areas will be necessary to accommodate the NorthPoint development. However, the relocation of Lechmere Station as proposed for the Green Line Extension Project would not preclude the NorthPoint buildings or roadways from being constructed as permitted.

Since there are some differences in traffic circulation at the station with and without NorthPoint, this traffic analysis considers both future conditions as they relate to the Green Line Extension Project. However, it should be noted that the reconstruction of O’Brien Highway from Third Street to East Street is anticipated to be completed as part of the Green Line Extension Project prior to the opening of relocated Lechmere Station. General travel patterns from the East Cambridge neighborhood and access to the station headhouse would not change with NorthPoint completion and there would be no change in pedestrian or bicycle access. Therefore, only the difference in traffic operations and associated pedestrian crossings are discussed under the Interim Conditions.

Interim Conditions

The key difference in traffic circulation between the time the station is constructed and the time NorthPoint is fully constructed is access to and from the station at Water Street. Mitigation plans for this intersection, in both the Interim and Future Build Conditions, include breaking the median along O’Brien...
Green Line Extension Project

Highway and signalizing the intersection to permit a left turn into Water Street from southbound O’Brien Highway.

Under the Interim Condition, to accommodate bus operations – specifically the Route 69 bus that operates via Cambridge Street – a left-turn movement out of Water Street would be permitted. The circulation road for the park-and-ride traffic associated with Lechmere Station between Water Street and North First Street is a one-way street. Therefore, none of the patrons parking at the station would egress from Water Street. However, buses, existing Water Street traffic, and traffic related to the 22 Water Street development would be permitted to turn left until such time that NorthPoint is complete.

Once the busway and internal circulation road is reconstructed as part of NorthPoint, the intersection geometry and traffic signal timing and phasing would be revised to restrict left-turns from Water Street. In the final condition, no left-turns would be allowed out from Water Street. This restriction is necessary to control traffic queuing along O’Brien Highway between Water Street and North First Street and also to facilitate a better pedestrian crossing of O’Brien Highway at Water Street.

Table 5-1 presents the expected 2030 traffic operations at Study Area intersections in the vicinity of Lechmere Station under the Interim Condition, compared to the No-Build Condition. Since NorthPoint is not constructed in this scenario, traffic and pedestrian volumes related to the NorthPoint development have not been included in the analysis.

3 LOS – Level-of-Service

Lechmere Station 5-10
As shown in Table 5-1, assuming that all proposed area roadway improvements described in detail in the DEIR/EA and supplemented in this FEIR are made, acceptable traffic operations (LOS D or better) would occur under the Interim Condition at all locations except O’Brien Highway/Charlestown Avenue, which currently operates at LOS F and, therefore, would not be further degraded by the Green Line Extension Project.

Pedestrians at the intersection of O’Brien Highway and Water Street would be required to cross O’Brien Highway concurrently with the Water Street traffic phase. Lead pedestrian intervals, which are common throughout Cambridge, would be used to facilitate this crossing under the Interim Condition. A lead pedestrian interval allows pedestrians a few seconds to enter the crosswalk while all approaches have a red traffic signal indication, becoming visible to drivers before the light changes to green. The concurrent traffic movement (in this case the Water Street phase) then turns green so that traffic and pedestrians move together. Using the forecasted bus operations for the station and expected trip generation from the 22 Water Street development, approximately 80 peak hour vehicles are expected to exit Water Street turning left; this equates to one to two vehicles per minute or two to three vehicles per traffic signal cycle. Therefore, the chance of conflict between pedestrians and vehicles is small and the majority of pedestrians would cross O’Brien Highway unimpeded.

2030 Future Build Condition

The impacts discussed in the DEIR/EA are based on the 2030 Future Build Condition, which includes the NorthPoint development, relocated Lechmere Station, and other area development plans. A revised analysis was completed as part of this FEIR to address changes in circulation and access. These results, which compare the Future Build conditions to the No-Build Condition, are shown in Table 5-2.

No major changes in levels of service are expected between the No-Build and Future Build Conditions due to the Proposed Project. As discussed in the following sections, pedestrian operations have been analyzed in more detail in response to the Secretary’s comments on the DEIR/EA. Due to a slight modification in pedestrian distribution to/from the new station, traffic operations at the intersection of Cambridge Street and North First Street would degrade slightly (from LOS D to LOS E) from what was previously presented in the DEIR/EA. This is true for both the No-Build and Future Build Conditions. The analysis included the reconstruction of O’Brien Highway, as it is presented in Section 5.2, Land Use. No additional mitigation is proposed in the immediate vicinity of Lechmere Station.

Supplemental Analysis: O’Brien Highway

At the request of commenters, an analysis was completed as part of the FEIR to determine whether the southbound side of O’Brien Highway could be reduced from three travel lanes to two from just north of Third Street to East Street. With two lanes southbound, the intersection of O’Brien Highway at North First Street is expected to operate at LOS F during the morning peak hour. Intersections at Water Street and Third Street during the morning peak hour and all three intersections during the evening peak hour would operate at overall LOS D or LOS E. During both peak hours, the southbound O’Brien Highway approach to Third Street is projected to operate at LOS E or LOS F.

The estimated queues in the southbound direction, particularly during the morning peak hour, are substantial. It is anticipated that queue spillback would have a significant effect on upstream intersections, blocking side street traffic from being able to enter the mainline traffic flow. Estimated queues at Third Street are expected to extend back to the Twin Plaza driveway. Based on projected levels of service and queuing, a reduction in the number of travel lanes is not recommended for the southbound direction. The level of service and queue results for this assessment are provided in Appendix D.

5.3.3 Pedestrians and Bicycles

The pedestrian crossings across O’Brien Highway were identified as a concern for East Cambridge residents during the DEIR/EA process. To address and resolve these concerns, a full examination of pedestrian trip patterns was completed. The 2008 Green Line passenger survey results for passengers boarding at Lechmere Station were used as a basis for this assessment. These
data are provided in Appendix D. As part of the survey, passengers were asked various questions about their trip to Lechmere Station and their point of origin. For the purposes of the pedestrian analysis, the focus was on those responding as walking to or parking at Lechmere Station.

Approximately 11 percent of passengers boarding at Lechmere Station currently either park at the station parking lot or originate on the northeast side of O’Brien Highway. These passengers cross O’Brien Highway today but would no longer need to cross in the future. The survey identifies that about 25 percent of passenger trips originate in East Cambridge, east of Second Street. These pedestrians are most likely to use the new pedestrian crossing at North First Street to access the relocated station. The remaining 64 percent of passengers originate along Cambridge Street, between Cambridge Street and O’Brien Highway, or west of Second Street. These pedestrians are most likely to use the pedestrian crossing at Water Street to access the existing station. Some of these pedestrians may also choose to cross O’Brien Highway at Third Street.

All new crosswalks along O’Brien Highway and at Cambridge Street and First Street would be designed such that they provide pedestrian crossing times that are in compliance with the Federal Highway Administration’s MUTCD, ADA (including associated state regulations) and associated state requirements. To the extent feasible, delays to pedestrians could be minimized by reducing vehicular levels of service slightly (i.e. vehicular traffic operates at a worse level of service), particularly at the intersection of O’Brien Highway and North First Street. In this case, the proposed traffic signal plans have been established to manage vehicle queuing and progression rather than vehicle delay. The operations of signalized pedestrian crossings would be further refined as part of the Preliminary Engineering process. This includes identifying the exact width and length of crosswalks and further refinements to signal timing and phasing. The crossings of O’Brien Highway would be shortened to the extent feasible and provide substantial improvement over the existing condition.

The proposed configuration, with new crossings and split phase signal operation for First Street and North First Street will increase protection for pedestrians crossing between Lechmere Station and East Cambridge. The North First Street phase will allow pedestrians to cross in the westerly crosswalk across O’Brien Highway without facing conflicting left turning vehicles. Likewise, the First Street phase will allow pedestrians to cross in the easterly crosswalk without conflicting left or right turns. This approach to pedestrian phasing allows full crossings of O’Brien Highway on both the east and west side of North First Street. Additional half-crossing phases have been included in the phasing plan. The half-crossings provide effective extensions of the pedestrian crossing phases and a higher pedestrian level of service. The provision of half-crossings to a center median is a typical, often used method of accommodating pedestrians in an urban setting. It allows for the maximum capacity utilization at an intersection while providing good pedestrian accommodation. This is
accomplished by allowing pedestrian movements to “overlap” between multiple phases. This “overlapping” has the result of effectively providing for a full crossing for the majority of pedestrian movements without having to lengthen phases unnecessarily. It also allows pedestrians to take advantage of every possible interval for crossing O’Brien Highway, while protecting pedestrians from higher volume and higher speed left-turn movements.

The proposed pedestrian overlap phasing with supplemental half-crossings is dependent upon the provision of a center median island of sufficient width to accommodate those pedestrians who do not make it across in a single movement. However, even under a design that only provides for full crossings, a median for pedestrian refuge is recommended given the high vehicle volume and occasionally high travel speeds experienced along O’Brien Highway. Regardless of the care in designing proper pedestrian signal indications and signage, some portion of the population will choose to initiate a crossing of O’Brien Highway beyond the time at which a full crossing can be made. To address the potential safety implications associated with these pedestrians, and to properly channel opposing left-turns (O’Brien Highway north to First Street), a median with a minimum width of 20 feet is recommended.

Proposed bicycle access to/from relocated Lechmere Station has been refined since the DEIR/EA. From the east side of the station, bicycle access from the south would continue to be provided via the existing bicycle path along the Charles River Basin and connection into NorthPoint. Access from the north would be via a proposed (non-MassDOT) multiuse path to Water Street. Since the DEIR/EA was published, additional bicycle lanes have been added to the internal circulation road within the station area. At Water Street, and along O’Brien Highway, the Project proposes the construction of on-street bicycle lanes. Access to/from Lechmere Station from the west side of the tracks would be via these on-street accommodations. Bicyclists entering from the north can choose to ride with roadway traffic, turning left to enter the station at Water Street or dismount and use pedestrian crosswalks at Water Street or North First Street. Bicycle parking (at a minimum of 110 spaces) would be provided near the northern entrance to the station concourse.

5.3.4 Automobile Parking

A parking demand analysis was performed to evaluate whether there is an opportunity to reduce parking at Lechmere Station with the planned extension of the Green Line through Somerville and Medford. The existing parking lot at Lechmere Station provides 347 marked parking spaces that are available for a daily parking rate of $5.50. The Lechmere Station parking lot is currently more than 95 percent full (about 330 vehicles) throughout the day, which suggests that a permanent reduction in parking supply may not be feasible. If parking demand is high, and the new Green Line service does not serve the people who currently park at Lechmere Station, a reduced parking supply could encourage drivers to
park on-street, where they can, or in area parking garages. A more detailed analysis was performed to determine whether current parkers at Lechmere Station would likely board the Green Line at other stations along the extension, thereby reducing the number of spaces needed at Lechmere.

**Origin-Destination Research**

A license plate survey was conducted at Lechmere Station in April 2010. The survey results were used to determine what municipalities the vehicles originated from. This information was used to estimate the number of riders who currently park at Lechmere who may change travel mode and walk to stations that would now be closer to their home, thereby reducing the number of parking spaces needed at Lechmere. With assistance from CTPS, the Registry of Motor Vehicles’ database was used for this assessment.

A total of 367 license plates were recorded. Out of 336 Massachusetts plates recorded, almost 93 percent, or 312, were matched with an address. Combined with the 31 out-of-state plates, there were 343 usable results. This is virtually equal to the capacity of the lot. Table 5-3 summarizes the origins of the 343 usable plates.

</tbody>
</table>

**Projected Parking Demand/Supply**

Each of the four points of origin in Table 5-3 was analyzed to project how many drivers would likely continue to park at Lechmere Station after opening of the Green Line Extension. This demand was compared to the proposed parking supply of 180 spaces, which is the amount that can be provided prior to NorthPoint construction.

In the license plate survey, there were 194 vehicles that originated from communities north of Lechmere Station but not in the communities that would be directly served by the Green Line Extension. One can hypothesize that the drivers of these vehicles need parking to continue to use the Green Line. Since
none of the new stations along the planned extension would provide parking, drivers from communities to the north would still want to park at Lechmere.

Forty-five vehicles originated in neighborhoods along the Green Line Extension. Based on the proximity of the origin to the proposed stations, (using the methodology described in the DEIR) it was estimated that the drivers of 31 of those vehicles live close enough to a planned Green Line station to walk to it. The remaining 14 drivers would continue to drive and park at Lechmere Station or could potentially change modes and bike to a new station.

The 31 out-of-state plates were assumed to belong to regular parkers who are residents of the area but have not registered their vehicles in Massachusetts. Based on the projected diversion of vehicles registered in Massachusetts, it was assumed that the same share of vehicles registered out-of-state would change travel mode and chose one of the new Green Line stations. This would remove another four vehicles from the Lechmere Station parking area.

The behavior of drivers from Boston and points south is more difficult to project. Since Lechmere Station is the current end of the Green Line north of the Boston, everyone boarding at this station is destined for Boston and points south. It seems likely that drivers from Boston and points south are destined for downtown Boston but park at Lechmere Station and use the Green Line to save the cost of parking in expensive downtown garages. None of the new stations on the Green Line Extension would serve these drivers, who can be expected to continue using Lechmere Station.

Based on this analysis, only 35 vehicles currently parking at Lechmere Station are expected to change travel mode and use a station along the extension. Assuming no latent demand for parking at Lechmere Station, the demand for parking would be reduced to 295 or 115 spaces more than the planned supply of 180 spaces. Since the new station would be built on the site of the existing parking area, no parking is expected to be available during construction. During the design phase for the project, alternate parking locations for construction and during the Interim Condition would be evaluated and recommended.

Suggestions for temporary parking in the area have been made by commenters. Based on the analysis described above, it appears that the overall parking supply can be reduced by 35 to 50 spaces. This range encompasses the number of people who are likely to switch to a new station and those who may live too far to walk but are within a reasonable biking distance. However, a vast majority of those who drive and park at Lechmere Station today would continue to do so in the future since they live outside the pedestrian catchment area for the proposed stations. Those living in towns north of Boston have few alternate options and are unlikely to be able to change their travel patterns and still use public transit as a means of commuting. Therefore, the findings of this analysis are that the
existing Lechmere Station parking supply should be reestablished as currently planned in the NorthPoint special permit.

Because of limited available information and the difficulty in quantifying latent demand for parking in and around Lechmere, the analysis does not include the latent demand that exists anecdotally. The passenger surveys used to determine pedestrian routes were also used to determine whether passengers admit to parking in East Cambridge (either on-street or in a parking garage) to board at Lechmere Station. None of the survey respondents identified this as a mode choice. The likelihood of latent demand supports the need to reestablish a higher number of parking spaces as soon as it is reasonably feasible to do so.

### 5.4 Environmental Impacts

This section describes the potential environmental impacts associated with the proposed changes to the design of relocated Lechmere Station, as required by the MEPA Certificate. Impacts to abutting land uses, specifically noise and vibration impacts, were evaluated for the revised station design. All other environmental impacts related the station have not changed since the DEIR/EA and are described in detail therein.

#### 5.4.1 Noise

This section compares the direct noise impacts of the relocated and redesigned Lechmere Station, including the Green Line operations in the vicinity of the station. The noise impact analysis for the Green Line Extension Project is based on the methodology defined in the FTA guidance manual *Transit Noise and Vibration Impact Assessment*. Background information on noise and vibration fundamentals, descriptors, impact criteria, land use categories, existing noise conditions and sensitive land use in areas other than near Lechmere Station are presented in DEIR/EA Section 4.8, *Noise*. Buildings with potential noise impacts are shown in Figure 5-4.

The Proposed Project would introduce new noise sources into the surrounding areas and would contribute to the future noise exposure conditions at sensitive receptors. Potential noise impact has been assessed at sensitive receptors near Lechmere Station including a residential development planned at 22 Water Street, the Hampton Inn Hotel, the Glass Factory Condominiums, NorthPoint development properties and two planned Archstone residential buildings. Based on the current NorthPoint development plan, eight sites have been assumed to

---

be noise-sensitive including the existing Tango and Sierra residential properties and future planned properties shown in Figure 2-10 (Site 1, Site 2, Site 3, Site 4, Site 5 and a park). Based on the current Archstone development plan, two sites have been assumed to be noise-sensitive including a future building east of East Street (Site 1) and a future building west of Leighton Street (Site 2).

Potential noise impact is assessed by comparing the existing noise conditions with future conditions. Existing noise conditions were measured at four locations near sensitive properties near Lechmere Station. A summary of the measurement sites and results is shown in Table 5-4 and the measurement locations are shown in Figures 2-5 through 2-7. Short-term measurement site ST-1 was conducted on the northeast side of the Hampton Inn Hotel and is representative of the existing noise conditions on the northeast sides of the Glass Factory Condominiums, the Hampton Inn Hotel and the proposed residential property at 22 Water Street. Short-term measurement site ST-8, at the end of Water Street, is representative of existing noise conditions at the five future NorthPoint properties and the park. Long-term measurement site LT-10, on the southwest side of the Glass Factory Condominiums, is representative of the existing noise conditions at the existing Tango and Sierra NorthPoint properties (adjusted for relative distances to O’Brien Highway). Short-term measurement site ST-9 was conducted at the planned Archstone properties (Phase II) and is representative of the existing noise for those two properties.

Future noise sources associated with the Project near Lechmere Station include mainline Green Line operations, maintenance facility noise sources and the bus operations at Lechmere Station. Noise from mainline Green Line operations near Lechmere Station includes an increase from radiated noise when on elevated structure. Maintenance facility noise sources include train movements in and out of the yards, increases in noise from special trackwork (crossovers or turnouts), potential wheel squeal on tight radius curves, stationary cars in the yards operating with auxiliary equipment on, the traction power substation, and the employee parking lot. Noise from buses is based on current activity from the MBTA Bus Routes 69, 80, 87 and 88, based on the MBTA’s 2010 service schedules, which total approximately 162 buses arriving during daytime hours (7 AM to 10 PM) and approximately 40 buses arriving at the station during nighttime hours (10 PM to 7 AM).

a Ldn estimated by comparing SEL levels of train events to long-term sites whose noise environment is dominated by train noise.
b Ldn estimated according to the FTA guidance for short-term measurements conducted between 7 AM and 7 PM.
c Measurement conducted March, 2006 and reported in Environmental Assessment for the Lechmere Station Relocation Project (November, 2006).
d Commuter train noise level is average of all events at site.

5.4.2  Impact Assessment

Table 5-5 presents a summary of the potential noise impact at sensitive receptors near Lechmere Station prior to mitigation. This table shows the results for the Project including the preferred maintenance facility location at Option L described in detail in Chapter 2. This table includes the sensitive receptors, which side of the tracks it is on, the future distance between the receptor and the near track centerlines of the mainline Green Line, the existing noise condition (Ldn), the moderate and severe impact criteria, the contribution of noise from mainline operations (which includes bus noise), the contribution from maintenance facility noise sources, the total future noise level (which includes mainline operations, bus noise, maintenance yard and existing noise sources), the increase in noise between the existing and future conditions and whether the potential impact would be moderate or severe. Potential noise impact locations are also shown in Figure 5-4.

Near Lechmere Station, a total of two properties (NorthPoint Tango and Sierra) may be exposed to moderate noise impact and four properties (proposed 22 Water Street, Hampton Inn Hotel, Glass Factory Condominiums and the proposed Archstone Phase II Site 1 building) may be exposed to severe noise impact prior to mitigation. Future noise levels from mainline operations include a four decibel increase due to radiated noise from the structure at Glass Factory Condominiums, NorthPoint properties Tango and Sierra and the proposed building at Archstone Site 1. This increase in noise is not included for the Hampton Inn Hotel and 22 Water Street where the alignment is proposed to be on retained fill rather than on an elevated structure.

Total noise impacts prior to mitigation for Option L: 2 4

a Total future noise level includes future mainline noise (including bus transit noise), future yard noise sources and existing noise sources.
b Receptor does not have significant contribution from yard noise sources.
c Distance to alignment estimated for future proposed property.
d Future noise level from mainline includes contribution from bus transit center at Lechmere Station.
e Noise from train operations includes increase due to radiation of elevated structure.

5.4.3  Vibration

This section documents direct vibration impacts from the Project to vibration-sensitive receptors near Lechmere Station. The vibration impact analysis for the Green Line Extension Project is based on the methodology defined in the FTA guidance manual *Transit Noise and Vibration Impact Assessment.* Vibration impacts are assessed for maximum levels, as vibration — unlike noise — is not a cumulative metric. The FTA criterion for vibration impacts for residential spaces is 72 VdB. The FTA impact criterion does not distinguish between “moderate” and “severe” vibration impacts.

Potential vibration impact has been assessed at sensitive receptors near Lechmere Station including a residential development planned at 22 Water Street, the Hampton Inn Hotel, the Glass Factory Condominiums, NorthPoint development properties and two planned Archstone residential developments. Based on the current NorthPoint development plan, seven sites have been assumed to be vibration-sensitive including the existing Tango and Sierra residential properties and future planned properties shown in Figure 2-10 (Site 1, Site 2, Site 3, Site 4 and Site 5). Based on the current Archstone Phase II development plan, two sites...
have been assumed to be vibration-sensitive including a future building east of East Street (Site 1) and a building west of Leighton Street (Site 2).

Vibration generated by trains depends on several factors including the speed of the train, the presence of special trackwork (crossovers and turnouts) and whether the track alignment is at-grade or on an aerial structure. Special trackwork introduces gaps in the rail running surface which would increase vibration levels, similar to noise, from the train as the wheels impact these gaps. An aerial structure reduces vibration significantly (10 VdB) compared to at-grade alignments because the vibration must propagate through the structure to the support columns and then into the ground and into surrounding buildings.

The proposed Lechmere Station would not result in vibration impact for these properties. While the future planned Archstone Phase II Site 1 and 2 buildings would be approximately 15 feet from the relocated Green Line alignment, train speeds are relatively slow (20 mph) and vibration impact is not expected.

5.5 Mitigation Measures

This section discusses the proposed noise and vibration mitigation to address adverse environmental impacts associated with construction and operation of the proposed relocated Lechmere Station, as identified in the previous sections. MassDOT would be responsible for ensuring that all mitigation commitments are implemented.

5.5.1 Noise

Several options for mitigating potential impacts have been considered for properties near Lechmere Station including source treatments, path treatments and receiver treatments. Since the existing buildings near Lechmere Station, the Hampton Inn Hotel and Glass Factory Condominiums do not have any noise-sensitive exterior land use with frequent human activity, potential sound insulation mitigation has been considered to minimize potential impacts to interior spaces. The outdoor-to-indoor noise level reduction (OILR) of these buildings was measured by playing a high-amplitude broadband noise outside of the building and measuring the relative difference inside and outside of the building. Building facades, windows and doors generally reduce high-frequency noise more efficiently than low-frequency noise. Therefore, the frequency content (or spectrum) of the Green Line trains has been used to project the overall A-weighted noise level reductions of the buildings. Green Line trains on elevated structure generate more low frequency noise due to the radiation of the structure and, therefore, a spectrum from Green Line trains on elevated structure has been used accordingly.
The existing OILRs of the Hampton Inn and Glass Factory Condominiums range from 28 to 31 dBA and 27 to 35 dBA, respectively. These measurements show that the windows and walls of these buildings have relatively high existing noise reduction. Interior day-night sound levels (Ldn) from future transit noise sources (mainline operations, bus transit noise and maintenance facility noise) and maximum single-event (train pass-by on mainline) noise levels (Lmax) from the Proposed Project have been projected based on the lowest measured OILR at each building including a three decibel factor of safety. The noise criteria for interior spaces, when there is no outdoor land use with frequent human activity, are a day-night sound level (Ldn) of 45 dBA and a maximum single-event noise level (Lmax) of 65 dBA with windows closed. Table 5-6 presents the exterior Ldn and Lmax noise levels from project sources, the minimum OILR measured at each building, the interior noise levels from project sources and whether mitigation is required based on both interior noise level criteria at the Hampton Inn Hotel and Glass Factory Condominiums. Future interior noise levels at the Hampton Inn Hotel are projected to be 42.7 (Ldn) and 59.3 (Lmax) which are both below their respective criteria; therefore, noise mitigation is not required for this receptor. At the Glass Factory Condominiums, interior noise levels are projected to be 46.0 (Ldn) which is above the criterion for interior day-night sound levels. Therefore, noise mitigation is required for the Glass Factory Condominiums.

Since the Glass Factory Condominiums building has relatively good existing noise reduction performance (27 to 35 dBA), mitigation by means of barriers on the elevated guideway and the use of vibration track isolation (ballast mats or resilient rail fasteners) would be more effective than sound insulation in mitigating potential impact and would also provide benefit to other exterior areas near the relocated Lechmere Station.

Absorptive barriers on both the near edge of the elevated guideway and between the inbound and outbound tracks will be effective in reducing noise from Green Line trains at sensitive receptors even at upper floor receptors. The elevated guideway barrier between the inbound and outbound tracks is needed for reducing noise from trains on the far track. The heights of these barriers depend significantly on the guideway design and how close to the trains they can be constructed. Ideally, the barriers would be located within four feet of the near rail or closer. The heights of these barriers will be refined during the Preliminary Engineering phase of the Project.

Source: HMMH, 2010. Interior future noise levels are calculated by subtracting the minimum outdoor-to-indoor noise level reduction from the exterior noise levels and subtracting a three decibel factor of safety.

Vibration isolation of the track by means of ballast mats (if ballast and tie track is installed on the elevated structure) or resilient rail fasteners (if direct fixation track is used) will minimize the contribution of noise radiated from the structure. While ballast mats or resilient fasteners are often intended to mitigate potential vibration impact, they would also be effective in this circumstance in reducing radiated noise from the structure.

Potential moderate noise impact has been identified for exterior land use at the existing Tango and Sierra residential properties at NorthPoint due to the proposed relocation of the Green Line near East Street. Since these are moderate noise impacts, existing noise levels are below 65 dBA (Ldn) and the relative increase in noise is low due to the proposed shifting of the Green Line structure, no mitigation is required for this property. If constructed, the Archstone Phase II buildings would provide acoustic shielding from Green Line operations.

Since the proposed developments at 22 Water Street and Archstone Phase II Site 1 are not currently constructed and are assumed to be completed concurrent with the Green Line Extension Project, the buildings could be designed with consideration of the noise environment (i.e. windows with high transmission loss or STC ratings) to mitigate potential impact. It is anticipated that the developments would be designed and constructed to address the impacts of the Green Line Extension and MassDOT would not be responsible for additional mitigation.

Table 5-7 summarizes the proposed noise mitigation for receptors near Lechmere Station including the Option L maintenance facility. Noise barriers totaling 900 feet in length (two barrier each 450 feet long) and 450 feet (900 track-feet) of ballast mat or resilient rail fasteners would be effective in minimizing the potential for noise impact at Glass Factory Condominiums. Figure 5-4
shows the location of the proposed noise mitigation near proposed relocated Lechmere Station.

5.5.2 Vibration

No mitigation would be needed as no potential vibration impact has been identified for receptors near the proposed relocated Lechmere Station.
MassDOT and the MBTA are committed to active engagement with the public during completion of the Green Line Extension, through engineering, into construction and eventual Project completion. The Secretary’s Certificate on the DEIR requires development of a PIP for the Project:

- To facilitate collaborative land use planning, review of advanced Project design elements (notably station design), and implementation of mitigation measures.

- To clearly outline how a broad range of participants (i.e., representatives of regional planning agencies, local government, business interests, community groups, representatives of environmental justice areas and the disabled community, abutters, and bicyclist and pedestrian groups) would continue to provide meaningful community involvement throughout the duration of the entire Project, including detailed design, engineering, construction phases.

- To build on the lessons learned from the previous Advisory Groups convened in association with the Project, to consider ideas presented as part of the Community Corridor Planning Project, to reflect on comments received on the DEIR, and to represent a serious commitment by both MassDOT and the MBTA to actively engage the public upon completion of MEPA review.

- To provide not only a plan for procedural engagement of the various participants, but that it would also outline the primary substantive topics that are anticipated to be addressed through the PIP process.

This chapter lays out strategies and tools for accomplishing MassDOT’s goals and complying with the Secretary’s Certificate.
6.1.1 Overview

MassDOT developed and implemented a robust program of community involvement during previous stages of planning for the Green Line Extension Project. The Project has benefitted from strong interest and involvement in Cambridge, Somerville and Medford, as well as neighboring communities. Local government officials, planners, community organizations, neighborhoods and hundreds of individuals have participated in the Project. They have shared their time, ideas and concerns at meetings, in letters and emails, on websites and in newspaper articles.

In partnership with the MBTA, MassDOT would continue this outreach through the design, engineering and construction of the Green Line Extension. This chapter lays out the elements of the PIP that would guide that outreach through the remaining phases of the Green Line Extension Project.

Public outreach for the Green Line Extension has four principal goals:

- To provide an interactive, collaborative and credible public process;
- To equip the design team with ideas and recommendations from the public that would inform the design of the Green Line Extension;
- To solicit input from local residents and businesses, local and regional government agencies and interest groups; and
- To provide methods to keep residents, business owners and municipal officials informed about construction, its potential impacts and schedule, and to lessen those impacts as much as possible.

The team has consulted with the corridor municipalities, community groups and many others in developing this plan. Suggestions made in the DEIR/EA comment letters were strongly considered, as were lessons learned from the public process undertaken during preparation of the DEIR/EA. While this plan outlines a set of approaches and topics, it is a flexible and evolving document. MassDOT plans to periodically update the PIP, to assess successes and/or challenges associated with the outreach and consider suggestions for changes or improvements.

6.1.2 Public Involvement Background and Lessons Learned

MassDOT established a public involvement process for the environmental review/conceptual engineering phase of the Green Line Extension Project in September 2007. This effort was, in some sense, a continuation of the work begun in 2004 during the Beyond Lechmere Major Investment Study/Alternatives
Analysis process. MassDOT formed a Green Line Extension Advisory Group (which included some participants from the Beyond Lechmere process), conducted public meetings and coordinated with staff and elected officials of Cambridge, Somerville and Medford, as well as other stakeholders and neighborhood interest groups along the corridor.

The public involvement effort during the environmental review/conceptual engineering phase included:

- Eleven Advisory Group meetings (between September 2007 and March 2009);
- Two rounds of public meetings (two meetings in January/February 2008 and two in March 2009, of which one round included more than 600 people);
- Five station workshops in January and February 2008; and
- Participation in numerous community and neighborhood briefings.

In response to public requests, the Green Line Extension team held technical tutorials on ridership modeling; conducted a technical tutorial and tour of the Green Line Riverside vehicle maintenance and storage facility; and in response to public concerns, produced a full study of the maintenance facility site selection process and added several new sites to the evaluation process. In response to suggestions from the public, MassDOT studied the possibility of constructing tunnel segments for the Green Line Extension. Also based on public concern about construction impacts, the Green Line Extension team developed a construction staging plan to help minimize potential future impacts, which would continue to be updated throughout the next phases of Project development.

MassDOT translated materials into languages spoken in the Project area, provided interpreters as requested and prepared audiotapes and large-print documents. An electronic and postal mail database was maintained and frequently updated. Email blasts updated the public on meetings and other Project-related activities; postal mail was used for people who do not use email.

The Project website provided and continues to provide easy access to current and archived documents, meeting notices and summaries, and reference materials; it also provides a way to sign up for the Project mailing list and to send questions to the Project Team. Between November 2007 and March 2009, the site attracted more than 23,000 new visitors and had a total of more than 145,775 page views.

Based on public comments received during the DEIR process, MassDOT understands that the next phase of public involvement should build upon past experiences and gained knowledge to meet the goals we have now set out. Furthermore, the Green Line Extension Project is now entering a fundamentally
new phase – one with a focus on physical and site-specific design rather than large-scale planning issues – requiring a different kind of public involvement process. In particular:

- Meetings of the Project Design Working Group should be scheduled on a regular and predictable basis so participants can plan in advance and have their time and commitments respected;
- Disagreements or conflicts should be addressed promptly and solutions or agreements shared publicly;
- Participants in the Design Working Group should be committed to and supportive of the planning process for the Green Line Extension Project;
- Topics raised and covered by the Design Working Group should be generally germane to the Green Line Extension Project as it has been defined and must not claim resources of the Project and the Design Working Group that could be better dedicated to pertinent and pressing issues;
- Options for mitigation must be understood and described effectively (mitigation is provided to prevent or remediate negative impacts caused by the Project); and
- MassDOT and the MBTA must be full partners in the process, with support from the corridor communities.

### 6.2 Topics

While it is not possible to predict all of the issues the corridor communities, residents and businesses would be interested in during the upcoming phases, the list below is based on the Green Line Extension planning process to date, DEIR comments and feedback from reviewers, comments on the process and documents and experience with transportation engineering and construction.

Before listing the primary topics on which MassDOT would be seeking public input during the upcoming phases of the Green Line Extension Project, it must be noted that special attention should be paid to the topic of mitigation, which has been cited frequently as a topic of interest. While the Green Line Extension Project is in general a low-impact project, the Green Line Extension team would outline avoidance or mitigation policies, construction mitigation, and mitigation for long-term operation of the system to the extent possible. These strategies would include vehicular, bicycle and pedestrian mitigation; traffic mitigation; and construction management and detour plans. Mitigation decisions would be made both on a corridor-wide basis (i.e., construction of sound walls) and an individual property basis (when there are impacts to be mitigated). The MBTA has existing policies on mitigation, which would be followed for the Green Line
Extension. MassDOT has pledged to work with the corridor municipalities to develop station-area parking enforcement plans as appropriate, although ultimate establishment and enforcement would be local responsibilities. Plans to mitigate noise and vibration would be presented to the public, with adherence to existing standards (in accordance with the FTA guidance) to serve as the goal. The design documents would detail how MassDOT would evaluate, monitor and compensate affected parties along the corridor with respect to noise and vibration and other impacts. FEIR Chapter 8 outlines Section 61 mitigation commitments as required by the FTA and state regulatory programs.

The following topics represent other key subject areas where MassDOT expects that members of the public are likely to comment. While MassDOT welcomes this input, topics related to building and operating the transit system safely must remain in the purview of MassDOT and the MBTA.

The sub-topics listed below are representative but not necessarily exhaustive. MassDOT and the MBTA would present them in the context of the financial, operational and program constraints within which the agencies operate.

### 6.2.1 Preliminary Engineering Topics

The Project Team anticipates that the topics listed below would be of interest to Project constituencies. While this interest is welcome, final determination of many elements of the transit system would be guided by regulation and established practice. In these cases, the Project Team would provide relevant explanations for policies and decisions.

**Design**

- Design, approaches to and use of each station in the corridor, including the look and feel of the stations (to be the subject of workshops in the communities);
- Access to each station, traffic management and approaches to the stations, safety, connectivity – for all modes;
- Accessibility (stations and the Community Path);
- Connectivity with bus service;
- Pedestrian access and safety;
- Bicycle approaches and storage;
- Design of the Community Path;
- Design of the Maintenance Facility, layover storage and yard layout;
Green Line Extension Project
Final Environmental Impact Report

- Mitigation of operations, noise, safety; and
- Bridge redesign.

Land Use

- Land use planning in the station areas: the topic of the first round of Green Line Extension Workshops; the results would be presented to the corridor municipalities for their use in local planning and zoning;
- Connections to the Community Path and other local destinations; and
- Siting and land acquisitions for stations and maintenance facility.

Operations and Maintenance

- MBTA station program elements and operation;
- Maintenance of stations;
- Protective fencing;
- Community Path maintenance and safety;
- Maintenance facility and yard use; and
- Mitigation of noise and vibration (noise walls, vibration mats and other mitigation).

Final Design, Construction Impacts and Testing

- Communication: Project schedule and updates, construction office and access to staff, progress updates, emails and notices to media;
- Management of right-of-way issues: noise, construction equipment and dust/dirt, safety;
- Permit management and compliance;
- Traffic management and detours; communication about detours and closings;
- Business operations (maintaining deliveries and customer access);
- Parking impacts;
- Effects on commuter rail (regional issue);
- Effects on bus travelers, pedestrians and bicyclists, if impacted by traffic detours; and
Stakeholders and Constituencies

The Green Line Extension Project has benefitted from extraordinary public interest and support. The Secretary of the EEA received hundreds of comment letters and petitions expressing opinions on the Project during the DEIR phase. Almost all of the commenters supported the Proposed Project and had suggestions for improvements, enhancements or changes. The major stakeholders include:

- The FTA;
- The MBTA;
- The cities of Cambridge, Somerville and Medford, their municipal governments, elected officials and staff;
- Residents, businesses and property owners near the stations, maintenance facility and Community Path;
- Interested members of the general public;
- MBTA users; and
- Environmental justice populations in Cambridge, Somerville and Medford.

Throughout the Project, MassDOT has worked with and would continue to work with various local environmental justice community groups, including but not limited to:

- Affordable Housing Organizing Committee of Somerville
- Assembleia De Deus
- Bethel Evangelical Church
- Cambridge Council on Aging
- Cambridge East End House
- Cambridge Housing Authority
- Catholic Center at Tufts
- City of Medford Office of Human Diversity
- City of Somerville Multi-Cultural Commission
- Community Action Agency of Somerville
- Comunidade Evangélica Pentecostal Church
- Concilio Hispano, Inc.
- East Cambridge Planning Team
- East Somerville Main Streets
- East Somerville Neighborhood Association
- East Somerville Organizing Initiative
- First Church of Somerville
Friends of the Community Path
Green Line Advisory Group of Medford
Groundwork Somerville
Holy Cross Polish Church
Igreja Presbiteriana De Boston
Just a Start Corporation
Latin Coalition of Somerville
Massachusetts Alliance of Portuguese Speakers
Medford Council on Aging
Medford Green Line Neighborhood Association
Medford Housing Authority
Mission Church of Our Lord Jesus Christ
Mystic Learning Center, Inc.
Mystic Valley Elder Services
Saint Ann’s Parish
SCM Community Transportation
Somerville Climate Action
Somerville Community Corporation
Somerville Council on Aging
Somerville Housing Authority
Somerville Immigrant Service Providers Group
Somerville Living Wage Committee
Somerville Transportation Equity Partnership
Somerville/Cambridge Welfare and Housing Coalition
Somerville-Cambridge Elder Services
Saint Clements Parish, Medford
Saint Francis of Assisi Church
Saint Joseph’s Church
Tri-City Community Action Program, Inc.
Unity Church of God
West Medford Community Center
Zion Christian Fellowship Church

The Community Path

MassDOT has committed to completing 100-percent of the planning, design, and engineering for the proposed extension of the Somerville Community Path between Lowell Street and Inner Belt Road as part of the final design of the Green Line Extension Project (as described in the Secretary’s Certificate, page 9). Planning for the Community Path would be part of the overall Green Line Extension outreach efforts, including:

- Focusing on connections between the stations and the Community Path at the public design workshops;
Consider materials and design elements;

- Highlighting planning and design challenges (“pinchpoints,” etc)
- Considering landscaping and “green” design components;
- Seeking input on access to the Path as a way to support pedestrian and off-road bicycle access to stations; and
- Providing information on design progress and seeking input at key milestones.

The Project Team would plan for access to bicycle parking facilities at stations (as part of the design workshops). MassDOT is committed to working with the City of Somerville, residents and businesses in the Brickbottom and Inner Belt neighborhoods, and Community Path advocates to design the Path in such a way as to create improved connectivity within the Brickbottom and Inner Belt neighborhoods and between the Community Path and the Green Line Extension. MassDOT notes Somerville’s goal to secure funding for the simultaneous construction of the Community Path and the Green Line Extension. MassDOT is not at this point to commit to funding the construction of the Community Path. However, MassDOT will continue to work with the City of Somerville to identify potential state and Federal funding opportunities for the construction of the Community Path.

### 6.3 Public Outreach Strategies

MassDOT and the MBTA share the goal of maintaining a collaborative relationship with the Green Line Extension stakeholders and municipalities during the upcoming engineering and construction phases. The agencies plan to continue and enhance effective outreach strategies and hope to involve new stakeholders and interests in the design review. During construction, the outreach approach would shift to providing frequent and accurate public information on construction progress, schedule, traffic and pedestrian detours, and other pertinent issues.

The methods for this engagement are described in this section. They include public information meetings; community briefings, meetings and presentations; formation of a Design Working Group; Design Public Workshops; maintenance of a website; production of Project fact sheets and information materials; email notices and communication; media outreach; coordination with ongoing projects; and outreach to environmental justice populations.
6.3.1 Public Information Meetings

MassDOT would host a number of public information meetings (with open houses before the formal meetings) to share milestone information and collect public comments and suggestions. These meetings are scheduled for non-work hours, in locations that are accessible and near public transportation. The meetings typically move among locations in Somerville, Cambridge and Medford and have attracted strong participation. The meetings would be held:

- To kick off the Preliminary Engineering work and introduce the MBTA’s Station Design Program;
- Between the Schematic Design Update and Intermediate submittals (before designs are finalized for the facilities);
- Between the Intermediate and Pre-final Final submittals (when there are draft final materials for public review); and
- After the Pre-Final Submittal, but before the Design/Build construction contractor is procured, to present the preliminary design effort.

6.3.2 Community Meetings, Briefings and Presentations

MassDOT and the MBTA would respond to requests for meetings and briefings with community, civic, business and citizen groups in Cambridge, Somerville and Medford, and other municipalities as appropriate. These would include presentations to elected and municipal officials; briefings for chambers of commerce, environmental or community groups; to residents and business owners along the right-of-way. These meetings augment larger forums and help MassDOT speak directly to stakeholders in convenient neighborhood or group settings.

6.3.3 Design Working Group

MassDOT and the MBTA would convene a Green Line Extension Design Working Group. This group would advise MassDOT and the MBTA on the planning of public design workshops, participate in the workshops, share Project information with their neighborhoods, and serve as a corridor advisory group during engineering and construction. MassDOT and the MBTA invited the public to apply for membership with the goal of having representation from all of the neighborhoods adjacent to Green Line Extension facilities (the maintenance facility, Union Square, Lechmere, Brickbottom, Lowell Street, Ball Square and College Avenue, with interest in the Community Path as well). The group would include representatives from the MBTA and from Cambridge,
Somerville and Medford. The group would convene in June 2010 and at least quarterly, but potentially more often as engineering begins.

The Design Working Group would meet approximately quarterly for the duration of Preliminary Engineering and would advise MassDOT and the MBTA on issues related to station design, general construction, and other community-related concerns. Topics expected to be discussed in the meetings are described in Section 6.2, Topics. Meetings of the Design Working Group would be public, with a period at the end of each meeting for public comments and questions. Meetings of the group would be scheduled in advance with public notice. Summary meeting notes would be posted on the Project website and made available in print by request. A list of the Design Working Group members would be made available on the Project website once available.

If issues arise among the members of the Design Working Group that cannot be resolved, the members may bring concerns to the leadership of MassDOT and the MBTA. MassDOT and MBTA staff would endeavor to help resolve the issues if at all possible. A Green Line Extension Project Ombudsman would address issues that arise during construction; see Section 6.4, Public Outreach During Construction.

### 6.3.4 Green Line Extension Workshops

MassDOT and the MBTA would conduct a series of public workshops to gather input on land use and facility (stations, vehicle maintenance and storage facility, Community Path) design issues. The workshops would be organized around facility locations or groups of locations. All would be well-advertised, open to the public and in accessible venues. The workshops would be held in a series format in Cambridge, Somerville and Medford and would address the following topics:

- **Workshop Series 1**: Site issues and land uses around stations, the maintenance facility and the Community Path (late Spring 2010)
- **Workshop Series 2**: Station and facility elements (September 2010)
- **Workshop Series 3**: Design of each facility (November 2010)
- **Workshop Series 4**: Final review of Preliminary Engineering facility designs and the Community Path (Spring 2011)

MassDOT and the MBTA would organize the workshops and other events in consultation with city planners from each community, the Green Line Extension Design Working Group, and professional planners on the team. The workshops would include information on each facility location, maps and draft plans,
comment and review sessions, and other features. Information on the dates, agendas, etc., would be circulated using community resources, media, emails and flyers. Venues would be chosen in consultation with the communities and the Design Working Group.

Summaries of workshop materials and notes would be available on the Project website and presented to the communities. The workshops would include facilitated discussion groups, and interpreters would be available. The goals of the workshops are: (a) to gather opinions and ideas on facility issues in advance of key design milestones, (b) to present the facility designs for public review, and (c) to submit the designs for final public review in advance of final design and construction.

6.3.5 The Green Line Extension Website

The Green Line Extension website is www.mass.gov/greenlineextension. The site includes a Project overview, history and ways to participate; stores Project documents, current and archival; announces meetings and events and new activities; welcomes comments and questions via email and invites site visitors to sign up for Project information and emails. The site is updated frequently. Notes and presentations from Project meetings, workshops and other activities are posted on the site.

6.3.6 Project Fact Sheets

MassDOT and the MBTA would produce Project fact sheets during Preliminary Engineering to provide updates on Project status, key contracts, summaries of new reports or plans, schedule information and milestone descriptions. The fact sheets would be posted on the website for easy printing (in PDF format, so they can be downloaded and/or shared electronically) and distributed at Project meetings and presentations. The fact sheets would be available at all community and public meetings and in appropriate formats. Each issue would be translated into Spanish and made available in other languages on request.

6.3.7 Email, Communication and Notices

The Green Line Extension Project team would continue to use a number of methods for communicating with the public about Project meetings, issues and publications. In addition to the website, the team maintains an electronic database with contact information for over 4,500 people who have attended meetings, requested information, signed up online, written a comment letter, talked with a staff member, or are abutting property owners to the Green Line
Extension. The database contains emails and postal addresses. Emails are used regularly for notices; postal addresses for public meetings and others. The database would be updated after meetings and events. (Emails are not used for purposes other than sharing Green Line Extension information. Individuals can unsubscribe from the list upon request.)

In addition, the Project Team would continue to use the following communication strategies:

- Sending letters to right-of-way abutters notifying them of any upcoming field work and advising them how to stay informed on the schedule of work. For the field survey and boring work conducted February to June 2010, weekly updates were also mailed or emailed (as appropriate) to the database;
- Posting meeting information on the website and including it in emails to the database;
- When appropriate, preparing and distributing flyers at Lechmere and Haymarket Stations, at Orange Line Stations or door-to-door;
- Sharing meeting and Project information with community groups, the cities in the corridor, regional planning agencies, and translating them into Spanish (and other languages on request);
- Placing ads in local and regional publications for major meetings; and
- Using the MassDOT blog (Commonwealth Conversations: Transportation) and the MassDOT Twitter feed.

The team also provides materials in alternate formats on request (including large print and languages other than English). The Project Team welcomes suggestions on ways to continue to broaden communication and outreach.

6.3.8 Media Outreach

MassDOT and the MBTA would provide frequent updates to local and regional media to enhance communication with residents and business owners in Cambridge, Somerville and Medford. The team would distribute media advisories/press releases for all public meetings, workshops, major document releases and events of interest. In the past, this communication has enhanced the release of Project information. The Project Team would also invite local cable television stations to film major meetings to make them more accessible to corridor residents who find it difficult to attend meetings in person.
Advisories would be distributed to the following media outlets:

**Newspapers**
- Boston Courant
- Boston Globe
- Boston Herald
- Boston Metro
- Boston Post-Gazette
- Cambridge Chronicle
- Daily Medford Mercury
- El Mundo
- El Planeta
- Medford Transcript
- Somerville Journal
- Somerville News
- Vocero Hispano

**Radio Stations**
- WBMX 98.5 FM

- WBZ CBS
- WCEA TV
- WCVB ABC
- WGBH
- WHDH NBC
6.3.9 Coordination with Ongoing Projects

The MBTA and MassDOT are continually coordinating the planning and engineering of the Green Line Extension Project with other projects. This is an issue of concern to stakeholders, who often express concern about Project coordination or are interested in obtaining more information about other projects. When appropriate, the Project Team would include updates on coordination with relevant projects in the communities or corridor that might affect or be impacted by the Green Line Extension. These may include proposed transit projects, such as changes to the Orange Line, implementation of the Urban Ring, commuter rail service expansion, or roadway, projects or issues related to the bicycle and pedestrian path networks.

6.3.10 Environmental Justice Populations

The Green Line Extension would benefit environmental justice communities by improving access to public transit. The Green Line Extension is not anticipated to disproportionately affect environmental justice populations through land acquisition or other impacts. During the next phases of Project development, the Project Team would continue to target efforts to reach this population. This outreach would include activities to:

- Widely distribute Design Workshop notices in multiple languages at local bus stops and to potential abutters, door-to-door (languages include Spanish, Portuguese and Haitian Creole; other requests would be accommodated);
- Provide information to city, community and neighborhood groups on the Project, on meetings and on how to participate;
- Provide interpreters, materials and flyers in multiple languages;
- Translate the fact sheet into Spanish and provide other languages, on request, and make these materials available on the website and in print;
- Provide accommodations such as taped meetings for the visually impaired and audio equipment at meetings and workshops for the hearing impaired; and
- Meet individually with community groups to present information on the Project and collect input and comments.
6.3.11 Accessibility

MassDOT and the MBTA would conduct all of their meetings in accessible location and would provide accommodations on request for participants, including interpreters, audio equipment and large print materials. Notices would include Spanish and Portuguese text, at minimum, describing the importance of the announcement.

6.4 Public Outreach During Construction

MassDOT and the MBTA are committed to continuing a robust public involvement process during the construction of the Green Line Extension. In general, MassDOT and the MBTA are committed to strategies that would (a) inform the public of construction plans, (b) provide regular updates on construction, traffic detours and other impacts, and (c) solve problems that arise during construction. MassDOT and the MBTA would achieve these goals in part by requiring the Green Line Extension construction contractor to commit to a spectrum of outreach activities and efforts to mitigate the impacts of construction. MassDOT and the MBTA would hold the construction contractor to these obligations. Working together, agency and contractor staff members would be dedicated to implementing these communication and problem-solving strategies.

- Establishing a Project construction office along the right-of-way that is accessible to the general public.
- Establishing the position of Green Line Extension Project Ombudsman; this staff member would be employed by the construction contractor and would field all construction-period comments and complaints, coordinate with the cities, and respond to public concerns.
- Providing a Project phone number for inquiries and setting up a database tracking system to respond to concerns.
- Continuing to maintain the Project website to post construction updates and bulletins, changes in schedules and traffic management updates.
- Meeting quarterly with the Design Working Group, which would become the Construction Working Group, to review issues associated with construction (e.g., notices, schedule, traffic management) and advise MassDOT and the MBTA on solving problems that often arise from unexpected conditions, weather or construction-related challenges.
- Hosting construction kick-off meetings for neighborhoods along the right-of-way before construction begins to outline work, schedules, detours, construction mitigation, etc. The team would schedule periodic briefings for
elected and municipal officials and coordinate technical issues with local and state agencies.

- Producing **quarterly construction updates** for website posting, emailing and sharing with communities. MassDOT and the MBTA would provide an annual summary of Project construction progress and schedule updates.

- Developing a **business outreach plan** to assist local businesses during construction. Assign construction management staff to work with the construction contractor(s) to keep businesses open.

- Implementing the MBTA’s policies on mitigating construction impacts (such as dust, rodent control, pedestrian access, road detours and support for local businesses, as mentioned above).

- Providing **regular updates** on construction work to local and regional media. Update traffic management plan information through media advisories and Project update meetings (see above).

- Participating in **Project coordination meetings** to anticipate challenges, mitigation needs and solve problems that arise during construction. Meet with officials, residents and business owners to identify and solve problems.

MassDOT and the MBTA would review these communication and outreach plans in light of comments received on this document and the final Certificate from the Secretary of EEA, new ideas or proposals from the Design Working Group, communities, or individuals, and information that arises during the Preliminary Engineering phase. As always, MassDOT and the MBTA are committed to public outreach strategies that reflect the phase of the Project, that provide all interested individuals with an opportunity to give input and ask questions, and that assist the Project Team in its plans and designs for the Green Line Extension.
This Page Intentionally Left Blank
Summary of Proposed Project Benefits and Impacts

The Secretary’s Certificate on the DEIR required MassDOT to identify, describe and assess environmental impacts of any changes in the Project that have occurred between the preparation of the DEIR and the FEIR. This Chapter summarizes the benefits and impacts of the Proposed Project and highlights any changes since the DEIR was released.

7.1 Overview

The DEIR/EA evaluated the Proposed Project’s impacts – both beneficial and adverse – on natural and human resources. Table 7-1 provides a summary of adverse permanent, temporary, and construction-related impacts to environmental resource categories from the entire Proposed Project. These impacts were compared to the effects of the No-Build Alternative, in the year 2030. The Green Line Extension Project offers tremendous benefits with minimal impact to the Project Area by virtue of the fact that it is being constructed along existing MBTA railroad rights-of-way, which would enable light rail service to serve pedestrian-oriented centers with minimal disruption to the surrounding community and without significant property or neighborhood impacts. Other benefits related to the Project’s environmental impacts include:

➢ Land Use, Social and Economic Resources - The Proposed Project is expected to decrease low intensity commercial and light industrial uses in the Project corridor and increase mixed-use, high-density transit-oriented development, particularly at Union Square, Brickbottom Station, and Ball Square Station. Impacts to land, businesses and residences have been minimized as much as possible through the use of existing transportation corridors. The Proposed Project would provide socioeconomic benefits due
to increased transit access, which enhances both the potential for local commerce and the potential for area residents to commute to jobs elsewhere.

- **Environmental Justice** – According to the transit modeling performed for the Project, the Proposed Project would substantially increase transit access to environmental justice and disability populations. The Proposed Project would focus regional transportation investment funds in established environmental justice communities, connecting residents to jobs and services in Boston and Cambridge and strengthening business and residential districts in the corridor. There would be no disproportionate impacts to environmental justice areas from the Proposed Project.

- **Traffic** – The Proposed Project does not have an adverse impact on traffic operations throughout the Study Area and, in fact, makes improvements to many intersections for traffic and pedestrian movements. The Project would not physically alter designated bicycle facilities nor disrupt plans for future on-road or off-road facilities. When the opportunity is available, connections can be made from bicycle facilities directly to proposed stations. Ample bicycle parking would be provided at the Proposed Project station locations to accommodate and encourage commuting by bicycle. Minimal impacts to parking and recommendations for parking enforcement plans are expected as part of the Proposed Project.

- **Air Quality** – The Proposed Project represents a significant investment in urban mass transit which would provide important transportation, air quality, and urban redevelopment benefits and would fulfill a longstanding commitment to incorporate transit projects as an integral element of the Central Artery/Tunnel project. The air quality study performed for the Proposed Project demonstrates that the Green Line Extension Project complies with the Federal Clean Air Act and the SIP. The Proposed Project would reduce daily VMT by 25,018, improving air quality and providing zero-emission transportation capacity for anticipated growth.

- **Noise** – Although the Proposed Project would introduce a new noise source into the Project Study Area, proposed noise barriers, potential sound insulation, and rail lubrication would be effective in mitigating all potential noise impacts from the Proposed Project and no residual impacts would be expected. In fact, for locations along the existing commuter rail lines, the future noise levels would be substantially lower than the existing noise levels due to the introduction of noise barriers.

- **Vibration** – The proposed vibration mitigation for the Proposed Project – including ballast mats or resilient fasteners on the proposed Green Line tracks and the relocated commuter rail tracks and the relocation or use of specially-engineered trackwork – would be effective in keeping future vibration levels at or below existing levels for commuter trains and in
reducing future vibration from Green Line trains below the impact criteria (72 VdB for commuter rail and 75 VdB for Green Line trains).

- **Visual** – The Proposed Project would not have a significant effect on the local visual environment. The changes proposed would occur in urbanized areas within and adjacent to the existing right-of-way and would have little overall visual impact for the public. The most significant change would be the loss of forested areas along the right-of-way, reducing the green space visible from local residential areas. The addition of landscaping at the stations and both on and above the retaining walls would reduce the overall visual effect of vegetation losses. The proposed noise barriers would block the view of the right-of-way for adjacent homes and prevent any further visual impacts by obscuring the trains and rails that would otherwise be visible from residential back yards. Noise barriers can be designed in a manner to minimize the visual impacts on abutters.

- **Historic Resources** – The Proposed Project has impacts on a minimal number of historic or archeological resources, including the existing Lechmere Station (which is eligible for listing in the National Register), several domestic properties, and the industrial area surrounding Option L. However, a Memorandum of Agreement (MOA) has been developed that specifies measures to be implemented to mitigate adverse effects resulting from the Project.

- **Hazardous Materials** – The Proposed Project would have an environmental benefit by remediating several sites that currently contain contaminated soils. Mitigation measures during construction include special handling, dust control, and management and disposal of contaminated soil and groundwater in order to prevent construction delays and to provide adequate protection to workers and any nearby sensitive receptors. All response actions must ensure that any nearby or adjacent receptors are adequately protected.

- **Indirect and Cumulative Impacts** – The Green Line Extension Project is proposed for an area that is already densely developed. The extension of rail service through this area provides opportunities for the cities to modify their zoning and create infill development. The Proposed Project would support a number of major redevelopment projects that are currently planned and underway near the proposed station sites. It is not expected that the Green Line Extension would lead to an increase in the overall level of growth in the region. Rather, it would focus the growth into patterns that would increase the number of viable travel options available to corridor residents and employees, including transit, walking, and bicycling. The Proposed Project is also not likely to generate additional regional growth in jobs or population. However, it may affect where that growth occurs, the form of the growth, and the pace of redevelopment.
## Table 7-1: Summary of Proposed Project Impacts

<table>
<thead>
<tr>
<th>Environmental Categories</th>
<th>Impacts</th>
<th>Type/Timeframe</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Land Use</strong></td>
<td>Acquisition of 41 properties (approximately 16 acres), including eight buildings.</td>
<td>Permanent</td>
</tr>
<tr>
<td><strong>Socioeconomics</strong></td>
<td>Reductions in local commerce as affected/acquired businesses relocate.</td>
<td>Permanent to Temporary</td>
</tr>
<tr>
<td></td>
<td>Reduction of annual property tax revenue by $6,527 in Cambridge, $15,777 in Medford, and $528,375 in Somerville from the Green Line extension (includes an increased tax revenue loss since the DEIR/EA of $322,440 in Somerville from the Option L maintenance facility).</td>
<td>Permanent</td>
</tr>
<tr>
<td></td>
<td>Displacement or relocation of 92 jobs in Somerville for the Green Line extension (includes 74 jobs for the proposed maintenance facility).</td>
<td>Permanent to Temporary</td>
</tr>
<tr>
<td><strong>Environmental Justice</strong></td>
<td>Displacement or relocation of 92 jobs, all located in environmental justice areas.</td>
<td>Permanent to Temporary</td>
</tr>
<tr>
<td></td>
<td>58 percent of noise impacts to sensitive receptors located in environmental justice areas.</td>
<td>Permanent (in absence of mitigation)</td>
</tr>
<tr>
<td><strong>Traffic</strong></td>
<td>Level of Service decreases at five intersections.</td>
<td>Permanent (in absence of mitigation)</td>
</tr>
<tr>
<td></td>
<td>Minor modification of MBTA Routes 69, 80, 87 and 88 upon construction and completion of the Lechmere Station.</td>
<td>Permanent (in absence of mitigation)</td>
</tr>
<tr>
<td></td>
<td>Removal of approximately 12 parking spaces on Boston Avenue near Winthrop Street</td>
<td>Permanent (in absence of mitigation)</td>
</tr>
<tr>
<td></td>
<td>Road closures related to bridge reconstruction requiring traffic detours and resulting in some disruption to typical travel patterns.</td>
<td>Construction</td>
</tr>
<tr>
<td></td>
<td>Temporary displacement of parking spaces, particularly in the immediate vicinity of station and bridge construction.</td>
<td>Construction</td>
</tr>
<tr>
<td></td>
<td>Two bridges would be temporarily closed to traffic during construction.</td>
<td>Construction</td>
</tr>
<tr>
<td><strong>Noise</strong></td>
<td>Increase in noise levels for the Hampton Inn Hotel, Glass Factory Condominiums, and Brickbottom Lofts; 6 to 19 decibels higher than relatively quiet existing conditions.</td>
<td>Permanent (in absence of mitigation)</td>
</tr>
<tr>
<td></td>
<td>Moderate noise impact projected at 121 single-family and multi-family residential buildings and severe noise impact projected at 43 residential buildings. Moderate noise impact projected at three institutional buildings (Science and Technology Center at Tufts University, Outside the Line Artist’s Studio, and Bacon Hall at Tufts University) and severe noise impact projected at one institutional building (Walnut Street Center).</td>
<td>Permanent (in absence of mitigation)</td>
</tr>

The following sections provide additional detail on the Project’s impacts and benefits.

7.2 Land Use, Social, and Economic Resources

This group of categories evaluates the impacts on properties, types of land uses, jobs, neighborhoods, and property tax revenues. The increased transit access and ridership has the potential to increase commerce and encourage greater economic development along the Green Line Extension, which would increase property values and offset decreases in municipal property tax revenue.

Increases in projected land acquisitions have occurred since the development of the DEIR due to the required land acquisitions for the proposed maintenance facility Option L. Specifically, additional full land acquisitions are required at 20 Third Avenue (M.S. Walker Wholesale Distribution) and 44-48 Third Avenue (APCA Third Avenue, LLC) for construction of the Option L maintenance facility, totaling 7.4 acres. Additional partial land acquisitions at 70 Inner Belt Road (CRG West Parking Lot) and 200 Inner Belt Road (Fine Arts Storage Partners), totaling 2.8 acres, are also required.

Acquiring buildings and properties for the Project is unavoidable due to the dense urban character of the Project Area. Despite the relative abundance of commercial and industrial properties in the affected cities, the acquisition and demolition of existing businesses could result in temporary reductions in local commerce as the affected businesses relocate or permanent reductions if the businesses do not reopen locally or at all. The use of the existing right-of-way minimizes the property acquisitions, which would be much higher for an extension that involved establishing a new right-of-way through these cities.
The use of the existing right-of-way for most of the tracks also avoids dividing and segmenting any neighborhoods, which could otherwise cause significant changes to the local character. The proposed property acquisitions would not cut off access within any existing neighborhoods or block access from one neighborhood to another.

The Proposed Project is expected to decrease low intensity commercial and light industrial uses in the Project corridor and increase mixed-use, high-density transit-oriented development, particularly at Union Square, Brickbottom Station, and Ball Square Station. Impacts to land, businesses and residences have been minimized as much as possible through the use of existing transportation corridors.

Constructing the Proposed Project as currently designed would require approximately 16 acres of land acquisition from approximately 41 properties, and would require relocating seven businesses. Since the DEIR/EA, Option L has been designated as the preferred location for the Green Line maintenance and storage facility. The largest area acquisitions are for the Project’s maintenance and storage facility at Option L in Somerville (four parcels totaling 10.2 acres). In terms of impact, the most substantial acquisitions are those that require the displacement and relocation of residences and active businesses. These are located at Ball Square (three businesses), Union Square (two businesses), and for the Option L maintenance facility (two businesses). No residences would be displaced. Tables 7-2 and 7-3 show the land acquisitions required for the extension to Medford Hillside and to Union Square, respectively.

Total number of parcels: 31  
Total Area: 629,750 square feet (14.5 acres)

Note: N/A = Not Applicable

The Proposed Project would provide socioeconomic benefits due to increased transit access, which increases both the potential for local commerce and the potential for area residents to commute to jobs elsewhere. As a result of the land acquisition, the Proposed Project would result in a total decrease of $550,679 in municipal property taxes (includes land acquisition required for the Option L maintenance facility).

The Proposed Project would displace an estimated 92 jobs in Somerville (74 jobs would be displaced for the maintenance facility at Option L). Although it is uncertain how many of the jobs displaced are held by local residents rather than commuters, the small scale of the job losses relative to the Somerville workforce (47,656 workers [2000 U.S. Census]) makes it clear that the jobs at stake represent at most a minor economic impact. There is an inherent economic advantage to being located close to public transit and to educational and social centers such as...
Tufts University and Union Square. Therefore, many of the jobs affected would not actually be eliminated but only relocated locally.

### 7.3 Environmental Justice

According to the transit modeling performed on the Project, the Proposed Project would increase transit access to environmental justice and disability populations. The Project connects low-income and environmental justice communities to the region’s fixed-guideway network, thus improving access to jobs and services. The Project is designed to provide fair access to stations and economic development opportunities and avoid any disproportionate share of impacts. The Project complies with Federal DOT requirements for environmental justice as developed through Executive Order 12898, DOT Order 5610.2, and Title VI of the Civil Rights Act of 1964.

The proposed Option L maintenance and storage facility requires the acquisition of two commercial buildings and the displacement of an additional 74 jobs, all located within environmental justice areas. These acquisitions would reduce annual property tax revenue by 0.33 percent in Somerville. However, this change would not represent a significant fraction of the jobs in Somerville and many of the jobs displaced would likely be relocated or replaced within Somerville. Furthermore, no residential land would be acquired, resulting in no direct effect on local environmental justice populations.
The primary benefit of the Project for local residents and workers is improved access to transit. The Green Line Extension would improve transit access to jobs, on average, by 6.1 percent; access to colleges by 7.6 percent, and access to hospital beds by 9.8 percent.\(^1\) While there are impacts of building acquisitions and noise on environmental justice populations, these impacts are unavoidable due to the proximity of the existing rail corridors to environmental justice areas. These impacts are neither severe nor disproportionate, and the impacts would be balanced by the transit benefits to environmental justice populations. While the exact economic benefits cannot be determined, providing increased transit access and economic opportunities to the same neighborhoods affected by the Project would offset any economic impacts to these neighborhoods.

In summary, the Proposed Project would result in the acquisition of seven commercial buildings and displace approximately 92 jobs in environmental justice areas. There would be no disproportionate noise impacts to environmental justice areas from the Proposed Project. Noise mitigation would be required for the residences affected, resulting in no residual adverse impacts due to noise.

### 7.4 Traffic

This section discusses the direct, indirect, and cumulative effects of the Proposed Project with respect to intersection, pedestrian, bicycle, public bus transportation, and parking systems in the Study Area. For the year 2030, the DEIR/EA analyzed future traffic volumes throughout the Study Area (both with and without the Project), the impacts of the Project on the transportation system in the surrounding communities, and any measures that would mitigate Project impacts. Potential impacts to traffic circulation, including pedestrian and bicycle use, from the Proposed Project would remain the same as those analyzed in the DEIR/EA.

The DEIR/EA analyzed traffic for the No-Build and Proposed Project in order to evaluate the effects of the Project on intersection levels of service and pedestrian and bicycle circulation. The DEIR/EA provides a detailed assessment of the impacts on the transportation system associated with the Proposed Project. The following conclusions were reached:

- **Traffic Operations** – With mitigation at four intersections, the Proposed Project would improve operations at ten intersections.

---

\(^1\) Improved access was evaluated only for the Full-Build Alternative (DEIR/EA Alternative 2), which provides similar benefits to the Proposed Project (DEIR/EA Alternative 1 and the subject of this FEIR). This analysis was provided in DEIR/EA Appendix G, *Transit Access for Environmental Justice and Disability Populations*. 
Green Line Extension Project

Pedestrians – Pedestrian improvements would be implemented at 33 locations throughout the Study Area to accommodate the expected number of pedestrians accessing proposed stations. Pedestrian delays throughout the Study Area would be improved and signals would be timed to ensure pedestrians have adequate time to cross the street.

Bicycles – The Proposed Project would not physically alter designated bicycle facilities nor disrupt plans for future on-road or off-road facilities. When the opportunity is available, connections from bicycle facilities directly to proposed stations can be made. Ample bicycle parking (a minimum of 380 spaces) would be provided at the Proposed Project station locations to accommodate and encourage commuting by bicycle.

Parking – A total of 12 parking spaces would be removed to accommodate mitigation at Boston Avenue and Winthrop Street. Enforcement would be necessary to ensure that on-street parking is being used appropriately. At the redesigned Lechmere Station there would be a loss of approximately 167 existing parking spaces during the Interim Condition. As the NorthPoint development project is currently permitted, these spaces would be replaced in full upon completion of the NorthPoint development project.

Bus Transportation – Slight operational changes to bus service would occur at relocated Lechmere Station to facilitate the station relocation. No other bus routes or services would be impacted. The MBTA may in the future consider the relocation of bus stops to encourage the use of the bus to access the station. Additionally, once the Green Line Extension is constructed and operational, the MBTA would, as they do throughout their systems, continuously evaluate opportunities to optimize bus services. The benefit of this action would be further evaluated during Preliminary Engineering.

Construction Impacts – Construction impacts would be related to construction and traffic detours and would be temporary. In the vicinity of the stations and bridges, available parking may be temporarily displaced. Construction staging would limit the number of temporary bridge closures and ensure that adjacent bridges are not closed at the same time.

7.5 Air Quality

The Proposed Project is a significant investment in urban mass transit which would provide important transportation, air quality, and urban redevelopment benefits and would fulfill a longstanding commitment to incorporate transit projects as an integral element of the Central Artery/Tunnel project. The DEIR/EA described the air quality benefits associated with the Green Line Extension Project and describes its consistency with the SIP and MassDEP’s Transit Regulations. The DEIR/EA included a mesoscale and microscale air...
quality analysis that evaluated emissions of VOCs, NOx, carbon dioxide (CO2), CO, and particulate matter (PM). The microscale (local or hotspot) analysis evaluated CO and PM. The regional (mesoscale) analysis evaluated ozone precursors (VOCs, NOx, CO2, CO, and PM).

Based on the origin-destination study and parking demand study conducted for Lechmere Station, there would continue to be a demand for parking in the vicinity of Lechmere Station, either at the Station or in parking facilities nearby. As such, the projected regional air quality is not expected to notably change because the parking demand is expected to continue through the construction and implementation of the Green Line Extension. It is anticipated that these vehicles would continue to travel their existing routes and park in the Lechmere Station area and, therefore, there would be no change in the air quality on a regional (mesoscale) level.

In addition, a hot spot (microscale) air quality analysis was conducted at the intersections of Cambridge Street at First Street, Monsignor O’Brien Highway at East Street/Cambridge Street, and Monsignor O’Brien Highway at Charlestown Avenue/Lands Boulevard. As major intersections in the Study Area, the emissions are not expected to considerably change at these hot spots. Although reduced parking would be available at Lechmere Station, the parking demand is expected to continue to be there and the number of vehicles through these intersections is expected to be the same in the area (although the movement of the vehicle [right, through, or left-turn] may be different). The emissions at these study intersections are, therefore, not expected to notably change from what was calculated in the DEIR/EA.

7.5.1 Microscale Analysis

The microscale analysis indicates that reductions in CO concentrations are expected to occur over time when compared to 2007 existing conditions. All of the calculated future CO concentrations are equal to or less than the 2007 existing conditions concentrations. These reductions can be attributed to more efficient automobiles with enhanced emissions control technologies and the benefits of the Massachusetts Vehicle Inspection and Maintenance program. The Proposed Project would not exceed the CO NAAQS.

The microscale analysis also calculated the 24-hour PM10 concentrations and the 24-hour and annual PM2.5 concentrations for 2030. All of the 24-hour PM10 concentrations are well below the PM NAAQS of 150 ug/m³. All of the annual PM2.5 concentrations are well below the PM2.5 NAAQS and all of the 24-hour PM2.5 concentrations are below the PM2.5 NAAQS.
7.5.2 Mesoscale Analysis

The air quality study included a mesoscale analysis that estimates the area-wide emissions of VOCs, NOx, CO2, CO, and PM emissions. The mesoscale analysis evaluated the changes in emissions based upon changes in the average daily traffic volumes, roadway lengths, and vehicle emission rates. The mesoscale analysis calculated the 2030 mobile source emissions from the major roadways in the Study Area. These emissions, estimated to be 22,687.5 kilograms per day (kg/day) of VOCs, 19,186.2 kilograms per day of NOx, and 3,385.7 kg/day of PM10, establish a baseline to which future emissions can be compared.

The results of the mesoscale analysis demonstrate that the Proposed Project would reduce emissions of VOC, NOx, and PM10 as compared to the No-Build Alternative. The air quality study demonstrates that the Proposed Project for the Green Line Extension Project complies with the CAAA and the SIP.

7.5.3 Greenhouse Gas (CO2) Analysis

The EEA has developed a policy that requires a Proposed Project to evaluate GHG emissions. The air quality study calculated the GHG emissions from mobile sources related to the Proposed Project. While GHG emissions include several gases, CO2 was selected for evaluation because it is the most significant component of transportation-related GHG emissions. The year 2030 was selected as the future year of analysis to be consistent with the regional long-range transportation plan. The Proposed Project would reduce CO2 by 17,115 kg/day in comparison to the No-Build Alternative and therefore not contribute to an increase in GHG emissions.

7.6 Noise

The Green Line Extension would add a new noise source to the environment along the proposed corridor. While there is existing noise exposure from sources such as commuter trains and automobiles, introducing an additional noise source and relocating the commuter rail lines have the potential to increase future noise at some noise-sensitive receptors. The Proposed Project involves relocating the commuter rail lines up to 18 feet along some portions of the corridor and introducing the proposed Green Line tracks on the west side of the corridor along the Medford Branch and on the south side on the Union Square Branch.
The noise analysis conducted for the FEIR for the proposed Option L maintenance facility showed a slight increase in overall noise impact from that reported in the DEIR/EA. Specifically, noise from train movements in and out of the yard at Option L would be slightly higher at the southwest façade of the Brickbottom Artists Building than would be Yard 8 due to the presence of a tight radius curve on the Medford Lead track. In addition, noise from train movements in and out of the yard at Option L would be slightly higher at the Hampton Inn Hotel and the Glass Factory Condominiums due to stationary cars in the south yard operating with auxiliary equipment on. At the northeast façade of the Brickbottom Artists Building, the Option L maintenance facility would only increase future noise levels by 1.1 decibels compared to the mainline operations alone. At the other receptors potentially impacted under Option L, the contribution of noise from maintenance facility operations is even less than at Brickbottom Artists Building.

Potential noise impact on the west side of the MBTA Lowell Line alignment is due primarily to the proximity of noise-sensitive receptors to the Green Line trains. At close distances (within approximately 50 feet) the contribution of noise from Green Line trains is more significant than from commuter trains. Future noise levels on the west side are projected to generally increase one to two decibels due to the close proximity of noise-sensitive receptors to the Green Line trains. At a few specific locations (Alston Street near Cross Street) the increase in noise levels is higher (five decibels) due to the close proximity (25 feet) to the near track centerline of the proposed Green Line trains.

Because existing noise levels are relatively high at locations along the existing commuter rail line, even small increases in future noise levels are considered to have the potential for moderate or severe noise impact. Moving the commuter rail closer to residences on the east side of the MBTA Lowell Line right-of-way would therefore have moderate to severe impacts in some locations. The areas of noise impacts are shown in Figures 7-1 through 7-5.

Temporary noise impacts could result from construction activities associated with utility relocation, grading, excavation, track work, and installation of systems components. Such impacts may occur in residential areas and at other noise-sensitive land uses located within several hundred feet of the alignment. The potential for noise impact would be greatest at locations near pile-driving operations for bridges and other structures, and at locations close to any nighttime construction activities.

The Proposed Project would expose 164 residential buildings to moderate (121) or severe (43) noise levels, and would expose three institutional buildings (Tufts Science and Technology Center, Outside the Line Artist’s Studio, and Bacon Hall at Tufts University) to moderate noise levels and one severe institutional impact.
With mitigation, there would be no severe noise impacts from the Proposed Project expected. Noise mitigation including noise barriers and potential sound insulation treatments would be feasible, reasonable, and effective in mitigating all potential noise impact due to the Proposed Project. During the next phase of the Project, the existing outdoor-to-indoor noise reduction of the buildings would be measured. Some of these large buildings, however, may have a greater outdoor-to-indoor sound reduction than for typical buildings (about 25 dB with windows closed). If it can be established that there is indoor activity only and that the performance of these windows is sufficiently better than normal, sound insulation mitigation may not be necessary. If sound insulation is required and the most effective mitigation option, it would be considered cost-effective if it can improve the noise reduction of the building by five decibels or more.

At most locations, the noise barriers would be effective in reducing noise levels from transit sources generally seven to 11 decibels and would result in substantial reduction in future noise levels in comparison to existing noise levels. The proposed noise barriers and potential sound insulation would be effective in mitigating all potential noise impacts from the Proposed Project and no residual impacts would be expected. In fact, for locations along the existing commuter rail lines, the future noise levels would be substantially lower than the existing noise levels due to the noise barriers. Therefore, with mitigation, there would be no severe noise impacts from the Project and noise improvements would be made along the corridor.

### 7.7 Vibration

The Green Line Extension Project would add a new vibration source to the environment along the proposed corridor. While there is existing vibration exposure from sources such as commuter trains and automobiles, introducing an additional vibration source and relocating the commuter rail lines have the potential to increase future vibration at some sensitive receptors. The Project involves relocating the commuter rail lines up to 18 feet to the east along some portions of the corridor and adding the proposed Green Line tracks on the west side of the corridor.

Vibration from the Option L maintenance facility would remain the same as that analyzed in the DEIR; at a maximum vibration level of 77 VdB at the Brickbottom Artists Building, generated from trains on the elevated near mainline track approximately 18 feet away.
Vibration impact from the commuter trains generally occurs within 60 feet of the future commuter rail near-track centerline and within 40 feet of the proposed Green Line near-track centerline. Most receptors projected to be exposed to vibration impact from commuter train activity are on the east side of the MBTA Lowell Line or the south side of the MBTA Fitchburg Line where the proposed commuter rail near track is planned to shift up to 18 feet closer than its current location. Shifting the existing commuter rail lines closer to sensitive receptors is expected to increase vibration levels. Most receptors projected to be exposed to vibration impact from Green Line train activity are located on the west side of the MBTA Lowell Line. The areas of vibration impacts are shown in Figure 7-6 through 7-10.

Temporary vibration impacts could result from construction activities associated with the Green Line Extension Project. The potential for vibration impact would be greatest at locations near pile driving and vibratory compactor operations.

The Proposed Project may potentially expose 95 vibration-sensitive buildings to impact without vibration mitigation. This includes 92 single-family and multi-family residential buildings and three institutional buildings (Tufts Science and Technology Center, Outside the Line Artist’s Studio, and Bacon Hall at Tufts University).

The proposed vibration mitigation including 19,700 track-feet of vibration mitigation such as ballast mats or resilient fasteners on the proposed Green Line tracks and the relocated commuter rail tracks and the relocation or use of specially-engineered track (flange-bearing or moveable-point frogs) for 10 crossovers and turnouts would be effective in keeping future vibration levels at or below existing levels for commuter trains and in reducing future vibration from Green Line trains below the impact criteria of 72 VdB (commuter rail) or 75 VdB (Green Line trains).

### 7.8 Visual

The Proposed Project would require acquiring property, demolishing buildings, constructing new Green Line track and stations, and relocating the commuter rail track within the existing right-of-way. Some existing vegetation would be removed, and new retaining walls and noise barriers would be built. Noise barriers can be designed in a manner to minimize the visual impacts on abutters. Fences, trees, and steep slopes on each side of the right-of-way minimize the rail corridor’s visibility. The right-of-way is only visible to the public from certain locations, such as from bridges or through fences. With the exception of the Lechmere Station area, which would be on an elevated structure, there would be
minimal visual impact on the area. Because the changes would occur in
urbanized areas within and adjacent to the existing right-of-way, they would
have little overall visual impact on the public. New planting and screening
efforts along the right-of-way and atop the retaining walls would be done in
coordination with abutting residents and businesses to ensure that no undue
visual impacts are imposed on local neighborhoods. The Project would
incorporate vegetation in and above these walls and at the stations in order to
maximize the amount of vegetation along the expanded right-of-way. These
would reduce the net loss of vegetation and reduce the visual impact of any tree
removal on the neighborhoods.

The additional analysis of the proposed Option L showed that the Option L
maintenance building would be less visible from the Brickbottom Artists
Building than would have been the building at Yard 8. However, given the
existing industrial (MBTA’s BET facility) and commercial buildings visible from
this area, the support facility would result in only a minor change to the overall
local landscape.

The stations themselves generally have small footprints and are located along
and within the right-of-way to the greatest extent possible, minimizing the
overall visual impact. The major materials used in the station buildings would be
masonry, steel, and glass. Landscaping would be designed to provide protection
from the elements without obscuring visibility. Landscaping would be inviting
both to the users of the stations and to the passers-by, using small trees and low
shrubs which are easily maintained. The new stations would be visible from their
street access points and from nearby bridges.

The Proposed Project would require noise mitigation, usually consisting of noise
barriers, to protect sensitive receptors (such as residences) from increases in train
noise. Noise barriers would range from six to 12 feet tall and would block the
view of the right-of-way from adjacent homes. While this would reduce the
visibility of the green space surrounding the right-of-way, it would also prevent
any further visual impacts by obscuring the trains and rails that would otherwise
be visible from residential back yards.

The Proposed Project would not have a significant effect on the local visual
environment. The changes proposed would occur in urbanized areas within and
adjacent to the existing right-of-way and would have little overall visual impact
on the public. The most significant change would be the loss of forested areas
along the right-of-way, reducing the green space visible from local residential
areas. The addition of landscaping at the stations and both on and above the
retaining walls would reduce the overall visual effect of vegetation losses. The
proposed noise barriers would block the view of the right-of-way for adjacent
homes and prevent any further visual impacts by obscuring the trains and rails that would otherwise be visible from residential back yards.

7.9 Historic Resources

The FTA is the lead Federal agency for the Green Line Extension Project with responsibility for compliance with Section 106 of the NHPA of 1966 and other Federal statutes. The Draft Environmental Assessment filed under NEPA addresses compliance with Section 106 of the NHPA and Section 4(f) of the Department of Transportation Act of 1966. Potential impacts to historic resources from the Proposed Project would remain the same as those analyzed in the DEIR/EA.

The Proposed Project would impact historic resources by relocating the existing Lechmere Station, which is recommended in the *Historic and Archaeological Resources Reconnaissance Survey Technical Report* as potentially eligible for the National Register of Historic Places, to the north side of the O’Brien Highway in Somerville. This constitutes an “adverse effect” under Section 106 and a “use” under Section 4(f). The DEIR/EA documented that there are no feasible and prudent alternatives to the use of the Lechmere Station, and that adverse effects cannot be avoided.

Relocated Lechmere Station and associated roadway and busway improvements have long been intended to be constructed as part of the NorthPoint development project. However, due to the uncertainty surrounding the future of the NorthPoint project, the Commonwealth has included the planning for the relocation of Lechmere Station and area roadway improvements into the Green Line Extension Project. The new Lechmere Station would be relocated and elevated, situated on a new and realigned viaduct on the east side of Monsignor O’Brien Highway/Route 28. Once the relocation is complete, the existing Lechmere Station would be demolished and cleared, and the area would be made available for potential future redevelopment.

A draft MOA has been developed that specifies the measures that would be implemented by the FTA to mitigate the adverse effects. Mitigation measures include archival photographic documentation for recording purposes and historical interpretation. In its comment letter on the DEIR/EA, the Massachusetts Historical Commission (MHC) requested that the FTA complete its identification, evaluation and consultation for the undertaking and make a

---

finding of effect prior to finalizing the MOA, which could be a programmatic agreement including a future extension to the Mystic Valley Parkway/Route 16.

Due to their location primarily within the existing right-of-way and their design, the remaining proposed stations would have no effect or no adverse effect on historic properties in the surrounding APE.

The Proposed Project would potentially affect one archaeological sensitive area needed for the proposed Brickbottom Station. This sensitive area is documented as having the potential to contain significant belowground remains associated with mid-late nineteenth-century worker housing that characterized the Joy Street section of Somerville during the late industrial period.

The Option L maintenance and storage facility may also contain deeply buried archaeologically sensitive strata that could be impacted by construction associated with the proposed new vehicle maintenance building. Mitigation measures for archaeological sites that would be adversely affected by construction activities would include an archaeological data recovery program designed in accordance with state and Federal guidelines and standards for the excavation of National Register-eligible archaeological sites. Should any significant and National Register-eligible archaeological resources be identified during the intensive survey or subsequent site evaluation testing, measures to avoid, minimize, or mitigate any adverse effects of the Project on the National Register-eligible resource(s) would need to be determined by the FTA and MassDOT, in consultation with the MHC and other consulting and interested parties.

### 7.10 Hazardous Materials

The Proposed Project would require construction in areas where contaminated soils or groundwater are likely to be present in the vicinity of the rail right-of-way or proposed stations and where soil and/or groundwater remediation may be required as the Project design progresses. The remediation includes removing contaminated soil and pumping contaminated groundwater in accordance with the provisions of the MCP, MGL Chapter 21E and 21C, and the Federal RCRA.

The analysis of proposed Option L maintenance and storage facility for the FEIR determined that construction at this site may encounter seven RECs hazardous releases.
The Proposed Project requires construction in seven areas which collectively contain 23 RECs. These include off-site properties where releases have occurred but have been cleaned up or where there are underground storage tanks that are unlikely to have leaked; properties such as those with potential sources of oil and hazardous material with limited or inconclusive information; and sites such as those with confirmed soil, groundwater, and/or indoor air impacts that were reported to MassDEP and have undergone some type of cleanup or remain an active case.

The Proposed Project would have an environmental benefit by remediating sites that contain “high impact” RECs. Three high-impact sites would be cleaned as part of the proposed Green Line Extension Project.

Mitigation measures during construction on sites with RECs include special handling, dust control, and management and disposal of contaminated soil and groundwater in order to prevent construction delays and to provide adequate protection to workers and any nearby sensitive receptors. All response actions must ensure that any nearby or adjacent receptors are adequately protected.

7.11 Indirect and Cumulative Impacts

The DEIR/EA evaluated the consistency of the Project with ongoing and planned projects and evaluated the indirect and cumulative effects of the Proposed Project by topic. Potential indirect and cumulative impacts from the Proposed Project would remain the same as those analyzed in the DEIR/EA.

Indirect impacts are defined as “effects which are caused by the [proposed] action and are later in time or farther removed in distance, but are still reasonably foreseeable. Indirect effects may include growth-inducing effects and other effects related to changes in the pattern of land use, population density, or growth rate…” For this analysis indirect effects are defined as potential land use impacts of the Proposed Project. In comparison, direct land use impacts are displacements of properties required for the Project.

Cumulative impacts are defined as “the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such actions. Cumulative impacts can result from individually minor, but collectively significant, actions taking place over a period of time.” Cumulative impacts include the direct and indirect impacts of a project together with the reasonably foreseeable future actions of others.
The Proposed Project is not likely to generate additional regional growth in jobs or population. However, it may affect where that growth occurs, the form of the growth, and the pace of redevelopment.

The Green Line Extension Project is proposed for an area that is already densely developed. The extension of rail service through this area provides opportunities for the corridor cities’ to modify their zoning and create infill development, with opportunities for more housing and other changes that Somerville is already contemplating. The Proposed Project would support a number of major redevelopment projects that are currently planned and underway near the proposed station sites, particularly in the NorthPoint area of Cambridge. Improved mobility, access to a wider range of transportation options, and less traffic congestion would make these projects particularly appealing.

This section describes the potential indirect effects on land use within a ½-mile radius of each proposed station site. This represents the maximum distance riders are willing to walk.

**Land Use** – The Proposed Project is likely to result in higher density redevelopment, more TOD, and lower on-site parking requirements in areas that are within walking distance of the stations. The following station areas have the greatest potential for higher density redevelopment and TOD: relocated Lechmere, Brickbottom, and Union Square.

**Transportation and Traffic** – The Green Line Extension Project would provide a new transit option northwest of NorthPoint that would mitigate potential increases in automobile traffic from continued growth and redevelopment in the Project corridor. Combined with the Community Path and the Alewife Brook Parkway to Mystic Valley Path, the Green Line Extension would improve the regional transportation network and reduce regional traffic and congestion.

**Property Values** – Property values are likely to increase in areas within walking distance of the stations. However, the increases are likely to be relative, as the Project corridor is already highly desirable, and housing affordability is already a concern. The greatest increases are likely to occur in areas that are planned for significant redevelopment: Union Square, Boynton Yards, the Brickbottom District, and the Inner Belt District. Public policy to preserve affordability for moderate-income residents and small businesses should be implemented to mitigate transit-related increases in land values.

**Economy** – Continued transition away from the industrial and trade sectors toward the services, knowledge-based industries, life sciences, technology, and the arts is anticipated and is supported by public policy. Planned and Proposed
Projects that would expand employment centers in the corridor (redevelopments in East Cambridge, Brickbottom and Inner Belt districts, Union Square, and Boynton Yards) would support this trend and are more likely to proceed with the existence of the Green Line Extension.

**Neighborhoods** – Redevelopment of underused land in the Project corridor would be enhanced by the addition of a new and improved transit alternative. The greatest changes would likely occur in the Brickbottom and Inner Belt districts and in Boynton Yards, where planning is underway for potential redevelopment of these lower rent, commercial/industrial neighborhoods as mixed-use employment centers. Public policy to preserve affordability for moderate-income residents and small businesses should be implemented to minimize impacts of redevelopment on existing neighborhoods.

**Environmental Justice** – Environmental justice populations would benefit from the addition of a reliable transit alternative that would provide more opportunities to live and work in places throughout the region. However, increases in land values near new stations, particularly around Brickbottom and Union Square, may impact small businesses and limit affordable housing opportunities. Public policy to help preserve small businesses and maintain housing affordability should be implemented to help maintain diverse communities in the corridor.

### 7.12 Summary

The DEIR/EA evaluated the Project’s impacts – both beneficial and adverse – on natural and human resources. The analysis of the proposed Green Line Extension with respect to the maintenance and storage facility, College Avenue Station, and Lechmere Station described in this FEIR shows that the benefits and impacts of the Proposed Project are as described in the DEIR/EA, with only minor changes.

As described in this FEIR, the Proposed Project consists of extending Green Line service along the Medford Hillside Branch from the relocated Lechmere Station to the College Avenue Station, with four intermediate stations (Brickbottom, Gilman Square, Lowell Street, and Ball Square). The Union Square Branch would have one station, at Union Square. The Green Line Extension would be constructed entirely within existing railroad rights-of-way, which would require that the existing commuter rail tracks be shifted and that several roadway bridges over the rail right-of-way be widened. A maintenance and storage facility would be constructed in Somerville at the Option L site. The Proposed Project, as analyzed in the DEIR/EA and this FEIR, meets the state Air Quality regulatory criteria and the requirements of the SIP.
Since the publication of the DEIR/EA, two substantive changes have been made to the Proposed Project:

- The maintenance facility is proposed at the Option L site, and is no longer proposed at the Yard 8 site.
- The relocated Lechmere Station has been redesigned in response to comments on the DEIR/EA, with reduced parking and modified access.

These changes have not substantively changed the project impacts, and have reduced impacts in some categories.

The Proposed Project would provide transportation benefits, unchanged since the DEIR/EA:

- Substantially increasing transit access to environmental justice and disability populations;
- Focusing regional transportation investment funds into established environmental justice communities, connecting residents to jobs and services in Boston and Cambridge and strengthen business and residential districts in the corridor;
- Making connections from bicycle facilities directly to proposed stations, when the opportunity is available and providing ample bicycle parking at the Proposed Project station locations to accommodate and encourage commuting by bicycle;
- Reducing daily VMT by 25,018, improving air quality and providing zero-emission transportation capacity for anticipated growth.

With the mitigation measures committed to by MassDOT and the MBTA, the Proposed Project would have measurable benefits in several categories:

- Improving many intersections for traffic and pedestrian movements;
- Lowering future noise levels at locations along the existing commuter rail lines due to the noise barriers;
- Keeping future vibration levels at or below existing levels for commuter trains and in reducing future vibration from Green Line trains below the impact criteria (72 VdB for commuter rail and 75 VdB for Green Line trains);
- Remediating several sites that contain contaminated soils.

The Proposed Project would also have indirect social and economic benefits:
Decreasing low intensity commercial and light industrial uses in the Project corridor and increase mixed-use, high-density TOD, particularly at Union Square, Brickbottom Station, and Ball Square Station;

Providing socioeconomic benefits due to increased transit access, which increases both the potential for local commerce and the potential for area residents to commute to jobs elsewhere.

Further analysis completed since the DEIR/EA filing, including an analysis of environmental impacts of the Option L maintenance and storage facility, the College Avenue Station as a terminus, and the relocated Lechmere Station, revealed the following changes in environmental impacts:

- Additional annual property tax revenue reduction of $322,440 in Somerville from the Option L maintenance and storage facility;
- Reduction of impervious surfaces by 3.2 acres, improvement in water quality and decrease in stormwater runoff from the Option L maintenance and storage facility;
- Displacement or relocation of 74 jobs in Somerville for the proposed Option L maintenance and storage facility;
- Slightly higher noise from train movements in and out of the yard at Option L at the southwest façade of the Brickbottom Artists Building than at Yard 8 due to the presence of a tight radius curve on the Medford Lead track.
- Slightly higher noise at the Hampton Inn Hotel and the Glass Factory Condominiums from train movements in and out of the yard at Option L due to stationary cars in the south yard operating using auxiliary equipment;
- An additional seven RECs hazardous releases to be remediated at the proposed Option L maintenance facility.
Draft Section 61 Findings and Mitigation Commitments

8.1 Introduction

The Secretary’s Certificate requested that the FEIR include:

- A distinct draft Section 61 finding for each state agency action that contains:
  - A clear commitment to mitigation, a schedule for implementation;
  - An estimate of the individual costs of the proposed mitigation; and
  - An identification of the parties responsible for implementing the mitigation.

- A conceptual plan for evaluating, monitoring, and compensating affected parties along the corridor that includes:
  - A specific emphasis on, but not limited to, noise, vibration, and land acquisition impacts; and
  - Mitigation measures associated with the future ongoing operations of the Green Line Extension and impacts uniquely limited to the construction period.

This chapter presents MassDOT’s proposed mitigation program to address adverse environmental impacts associated with construction and operation of the proposed Green Line Extension Project. This chapter also includes draft Section 61 Findings for the Proposed Project, as specified above.

Typically, transit projects such as the Green Line Extension Project evaluate the potential impacts of the Proposed Project using standard analytical measures and methods approved by the FTA and relevant state agencies, as was done in Chapter 5, Environmental Consequences, of the DEIR/EA and updated in Chapter 7, Summary of Proposed Project Benefits and Impacts, of the FEIR. Mitigation measures are typically developed based on these standard methods.
and legal requirements, and are the basis for the Project’s mitigation commitments (as articulated in Chapter 6, Draft Section 61 Findings and Mitigation Commitments, of the DEIR/EA and summarized in Chapter 7, Summary of Proposed Project Benefits and Impacts, of the FEIR).

Specific mitigation elements that are subject to FTA regulations and guidelines include noise, vibration, and land acquisition (which is governed by the Uniform Relocation Act). The Uniform Act stipulates how the value of property acquisition must be established, and requires FTA to compensate land owners for the fair market value of their property. MassDOT is required to follow the procedures established by the Uniform Act for any property acquisition.

This requirement of the Certificate appears to require MassDOT to monitor noise and vibration during and after construction (with the proposed mitigation measures in place), evaluate whether the actual noise and vibration levels correspond with the modeled values, and somehow compensate property owners for any noise or vibration in excess of the modeled mitigated values. Presumably, this implies that MassDOT would compensate property owners for any decrease in property value due to noise or vibration, rather than (as would normally be the case for MBTA projects) installing additional noise or vibration mitigation measures within the right-of-way or offering the homeowner additional sound insulation.

MBTA would monitor noise and vibration after service starts to determine future noise levels generated by the Green Line Extension and the relocated commuter rail. If noise levels are found to be higher than the projections, the MBTA would investigate the cause and take appropriate corrective action. It is worthwhile to note that when conducted for the Greenbush Line, projections made based on measurements of actual MBTA commuter rail trains on the Greenbush Line showed that there were no locations where actual noise levels exceeded the pre-construction modeled levels.

### 8.2 Project Benefits

The Proposed Project is expected to generate 52,000 new daily boardings and alightings at the Project’s seven stations and generate new systemwide transit ridership of 7,900 boardings per day and a reduction of 25,018 VMTs per day (projected to the year 2030). The increased transit access and ridership would improve corridor mobility, improve traffic conditions, improve regional air quality, increase services to environmental justice populations, and support future smart growth initiatives and sustainable development.
8.3 Overview of Project Mitigation Measures

This section summarizes the mitigation measures proposed to prevent or reduce environmental impacts.

8.3.1 Traffic

By 2030, regardless of the Green Line Extension Project, traffic signal timing and phasing would be inadequate to accommodate the projected traffic demands at a number of locations. The Project would include optimizing traffic signal timing and phasing at all signalized study area intersections to maximize the efficiency of these locations.

Pedestrian Mitigation

Mitigation measures are necessary to accommodate efficient pedestrian access to the proposed Green Line Extension stations. Mitigation measures include:

- Installing crosswalks, wheelchair ramps, and appropriate warning signage;
- Increasing pedestrian walk time;
- Improving existing crosswalk markings and repairing existing pedestrian signal equipment;
- Signalizing side street crossings and increase walk time on main streets; and
- Conducting signal warrant analyses and, if warranted, installing signals.

Under existing conditions, 18 signalized intersections do not currently provide enough time (as defined in the MUTCD, the ADA and associated state regulations) for pedestrians to cross the street before the flashing “Don’t Walk” signal ends. In total, pedestrian mitigation is proposed at 33 locations. In some cases, pedestrian mitigation is proposed at locations that were not otherwise studied as part of this analysis. These locations were identified for mitigation as part of the regional pedestrian analysis, as documented in DEIR/EA Appendix F. These measures are presented in Table 8-1.

</table>
Traffic Mitigation

Several intersections would require additional physical mitigation to address adverse impacts, caused by the Project’s increased vehicular traffic, as described in the following sub-sections.

**Boston Avenue at Winthrop Street**

Impacts at Boston Avenue and Winthrop Street would be mitigated by restriping the Boston Avenue northbound approach (currently a single-lane approach) to provide an exclusive left-turn lane and a shared through/right-turn lane. Signal timing and phasing changes would also be implemented. Approximately 12 parking spaces along Boston Avenue would be removed for this improvement. It is anticipated that level of service would improve at this intersection from LOS F to LOS D during the evening peak hour as a result of this mitigation, which is when traffic operations at this location are at their worst. The improvement would improve queuing in the northbound direction at the intersection during other times of the day, but not substantially change level of service since it is expected to operate at an overall acceptable level (LOS D or better) during the rest of the day.

**Boston Avenue at College Avenue**

Boston Avenue at College Avenue would be mitigated by widening College Avenue westbound to provide an exclusive right-turn lane and a shared left-turn/through lane. Signal timing and phasing changes at this location would also be incorporated. To accommodate this improvement, the College Avenue bridge over the railroad tracks would be widened. Since the bridge is already slated for reconstruction as part of the Project, changes can be made without additional construction impacts. It is anticipated that level of service would improve at this intersection from LOS F to LOS D during the critical evening peak hour with this mitigation. The improvement would improve queuing at the intersection during other times of the day, but not substantially change level of service since it is expected to operate at an overall acceptable level (LOS D or better) during the rest of the day.

**Washington Avenue at McGrath Highway**

A new traffic signal phasing sequence is proposed at this intersection to incorporate a pedestrian phase into the traffic signal (although this is a signalized intersection, pedestrian crossings at this location are not part of the traffic signal). This change would likely require new traffic signal equipment and new wiring to connect the traffic signal heads to the control cabinet. With these improvements
in place, it is anticipated this intersection would remain at LOS E rather than degrade to LOS F during the morning and evening peak hours.

**Prospect Street at Somerville Avenue**

To accommodate Project-related pedestrian traffic at this location, pedestrian crossing times would increase, which would cause an adverse impact to overall vehicular traffic operations (i.e. increased delay) during at least one peak hour. There is no opportunity at this location to increase capacity by adding lanes or changing lane allocation. However, traffic and pedestrian signal timings could be further adjusted to balance the needs of pedestrians and motorists once the Project is in service.

**Washington Street at Somerville Avenue/ Webster Street**

To accommodate Project-related pedestrian traffic at this location, pedestrian crossing times would increase, which would cause an adverse impact to overall vehicular traffic operations (i.e. increased delay) during at least one peak hour. There is no opportunity at this location to increase capacity by adding lanes or changing lane allocation. However, traffic and pedestrian signal timings could be further adjusted to balance the needs of pedestrians and motorists once the Project is in service.

**Medford Street at Pearl Street**

This unsignalized intersection processes a high volume of traffic, currently operates at LOS F during the morning peak hour, and would degrade to LOS F during the evening peak hour by 2030, with or without the Project in place. The number of pedestrians crossing Medford Street would increase and would require a crosswalk to accommodate pedestrian demands.

A traffic signal would be installed to accommodate changes to this intersection as a result of the Project. Pearl Street would be controlled by the traffic signal and crosswalks would be striped on the south (Medford Street) and east (Pearl Street) approaches to the intersection. Due to the intersection’s proximity with School Street, the two traffic signals would operate as a coordinated system. With the proposed improvement, the intersection of Medford Street and Pearl Street would operate at LOS B during both the morning and evening peak hour.
O’Brien Highway Reconstruction

The Future-Build NorthPoint development is assumed to be in place by 2030, the design year for the Green Line Extension transportation analysis. By 2030, it is also assumed that all mitigation associated with the NorthPoint development would be in place. This includes reconstructing O’Brien Highway from Third Street to Museum Way (including the midblock pedestrian crossing west of Land Boulevard) and constructing internal NorthPoint streets as delineated in the NorthPoint special permit.

A number of the mitigation measures associated with NorthPoint are necessary to support the relocation of Lechmere Station across O’Brien Highway. With the delay of the NorthPoint development, these mitigation measures would be undertaken by MassDOT as mitigation for the Green Line Extension. Specifically, the following measures are proposed:

- Reconstruct O’Brien Highway at its intersection with Third Street to restrict westbound left-turns from O’Brien Highway to Third Street, provide an upgraded pedestrian crossing, new signal timing, and new phasing.

- Reconstruct O’Brien Highway at its intersection with Water Street to remove the median and allow eastbound left-turns from O’Brien Highway to Water Street. Left-turns from Water Street would be allowed on an interim basis until NorthPoint is constructed and then restricted once NorthPoint is built. A new crosswalk would be provided on the south side of the intersection and the intersection would be signalized.

- Reconstruct O’Brien Highway at North First Street and East Street:
  - First Street would be extended to connect to O’Brien Highway, creating a new signalized intersection.
  - Eastbound left-turns onto North First Street (into the new station) would be prohibited. This movement would be accommodated at Water Street.
  - Westbound left-turns from O’Brien Highway to First Street and Cambridge Street would occur at this intersection under the proposed mitigation.
  - East Street would be reconstructed to be a right-turn in/right-turn out driveway and the median extended along O’Brien Highway to prohibit other movements. The existing traffic signal would be removed.

- Reconstruct the intersection of Cambridge Street and First Street, including new signal timing and phasing.

- Reconstruct First Street between Cambridge Street and O’Brien Highway to make the roadway one-way eastbound to O’Brien Highway southbound.
The proposed improvements are necessary to support vehicular traffic and pedestrian crossings associated with the relocation of Lechmere Station. Traffic signal wiring would extend roughly to East Street, to be tied into by the NorthPoint proponent in order to complete the mitigation measures committed to along O’Brien Highway as part of their special permit.

Parking Enforcement Mitigation

The lack of available long-term parking at the Green Line Extension stations may encourage some motorists to park on local streets. Increasing parking enforcement or changing local parking restrictions to restrict commuter parking would be effective in reducing neighborhood impacts. MassDOT would work with the affected communities to develop acceptable parking enforcement plans for the areas within one-half mile of the stations in order to limit potential impacts.

8.3.2 Noise

In the absence of mitigation, a total of 164 noise-sensitive receptors would be exposed to noise impact by the Proposed Project. These include 121 moderate impacts and 43 severe impacts at single-family and multi-family residential buildings, moderate impact at three institutional buildings (Tufts Science and Technology Center, Outside the Line Artist’s Studio and Bacon Hall at Tufts University), moderate impact at Trum Playground and severe noise impact at the Walnut Street Center (a non-profit support center for adults with developmental disabilities) near Union Square.

MassDOT would mitigate both moderate and severe noise impacts wherever feasible and wherever existing noise levels are above 65 dBA, based on FTA noise mitigation guidance. At locations with no outdoor areas of frequent human use (as defined per FTA), noise mitigation would be considered for interior spaces. Some of the large buildings, however, may have a greater outdoor-to-indoor sound reduction than for typical buildings (about 25 dB with windows closed). If it can be established that there is indoor activity only and that the performance of these windows is sufficiently better than normal, sound insulation mitigation may not be necessary. Mitigation would be considered based on whether interior maximum single-event (train pass-by) noise levels ($L_{max}$) are above 65 dBA or whether interior day-night sound levels from Project sources ($L_{dn}$) are above 45 dBA.

To mitigate noise impact from train operations, noise control would be considered at the source, along the sound path, or at the receiver. Source noise control options may include special hardware at turnout locations, relocating special trackwork away from sensitive areas and using continuous welded rail.
Noise barrier construction is the most common sound path noise control treatment and can be very effective at reducing noise levels in the community. Noise control at the receiver can also be achieved by using sound insulation treatments at residences and institutional buildings. Sound insulation would be considered an effective mitigation measure if it is possible to improve the noise reduction of the existing building by five decibels or more and provide interior noise levels of 65 dBA or less (Lmax or maximum noise level) from transit sources. Proposed mitigation recommendations would be refined further during the design process of the Project.

For many locations along the MBTA Fitchburg and Lowell Lines, noise barriers are a feasible and effective means of noise mitigation because the existing right-of-way is lower than sensitive receptors for substantial portions of the Project. Noise barriers would be constructed with an absorptive surface to minimize the potential of sound reflecting off barriers to sensitive locations on the opposite side of the tracks. Table 8-2 shows a summary of proposed noise barrier mitigation. This table includes the barrier length, side of tracks, barrier height, and range of noise reduction and the general location of the barrier. The areas of impact and proposed noise barrier locations are shown in Figures 7-1 through 7-5.

Noise barriers ranging between six and 12 feet in height would be effective in reducing noise levels from the Project by generally seven to 11 decibels. The 18 noise barriers (10,750 feet in length and approximately 90,000 square feet in area) would cost approximately $2.7 million dollars based on $30 per square foot of installed noise barriers not counting design and inspection costs.

Near College Avenue Station, a noise barrier 1,000 feet long, approximately six feet in height on a retaining wall along the right-of-way would be effective in mitigating potential noise impact at receptors on Burget Avenue and Brookings Street (noise barrier # 16). Since the additional noise at these sensitive receptors due to College Avenue Station being a terminal station is small, this noise barrier is not required specifically due to College Avenue Station being a terminal station for the Proposed Project. Future noise levels from both commuter and Green Line trains are expected to be reduced nine to 11 decibels with this barrier and future noise levels are expected to be lower than existing levels.

Additionally, refinements in mitigation related to the new Option L maintenance facility location in conjunction with the redesigned Lechmere Station have resulted in additional recommended mitigation including noise barriers totaling 900 feet in length (two barrier each 450 feet long) and 450 feet (900 track-feet) of ballast mat or resilient rail fasteners, which would be effective in minimizing the potential for noise impact at Glass Factory Condominiums. Since the contribution of noise from the proposed Option L maintenance and storage facility is low compared to mainline operations, this noise barrier is not required.
due to the maintenance facility alone. The heights of these barriers depend significantly on the guideway design and how close to the trains they can be constructed. Ideally, the barriers would be located within four feet of the near rail or closer. The heights and effectiveness of these barriers would be refined during the Preliminary Engineering phase of the Project.

<sup>a</sup> There is an existing 6-foot barrier at this location.

<sup>b</sup> Barrier includes segment on guideway edge and in between inbound and outbound tracks (two segments 450 feet in length each)

At some locations projected to be exposed to noise impact, noise barriers as described above may not be a feasible or effective means of mitigation. These locations include the:

- Brickbottom Lofts;
- Apartment complex on Pearl Street (near Medford Street);
- Visiting Nurses Association;
- Tufts Science and Technology Center;
Outside the Lines Art Studio;
 Tufts Bacon Hall; and
 Walnut Street Center in Union Square.

Some of these buildings have upper-floor residences that may not benefit from a potential noise barrier. For buildings that do not have significant outdoor land use, sound insulation mitigation would be considered during the Preliminary Engineering phase of the Project. Substantial improvements in building sound insulation (on the order of 5 to 10 dBA) can often be achieved by adding an extra layer of glazing to windows, by sealing any holes in exterior surfaces that act as sound leaks, and by providing forced ventilation and air conditioning so that windows do not need to be opened.

In order to best determine the most appropriate mitigation type for each of these individual properties, during the next phase of the Project, the existing outdoor-to-indoor noise reduction at these locations would be measured and assessed. An analysis would be made as to whether mitigation is required for buildings that do not have significant outdoor land use, if the noise reduction of the building could be improved by five decibels or more with sound insulation treatments or if noise barriers would be effective in reducing interior noise levels at these locations. Specific mitigation measures would be developed as they are appropriate to each individual structure during Preliminary Engineering.

Estimated costs for sound insulation depend on specific factors such as the existing noise reduction, existing HVAC systems and the number and size of windows and doors that would need to be replaced. The costs associated with potential sound insulation or noise barrier mitigation for these properties would be defined during the next phase of the Project.

The following mitigation measures would be applied where feasible to minimize temporary construction noise impacts:

Avoiding nighttime construction in residential neighborhoods;
 Using specially quieted equipment with enclosed engines and/or high-performance mufflers;
Locating stationary construction equipment as far as possible from noise-sensitive sites; and
Constructing noise barriers, such as temporary walls or piles of excavated material, between noisy activities and noise-sensitive receivers.
The Secretary’s Certificate included the requirement that the “FEIR should include a conceptual plan for evaluating, monitoring, and compensating affected parties along the corridor with a specific emphasis on, but not limited to, noise, vibration, and land acquisition impacts.”

Typically, transit projects such as the Green Line Extension Project evaluate the potential impacts of the Proposed Project using standard analytical measures and methods approved by the FTA and relevant state agencies, as was done in Chapter 5 of the DEIR/EA and updated in Chapter 7 of the FEIR. Mitigation measures are typically developed based on these standard methods and legal requirements, and are the basis for the Project’s mitigation commitments (as articulated in Chapter 6 of the DEIR/EA and summarized in Chapter 7 of the FEIR). The MBTA’s experience is that this type of mitigation program is very successful and homeowners find that it provides a significant amount of noise reduction.

As was done for the Greenbush Line, the MBTA would monitor noise and vibration after service starts to determine noise levels generated by the Green Line Extension and the relocated commuter rail. If the levels are found to be higher than the projections, the MBTA would investigate the cause and take appropriate corrective action. It is worthwhile to note that when conducted for the Greenbush Line, projections made based on measurements of actual MBTA commuter rail trains on the Greenbush Line showed that there were no locations where actual noise levels exceeded the pre-construction modeled levels.

8.3.3 Vibration

The goal for mitigating potential vibration impact from the proposed Green Line Extension Project is to reduce future vibration below the impact criteria, which is 72 VdB for Green Line trains and 75 VdB for commuter trains. At some locations, mitigation measures that would reduce vibration levels five decibels or more would be considered reasonable and effective with the intention of keeping future vibration levels at or below existing vibration levels.

The effectiveness of specific vibration mitigation measures is dependent on several factors such as the component design, installation techniques, and axle loads of the trains and frequencies of concern. The following are vibration mitigation options proposed for locations along the proposed Green Line Extension Project shown in Table 8-3:

- Resilient rail fasteners connect the rails to the ties and may reduce vibration by 5 to 10 VdB.
- Ballast mats are rubber pads placed underneath the ballast and may reduce vibration levels 10 to 15 VdB.
Resiliently supported ties are rubber pads placed underneath the ties and may reduce vibration 10 VdB.

Floating slabs isolate train vibration from the surrounding ground with springs or rubber pads and may reduce vibration 15 VdB or more. Drawbacks towards floating slabs include difficulties in designing for heavy commuter trains, difficulties in designing for outdoor environments and the relatively high cost.

Similar to noise, gaps in the rail increase vibration levels of the trains. Mitigation may include using special hardware or relocating turnouts and crossovers and using continuous-welded rail rather than jointed rail.

Maintenance programs are important for controlling vibration. Rail grinding and wheel truing to maintain smooth rails and true wheels can be effective in reducing potential vibration impact.

The areas of impact and proposed vibration mitigation locations are shown in Figures 7-6 through 7-10. During the Preliminary Engineering phase of the Project, vibration measurements would be conducted at several properties expected to be impacted by vibration. These measurements would further refine the vibration reduction needed to mitigate potential impact. A vibration reduction goal for mitigation measures, such as ballast mats or resilient fasteners, would be specified in the bid documents. Suitable mitigation measures would be introduced into the Project to achieve the mitigation goal.

Assuming that both tracks of a particular rail line are mitigated, a total of 19,700 track-feet of vibration mitigation is proposed to mitigate potential impacts for the Proposed Project. An estimated cost for installed ballast mats is $3.5 million based on a cost of $180 per track-foot and an estimated cost for resilient fasteners is $5.9 million based on a cost of $300 per track-foot.

Special trackwork (turnouts and crossovers) cause local increase in vibration levels of up to 10 VdB. In addition to the locations of proposed vibration mitigation shown above, relocating special trackwork (turnouts and crossovers) away from sensitive receptors or using specially-engineered trackwork (flange-bearing or moveable-point frogs) would minimize potential vibration impact at some locations. Table 8-4 provides a summary of existing crossovers and turnout locations that are recommended for specially-engineered trackwork or relocation. These crossovers and turnout locations are shown on Figures 7-6 through 7-10.

1  See Figures 7-6 through 7-10
8.3.4 Water Quality/Stormwater

The Proposed Project would create approximately two acres of new impervious surfaces, including roofs, walkways, platforms, and other pavement for the new stations. Since the DEIR/EA, there has been a reduction in impervious surface for the overall Project as a direct result of the use of Option L for the maintenance facility location. Because part of the Option L site is currently covered by buildings and pavement but would be replaced with substantial areas of trackwork with pervious stone ballasted surface areas, the Option L maintenance facility would decrease impervious area by approximately 3.2 acres. Taking into consideration the increase in impervious surfaces at the station areas and the reduction in impervious surfaces at the maintenance facility, there would be no net increase in impervious surfaces as a result of the overall Proposed Project.

New and expanded stormwater management systems would be required to collect the runoff from these areas. These systems would discharge into the existing municipal stormwater drainage systems. Proposed stormwater management devices include:

- Deep sump catch basins to collect runoff from paved areas;
- Underdrains beneath the rail ballast to collect runoff within the rail corridor;
- Hydrodynamic particle separators to treat pavement runoff;
- Low Impact Development practices, where feasible, to maintain natural hydrology (e.g., raingardens to treat disconnected roof drainage and/or parking runoff);
- Underground infiltration/detention chambers to store and infiltrate runoff; and
- Overflow from the underground chambers to municipal storm drainage systems.

The proposed stormwater management system would include detention/infiltration systems as needed to maintain existing flow rates at existing outfalls. The extent of infiltration for each system would be determined during a later phase of the design based on actual soil analysis at the proposed system location. The infiltration systems would be sized taking into consideration soil conditions, and the remaining volume of runoff would be stored and released through a controlled outlet to match the existing rate of flow. Where infiltration is not possible due to poor soils or high groundwater subsurface detention systems would be sized to maintain predevelopment flow rates at each design point.

The Massachusetts Stormwater Management Standards require controlling flow rates to prevent flooding and removing total suspended solids (TSS) to improve water quality. The proposed drainage system would include...
detention/infiltration systems to maintain existing flow rates at existing outfalls. The extent of infiltration for each system would be determined for the final design based on actual soil analysis at the proposed system location. The remaining volume of runoff would be stored and released through an outlet control structure to match the existing rate of flow at each design point. Where infiltration/exfiltration is not possible due to poor soils or high groundwater, the subsurface detention system would be sized to maintain predevelopment flow rates at each design point. Maintaining existing flow rates would avoid exacerbating the existing effects of combined sewer overflows (CSOs) on the receiving waters.

TSS removal would not be necessary since the right-of-way would generate negligible TSS as it is not salted or sanded as roads and parking lots are. Where needed, TSS removal would be accomplished by way of proprietary water quality devices such as Vortechs units, which use whirlpool-like chambers to remove floating and suspended solids. These units would be installed prior to the proposed detention systems or before each connection to the existing drainage system. Each device would be sized to treat the 10-year flow rate at the proposed outfall and to maintain the predevelopment rate of flow in the existing drainage system.

With these measures in place, no increases in flooding or impairment of the receiving waters are expected.

MassDOT would prepare a detailed long-term operations and maintenance plan for the Proposed Project’s stormwater management system. MassDOT would design a drainage system to meet MassDEP Stormwater Standards to the extent feasible, including meeting any applicable Total Maximum Daily Load (TMDL) requirements. MassDOT also acknowledges that the Proposed Project would be required to achieve requisite NPDES permit obligations, including MS4 requirements to implement construction site runoff controls, post-construction runoff controls, and pollution prevention/good housekeeping measures.

8.3.5 Historic Resources

The south end of the Project Area that intersects with the Cambridge steel elevated portion of the Lechmere Viaduct, which is eligible for listing in the National Register as part of the Viaduct, and would be impacted by the Proposed Project. In addition, removing the existing Lechmere Station structure and constructing a new station on the east side of O’Brien Highway/Route 28 would affect a property that is recommended as National Register-eligible. This work would require mitigation as stipulated in the MOA. The proposed Gilman Square Station would have an indirect effect on the Gilman Square Area and Central Hill Area through the introduction of new visual elements.
With the exception of these areas, direct permanent impacts from work within the existing railroad right-of-way is not likely to directly affect significant historic resources, as no significant resources are found inside the railroad right-of-way. However, a number of historic architectural resources immediately abut the right-of-way and would be indirectly affected by noise and vibration. Impacts to these historic structures could occur as a result of soundproofing, if the noise study found that noise mitigation was required.

Noise mitigation would include noise walls and sound insulation, treatments which in themselves have the potential for adverse effect. Noise walls that are proposed adjacent to the Susan Russell House, Michael Cotter House, and Hill-Michie Co. Auto Garage would be of a material and color that is compatible with the historic character of the properties to minimize any additional visual affect from noise walls. The introduction of new doors, windows, or other insulating treatments would be appropriate for the historic property and meet the Secretary of the Interiors Standards for Rehabilitation.

Mitigation would be provided for individual and district historic resources that are listed or eligible for listing in the National Register and that would be adversely affected by permanent aspects of the Project. Attention to the historic character of Somerville would be integrated into the design of stations, although the stations would not adversely affect historic properties. Mitigation at Lechmere Station, which is proposed to be demolished, would consist of archival documentation and consideration of salvage of architectural elements. Historic interpretive signage may also be included.

Affected historic properties proposed to be subject to sound insulation mitigation consist of the A & P Warehouse (Brickbottom Lofts) and Warner and Childs Garage (Tufts Bacon Hall). Vibration mitigation would consist of measures incorporated into the rail bed, ballast, and track design and therefore there would be no effects and no need for additional mitigation.

The Proposed Project would affect one archaeologically sensitive area, a potential mid-late nineteenth-century worker housing site at the proposed Brickbottom Station. There is also the potential for archaeologically sensitive strata below railroad and upper fill deposits in the Option L maintenance and storage facility area where the new vehicle maintenance building is proposed.

For archaeological resources, final design of the Proposed Project would seek to avoid the archaeologically sensitive areas discussed above. If avoidance through Project redesign is not possible, then subsurface testing as part of an intensive (locational) archaeological survey may be warranted in consultation with the FTA, MassDOT, and MHC. The intensive survey would be designed to locate and identify any potentially significant archaeological resources that may be impacted by the Project. The intensive survey would be conducted under a state
archaeological permit issued by the MHC/State Archaeologist following a research design and testing strategy developed specifically for each sensitive area according to the type of expected archaeological resource(s).

Should any significant and National Register-eligible archaeological resources be identified during the intensive survey or subsequent site evaluation testing, then measures to avoid, minimize, or mitigate any adverse effects of the Project on the National Register-eligible resource(s) would need to be determined by the FTA and MassDOT, in consultation with the MHC and other consulting and interested parties. Mitigation measures for archaeological sites that would be adversely affected by construction activities would include an archaeological data recovery program designed in accordance with state and Federal guidelines and standards for the excavation of National Register-eligible archaeological sites.

8.4 Section 61 Findings

These proposed Section 61 Findings for the Project have been prepared to comply with the requirements of Massachusetts General Laws, Chapter 30, Section 61, and in accordance with the MEPA regulations at 301 CMR 11.07(6)(k), which requires state agencies and authorities to review, evaluate, and determine the impacts on the natural environment of all projects or activities requiring permits issued by the state, and to issue findings describing the environmental impacts, if any, and certifying that all feasible measures have been taken by the Project Proponent to avoid or minimize these impacts. As described below, MassDOT has reviewed the environmental effects of the Proposed Project. Based on the review, MassDOT finds that all feasible measures have been taken first to avoid and then minimize those effects.

8.4.1 Project Description

The Green Line Extension Project is envisioned to provide service to Union Square and to Medford using a two-branch operation, both in existing commuter rail rights-of-way. One branch would operate from relocated Lechmere Station to Medford along the MBTA Lowell Line. This branch would begin at relocated Lechmere Station and head northwest, meeting the MBTA Lowell Line just south of Washington Street in Somerville. From Washington Street, the alignment would run parallel to the MBTA Lowell Line to Medford, terminating its route at Medford Hillside in the vicinity of College Avenue. The second branch would operate along the MBTA Fitchburg Line from Lechmere Station into a terminus at Union Square in Somerville. The Union Square Branch would begin at relocated Lechmere Station and head northwest, following the MBTA Fitchburg Line to Prospect Street in the Union Square area.
The route length would be about three miles to Medford Hillside with an approximately one-mile spur to Union Square. The primary infrastructure improvements of the Proposed Project would include relocating existing commuter rail lines, and constructing approximately four miles of new light rail track and systems, 11 bridge structures and a maintenance facility to support the extension service. The environmental impacts of the Proposed Project have been fully evaluated and are described in detail in the DEIR/EA, with supplemental information provided in this FEIR.

The Project would include one relocated Green Line station, six new Green Line stations, and a maintenance and storage facility (Option L). The stations include:

- Relocated Lechmere Station, Cambridge (relocated to the east side of O’Brien Highway);
- Union Square Station, Somerville;
- Brickbottom Station, Somerville;
- Gilman Square Station, Somerville;
- Lowell Street Station, Somerville;
- Ball Square Station, Medford; and
- College Avenue Station, Medford.

The Proposed Project for the Green Line Extension Project has been selected as it provides a balance of cost, ridership, and environmental impacts. MassDOT also believes that the Proposed Project would help the Commonwealth achieve its goal of providing expanded transportation services and improve regional air quality. The Proposed Project would meet all Project goals, would be operationally feasible, and would generate a high number of new systemwide transit trips.

8.4.2 History of MEPA Review

An EENF was submitted to the EEA on October 10, 2006. The Secretary of EEA issued a Certificate on the EENF on December 1, 2006, requiring a DEIR for the Proposed Project.

The DEIR/EA was submitted to the EEA on October 15, 2009, in compliance with the MEPA regulations (301 CMR 11.00). The MEPA Certificate was issued on January 15, 2010. This FEIR responds to the requirements of the Secretary’s Certificate.
8.4.3 Related Permits and Approvals

The Proposed Project would require permits and approvals from several local, state and Federal agencies. Table 8-5 below lists the permits and approvals that are anticipated for the Proposed Project.

1 Completion of construction (12/31/2014)
TBD = To be determined during final design
N/A = Cost not applicable for this item
Temporary, short-term impacts from construction activities would be mitigated to the extent feasible. Appropriate construction mitigation measures would be incorporated into the contract documents and specifications governing the activities of contractors and subcontractors constructing elements of the Project. Prior to construction, MassDOT would prepare a detailed plan to address various construction period impacts through coordination with cites and appropriate emergency personnel. This plan would seek to avoid, minimize and mitigate potential impacts to vehicular traffic, pedestrian and bicycle traffic, on-street parking, public access, emergency access to local businesses and residences, dust, noise, odor, rodents and construction-related nuisance conditions. MassDOT would work with contractors to establish construction protocols. On-site resident engineers and inspectors would monitor all construction activities to ensure that mitigation measures are properly implemented. The construction mitigation measures are summarized in Table 8-7, and described in Section 3.7.6 of the DEIR/EA.

¹ During construction (11/1/2011 – 12/31/2014)
² Completion of construction (12/31/2014)

### 8.4.5 Proposed Section 61 Findings

The language in the following paragraphs is a proposed Section 61 Finding that extends to cover all potential impacts of the Project and could be adopted by the MassDOT, MHC, Massachusetts Water Resource Authority (MWRA), or other state agency.

**Project Name:** Green Line Extension Project  
**Project Location:** Boston, Cambridge, Somerville, and Medford, Massachusetts  
**Project Proponent:** Massachusetts Department of Transportation  
**EEA Number:** 13886

The potential environmental impacts of the Project have been characterized and quantified in the EENF, DEIR, and summarized in this FEIR, which are incorporated by reference into this Section 61 Finding. Throughout the planning and environmental review process, the proponent has been working to develop measures to mitigate significant impacts of the proposed action. With the
mitigation proposed and carried out in cooperation with state agencies, the agency finds that there are no significant unmitigated impacts.

The proponent has summarized Project Mitigation and Construction Mitigation measures (Tables 8-6 and 8-7) that specify the mitigation measures that the proponent would provide.

Therefore, [AGENCY], having reviewed the MEPA filings for the Green Line Extension Project, including the mitigation measures summarized in Section 8.3, finds pursuant to M.G.L. C. 30, S. 61 that, with the implementation of these mitigation measures, all practicable and feasible means and measures would have been taken to avoid or minimize potential damage from the Project to the environment.
In accordance with Section 11.16 of the MEPA regulations at 301 CMR 11.00 and the MEPA DEIR Certificate, this FEIR is being distributed to the following governmental agencies and other parties.

It is expected that notice of the availability of this FEIR will be published in *The Environmental Monitor* on or about June 23, 2010. Per Section 11.06(1) of the MEPA regulations, the public review period for a FEIR lasts 30 days. Thus, written comments are due by July 23, 2010.

Copies of this report will also be posted on the Project website ([http://www.mass.gov/greenlineextension](http://www.mass.gov/greenlineextension)) and also made available at the listed libraries. A notice of availability will be sent to those who signed petitions, for which addresses are available. To request a copy of this document, please contact Regan Checchio at (617) 357-5772 or at rchechio@reginavilla.com.
